v. 2

BO'RAX, or BIBO'RATE OF SODA, is found native as a saline incrustation on the shores of certain lakes in Persia and Thibet. It also occurs in India, China, Ceylon, Saxony and South America. When collected on the banks of the lakes, it is impure, and goes by the name of *tincal*. The latter is purified by acting upon it with a solution of caustic soda, which removes the fatty matter that the crystals are coated with, to prevent evaporation of the water they contain, and thereafter dissolving in hot water and recrystallizing.

B. is likewise prepared from boracic acid (BO_3), (q. v.), by solution in boiling water, and the addition of a boiling solution of ordinary carbonate of soda ($NaOCO_2$), when B. ($NaO,2BO_3$) is formed, and carbonic acid (CO_2) is disengaged, and on cooling in wooden tanks lined with lead, the crystals of B. separate. The common crystalline variety of B. contains 10 equivalents of water ($NaO,2BO_3 + 10HO$); but if a stronger than ordinary solution be allowed to cool, crystals begin to separate at a higher temperature than usual, which contain only 5 atoms of water ($NaO,2BO_3 + 5HO$). B. is soluble in water to the extent of one part of the salt in two parts of hot water, and in twelve of cold, yielding a clear solution with a sweetish taste. It is readily reduced to powder, and is then known as *powdered borax*. It is of great use in the chemical arts. As an assistant agent in experimenting with the blow-pipe (q. v.), B. is of great service, from the readiness with which it forms colored glasses with the various metallic oxides. It is also employed in the manufacture of enamel, and for glazing or coating vessels in English pottery, as also in the formation of the paste for artificial gems. To the metallurgist, it is an aid in the readiness with which it promotes the fusion of metallic mixtures, and the separation of the metals; and to the solderer of all metals it is of service in forming a thin glassy coating over the edges of the metals, which prevents their oxidation at the time they are being joined together. B. is also used in dyeing.

Crystal of Borax.

BORDA, JEAN CHARLES, an eminent practical mathematician and astronomer, was born on 4th May 1733 at Dax, in the department of the Landes, in France. In 1771, he was associated with Verdun and Pingré in proving the accuracy of chronometers. He also devoted much attention to the subject of ship-building, and suggested great improvements in the form of vessels. In 1787 he took an active part in bringing the observatories of Paris and Greenwich into closer relations with one another. Along with Delambre and Méchain, he was a leading member of the French commission intrusted with the measurement of a meridian arc. He rendered essential service in the commission on the new system of weights and measures. He invented a new instrument for measuring the inclination of the magnetic needle; and his corrections of the seconds pendulum are still in use. But his reputation depends most of all on his improvement of the reflecting circle, on which instrument he published a work in two volumes (Par. 1787). He died at Paris on the 20th February 1799.

BORDEAUX, an important seaport town of France, chief town in the province of Gironde, beautifully situated in a plain on the left bank of the Garonne, about 60 miles from its mouth in the Atlantic. Ships of more than 1000 tons burden can easily ascend the river at high-water to B., which is accessible at all times to vessels of 600 tons. Its harbor is very capacious; and, by the Garonne, its commerce very extensive. The river is crossed by a noble bridge of 17 arches and 532 yards in length, erected by the elder Deschamps in 1811—1821. The old town, consisting partly of high wooden houses of the 15th c., has narrow crooked streets; but the newer parts of the city and the suburbs have wide streets, fine squares, and pleasant promenades lined with trees. The cathedral, which was consecrated in 1096, is remarkable for its beautiful towers. The church of St. Croix is a building of the 10th c.; that of St. Seurin is also very old, and has rare Gothic ornaments. The former archiepiscopal palace is now the town-hall. The Great Theater is one of the largest and finest buildings of its kind in France. B. has many other fine public buildings, and learned associations, and educational and benevolent institutions, with a public library of upwards of 140,000 volumes. The university, founded by Pope Eugenius IV. in 1441, has been, since 1839, an *Académie Universitaire*, with fifteen professorships. Pop. in 1881, 220,955.

Among the principal branches of industry are the production or preparation of sugar, brandy, liquors, vinegar, nitric acid, printed calicoes, woollen goods, carpets, hats, paper, earthenware, glass bottles, metallic wires, madder, and resinous articles. The rope-works, cooperages, and dock-yards are extensive and full of activity. The Canal du Midi, connecting B. with the Mediterranean, enables it to supply the whole south of France with the colonial produce which it imports; and also with English tin, lead, copper, coal, dye-stuffs, herrings, &c. Wine, brandy, vinegar, dried fruits, hams, turpentine, and glass bottles are among its principal exports.

Except the wines of Champagne, no French wines are so much exported to foreign countries as those grown in the district of B., and known as BORDEAUX WINES. Some of them are red (known in England as *Claret*), others white. Of the red wines, the Medoc is one of the best known. The red wines produced by the vineyards of Lafitte, Latour, Château-Margaux, and Haut-Briou, are particularly celebrated for their quality. The white wines of Graves, and those of Sauternes, Barsac, Preignac, and Langon are in highest repute.

In former times, B. was called *Burdigala*, and was the capital of the *Bituriges Vivisci*. It was a very prosperous town in the times of the Romans, was made by Hadrian the capital of Aquitania Secunda, and was both the principal emporium of the south-west of Gaul, and the seat of its best educational institutions. It was taken by Charles Martel in 735; but was again spoiled by Norman plunderers in the 9th century. It became the capital of the duchy of Guienne; and in 1152 passed, by the marriage of Eleanor of Guienne with Henry of Normandy (afterwards Henry II. of England), under the dominion of England. B. was for a considerable time the seat of the splendid court of Edward the Black Prince. During the Revolution, B. was the principal seat of the Girondists, and suffered fearfully at the hands of the Terrorists. Its inhabitants, disaffected to Napoleon's government, were the first to declare for the Bourbons in 1814. During the Franco-Prussian war, a delegation of the Government of National Defence, retreating before the advancing German army, stationed itself, December, 1870, at B.; and the first sittings of the National Assembly in 1871 were held there. Since the restoration of peace, the export trade of B. has increased greatly. In wines, there was an increase, between 1859 and 1871, of 124 per cent. in the quantity, and 73 per cent. in the value—arising from the amount of cheap wine shipped from the port during the two previous years. About one-sixth of the total export of this article goes to the British dominions.

BORDELAIS, a district of France, once forming part of the old province of Guienne, and having Bordeaux for its capital, but now included in the departments of Gironde and Landes.

BO'RDER, THE, is a term employed in historical as well as popular phraseology to signify the common frontier of England and Scotland. At present, the dividing boundary of the two countries consists partly of natural and partly of imaginary outlines. It is customary to speak of Scotland as a country 'north of the Tweed;' but the Tweed is the boundary only in a small part of its course, on the east, and large portions of several Scottish counties lie to the south of that river. Even at its mouth, the Tweed is not the division; for north of the river at its estuary lies the ancient town of Berwick, with the district known as its 'bounds,' which belong to England. The Tweed forms the division only for about 16 to 18 miles.

Leaving the river at Carham Burn, a few miles above Coldstream, the line proceeds towards the Cheviot mountains, the ridge of which is the boundary for about 25 miles; descending thence, the line strikes on Kershope Water, a tributary of the Esk. That river is the boundary for a number of miles to a point above Longtown. The line now quits the Esk abruptly in a northern direction, and taking into England part of what was known as the 'Debatable Land' (q. v.), strikes on the small river Sark, which is the boundary to the Solway Firth, the great natural division on the west. Such, in general terms, is the entire boundary, extending from sea to sea for about 100 miles, in which length the Tweed obviously plays an inferior part. The counties lying on the English side of the border are Northumberland and Cumberland; on the Scottish side, Berwickshire, Roxburgshire, and Dumfriesshire. Readers of history are aware that the division here indicated is comparatively modern; in former times, the frontier shifted according to the surging tide of war or diplomacy. For several ages prior to the 11th c., the kingdom of Northumbria, forming a part of what we now call England, included all that portion of Scotland south of the Firth of Forth as far west as Stirling. As a result of some warlike operations, this district was ceded by the Earl of Northumberland to Malcolm II., king of Scots, 1018, and ever since the Tweed, in its lower part, has been the boundary. What, however, was gained by Scotland on the east was lost on the west; for William the Conqueror wrenched Cumberland from the northern sovereign; and with little intermission the boundary in this quarter was settled according to its present limits.

It may be said that from the 11th till the end of the 17th c., there was almost constant disturbance on the border. Ruthless wars on a great scale between English and Scots sometimes caused the most frightful devastation, and became the source of lasting ill-will on both sides. History abounds in events of this kind, and the feuds and forays of clans and families are commemorated in a series of balads, for ever embalmed in the *Minstrelsy of the Scottish Border*, by Sir Walter Scott. The most notable of these forays from the Scotch side is narrated in the ballad of the *Battle of Otterburne*, or, as it is sometimes called, *Chevy Chase*. The event referred to occurred in 1388. Among the latest of the regular inva-

sions from England was that in 1543, in the reign of Henry VIII., conducted by the Earl of Hertford.

The invasion was by the eastern marches, and in their devastating course, the English army set fire to and destroyed all the towns, villages, monasteries, and numerous castles within a wide range of country. At an early date, wardens and commissioners had been appointed to repress petty insurrections, and punish the moss-troopers who made cattle-lifting from their neighbors on the opposite side of the border a kind of profession. For these measures of police, the border was divided into three parts—the east, middle, and western marches. Such was the lawlessness in the early part of the 16th c., that in 1511, Sir Robert Kerr, warden of the eastern marches, was slain at a border meeting by three Englishmen. The principal murderer escaped as far as York, and for a time tried to conceal himself; but he was sought out by two of Sir Robert's followers, who brought his head to their new master, by whom, in memorial of their vengeance, it was exposed at the cross of Edinburgh (Scott's *Essay on Border Antiquities*). Sometimes the Scottish borderers met ostensibly to amuse themselves with the ancient sport of football, but in reality to plan and execute daring military exploits. During the reigns of Elizabeth and James VI., strenuous efforts were made to preserve peace on the border, and this was attained only by extraordinary severities. Many of the more audacious reivers were hanged, and great numbers were banished. Some account of the measures adopted at this period to suppress border outrages will be found in the *Memoirs of Sir Robert Cary*, who long acted as English warden on the marches; also in the *Domestic Annals of Scotland*, by R. Chambers, vol. i. After the accession of James to the English throne, a sweeping clearance of the Scottish border was effected. The laird of Buccleuch collected under his banners the most desperate of the border marauders, whom he formed into a legion for the service of the states of Holland. At the same time, the Debatable Land was cleared of the Græmes, a daring sept of freebooters, who were transported to Ireland, and their return prohibited under pain of death. The legislative union of 1707, and the firm administration of justice, along with a general improvement in manners, finally terminated the long course of misrule.

In the present day, there is nothing to distinguish the border from other districts of the country, unless it be the prevalence of picturesque ruins of old castles, generally roofless, but, from the vast thickness and strength of the walls, still in a good state of preservation. The border strengths were of three kinds—regular fortresses, large baronial castles, and the lesser kind of towers. On the east, the English owned the fortified town of Berwick, and at no great distance Newcastle-on-Tyne; and on the west, Carlisle. The chief Scottish border fortresses were the royal castles of Roxburgh, Jedburgh, and Lochmaben; and we might almost include Edinburgh Castle, for it is only 60 miles distant. Among the baronial castles on the English side were numbered Norham, Alnwick, Bamborough, Naworth, Brougham, Penrith, and Cockermouth. Among the Scottish fortlets of the baronial class may be mentioned Newark, Hermitage, and Caerlaverock. The smaller kind of towers on both sides of the frontier appear to have been exceedingly numerous, and it is their remains that form the more conspicuous memorials of old border strife. These buildings consist of a single square tower, usually of three floors; the lower vaulted, for the reception of cattle; while the two upper, consisting of but one small apartment each, with narrow slit-hole windows, comprised the accommodation for the family. It is conjectured, however, that retainers lived in thatched huts outside, which are now obliterated, and were brought into the tower, along with the cattle, only in the case of an anticipated attack. These towers, known as bastel-houses or peels, once the residences of a warlike yeomanry, are thickly studded over the south of Scotland, more particularly along the vale of the Tweed; and by the lighting of beacons on their summits, the whole country between the border and the Forth could be speedily summoned to arms. On the English side, there are similar towers, such as those of Thirlwall, Fenwick, and Widdrington. The English border castles of every kind appear to have been of greater splendor and strength than those on the Scottish side. 'Raby Castle, still inhabited, attests the magnificence of the great Nevilles, Earls of Westmoreland; and the lowering strength of Naworth shows the power of the Dacres' (*Scott*). On the English side, however, there is nothing which can be compared to the ruins of that remarkable group of Scottish border abbeys—Melrose, Dryburgh, Kelso, and Jedburgh, not to speak of the remains of various other religious houses. For an account of these and other architectural remains on the border, we must refer to the *Border Antiquities of England and Scotland*, by Sir Walter Scott, 2 vols. folio, illustrated with plates; also to Billing's *Baronial and Ecclesiastical Antiquities of Scotland*, 4 vols. 4to, illustrated with plates.

Assimilated in habits to the rest of the population, the old Scottish border families are still distinguishable by their surnames—as, for example, the Maxwells, Johnstons, and Jardines on the west, and the Elliotts, Armstrongs, Scotts, and Kerrs on the middle and eastern marches. The principal Scottish border families of rank are the Scotts, Dukes of Buccleuch, descendants of a famed border chief, Sir Walter Scott of Buccleuch; and the Kerrs, Dukes of Roxburgh, who are sprung from an equally celebrated borderer, Sir Robert Kerr of Cessford. The possessions of both families are extensive, particularly those of Buccleuch (q. v.), which spread through several counties. The family of corresponding rank within the English border is that of the Percies, Dukes of Northumberland. Local intercourse across the border is considerably obstructed by the long range of hills and the moors which generally lie on the line of boundry; and the circumstance of the peculiar civil and ecclesiastical institutions of the two kingdoms shedding off here towards different centers, still further tends to lessen community of feeling. At no distant day, certain exciseable articles were charged with a less duty in Scotland than England, and the consequence was an active contraband trade on the border, chiefly by the mountain-passes and the Solway. Now, these duties are assimilated, and this demoralizing kind of traffic has disappeared. The great channels of communication across the border are two railway routes, one by the way of Berwick, and the other by Carlisle. There are also good roads in various directions for those who wish to explore this interesting district of country. Besides the books relative to the border already referred to, there are some works of local note, among which the most comprehensive is Richardson's *Borderer's Table-book*, 8 vols. royal 8vo (New-castle-on-Tyne); we may also refer to Jeffrey's *History and Antiquities of Roxburghshire*, 3 vols.; and Ridpath's *Border History*, 1 vol. 4to.

BO'RDER-WARRANT, in the law of Scotland, is a warrant issued by the judge ordinary—that is, by the sheriff or county court judge, or by magistrates of royal burghs within the royalty, or by justices of the peace—on the borders between Scotland and England, on the petition of a creditor who desires to arrest the person or effects of a debtor residing on the English side, and to detain him until he finds bail for his appearance in, and abiding the result of, any action which may be brought for the debt within six months. The creditor must swear to the truth of the debt, and before resorting to imprisonment of the debtor, it is proper to examine him as to his domicile, or usual residence, and occupation. These warrants are in use in the counties of Dumfries, Roxburgh, and Berwick.

They are more used in the country districts than in the burghs, though not frequently even in the country districts. In Dumfriesshire and Berwickshire, border-warrants are granted exclusively for arresting the persons of alleged debtors. In Roxburghshire—save in Kelso and Melrose districts—the warrants are granted for the purpose of arresting both the debtor's person and goods.

In English practice, the warrant to arrest an absconding debtor, which includes any foreigner who may be in England on business or pleasure, is very similar. See ARRESTMENT FOR FOUNDING JURISDICTION; DEBTORS, ABSCONDING; FOREIGN ATTACHMENT; JURISDICTION.

BORDIGHERA, a small town of the Riviera, North Italy, frequented as a health-resort. It is on a hill overlooking the Mediterranean, between Mentone and San Remo.

BO'RDURE, or BORDER, in Heraldry. Coats of arms are frequently surrounded with a B., the object of which is generally to show that the bearer is a cadet of the house whose arms he carries. The character of the B. often has reference to the profession of the bearer: thus, a B. *embattled*, is granted to a soldier; and a B. ermine, to a lawyer.

BORE is a tidal phenomenon at the estuaries of certain rivers. When a river expands gradually towards a very wide mouth, and is subject to high tides, the spring flood-tide drives an immense volume of water from the sea into the river; the water accumulates in the estuary more rapidly than it can flow up into the river; and thus there is gradually formed a kind of watery ridge stretching across the estuary, and rushing up towards the river with great violence. In some cases, this ridge, or B., is many feet in height, and contends against the descending stream with frightful noise. This phenomenon is observable in several British rivers, as the Severn, Trent, Wye, and Solway. The most celebrated bores are those of the Ganges, Brahmaputra, and Indus; in the Hoogly branch of the Ganges, the B. travels 70 miles in 4 hours, and sometimes appears suddenly as a liquid wall 5 feet high. The Bay of Fundy has the largest B.

BORE is a name for the internal cavity of a cannon, mortar, howitzer, rifle, musket, fowling-piece, pistol, or other kind of firearm. It is in most cases cylindrical; but in the Lancaster gun the B. is oval; in the Whitworth gun, it is hexagonal; while in the Armstrong, and many other kinds of gun, it is furrowed by spiral grooves. Technically, the B. of a gun often means simply the diameter of the cavity, as when we speak of a gun ' of 8-inch bore;' and in that case its meaning is equivalent to ' calibre.'

The BORING of a cannon is a process which may best be de-

scribed in connection with CANNON FOUNDING. It is desirable to mention in the present place, however, that there is an operation called 'boring-up' conducted at Woolwich Arsenal, for enlarging the bore of a gun. It has been found in recent years that many of the old cannon are thicker and heavier than needful for the size of shot propelled, and that they could be fitted for the discharge of larger shot without danger. A change was begun in the armament of the British fleet in 1839 by substituting heavier broadsides; and as one part of the process, many of the old 24-pounders were 'bored-up' to 32s.; even some of the 18-pounders were found to be thick and strong enough to undergo this process. More than 2000 iron naval guns were thus treated at Woolwich preparatory to the change in 1839; and many others have since been similarly bored-up. About 1860, important experiments were carried on at Woolwich, to determine whether the old smooth-bore iron guns could not only be bored-up, but *rifled* at the same time. There were 15,000 of such guns belonging to the British government, and it was suggested that they ought to be improved, instead of being cast aside as useless in the event of the success of the Armstrong and Whitworth guns. The process has not proved altogether satisfactory.

BO'REAS, the Greek name of the north-east wind, blowing towards Hellas from the Thracian mountains, and personified in mythology as the son of Astræus and of Eos or Aurora, and the brother of Notus, Zephyrus, and Hesperus. B. was said to dwell in a cave of the Thracian Hæmus, to which he carried Oreithyia, the daughter of the Athenian king Erechtheus, who bore him Zetes and Calaïs—employed as the symbols of swiftness—and Cleopatra, the wife of Phineus. According to Homeric fable, he begat, with the mares of Erichthonius, twelve horses of extraordinary fleetness. The rape of Oreithyia was represented on the ark of Cypselos, where B. instead of feet has the tails of serpents. He had a temple in Athens, because he destroyed the ships of the Persians under Xerxes; and at Megalopolis, a yearly festival was celebrated in his honor, because upon one occasion he helped the Megalopolitans against the Spartans.

BO'RECOLE. See KALE.

BORELLI, GIOVANNI ALFONSO, a distinguished mathematician and astronomer, and the founder of the iatro-mathematical school, born at Naples in 1608, was educated at Florence, and became professor of mathematics at Pisa, and afterwards at Messina. Having taken part in a revolt, he was obliged to leave Messina, and spent the remainder of his life at Rome, where he enjoyed the patronage of Queen Christina of Sweden, and where he died in 1679. He carefully observed the motions of the satellites of Jupiter, then little known, and seems to have been the first to discover the parabolic paths of comets. He made many valuable observations on a malignant fever in Sicily, and wrote a treatise on the causes of such fevers. He wrote also an account of an eruption of Etna, and a number of works on subjects of applied mathematics, of which the most celebrated is that *De Motu Animalium* (Rome 1680—1681). In this work, he applies the laws of mechanics to the motions of animals, regarding the bones as levers, in which the power acts between the weight and the fulcrum, and endeavoring to calculate the power of muscles from a consideration of their fibrous structure, and the manner in which they are united to the tendons. All more recent authors on the same subject have been much indebted to Borelli.

BORER, a name common to many insects of the Linnæan genus *Ptinus*, the tribe *Ptiniores* of Latreille, coleopterous (q. v.) insects of small size, the larvæ of which—small, white, soft, worm-like creatures with six minute feet—are furnished with strong cutting jaws (*maxillæ*), by means of which they eat their way in old wood, and similar substances, boring little holes as round as if made with a fine drill. Every one is familiar with the appearance of these holes, and with the injury done by these insects to furniture, &c. The holes are filled, as the insect works its way onward, with a fine powder, formed from the wood which it has eaten; and finally it constructs for itself a little silky cocoon, and having passed through the pupa state in the bottom of its hole, comes forth a winged insect—a small beetle in the widest popular sense of that term. One of the most common British species is *Anobium striatum*, a dark-brown insect, not much above one line in length. The thorax, as in the whole tribe, is proportionately very large, and has a swollen hood-like appearance, the head being, as it were received within it. This insect has long been noted for the pertinacity with which it simulates death. This instinct appears to be common to the whole tribe, as it is also to many other insects.—Another species of the same genus, *Anobium tesselatum*, has become an object of interest as one of the insects which, being sometimes heard to make a peculiar ticking noise, are connected with superstitious fancies and fears, and receive the name of Death-watch (q. v.).

Borer (*Anobium striatum*), Natural size, and magnified.

BORGE'TTO, a town of Sicily in the province of Palermo, and 13 miles west-south-west from Palermo. It is a long straggling town, of mean houses, but picturesquely situated on a wooded cliff overhanging a plain, and itself overhung by a lofty precipice of red rock. Pop. 6000.

BORGHE'SE, a family of great distinction in the republic of Siena, and afterwards at Rome. CAMILLO B. ascended the papal throne in 1605 as Paul V., and by him other members of the family were advanced to high positions. A marriage with the heiress of the family of Aldobrandini brought the B. family into the possession of great wealth. CAMILLO FILPPO LUDOVICO B., Prince B., born at Rome in 1775, joined the French army when it invaded Italy; and in 1803 married Pauline, the sister of Napoleon Bonaparte, and widow of General Leclerc. His wife subsequently received the principality of Guastalla, and he was created Duke of Guastalla, and under the French Empire he was for some time governor-general of the provinces beyond the Alps. He held his court at Turin, and was very popular among the Piedmontese. He sold the B. collection of artistic treasures to Napoleon for 13,000,000 francs, receiving in part payment the Piedmontese national domains; but when these were reclaimed by the king of Sardinia in 1815, he received back some of the works of ancient art. After the overthrow of Napoleon, he separated from his wife, and broke off all connection with the Bonaparte family. He lost Guastalla, but retained the principalities of Sulmona and Rossano his hereditary possessions. He died in 1832.—The *Borghese Palace* is one of the most magnificent at Rome. The noble portico of the inner court is composed of 96 granite columns; the collection of paintings is remarkably fine.

BORGHE'SI, BARTOLOMMEO, COUNT, a distinguished antiquarian, born at Savignano, Central Italy, on the 11th July 1781. His father, Pietro Borghesi, who was one of the most accomplished scholars of his time, trained him to an early delight in learned pursuits. He studied at Bologna, and afterwards devoted himself to archæological researches. He arranged the numismatic collection in Milan, and that of the Vatican, of which he drew up a catalogue. In 1821 he fixed his residence in the republic of San Marino, where he died in 1860. The French government undertook the publication of his works, of which 7 vols. appeared in 1862—1871. His principal work is his *Nuovi Frammenti Dei Fasti Consolari Capitolini Illustrati* (2 vols., Milan, 1818—1820). His contributions to Forcellini's Latin Lexicon are very highly prized.

BO'RGIA, a family originally Spanish, but which acquired great eminence in Italy after the elevation of Alfonso Borgia to the popedom, as Calixtus III., in 1455. He had previously been a privy-councillor of the king of Aragon. He died in 1458.—Rodrigo B. ascended the papal throne in August 1492, under the name of Alexander VI. (q. v.). Before his elevation to the popedom, he had a number of children by a Roman woman named Vanozza (Giovanna de' Catanei), of whom two, Cesare and Lucrezia, share their father's extraordinary historic infamy.—CESARE or CÆSAR B. was one of the greatest monsters of a time of depravity, when the court of Rome was the scene of all the worst forms of crime. He unscrupulously made use of the most sacred things as means to the most iniquitous ends. He had early received high ecclesiastical preferment, and his father, soon after becoming pope, invested him with the purple. But his father conferring upon his brother Giovanni the Duchy of Benevento, with the counties of Terracina and Pontecorvo, Cæsar, as was believed, moved with envy, caused his brother to be assassinated. He obtained the duchy and counties for himself, and was permitted by his father to resign the purple and to devote himself to the profession of arms. He was sent in 1498 to France, to convey to Louis XII. a bill of divorce and dispensation from his marriage with Anne of Brittany. Louis rewarded him for the pope's complaisance with the Duchy of Valentinois, a body-guard of 100 men, 20,000 livres of yearly revenue, and a promise of support in his schemes of ambition. In 1499, Cæsar married a daughter of the king of Navarre; and accompanied Louis XII. to Italy, where he undertook the conquest of the Romagna for the Holy See. The rightful lords of that country, who fell into his hands, were murdered, notwithstanding that their lives had been guaranteed by his oath. In 1501 he was named by his father, Duke of Romagna. In the same year, he wrested the principality of Piombino from Jacopo D'Appiano, but failed in an attempt to acquire Bologna and Florence. He took Camerino, and caused Giulio Di Varano, the lord of that town, to be strangled along with his two sons. By treachery as much as by violence he made himself master of the Duchy of Urbino. A league of Italian princes was formed to resist him, but he kept them in awe by a body of Swiss troops, till he succeeded in winning some of them over by advantageous offers, employed them against the others, and then treacherously murdered them on the day of the victory, 31st December 1502, at Sinigaglia.

He now seized their possessions, and saw no obstacle in the way of his being made king of Romagna, of the March, and of Umbria, when, on 17th August 1503, his father died, probably of poison which he had prepared for twelve cardinals. Cæsar, also, who was a party to the design (and who, like his father, had long been familiar with that mode of despatching those who stood in the way of his ambition, or whose wealth he desired to obtain), had himself partaken of the poison, and the consequence was a severe illness, exactly at a time when the utmost activity and presence of mind were requisite for his affairs. Enemies rose against him on all hands, and one of the most inveterate of them ascended the papal throne as Julius II. Cæsar was arrested and conveyed to the Castle of Medina Del Campo, in Spain, where he lay imprisoned for two years. At length he contrived to make his escape to the king of Navarre, whom he accompanied in the war against Castile, and was killed on the 12th March 1507 by a missile from the Castle of Biano. With all his baseness and cruelty, B. was temperate and sober. He loved and patronized learning, and possessed in a remarkable degree a ready and persuasive eloquence. Macchiavelli has delineated his character in his *Principe*.—LUCREZIA B. was a woman of great beauty. She was married first to Giovanni Sforza, Lord of Pesaro, but this marriage was dissolved by the Pope. She was said, without ground, to have lived in incest with her brothers and father. She next married in 1498, Alfonso, Duke of Bisceglie, a natural son of Alfonso II. of Naples; but he was assassinated by her brother Cæsar in 1501. In September of the same year, she married Alfonso of Este, who afterwards inherited the Duchy of Ferrara. She died in 1520. Like her brother Cæsar, she shrank from no crime; but she also was a patroness of art and learning, and was therefore adulated by several poets. See Gregorovius, *Lucrezia B.* (1874).

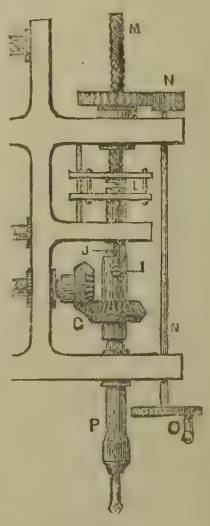
BO'RGO, a name given to a number of towns and villages in Italy and Southern Tyrol, and indicating the growth of the town or village around a castle or castellated rock, the original Borgo. See BOROUGH. Thus, *B. di val Sugana* is a place of (1869) 4092 inhabitants, with a castellated hill, in Tyrol; *B. Lavezzaro* is an Italian town in the province of Novara, with about 3000 inhabitants; *B. San Donnino*, in the province of Parma, with 6000 inhabitants; *B. San Sepolchro*, in the province of Arezzo, with 8000 inhabitants, &c.

BORGOMANE'RO, a town of North Italy, in the province of Novara, and 19 miles north-north-west from Novara, situated near the left bank of the Agogna. It is a walled town, well built, and contains a communal college and an hospital. It has little trade. Pop. 5320.

BO'RGO SAN DONI'NO, a city of North Italy, in the province of Parma, situated in a plain, 14 miles north-west from Parma, on the railway between Parma and Piacenza. It is surrounded by walls, has several good streets, is an episcopal see, and has a cathedral (the oldest part of which is in the Lombard style), several churches, and several educational institutions. Manufactures of silken linen, and woollen fabrics are carried on; and oil and wine are produced in considerable quantities. The city derives its name from a saint, who is said to have been a soldier in the army of the Emperor Maximian, and to have suffered martyrdom here. The shrine of St. Donino has long been one of the most frequented in Italy. There are curious remains of very rude medieval sculpture in the cathedral. Pop. about 4200.

BORGOTA'RO, a town of North Italy, in the province of Parma, and 35 miles south-west from Parma, on the left bank of the Taro, a tributary of the Po. It is encircled by walls, and is well built. Pop. (including commune 6938. The surrounding district is hilly and wooded.

BORING, as a process in carpentry and in the working of metals, is performed in a variety of ways. For boring holes in wood the carpenter makes use of *awls*, which simply displace a portion of the wood, and of *gimlets*, *augers*, and *bits* of various kinds, these last being applied by means of the crank-shaped instrument called a *brace*. All these are too familiar to need description. The boring of holes in metal plates for making attachments, is effected by means of *drills* driven by machinery. The annexed figure shows the essential parts of such a boring machine. The drill is inserted in the end of a vertical spindle P, which revolves in a fixed frame, and is driven by the bevel-wheels, G. The metal to be bored is placed on a table or other support below the drill; and the up and down motion, or end-pressure and off-action, of the drill is effected by the hand-gear, O, N, turning the screw M; which being coupled to the top of the spindle at L, presses it down or raises it, according to the way it is turned. The spindle slides vertically in the collar forming the axis of the bevel wheel, but is carried round with it by means of the pin I, which projects into a groove seen at J.



Boring Machine.

The Boring of Cannon and of Cylinders for steam-engines is most conveniently described under CANNON-FOUNDING; see also LATHE.

BORING, applied to the earth and to rocks, has two chief uses. 1. *For Draining*.—In some districts, owing to the existence, near the surface, of a bed of clay impervious to water, surface-water is retained in hollows, of greater or less extent. The expense of deep draining has been so great as to induce proprietors to neglect such land, but this expense has lately been avoided by leading drains to the lowest portion of the hollow, and then opening a bore through the clay to the pervious strata of sand or gravel beneath. This is done by a simple instrument, an auger of 2½ or 3½ inches in diameter, wrought by means of a cross-bar by one or two men.

2. *For Artesian wells, and for the discovery of the mineral contents of the earth*.—As the borings for these purposes are performed in the same manner, it is unnecessary to give them separate notices. The object in boring for Artesian wells is to open a passage for the escape of water from water-logged strata. See ARTESIAN WELLS. In the search for minerals, B. is had recourse to as a cheap method of discovering the mineral wealth of a district, and whether the quantity and quality of the contained minerals are such as to make the working remunerative. It should, however, never be undertaken without a previous geological survey of the locality; the neglect of this has caused an immense loss of time and money in futile searches for minerals, as in the innumerable cases of bores driven into Silurian and Old Red Sandstone strata, in search for coal. B. is also of use even after the presence of coal has been ascertained, to determine the most advantageous position for sinking the shaft by which the coal is to be drawn up. The general method of operating is as follows: The boring instrument consists of an iron shank, having a cross-bar at the top and a hollow screw at the bottom; to this all the successive B. instruments are fastened. A simple chisel is first attached to the screw, and one or two men press upon the cross-bar, and at the same time force it round like an auger; while another workman, by means of a lever erected overhead, with a chain descending from it to the cross-bar, gives an up and down motion to the instrument. When the chisel becomes clogged, from the accumulation of material which it has loosened, it is exchanged for a cylindrical auger, provided with a valve, which scoops out the separated material; and thus by alternate chopping and scooping the work is carried on. The nature of the strata is determined with considerable facility and certainty by examining the fragments brought up by the auger. As the work advances, successive lengths of rod are screwed on at the upper end. Three poles are erected over the well, for the purpose of elevating the rods, to permit the change of the tools.

The cost of B. varies with the material through which the operation is carried on. In strata of moderate hardness, the cost is about 10*s*. a fathom for the first 10 fathoms, and an additional 6*s*. for each 5 fathoms beyond.

A simple method of B. has been long in use among the Chinese, by which the great loss of time, arising from the screwing and unscrewing the rods, at each elevation of the chisel or auger, is saved. The chisel and scooping instrument are fastened to a rope, which is alternately elevated and allowed to descend by the simple force of gravity; the instrument thus forces its way through the ground. In the softer rocks of the newer formations this method has been successfully employed in boring for Artesian wells.

A still greater saving in time and money has been obtained by a process invented by M. Fauvelle, and described by him before the British Association in 1846. His apparatus consists of a hollow boring-rod, formed of wrought-iron tubes screwed end to end, armed at the lower end with a hollow perforating tool. The upper end of the hollow rod is connected with a force-pump by a flexible tube. By means of the force-pump a current of water is sent down the rod into the bore hole as it is sunk, and the water coming up again brings with it all the drilled particles, so that, except for the renewal of the perforating tool, the rods do not require to be elevated. M. Fauvelle found, by experience, that when he was passing through gravel, or required to bring up considerable masses of broken-off rock, it was better to inject the water by the bore-hole and let it rise through the hollow tube. In this way he has succeeded in raising stones 2½ inches long by 1¼ inch thick. For B. in tunnels, see TUNNEL.

BORLASE, REV. WILLIAM, an English antiquarian, was born at Pendeen, Cornwall, February 2, 1696. Ordained a priest in the English Church in 1720, he was, in 1732, presented to the vicarage of his native parish of St. Just. Devoting himself to a study of the natural history and antiquities of Cornwall, he in 1753 published, at the Oxford press, a volume, entitled *Observations on the Antiquities, Historical and Monumental, of the County of Corn-*

wall. This was followed, in 1758, by the *Natural History of Cornwall,* printed at the same press. B. paraphrased the book of Job, and wrote several pieces of a religious nature, was active in the supervision of his parish, and took an especial interest in the improvement of its highways. But that which makes his name most interesting now, is the fact that he was one of Pope's correspondents, and furnished to the poet most of the curious fossils of which the Twickenham grotto was composed. He died August 31, 1772.

BO'RNEENE, FLUID BORNEO CAMPHOR, or OIL OF CAMPHOR, is a thin liquid, lighter than water, with a fragrant odor (somewhat resembling turpentine), obtained by distilling native oil of Borneo camphor, or oil of Valerian. The B. is employed in perfumery.

BO'RNEO, (called by the natives *Pulo Kalamantin* or *Klemantin,* which is the name of an indigenous fruit), next to Australia and Papua, the largest island in the world, is situated in the Indian Archipelago, in 7° N.—4° 20′ S. lat., and 106° 40′—116° 46′ E. long. It is bounded on the E. by the Sea of Celebes and the Macassar Strait, S. by the Sea of Java, W. and N. by the Gulf of Siam and the China Sea. Its length is about 800 miles, with a breadth of 700, and an area of about 300,000 square miles. The population is under 2,000,000. The largest part, ruled by the Dutch, had, in 1873, 457 Europeans and 1,235,187 natives; the independent kingdom of Borneo or Brunaï, in the north, between Sambas and Maludu, 225,000; Sarawak, 50,000; and the unexplored regions of the interior are sparsely peopled. The coasts of B., which are often low and marshy, and rendered dangerous to navigation by numerous islets and rocks, present no deep indentations, though they are pierced by numerous small bays and creeks. Two chains of mountains run through the island in a nearly parallel direction from south-west to north-east; the one rising in Sarawak (q. v.), gradually increases in elevation until it attains, in its termination in Mount Kini Balu, on the north-east coast, a height of 13,698 feet; a cross chain, branching off in about lat. 2° N., extends in a south-east direction through Banjermassin (q. v.). The other range, which is much lower, intersects the equator in long. 113° E. Between are well-watered plains. B. has fine rivers, especially on the north and west coasts. About their upper courses, however, little is known. The principal are: on the north, the Brunaï or Borneo, the Redjang, Baram, Bintulu, Sirabas, Batang-Lupar, and Sarawak; on the east, the Kutei or Mahakkan, Bulungan and Kuran, or Beru. The Barito, or river of Banjermassin, Kahaijan, Kapuas-Murung, Mendawei, Sampit, and other smaller streams, flow through the south-east part; while the Pontianak, or Kapuas-Bohang, Sambas, Simpang, Succadana, and Pawan, are the most important on the west. All the rivers of B. have banks at their mouths, which render them unfit for large ships; the Brunaï, however, is navigable 15 miles for vessels of considerable tonnage. There are numerous lakes, abounding in fish, the largest being Kini Balu, south-east of the mountain of the same name, 100 miles in circumference, beautified with islands, and having many Dyak villages on its bank. The climate, in the low grounds, is humid, hot, and unhealthy for Europeans; but in the higher parts towards the north, the temperature is generally moderate, the thermometer at noon varying from 81° to 91° F. During the rainy season, from November to May, heavy storms of wind and loud thunder are experienced on the west coast. Vegetation is extremely luxuriant. The forests produce iron-wood, teak, gutta-percha, ebony, sandal-wood, ratans, dye-woods, benzoin, wax, dragon's blood, sago, various resins, vegetable oils and gums. The camphor is the best in Asia, of which 4500 pounds are exported annually. The Mohor tree, well adapted for making native boats, attains a height of 80 feet, and the Kaladang, suited for large masts, to 200.

Nutmegs, cloves, cinnamon, pepper, betel, ginger, rice, millet, sweet potatoes, yams, cotton, sugar-cane, indigo, tobacco, coffee, melons, citrons, pine-apples, bananas, coco-nuts, &c., are largely grown. The mountains and forests contain many monkeys, among which is the orang-outang. Tapirs, tigers, bears, swine, wild oxen, and various kinds of deer abound. The elephant is only found on the north coast, and the rhinocerous on the north-west. The few domesticated animals are buffaloes, sheep, goats, dogs and cats. A few horses are seen in Banjermassin. The birds are remarkable for their plumage. The principal are eagles, vultures, Argus-pheasants, peacocks, flamingoes, pigeons, parrots, and the swallows (*Collocalia esculenta*) which construct the edible nests prized by the Chinese for making soup. The rivers, lakes, and lagoons swarm with crocodiles, and many kinds of snakes, frogs, lizards, and leeches. Fish is plentiful, and the coasts are rich in tortoises, pearl mussels, oysters, and bêche-de-mer, or trepang. Brilliant butterflies and moths are in great variety, and silk-worms are found. Among the mineral products are coal, gold, antimony, iron, tin, platina, nickel, diamonds, precious stones, rock-crystals, porcelain-clay, petroleum, and sulphur. The diamond mines are chiefly in Landak and Pontianak (q. v.); Sambas produces the greatest quantity of gold; the kingdom of Brunaï, Kutei, and Banjermassin, the largest amount of coal.

The population consists of three classes: the Dyaks, who are the aboriginal inhabitants, and almost all heathen; the Mohammedans or Malays, Buginese, Javans, and Arabs: and the Chinese. The Dyaks live chiefly in the interior, and employ themselves with land culture, collecting gutta-percha, resin, gums, ratans, gold dust, and wax. They are divided into numerous tribes. The Malays dwell on the coasts, are traders, and bold sailors. They are more civilized than the Dyaks, cultivate the grounds around their houses, lay out gardens, keep cattle, and live partly by fishing. The Chinese, chiefly from Canton, have penetrated far into the interior. They engage in trade and mining, are unwearied in their efforts to make money, and then return to their native country. They number about 75,000, and have always endeavored to live as an independent republic, under chiefs chosen by themselves, and according to Chinese laws. In 1857, the Chinese living in Sarawak (q. v.) rebelled against Sir James Brooke (q. v.), and were nearly exterminated. In the last years, the Dutch were also compelled to put them down by force of arms, and have imposed a poll-tax.

The women of B., except the Dyak, weave cotton fabrics, make earthenware, baskets, and mats of beautiful designs and colors. In the district of Banjermassin are factories of weapons. The principal exports are gold, gold-dust, diamonds, coal, ratans, gutta-percha, edible nests, cotton, wax, timber, dye-woods, mats, resins, sandal-wood, camphor, &c.; the imports—earthenware, iron, steel, and copper work, piece goods, yarns, woollen and silk fabrics, medicines, provisions, wines, spirits, rice, sugar, tea, tobacco, opium, trepang, gambir, gunpowder, &c.

By far the largest part of the island is ruled directly or indirectly by the Dutch, who have divided it into the residency of the western division of B., and that of the southern and eastern, the former having Pontianak (q. v.) as the seat of government; the latter, Banjermassin. The smaller portion towards the north and north-east contains Sarawak and the territories of the Sultan of B. proper. Besides a number of small dependencies, the western division contains the important kingdoms of Landak, Mampawa, and Sambas, with the mining district of Montrado, in the north. The chief towns are Sambas (10,000), Pontianak (9000), Banjermassin (30,000), Borneo or Brunaï (30,000), and Sarawak (25,000).

The Portuguese effected a settlement in 1690 at Banjermassin; from whence they were, however, soon expelled. The Dutch succeeded in concluding a treaty of commerce with the princes of Banjermassin; and in 1643 erected a fort and factory, a second in 1778 at Pontianak, and others since. The British made unsuccessful attempts in 1702 and 1774 to effect a settlement in B.; but have, within the last twenty years, acquired a preponderating influence on the north-western coast. This has been in a great measure owing to the enterprise of Sir James Brooke (q. v.) in Sarawak, and in part also to the occupation of Labuan (q. v.) as a colony and naval station. The British government refused to annex Sarawak to the British empire. In 1881 the British North Borneo Company obtained a charter from the government of the United Kingdom, which was protested against by Spain. The piracies carried on by some of the inhabitants of B. have often demanded severe punishment. See Wallace's *Malay Archipelago* (1869); Burbidge's *Garden of the Sun* (1880); Bock's *Head Hunters of Borneo* (1881).

BO'RNHOLM, an island in the Baltic Sea, belonging to Denmark, about 90 miles east of Seeland, and half-way between the island of Rügen and the Swedish coast. Area, including three small islands in its vicinity, about 230 square miles, with a population above 35,000. It is rocky, and traversed from north to south by a high mountain-ridge, the slope of which is in great part a waste heath, but elsewhere it is not unfertile, and agriculture and cattle husbandry are successfully prosecuted. High cliffs, sand-banks, and breakers, make the coast dangerous. The most notable product of the island is porcelain clay, with which the porcelain manufacture of Copenhagen is carried on. The capital of the island is Rönne, or Rottum, on the western coast, a place of 7000 inhabitants.

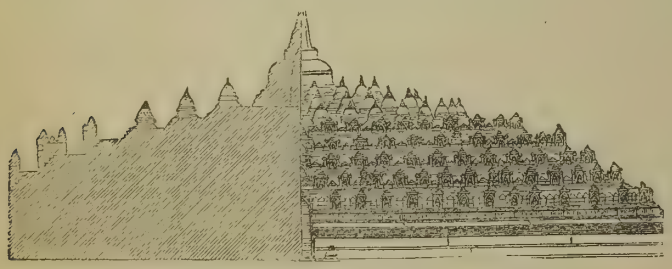
BO'RNING-PIECE (Fr. *borner,* to bound), a common and very simple implement, used by gardeners in laying out grounds, to make the surface either level or of perfectly regular slope. It consists of two slips of board, one about 18 inches long, and the other about 4 feet, the shorter fastened by the middle to one end of the longer, and at right angles to it. One B. being placed at one end of a line drawn in the piece of ground which is being laid out, with the edge of the shorter slip of board along the line, and the longer slip erect, others of the same size are similarly placed at the other end and in other parts of the line; and the requisite uniformity of surface is obtained by filling up with earth, or removing it, until on looking along their summits it appears that they are all in the same plane. The name is perhaps derived from the application of the implement to borders or edgings.

BO'RNU, a powerful state of Central Africa, extending between lat. 10° and 15° N., and long. 12° and 18° E., and bounded on the E. by Lake Tsad, S. by Mandara, W. by Hausa, and N. by Kanem and the Sahara. The greater part of the country is perfectly level, and much of it is liable to be overflowed in the rainy season, which lasts from October to April, when fevers and other diseases consequently prevail. The heat from March to June is excessive, ranging from 104° to 107° F. The two principal rivers are the Shary and the Yeou or Yo, both of which fall into Lake Tsad.

The soil is fertile, and although the cultivation is very imperfect, produces plentiful crops of maize, millet, barley, rice, various kinds of pulse, cotton, and indigo. The inhabitants possess elephants, horses, buffaloes, oxen, sheep, &c. Wild beasts, as lions, panthers, &c., are very numerous, having their chief haunts in the forests which occur only in the vicinity of the rivers, and which abound also in birds of many kinds, snakes, crocodiles, &c. Wild bees are extremely plentiful. The country produces no iron, that which is used being brought from Mandara. Much care is being bestowed upon the manufacture of coats-of-mail, both for horses and their riders. The only other manufacture carried to any considerable extent is that of cotton cloth, which is dyed with beautiful blue stripes by means of indigo, and much exported to Fezzan. The population, which is estimated at about five millions, are mostly of Negro race, and called Kanowry. The ruling race, called Shouas, are of Arab descent, and bigoted Mohammedans; but many traces of Fetishism remain among the masses. Whatever they have of civilization is derived from the Arabs. The slave-trade is eagerly prosecuted, and gives occasion to many warlike expeditions. B. appears to have existed as a state for many centuries, but in the beginning of the present century it was conquered by the Fellatahs, whose yoke, however, was soon shaken off, under the leadership of a fanatic faki, named Mohammed el Amin, whose services were called in by the sultan. On Mohammed's death, his son Omar, became ruler of B. instead of the sultan. Dr. Nachtigal, who visited B. in 1870, describes it as rapidly decaying.

BORO BUDDOR (the Great Buddha), the ruin of a splendid Buddhist temple in Java, residency Kadu, regency Magelang, and district Minoreh, near the junction of the Ello and Progo, is the most elaborate monument of the Buddhist style of architecture anywhere existing. Buddhism (q. v.) was early introduced into Java, and Javanese chronicles place the building of B. B. in the beginning of the 7th century. The figure (copied from Fergusson's *Handbook of Architecture*) represents a section through one half, and an elevation of the other half of the building. It is a pyramid of a square form, each side at the base measuring 600 feet, and consists of seven walls, which are built like the steps of a stair up a hill. Between the walls are narrow terraces running round the building. The walls are richly ornamented with statuary. Outside are niches, each of which is occupied by a statue of Buddha, larger than life, seated in the usual attitude, with his legs crossed under the body. The number of these figures is about 400. Between each of these are bas-reliefs, representing the god in the same attitude besides architectural ornaments and carvings of all sorts.

Below the niches, on the lower story, is an immense bas-relief running round the whole building, representing scenes from the life of Buddha, and religious subjects. The inner faces of the building are also profusely ornamented with bas-reliefs, seated figures, and architectural ornaments, carried to an extent unrivalled by any other building in the world. The art of sculpture



Elevation and Section of Temple of Boro Buddor.

appears in Java to have early attained the highest point of excellence. 'Above and within the upper square terrace are three circular ones, the outer ornamented with 32, the next with 24, and the upper with 16 small domes, each containing a seated statue of Buddha, which can be seen through the open work of their roofs. The whole is surmounted by what must be considered as the Pagoda (q. v.) itself, which is now empty, its center being occupied only by a sunken chamber 10 feet deep, meant originally, no doubt, to contain the relic for which this splendid temple was erected.' Mr. Fergusson considers that the five lower terraces are copied from and represent a Buddhist vihara or monastery; and that the niches containing the cross-legged figures were, in the originals, cells, each occupied by a shaven priest. The structure is thus a compound of a Tope (q. v.) with a copy, in durable architecture, of the frail cells of a vihara.

BORODI'NO, a village of Russia, in the government of Moskwa, and about 70 miles west from the city of that name. It is situated on the Kalouga, an affluent of the Moskwa, and gave name to the great battle fought between the French army under Napoleon, and the Russian under Kutusow, Barclay de Tolly, and Bagration, 7th September 1812. The battle of B. was one of the most obstinately disputed in history, and the loss on both sides was almost equally great. Out of 240,000 men engaged, between 70,000 and 80,000 were killed and wounded. The Russians retreated on the following day, but it was in the most perfect order, and without the enemy venturing to attack them. The Russians, therefore, have always held this battle as a victory, and in 1839 raised a fine mausoleum on the battle-field. To the French, however, certainly, belongs the honor, as they not only remained on the field of battle, but in seven days after, they had pushed on to Moscow. The French name it the battle of the Moskwa, from the river of that name, and it gave Marshal Ney his title of Prince of Moskwa.

BO'RON (symb. B, equiv. 11) is a non-metallic element present in Boracic Acid (q. v.) and Borax (q. v.). It was discovered in 1808 by Gay Lussac and Thenard in France, and Davy in England. The process followed in procuring B. till lately was to mix pure and dry boracic acid (BO_3) with thin slices of the metal potassium (K), and heat them in a tube, when three atoms of the potassium abstracted the oxygen, forming potash (KO), and set free the boron (B). On cooling and washing the mixture with cold water, the potash dissolved out, and left the B. as a dark greenish-brown powder, which, when heated, burned with a green flame, and was re-formed into boracic acid, by combining with the oxygen of the air. This *amorphous boron* is now obtained by heating boric anhydride with sodium. A crystalline form (Wöhler and Deville having discovered the method) is obtained by heating to a high temperature with aluminium, when B. is left as minute crystals interspersed through the earth alumina. These crystals possess great interest from their similarity in properties to pure crystallized carbon, or the diamond, and they are now known among scientific chemists as *B. diamonds*. They are remarkably transparent, are tinged yellow or red (though the colors may be accidental), and rival the ordinary diamond in their lustre and refractive power. B. diamonds not only scratch glass, but also the corundum and the sapphire; and a real diamond, with which a few B. diamonds were crushed, had its edges worn away. It is apparent, therefore, that the B. crystals possess in a high degree the characters of the ordinary diamond; and though they have as yet only been obtained in minute specks, yet it is not too much to expect that the size will be increased, and the artificial B. diamond come into market as an article of ornament, to rival the *natural* carbon diamond in its mysterious power of flashing back the rays of light. Indeed, so like are these two kinds of diamonds, that they can scarcely be distinguished by outward characters or signs; and it has been gravely suggested that some of the diamonds which now adorn the brow, the neck, or the arm, may be natural B. diamonds. They are very indestructible, requiring a high temperature to destroy them; and, like the true diamond, heat ultimately forms them into a *coke*.

BO'ROUGH (Ang. Sax. *byrig, burg, burh;* It. *borgo;* Fr. *bourg;* Scot. *burgh*). The original meaning of this word, by which we now designate a corporate township, seems to have been a hill, rising ground, or heap of earth; and it was probably from the elevated positions on which places of defence were erected, that it afterwards came to signify a fortification or castle, and latterly the aggregate of houses, churches, and other structures, which, in unsettled times, usually gathered under the walls of a castle; together with their inhabitants, and the arrangements which were made for their government. The questions whether we owe our municipal corporations to Roman, or to Saxon and other Teutonic influences, or to both; and if to both, then to what extent they have severally contributed to their formation, have been keenly discussed by constitutional historians. In so far as etymology goes, its authority is pretty equally divided, the term *municipal*, from the Latin *municipalis*, and *city*, from *civitas*, favoring the Roman view; whilst B. from the root above indicated, and *town*, from the Saxon *tun* or *dun*, a fortified hill, support the Teutonic. But the discussion forms a branch of a very wide subject, which has divided recent writers into two opposite schools, and of which we can here only indicate the existence. On the Roman side, Sir Francis Palgrave is the most uncompromising, and Mr. Allen, as it seems to us, the most judicious champion. The Teutonic side is espoused by most of the Anglo-Saxon scholars of England, and in general by German writers. But from whatever source derived, that the boroughs of England existed, not as aggregates of houses merely, but as corporate bodies, in the Saxon time, is now generally admitted. The B. system of Scotland is also of great

antiquity. 'A *Hanse*, or confederation of boroughs for mutual defence and the protection of trade, existed in Scotland, and was known by this name in the reign of David I., about a century before the formation of the Hanseatic League of the continental cities; and the famous burgh laws date from about the same period. This code of Scotch burghal regulation,' in Mr. Innes's opinion, 'though collected in the reign of David, and sanctioned by him, was the result of the experience of the towns of England and Scotland;' and he goes on to show the very close resemblance between these laws and the burghal usages of Newcastle, and even of Winchester, which seems to suggest their common Saxon origin.

Mr. Innes speaks favorably of the B. life of our ancestors; and he considers the burgh domestic architecture, of which monuments remain sufficient to show that 'the burgess of the Reformation period lived in greater decency and comfort than the laird, though without the numerous following, which no doubt gave dignity if it diminished food. I am not sure that this class has gone on progressively, either in outward signs of comfort, or in education and accomplishment, equal to their neighbors. The reason I suppose, is obvious. The Scotch burgher, when successful, does not set himself to better his condition and his family within the sphere of his success, but leaves it, and seeks what he deems a higher.' In confirmation of this view, Mr. Innes elsewhere mentions that 'many of the old citizen-merchants of Edinburgh had studied at the university, and appear in the list of graduates.'

Borough, in England, is properly a city or other town that sends burgesses to parliament—a privilege, the nature and extent of which will be explained under PARLIAMENT (q. v.); and in this sense it is also called a *parliamentary borough*. But in the interpretation clause of the Municipal Reform Act, 5 and 6 Will. c. 76, s. 142, the word *borough* is declared, for the purposes of the act, to mean a city, borough, port, cinque port, or town corporate, and whether sending representatives to parliament or not. See MUNICIPALITY.

BO'ROUGHBRIDGE, a town in West Riding, Yorkshire, on the right bank of the Ure, here navigable for small-craft, 17 miles north-west of York. It arose simultaneously with the decline of Aldborough, 1½ mile to the east, soon after the Conquest, when the great north road was diverted from Aldborough to this place. Its chief trade is in agricultural produce and hardware. Pop. (1871) 2508. Edward II., in 1321, defeated the Earl of Lancaster here. Near B. are three immense Druid stones, called the 'Devil's Arrows,' 16 to 22 feet high.

BOROUGH ENGLISH, is a custom that prevails in some ancient boroughs in England, according to which the youngest son inherits the property within borough in preference to his elder brothers. The reason assigned for it is, that the youngest son, on account of his tender age, is not so capable as his elder brothers to maintain himself. A posthumous son is entitled to this privilege, and dispossesses his elder brother. The right of representation also exists with reference to it, for should the youngest son die in his father's lifetime leaving a daughter, she will inherit the property. This custom obtains in the manor of Lambeth, Surrey, in the manors of Hackney, St. John of Jerusalem in Islington, Heston, and Edmonton in Middlesex, and in other counties. See CUSTOM, GAVELKIND, INHERITANCE.

BOROUGH FUND. This is a fund which is expressly defined by the Municipal Corporations Act, 5 and 6 Will. IV. c. 76, by which it is declared that the rents and profits of all hereditaments, and the interest, dividends, and annual proceeds of all moneys, dues, chattels, and valuable securities belonging or payable to any body corporate named in conjunction with a borough in the schedules, or to any member or officer thereof, in his corporate capacity, and every fine or penalty for every offence against this act (the application of which has not been already provided for), shall be paid to the treasurer of such borough; and all the moneys which he shall so receive shall be carried by him to the account of a fund to be called 'The Borough Fund;' and such fund, subject to certain payments and deductions, shall be applied towards the payment of the salary of the mayor, and of the recorder, police magistrate, town-clerk, treasurer, and other officers. Corporations may now, under certain checks, maintain parliamentary and legal proceedings at the expense of the borough fund, 35 and 36 Vict. c. 91. But existing gas and water companies authorized by statute are not to be competed with in this way.

The Court of Chancery exercises jurisdiction over the property of corporations in boroughs, which, since the Municipal Corporations Act, are considered to hold their property in trust for charitable uses; and the trusts are applicable as well to the personal as to the real estate. See Grant on *Corporations*, 1850; and see FUND.

BOROUGH JUSTICES were first created in the time of Charles I. Under the Municipal Corporations Act, 5 and 6 Will. IV. c. 76, these justices consist of the mayor during his year of office, and for one year after it determines; the recorder *ex officio;* and such persons as the crown may appoint by commission. Their duties cannot be delegated; and before acting, they must make the same declaration, and take the same oaths as the recorder does on entering his office. See JUSTICES.

BOROUGH LAWS, in Scottish legal history, was the name given to a collection of ancient laws relative to boroughs or *burghs*, which have long ceased to have any force, but serve to throw light on the ancient manners and customs of the country. The authenticity of these B. L. is beyond question; they are universally allowed to have been enacted in the reign of King David in the 12th century. See REGIAM MAJESTATEM.

BOROUGH RATE is a rate raised and levied within borough by order of the council of the same; and it has been decided by the Court of Exchequer that such rate is valid, though not made *in public*. By the 92d section of the Municipal Corporations Act, 5 and 6 Will. IV. c. 76, where there is a deficiency of the *borough fund* (q. v.), the borough council is authorized and required from time to time to order a B. R. in the nature of a *county rate* (q. v.) to be made within their borough, for which purpose the council shall have all the powers of county justices. As to boroughs not within the Municipal Corporations Act, the levying and application of borough rates in them is regulated by the 17 and 18 Vict. c. 71, by the first section of which it is enacted that the justices of the peace may make a B. R. in the nature of a county rate, for all the purposes for which a B. R. may be levied, such borough justices also having the same powers as county justices. The council of a borough cannot make a *retrospective* rate; and the provision of the 7 Will. IV. and 1 Vict. c. 81, s. 2, which declared lawful all such retrospective rates as might be made within six calendar months after the passing of the act, was merely for a temporary purpose. The Municipal Corporations Act directs that all sums levied in pursuance of a B. R. shall be paid over to account of the borough fund; and there is a provision as to *Watch Rates* (q. v.).

Where parties consider themselves aggrieved by a B. R., they may appeal to the recorder at the next quarter-sessions for the borough; or if there be no recorder, to the next county quarter-sessions.

BORO'VSK, or BORO'FSK, a town of Russia, in the government of Kalouga, and 49 miles north-north-east of the town of that name. Conjointly with Kalouga it gives title to a bishop. It has extensive manufactures of sail-cloth, and a trade in leather, flax, and hemp. Its onions and garlic are celebrated. In its vicinity is a convent, founded in 1444, one of the richest in the empire. Pop. (1880) 9491.

BORROME'AN ISLANDS, a group of small islands in the Lago Maggiore, Northern Italy. They are situated in the western arm of the lake, called the Bay of Tosa, and are named after the family of Borromeo, which for centuries has been in possession of the richest estates in the neighborhood. They are sometimes also called *Isole dei Conigli*, on account of the number of rabbits found on them. They were little more than naked rocks, till Vitaliano, Count Borromeo, master-general of ordnance to the king of Spain, about 1671, caused soil to be carried to them, built terraces, and converted them into gardens, the beauty of which and of their situation has won for them the name of the *Enchanted Islands*. The two most celebrated are *Isola Bella* and *Isola Madre*. On the west side of *Isola Bella* stands a palace of the Borromeo family, containing many admirable paintings and other works of art. The *Salle terrene*, a series of grottos, inlaid with stones of various colors and adorned with fountains, connect the palace with the gardens, the terraced style of which gives the whole island the appearance of a truncated pyramid; a colossal winged unicorn, the armorial device of the Borromeo family, crowning the whole. *Isola Madre* is laid out in the same terraced style, and is crowned by a castle. The odors of flowers from the islands, upon which grow many plants of tropical climates, are wafted far over the lake. The *Isola de' Pescatori* now contain a village of about 400 inhabitants, who derive their subsistence from fishing and smuggling.

BORROME'O, CARLO, COUNT, a saint of the Church of Rome, was born on the 2d October 1538, at the Castle of Arona, on the Lago Maggiore, the family seat of his ancestors. He studied law at Pavia, and took the degree of doctor in 1559. His uncle, Pope Pius IV., on being raised to the pontificate in 1560, appointed him, notwithstanding his youth, to a number of high offices, and made him a cardinal and archbishop of Milan. B. displayed great faithfulness and ability in governing Ancona, Bologna, and other parts of the States of the Church as legate, and in discharging the duties of offices connected with ecclesiastical administration at Rome. Surrounded as he was with magnificence and luxury, he was always grave, pious, and rigid in his life, studious, and a patron of letters. His uncle, the pope, made him his grand penitentiary, and did nothing considerable without his co-operation.

It was in a great measure by his influence that the re-opening of the Council of Trent was accomplished, and that its delibera-

tions were brought to a conclusion so favorable to the papal throne. He committed his decrees to memory, had the principal part in drawing up the *Catechismus Romanus* for exposition of them, and proceeded to give all possible effect to them in his archiepiscopal province. B.'s exertions, not only for the improvement of ecclesiastical discipline, but also for the reformation of morals in the archbishopric of Milan, drew upon him the hostility of the monastic orders, and also to some extent that of the Spanish authorities in Milan, who were jealous of the extension of his jurisdiction An attempt was even made upon his life in 1569. He spent great part of his income in beautifying the cathedral and other churches. With a view to provide well-qualified priests, he founded, in 1570, the Helvetic College at Milan. He brought about an alliance of the seven Catholic cantons, known as the *Golden Borromean League*, for the united defence of their faith. In the famine of 1570, and during the plague in Milan in 1576, he displayed equal energy, benevolence, and devotedness, saving the lives of multitudes by the prompt arrangements which he made for necessary relief. Exhausted by his labors and his austerities, he died on 3d November 1584. Many supposed miracles at his tomb led to his being canonized in 1616. His theological works were published at Milan in 1747, in 5 vols. folio. On the western bank of the Lago Maggiore, in the neighborhood of his birthplace, is a colossal brazen statue of him.—His brother's son, Count Frederico Borromeo, born 1563, was also a cardinal, and from 1595 to 1631 archbishop of Milan, and was the founder of the Ambrosian Library (q. v.).

BOROVI'TCHI, a town of Russia, in the government of Novgorod, 98 miles east of the town of Novgorod, on both sides of the river Msta, near some rapids. Pop. (1880) 9920. Its situation on the great canal and river waterway which connects the Volga with Lake Ladoga, renders it of considerable commercial importance.

BORROW, GEORGE, an English author, born in Norfolk in 1803. He displayed from his earliest years an extraordinary tal ent for languages, and a strong inclination for adventure. In his youth he lived for some time among gipsies, by this means acquiring an exact knowledge of their language, manners, and customs. His travels, as agent for the British and Foreign Bible Society, through almost all countries of Europe and a part of Africa, made him familiar with many modern languages, even to their dialectic peculiarities. Whatever was little known had peculiar charms for him, and he shrunk neither from toil nor danger. True to his youthful predilection, he made the gipsies scattered over every part of Europe one of the principal subjects of his study. His first work *The Zincali, or an Account of the Gipsies in Spain* (2 vols., Lond. 1841), made a favorable impression by its lively and dramatic style. It was followed by *The Bible in Spain* (2 vols., Lond. 1843), a book to which its author is chiefly indebted for his celebrity, and which consists of a narrative of personal adventures as various as it is interesting. The graphic power of the style amply compensates for the rather unmethodical arrangement of the book. After a long interval, B. published a work long before announced, *Lavengro, the Scholar, the Gipsy, and the Priest* (3 vols., Lond. 1851), which was generally regarded as an autobiography, with a spice of fancy mingling with fact. The principal character is depicted with extravagant exaggeration; and the somewhat bizarre originality which gave a peculiar zest to the author's earlier works here appears as mannerism. The book left the hero in the midst of his adventures, which were not continued until 1857, when B. published *The Romany Rye*, a sequel to *Lavengro*. He published *Wild Wales* in 1862, and *Romano Lavo-Lil* in 1874. He died 30th July 1881.

BORROWING has, in the case of *money*, several legal applications of a general nature, in which the law with regard to *bonds*, *mortgages*, and other similar *securities*, has to be considered. See the articles on these subjects. More strictly, borrowing may be described as a contract under the law of *bailments* (see CONTRACT), and may be briefly and simply defined as asking or taking a loan. The essentials of this contract are, that there must be a certain specific thing lent, such as a book, an article of furniture, a horse, or it may be a house, land, or even an incorporeal right. But in the law of England the contract is confined to goods and chattels or personal property, and does not extend to real estate.

Lord Chief-Justice Holt's definition described it as a borrowing of a thing *lent*, in contradistinction to a thing deposited, or sold, or intrusted to another for the sole benefit or purposes of the owner. Again, the borrowing must be gratuitous and for the borrower's use, which use must be the principal object, and not a mere accessory. Such use, too, may be for a limited time or for an indefinite period. The contract must also be of a legal nature, for if it is immoral, or against law, it is utterly void; this, however, is a necessary qualification of all contracts. Lastly, the property which is the subject of the contract must be borrowed or lent to be *specifically* returned to the lender at the determination of the agreement, in which respect it differs from a loan for consumption.

The persons who may borrow and lend are all those who can legally make a contract; a capacity, therefore, which excludes married women, unless they act with the consent of their husbands, when it binds the latter and not the wives.

It is not necessary that the lender should be absolute proprietor of the thing lent or borrowed; it is sufficient if he have either a qualified or a special property therein, or a lawful possession thereof. As to the borrower, he has the right to use the thing during the time and for the purpose intended, whether such intention is expressed or implied; but beyond this he cannot go. The following quotation from Mr. Justice Story's celebrated work on *bailments* (to which reference is generally made), is useful for popular information: 'A gratuitous loan is to be considered as strictly personal, unless from other circumstances, a different intention may fairly be presumed. Thus, if A lends B her jewels to wear, this will not authorize B to lend them to C to wear. So, if C lends D his horse to ride to Boston, this will not authorize D to allow E to ride the horse to Boston. But if a man lends his horses and carriage for a month to a friend for his use, there, a use by any of his family, or for family purposes, may be fairly presumed; although not a use for the benefit of mere strangers.' During the period of the loan, the borrower has no property in the thing, but a mere right of possession and use of it. But, notwithstanding, if the thing lent and borrowed be injured by a stranger, it would appear that the borrower may maintain an action for the recovery of damages; the mere possession of property without title being sufficient against a wrong-doer. See CONTRACT, LOAN, HIRE, besides the subjects above referred to.

BORROWING DAYS. The last three days of March are so called in Scotland and some parts of England. The popular notion is, that these days are borrowed or taken from April, and may be expected to consist of cold or stormy weather. Although this notion dates from a period before the change of the style, a few days of broken and unpleasant weather about the end of March still afford a sanction for old notions concerning the borrowing days. The origin of the term B. D. is lost in the mists of antiquity, though we are inclined to hazard the conjecture that it has no higher source than the popular rhyme in which it is introduced as a poetic fiction. The most dramatic form of this rhyme in Scotland is as follows:

> March said to April:
> 'I see three hoggs on yonder hill;
> And if you'll lend me days three,
> I'll find a way to gar [make] them die!'
> The first o' them was wind and weet,
> The second o' them was snaw and sleet,
> The third o' them was sic a freeze,
> It froze the birds' feet to the trees.
> But when the borrowed days were gane,
> The three silly hoggs came hirplin [limping] hame.

The superstition, if we may call it, respecting the B. D., though now little else than a jocular fancy, was so strong in Scotland in the 17th c., that when the Covenanting army, under Montrose, marched into Aberdeen on the 30th March 1639, and was favored by good weather, a minister pointed it out in his sermon as a miraculous dispensation of Povidence in behalf of the good cause. See Gordon of Rothiemay's *History of Scots Affairs from* 1637 *to* 1641. For further notice of the B. D. we refer to Brand's *Popular Antiquities*.

BORROWSTOUNNE'SS, or BONE'SS, a seaport in Linlithgowshire, on a low peninsula on the Firth of Forth, 17 miles west-north-west of Edinburgh. It has coal-mines extending under the bed of the Firth; and manufactures of salt, soap, malt, vitriol, and earthenware, and a trade in grain. Ironstone, limestone, and freestone also exist in the parish. Graham's Dike, a part of the Roman wall of Antoninus, traverses the parish. Dugald Stewart lived near Borrowstounness. Pop. (1871) 4986; (1881) 6037. In 1880, 2278 vessels, of 272,200 tons, entered the port, and 2265, of 268,210 tons, cleared it. A new dock, with an area of 7¼ acres, was opened here in 1881.

BORSAD, a town in the N. Division of the province of Bombay, in the district of Kaira. It is situated in the elevated region of Gujerat, 1900 feet above the sea level, and is connected by railway with Bombay and Baroda. Pop. (1872) 12,214.

BORY DE SAINT VINCENT, JEAN BAPTISTE GEORGE MARIE, a French traveler and naturalist, was born in 1780 at Agen, now in the department of Lot-et-Garonne. In 1798, he proceeded, along with Captain Baudin, in a scientific mission to New Holland, but separated from him before they reached their destination. On his return he wrote his *Essai sur les Iles Fortunées de l'antique Atlantide* (Par. 1803); and his *Voyage dans le quatre principales Iles des Mers d'Afrique* (Par. 1804). Having joined the army, he served at Ulm and Austerlitz, and on Soult's staff in Spain. He served as a colonel at Waterloo, and afterward had to retire to Belgium. At Brussels he edited, along with Van Mons, the *Annales des Sciences Physiques* (8 vols.). He also produced an admirable work on the subterranean quarries in the

limestone hills near Maestricht (Par. 1821). He returned to France in 1820, wrote for liberal journals, and for Courtin's *Encyclopédie*, &c. In 1827, appeared his *L'Homme, Essai Zoologique sur le Genre humain*. He wrote what relates to cryptogamic plants in Duperrey's *Voyage autour du Monde* (Par. 1828). He rendered an important service to science by editing the *Dictionnaire Classique de l'Histoire Naturelle*. When, in 1829, the French government sent a scientific expedition to the Morea and the Cyclades, the first place in it was assigned to B. de S. V.; and the results of his researches were given to the world in the *Expédition Scientifique de Morée* (Par. and Strasb. 1832, &c.), and in the *Nouvelle Flore du Péloponnèse et des Cyclades* (Par. 1838). In 1839, he undertook the principal charge of the scientific commission which the French government sent to Algeria. He died 22d December 1846.

BO'RZNA, a town of Russia, in the government of Tchernigov, 50 miles south-east of the town of Tchernigov. Pop. (1880) 7580.

BOS. See Bovidæ and Ox.

BOS, Lambert, a Dutch philologist, was born at Workum, in Friesland, 23d November, 1670, and studied at the university of Franeker, where, by the advice of Vitringa, he devoted himself especially to the Greek language. In 1704, he was appointed Greek professor in that university. He died 6th January, 1717. All his works are characterized by thorough scholarship and remarkable acuteness, and notwithstanding the advances of classical criticism since his day, some of them are still consulted, such as his *Vetus Testamentum ex Versione Septuaginta Interpretum* (Franeker, 1709; new edit., Oxford, 1805), his *Ellipses Græcæ* (Franeker, 1702), and more particularly his *Antiquitatum Græcarum præcipue Atticarum Descriptio Brevis* (Franeker, 1714).

BOSA, a town of the island of Sardinia, in the province of Cagliari, near the mouth of the Termo. Lat. 40° 17′ N., long. 8° 27′ E. Notwithstanding its fine situation, partly on the side of a hill, and partly on a plain, it is an unhealthy place. It is surrounded by decaying walls; has an old castle, a cathedral, several monasteries and churches; and a trade in wine, oil, grain, and cheese. Its port admits only vessels of small size. Pop. 6500.

BOSCAN-ALMOGA'VER, Juan, a Spanish poet, born in the year 1500 at Barcelona, of an ancient noble family. He received from his parents a careful education, and came to Granada, to the court of Charles V. The education of the celebrated Duke of Alva was afterwards intrusted to him. He spent the latter part of his life at Barcelona, and was employed in editing his own works and those of his friend Garcilasso de la Vega, when he died some time prior to to 1544. He was the first to make use of Italian measures in Spanish verse, and thus became the creator of the Spanish sonnet. By the introduction of various Italian forms, he made an epoch in Spanish poetry. His poems are still esteemed, but his other literary productions are forgotten. The best edition is that of Leon, 1549.

BOSCAW'EN, Edward, an eminent English admiral, second son of Viscount Falmouth, was born in 1711, and highly distinguished himself at the taking of Puerto-Bello, and at the siege of Carthagena in 1740. In April, 1744, he captured the French ship *Medée*, with 800 prisoners. He had an important share in the victory off Cape Finisterre (May 3, 1747), and six months after received the command of the East Indian expedition; he displayed high military skill in conducting the retreat from Pondicherry. He returned in 1750, and in the following year became a lord of the Admiralty.

In 1755 he was again afloat, and intercepted the French fleet off Newfoundland, capturing two 64-gun ships and 1500 men, including the French commander, Hoquart, whom he had twice before taken prisoner. Next year, now admiral of the blue, he was appointed commander-in-chief of the powerful expedition against Cape Breton, as the fruit of which that island and St. John's were taken after some hard fighting. B. crowned his career by his signal victory over the French Toulon fleet, in the Bay of Lagos, August 18, 1759. On his return home, he received the thanks of parliament, a pension of £3000 a year, a seat in the privy council, and the command of the marines. In the following summer, while his fleet lay idle in the Bay of Quiberon, ravaged by scurvy, B. and some of his men employed themselves in cultivating a garden on a small island, in order to supply the sick with vegetables. He died in the following year. Lord Chatham is said to have testified that when he proposed expeditions to other commanders he heard only of difficulties, but when he applied to B., he found him ready with suggestions and expedients.

BOSCH, Hieronymus de, born at Amsterdam 23d March 1740, died there 1st June 1811, was unquestionably the most distinguished Latin poet of recent times, and a philologist of varied acquirements. His *Poemata* first appeared at Leyden in 1803 (2d ed., Utr. 1808). He rendered an important service to classical literature by his edition of the *Anthologia Græca*, with a metrical translation by Hugo Grotius never before published (4 vols., Utr. 1795—1810, to which Van Lennep added a fifth volume, Utr. 1822). His Discourses and Treatises on subjects of literature, which are mostly composed in the Dutch language, display profound learning, excellent judgment, and refined taste.

BO'SCOBEL, an extra-parochial liberty of England, in the county of Shropshire, about 6 miles east-north-east of Shiffnal. The population of B. is only about 20, but the place is interesting in connection with the escape of Charles II. after his defeat at Worcester in 1651. After the battle, Boscobel House being proposed as a secure retreat, thitherwards Charles turned his steps. At White-Ladies, a seat of the Giffard family, which was reached in the early morning, the king had his long hair cut, his hands and face smeared with soot; and for his royal dress he substituted the green and greasy suit of a countryman, and a leathern doublet. Thus disguised, Charles passed through a secret door into a neighboring wood, in the thickest part of which he sat shivering in the rain until dusk, when he stole out, and along with a guide endeavored to reach Wales, where it was now thought he would be safer than at Boscobel. They reached a royalist's house at Madeley, on the banks of the Severn, at midnight, and it was then found that they could not escape to Wales, on account of the vigilance of the Puritans; and once more, after a day's rest in a stable loft, the king started for Boscobel wood, where he arrived about five o'clock in the morning.

He immediately, along with Major Carlis, who had led the forlorn-hope at Worcester, ascended a thick pollard oak, from which they could watch at intervals during the day the Roundheads in search of them passing by unaware of their near presence. In the evening, they descended from their elevated hiding-place, and made their way to the manor-house, where the king remained hidden for two days. After other adventures, Charles contrived to escape from England on the 17th October.—The title of Boscobel Tracts has been given to certain contemporaneous writings, first published in 1662, giving a graphic description of this passage of the monarch's life. The authorship is generally attributed to Thomas Blount, a loyal gentleman of Worcestershire; but Nash, his grandson, in his history of Worcestershire, denies that they were his, on the authority of Blount himself. But the author, whoever he was, was manifestly a stanch royalist, and his narrative bears evidence that he had good opportunity for ascertaining the truth of all the statements in it.

BO'SCO REA'LÉ, a town of South Italy, in the province of Naples, at the south base of Mount Vesuvius, 10 miles east-south-east of Naples city. It contains several churches and convents. Population, 4552. Good wine is produced in the neighborhood, and much silk. This town was in imminent danger of destruction by the eruption of Vesuvius in 1850, when a stream of lava advanced towards it with a front of about a mile and a half broad, and a depth of about 12 feet, enveloped the town, and consumed the wood on both sides of it, in which were many magnificent oak, ilex, and ash trees. The larger trees, as they were enveloped in the lava, poured out jets of hissing steam from every knot and branch, and then exploded with a loud noise, leaping into the air to the height of 10 or 20 feet.

BO'SCO TRE-CA'SÉ, a town of Italy, situated at the southern base of Mount Vesuvius. It has several churches and convents, and a royal manufactory of arms and gunpowder. Wine and silk are raised in the district. Pop. 2500.

BO'SCOVICH, Roger Joseph, a celebrated mathematician and astronomer, born at Ragusa, 18th May, 1711. He entered at an early age into the order of the Jesuits, and spent his life in scientific pursuits and important public labors. Before the completion of his course of studies in Rome, he was appointed teacher of mathematics and philosophy in the *Collegium Romanum* there. The pope gave him a commission to measure a degree of the meridian in the States of the Church, which he accomplished in the years 1750—1753. In 1764 he was appointed to a professorship in Pavia, but after some time retired from this office. He was subsequently appointed professor of astronomy and optics in the Palatine schools at Milan, and superintended the erection of the observatory in the Brera College, upon which he spent money of his own. After the dissolution of his order, he went to Paris in 1774, and received a pension from the king. B. afterwards went to Bassano, to superintend an edition of his works, on the completion of which he returned to Milan, but fell into a depression of spirits, which at last grew into complete insanity, and he died 12th February, 1787. His works include dissertations on a great variety of important questions in mathematical and physical science, and were published collectively under the title *Opera Pertinentia ad Opticam et Astronomiam* (5 vols., Bassano, 1785. His name is connected with a theory of physics, first published in his *Philosophiæ Naturalis Theoria, Redacta ad Unicam Legem Virium in Natura*

Existentium (Vienna, 1758). He was also a poet, and his Latin poem, *De Solis ac Lunæ Defectibus* (Lond. 1764), has been much admired.

BOSIO, FRANÇ. JOS., BARON, an eminent sculptor, was born 1769 at Monaco, in Sardinia; studied at Paris; and when only 19, returned to Italy, where he executed a multitude of commissions even at that early age. His reputation was greatly increased by the figures which, at the request of Napoleon, he executed for the column in the Place Vendôme. Louis XVIII. and Charles X. also patronized B., the former appointing him royal sculptor, the latter elevating him to the rank of baron. He also enjoyed several professional honors, being director of the Academy of Fine Arts in Paris, and member of the Berlin Academy of Arts. He died July 29, 1845. B.'s principal works are—the 'Hercules' in the garden of the Tuileries; the incomparably beautiful 'Hyacinth' in the Luxembourg; the 'Nymph Salmacis,' a figure displaying wonderful grace and purity of outline; an allegorical figure of France, 7 feet high, surrounded by the Muse of History and a group of Genii; the statue in memory of the Duc d'Enghien; the equestrian statue in the Place des Victoires, and the monument of Count Demidov, 30 feet high, composed of six figures, with bas-reliefs, &c. Besides these, B. executed a great multitude of busts of distinguished persons, such as the Emperor Napoleon, the Empress, Queen Hortensia, the king and queen of Westphalia, Louis XVIII., Charles X., &c. B.'s works are all marked by grace of form, harmony of design, and elegance of finish. His style generally reminds one of Canova.

BO'SJESMAN'S COUNTRY, a region in Africa to the north of the Cape Colony. The inhabitants, a variety of the Hottentot race, are remarkably diminutive in stature, and thoroughly savage in condition. See BUSHMAN.

Bosjesman.

BOSNA-SERAI', SERA'IO, or SARAJE'WO (Ital. Seraglio), capital of the province of Bosnia, is beautifully situated in the midst of gardens on both sides of the Miglliazza, an affluent of the Bosna, about 122 m. S.W. of Belgrade. Its pop. is estimated at 50,000, of whom the majority are Christian Bosniaks, the others Moslems and Jews. Four handsome stone bridges cross the river at different points of the city, which is adorned with many churches and mosques (among them a Christian cathedral), whose gilded domes and whitened minarets and spires give it quite an oriental appearance. B. has a palace built by Mohammed II., and an old castle on a height, erected in 1263 by the Hungarian general Cotroman; its old walls are decayed, and it is now of no military importance. B. has manufactures of tin, iron, and copper goods, and trade in dyeing. Its position makes it an important commercial entrepôt, and it is consequently a busy place. It has also valuable iron mines and mineral baths in the vicinity. The city was taken and occupied by the Austrians after a sharp engagement in August 1878.

BO'SNIA, till 1878 a Turkish vilayet, now a province of the Ottoman empire occupied and administered by Austria. Till 1876 it also included Herzegovina (q. v.), and still comprises the hitherto Turkish parts of Croatia and Dalmatia. It is bounded N. by the Save and Unna; E. by the Vrina, the mountain-chain of Jublanik, and a branch of the Argentaric Alps; S. by the Scardagh Mountains; and on the W. by the mountains of Cosman, Timor, and Steriza. At a few points in the south it reaches to the Adriatic Sea. Area, 20,000 sq. m. Pop. (1879) near 1,000,000; about ⅔ Christians, Moslems, and the rest Jews. With the exception of the northern tract, extending along the Save, it is everywhere a mountainous country, and is traversed by more or less elevated ranges of the Dinaric Alps, whose highest peaks rise to a height of from 5000 to 7700 feet above the sea, and are covered with snow from September to June. The mountain slopes are for the most part thickly covered with forests of oak, beech, lime, chestnut, &c., of magnificent growth, and only here and there exhibit meadows, pastures, and cultivated spots.

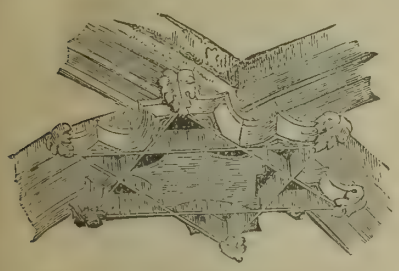
The principal river of the country is the Save, on the northern border, into which flow the Unna, the Verbas, the Bosna, and the Drin. The Narenta and the Boyana fall into the Adriatic Sea. The air is salubrious, the climate temperate and mild. It is only in the plain that agriculture is carried on to a considerable extent; grain, maize, hemp, vegetables, fruits, and grapes are produced in great abundance; and their cultivation would be much more extensively and actively prosecuted, but for the heavy impositions laid upon this branch of industry by the Turkish government. Game and fish abound, as well as wild animals, such as bears, wolves, lynxes, &c. The country is celebrated for the breeding of sheep, swine, goats, and poultry; and bees, both wild and tame, are very numerous. The gipsies and Morlacks dig for lead, quicksilver, coal, and iron; but beyond this, mining, owing to repressive government, is entirely neglected, although the country is rich in metallic ores. Commerce and manufactures—chiefly limited to the fabrication of firearms, sabre-blades, and knives—are entirely confined to the towns. The position of B. gives it the transit trade between Austria and Turkey. It has almost no good roads. The population consists of Bosnians, Croats, Morlacks, Montenegrines, Turks, &c., the much greater part of the Slavonian race. The Bosnians, or Bosniaks, who form about a third of the inhabitants, are partly Mohammedans (descendants of Slavonian Christians who changed their religion at the time of the Mohammedan conquest), and partly of the Greek and Roman Catholic Churches. They are brave, hardy, rapacious, and cruel; rude and repulsive towards strangers, yet among themselves they are peaceful and honest; they are also industrious, simple in their habits, and temperate. The Moslem women in B. are less secluded than in the other Turkish provinces, and have long enjoyed the liberty of appearing in public more or less veiled. The Croats, who form about a sixth of the population, belong partly to the Greek and partly to the Roman Catholic Church; only a few are Mohammedans. They are principally engaged in agriculture, the feeding of cattle, and the barter trade. The Morlacks, who number about 150,000, dwell mostly in the district of Herzegovina, and are courteous and clever in business. They are inveterate enemies of the Turks. Three-fourths of them are Greek Christians, and the rest Roman Catholics. The Osmanli Turks in B. are but about 2000 in number; the number of Greeks and Jews is between 20,000 and 30,000. B., in ancient times, was included in Pannonia; and previous to the 7th c., was governed by princes of its own, called Bans or Waiwodes, who became dependent on Hungary. Being conquered by the Turks, it was finally annexed to the Ottoman empire in 1522. A dangerous rebellion broke out in 1851. The insurrection which originated in Herzegovina in 1875, soon assumed the proportions of a national movement, and led to war between Turkey and Servia and Montenegro. The war of 1877–78 between Russia and Turkey followed; the treaty concluded at the close of it proposed to give B. administrative autonomy, but the Berlin Conference of 1878 resolved that B. should be occupied and administered by Austria (the sanjak of Novi-Bazar being put under special arrangements). The Bosnians sympathized with and supported the Anti-Austrian and Pan-Slavonic rising in Herzegovina and Dalmatia in 1882.

BO'SPORUS (of which *Bosphorus* is an ancient and common variation), the ancient name of the channel which separates Europe from Asia, and connects the Black Sea with the Sea of Marmora. The name, which signifies Ox-ford or Cow-ford, was given to it because here, according to the legend, Io, transformed into a cow, swam across; or, as is very generally supposed, because it is so narrow that an ox might swim across. Afterwards, as the same name was bestowed upon other straits, this was designated the *Thracian Bosporus*. Its south and north entrances have two lighthouses each. Its shores are elevated, and throughout its length the strait has 7 bays or gulfs, with corresponding promontories on the opposite side. One of these gulfs forms the harbor of Constantinople, or, as it is often called, the Golden Horn. The length of the Thracian B. is about 17 miles, with a breadth of from little more than a third of a mile to two miles. At the middle of this strait, where it is about 2800 feet in breadth, Darius made his bridge of boats when he marched against the Scythians. The B. has long been under Turkish control. Repeated European conferences, including that of Berlin in 1878, have confirmed the stipulation of the treaty made in 1841, providing that no ship of war belonging to any nation but Turkey shall pass the B. without the consent of the Ottoman authorities.

The name of CIMMERIAN BOSPORUS was given by the ancients to the Strait of Kaffa (q. v.), also called the Strait of Yenikalé or of Theodosia. The country on both sides of the Cimmerian B. formed, in ancient times, the kingdom of Bosporus, which was founded in 502 B.C. In 393 the kingdom was extended along the Asiatic coast; and Theodosia was united with it in 360. The kingdom became tributary to the Scythians in 290; and in the year 116 B.C., Mithridates, king of Pontus, vanquished the Scythians, and set his son, Machares, on the throne of Bosporus. On the death of Machares, soon followed by that of Mithridates, the Romans gave the country, in 63 B.C., to Pharnaces, the second son of Mithridates, and after his assassination, to several princes who gave themselves out for descendants of Mithridates. When at last the family became entirely extinct, in 259 A.D., the Sarmatians made themselves masters of the kingdom, from whom the inhabitants of the Chersonesus took it in 344. Along with Tauric Chersonesus, it afterwards formed a part of the Eastern Roman Empire, until the Chazars, and afterwards the Tatars, under Mongolian princes, made themselves masters of it. See TAURIDA.

BOSQUET, Pierre François Joseph, a distinguished French marshal, born 8th November 1810 at Mont de Marsan, in the department of Landes, entered, in 1829, the Polytechnic School at Paris, and in 1833 joined the artillery as sub-lieutenant. In June 1834, he proceeded with his regiment to Algeria, where he became conspicuous for his military tact, energy, and valor. In 1847, he had attained the rank of colonel, and the following year he was named general of brigade by the republican government. In the end of 1853, he returned to France, and in 1854 was appointed by the emperor general of division. He had the command of the second division of the French army in the Crimea, and at the battle of the Alma, 20th September, his successful manœuvres against the Russian left wing were mentioned in Marshal St. Arnaud's dispatch to the emperor as deciding the fate of the day. At Inkermann, 5th November, he contributed greatly to the defeat of the Russians. His conduct on this occasion was noticed with praise by Lord Raglan in his dispatch, and the British parliament voted its thanks to him in a special resolution. He also took a leading part in the capture of the Malakoff, 8th September 1855; but a wound he received from the bursting of a shell obliged him to retire to France. In 1856 he was made field-marshal. He died in 1861.

BOSS, in Architecture, a raised ornament, covering the intersections of the ribs of ceilings. They are more frequently seen in vaulted roofs, as in the aisles of a church, but occur also where the ceiling is flat. In early Norman work there are generally no bosses, and they become richer and more frequent as we advance towards the decorated and perpendicular styles. In the decorated



Boss.—From Notredame la Riche, Tours.

Boss, on Norman shield.

style the B. usually consists of foliage, sometimes combined with animals, heads, and the like. Coats-of-arms, charged with armorial bearings, came then also to be used for this purpose, though they were more frequent in the perpendicular.—The B. of a bit is the ornament with which a bridle-bit terminates at each end. It was borne in the arms of the corporation of Lorimers. See Lorimer.

BOSSI, Luigi, an Italian archæologist and historian, was born at Milan in February 1785; studied at Pavia, and became a canon of the cathedral of Milan; but when the French entered Italy, he took the side of the invaders, and was appointed by Bonaparte agent of the French government at Turin, and afterwards prefect of the archives of the kingdom of Italy. He died at Milan 10th April 1835. He was an extremely prolific author, and produced more than 80 works, great and small, including theological and religious works, dissertations on antiquarian subjects, historic works, works on subjects connected with the fine arts, tragedies, comedies, &c. That his works have afforded many opportunities for unfavorable criticism, is only what might be supposed, from their number and variety. His *Introduzione allo Studio delli Arti del Disegno*, is instructive and much esteemed. His most important historic works are a much enriched translation of *Roscoe's Life of Leo X.* (12 vols., Milan, 1816—1817); *Researches concerning Christopher Columbus* (Milan, 1818); and a *History of Italy* (19 vols., Milan, 1819—1823).

BOSSUET, Jacques Benigne, a distinguished French pulpit orator, was born, 27th September 1627, at Dijon; received his earlier education in the Jesuit college there; and then came to Paris to the College of Navarre, where he studied the Sacred Scriptures, the works of classical antiquity, and the Cartesian philosophy. In 1652, he was made a doctor of the Sorbonne, and a canon in Metz. Here he was called by the bishop to reply to the Catechism of the Protestant minister, Paul Ferri, and this he did in a way that commanded the admiration even of Protestants. He soon attained great distinction as a pulpit orator, and in 1661 he was made preacher to the court. His discourse on the occasion of Marshal Turenne's conversion to the Catholic church obtained for him the bishopric of Cordan. The king having, in 1670, intrusted to him the education of the Dauphin, he resigned his bishopric in 1671, because he believed that he would be unfaithful to his duty if he retained it during a continued absence from his diocese. He was now made a member of the Academy. The care with which he attended to the education of the Dauphin was rewarded, in 1680, by his nomination as first almoner of the Dauphin, and in 1681 by his appointment to the bishopric of Meaux. He was the author of the four articles, which secured the freedom of the Gallican Church, and the rights of the king in regard to it, against the aggressions of the pope; and his eloquence in the Assembly of the French clergy, in the year 1682, obtained their adoption of these articles. In 1697, he became a member of the Council of State, and in the following year first almoner to the Duchess of Burgundy. He spent the last year of his life in his diocese, where he died 12th April 1704. He was alike strict in morals and in religious doctrine; his strictness in the latter he showed particularly in his controversy with Fénélon (q. v.), whom he accused of heresy for his defence of the Quietists (q. v.). His style is vigorous and artistic. His orations at the funerals of the Duchess of Orleans and the great Condé are particularly noted as masterpieces of this kind of eloquence. All his writings attracted much attention. For the defence of those dogmas of the Catholic Church which are rejected by Protestants, he wrote his *Exposition de la Doctrine de l'Eglise Catholique sur les Matières de Controverse* (Par. 1671). His greatest controversial work is his celebrated *Histoire des Variations des Eglises Protestantes* (2 vols., Par. 1688), in which he founds his argument chiefly upon the doctrinal diversities of the churches of the Reformation. To the defence of the four articles of the Gallican Church he devoted his *Defensio declarationis celeberrimæ, quam de Potestate Ecclesiæ sanxit clerus Gallicus a.* 1682 (2 vols., Luxemb. 1730). With a view to the instruction of the Dauphin, he wrote his *Discours sur l'Histoire Universelle jusqu'à l'Empire de Charlemagne* (Par. 1681), a work particularly deserving of notice, as the first attempt at a philosophical treatment of history. The continuation of it to the year 1661 (Par. 1805) is entirely derived from materials which he left behind him, but to which the last touch of his own hand was wanting.

Another fruit of his political and historical studies, was the *Politique tirée de l'Ecriture Sainte* (Par.1709). The most complete edition of his works is that published under the care of the Benedictines (46 vols., Versailles, 1815—1819.)—His nephew, Jacques Bossuet, died bishop of Troyes, 12th July 1743. His very extensive correspondence, chiefly devoted to the elucidation and investigation of the views of Fénélon, is included in the abovementioned edition of the works of his uncle.

BOSSUT, Charles, a French mathematician and natural philosopher, born 11th August 1730, at Tartaras, near Lyon. So early as the year 1752 he became professor of mathematics in Paris, and in 1768 was received into the Academy of Sciences. The revolution deprived him of his situation and his income, and he lived in the greatest seclusion, and in almost misanthropical discontentment, till under the Empire he was appointed a professor in the Polytechnic School. He died 14th January 1814. His works are very numerous. The following may be mentioned as particularly valuable: *Recherches sur la Construction la plus avantageuse des Digues* (Par. 1764); *Recherches sur les Altérations que la résistance de l'éther peut produire dans le Mouvement des Planètes* (Par. 1776); *Nouvelle Expérience sur la Résistance des Fluides, par d'Alembert, Condorcet, et Bossut* (Par. 1777); *Traité élémentaire de Mécanique et de Dynamique* (Charleville 1763); *Cours Complète des Mathématiques* (7 vols., Par. 1795—1801); *Cours de Mathématique á l'Usage des écoles Militaires* (2 vols., Par. 1782); *Essai sur l'Histoire Générale des Mathématiques* (2 vols., 2d ed., Par. 1810), one of the best works on the history of mathematics; and *Traité du Calcul Différentiel et Intégral.* All his works are distinguished by methodical arrangement and great clearness. He was a great admirer of Pascal, and edited his works (15 vols., Par. 1779), to which he prefixed an introductory *Discours sur la Vie et les Ouvrages de Pascal*, in 5 vols.

BOSTA'N (El), a town of Asiatic Turkey, in the pashalic of Marash, situated in a plain on the Sihun, on the north side of Mount Taurus. Lat. 38° N., long. 36° 23′ E. B. can be surrounded with water on the approach of an enemy; it has several mosques, and a considerable trade in wheat. It occupies the site of the Cappadocian Comana, which had a celebrated temple dedicated to a deity which is 'supposed to have been called *Ma* in the language of the country, and to be the moon-goddess.' Pop. between 8000 and 9000.

BOSTANJI, a class of men in Turkey who, originally the sultan's gardeners (the name being derived from *bostan*, a garden), now perform, in addition to their garden labor, a variety of duties, such as mounting guard at the seraglio, rowing the sultan's barge, and attending on the officers of the imperial household. They are under a chief called Bostanji Bashi, who holds the rank of a pasha, and is governor of the sultan's residences, and steersman of his barge. He also holds the inspector-generalship of the woods and forests in the vicinity of the capital, has the jurisdiction of the shores of the Bosporus and Sea of Marmora, and is, altogether, so important a functionary that only personal favorites of the sultan can hope to fill the office. The financial reforms of Sultan Mahmoud, however, have greatly lessened the emoluments of the post. The B. at one time amounted to 5000, and were di-

vided into companies like the janissaries, with whom they were united in military duty. In war-time, their strength was 12,000. A scarlet bonnet, of excessive dimensions, formed the distinctive part of their costume. Their number now does not amount to more than 600.

BO'STON, an ancient English borough and seaport in Lincolnshire, on both sides of the Witham, 28 miles south-east of Lincoln. It is supposed to be identical with the Icanhoe, where St. Botolph founded an abbey in 654, destroyed in 870 by the Danes. Under the Normans, B. became a place of importance, and in 1204 it paid the largest dues (£780) of any English port except London (£836). In the reign of Edward III., many foreign traders settled, and the merchants of the Hanseatic League established a guild in Boston. After their departure, the town declined, and the suppression of the monasteries by Henry VIII. further injured it; but his grant of charter of incorporation, and Mary's subsequent grant of extensive lands, partly compensated for this. The modern town consists chiefly of two good streets, one on each side of the river. The parish church of St. Botolph (1309), 245 by 98 feet, is one of the largest without cross aisles in England, and has a fine tower 300 feet high, surmounted by a lantern visible 40 miles out at sea. The church was partially restored in 1857 at the expense of the inhabitants of Boston in America. The clearing of the river of silt and the closing of the adjacent fens have greatly promoted the trade of Boston. Vessels of 300 tons can reach the heart of the town. The chief export is corn. Pop. of muni. bor., (1871) 14,526; of parl., 18,279; (1881) 14,932 and 18,887. For bribery and corruption, it was determined in 1882 temporarily to disfranchise B., which heretofore returned two members. B. is a great market for cattle and sheep, and manufactures canvas, iron, brass, ropes, leather, bricks, whiting, and hats. In 1880, 471 vessels, of 35,651 tons, entered, and 476, of 34,968 tons, cleared the port.

BO'STON, capital of Massachusetts, United States, stands at the west end of Massachusetts Bay, on an inlet, which, whether for defence or trade, forms one of the best havens in the world. This inlet, known as Boston Harbor, the primary source of the city's growth and prosperity, has a seaward barrier of two headlands, the interval of 4 miles being so subdivided by an insular breastwork as to leave only three practicable entrances, the main one barely wide enough for two vessels to pass one another; while the enclosed space of about 75 square miles—at least half of it affording depth for the largest ships—greatly augments, with its islands and its peninsulas, both its military and its commercial capabilities. On an oblong peninsula, of about 700 acres, running to the north-east, B. was founded in 1630, its original owner, John Blackstone, selling out his right and title, five years thereafter, for £30. With so well chosen a site, and, doubtless, also through the industry and enterprise of its Puritan occupiers, the new town increased so steadily in wealth and population, that in less than a century and a half it became the foremost champion of a colonial independence. Since then it has overleaped its natural limits, swarming off, as it were, into an island towards the north-east and into the mainland on the south-east, and consists of Old, East, and South Boston; Roxbury, annexed in 1868; Dorchester, annexed in 1870; and Charleston, Brighton, and West Roxbury, annexed in 1873; which are connected together by bridges. An immense dam called the Western Avenue connects the whole with the inner side of the harbor. All the divisions of the city are of an uneven surface. Undulation, in fact, is a characteristic of the entire neighborhood—continent, islands, and peninsulas alike. From this irregularity, so different from the straight and formal lines of street in American cities, and also from being built of a very neat kind of brick, B. has much the appearance of a substantial English provincial town; the resemblance being perhaps heightened by the dress, manners, and feelings of the inhabitants, who are essentially of the old British types, as befits the descendants of the 'Pilgrim Fathers.' On a peninsula, to the north of East B., rises Bunker's Hill, so famous in the War of Independence; while the Dorchester heights, only less famous, occupy the center of South B.; and, lastly, the peninsula of Old B. seems to have originally taken the name of Tremont, from its three mounts or hillocks. Between 1840 and 1850 the population had swelled from 93,383 to 136,881; (1860) 200,000; (1870) 250,526; (1880) 362,535.

Among the public buildings, the principal are the State House, City Hall, Faneuil Hall, Faneuil-hall market, Massachusetts hospital, post-office, custom-house, county jail, houses of industry and correction, 4 theaters, an athenæum, an odeon, a library, an admirable music hall, and 200 churches, including the very handsome Roman Catholic Cathedral. Among other objects worthy of note are the Common, a beautiful park of 50 acres, on the peninsula; the wharfs and quays; and the bridges, 16 in number, which unite together the different portions of Boston. The waterworks demand special mention. To say nothing of an earlier enterprise of the kind on a smaller scale, the waters of Lake Cochituate, distant 20 miles, have since 1848 been conveyed by a brick conduit into the grand reservoir of Brookline, at the further end of the Western Avenue, and thence been carried into the subordinate reservoirs respectively of the different sections of the city. The annexation of Charlestown brought with it the waters of Mystic Lake. B., as the center—social, political, and commercial—of the best educated and most intelligent state in the Union, is pre-eminent throughout the republic in literature and science. Its trade, likewise, is marvelous: it is, in fact, more marvelous in proportion to physical facilities, than even that of New York, for while the latter city, with the lakes on the one side and the ocean on the other, and with the Hudson as a link between them, drains regions of vast extent and singular fertility, B., to say nothing of rugged soil and ungenial climate, is cut off from the interior, such as it is, by the entire want of inland waters. But what New York has so largely inherited from nature, B. has in some measure created for itself. By eight great systems of railway it reaches, besides the coasts to the north and south, the St. Lawrence and the Lakes, the Hudson and the Mississippi; while, as the Transatlantic terminus of the Cunard line, it virtually connects those channels of communication with Great Britain and its net-work of iron roads. In several departments of maritime trade, such as the coasting intercourse and the trade with Russia, India, and China, B. is understood to possess far more than its share; and as the port of the manufacturing districts of the Union, it may be said to monopolize the carrying alike of raw material and of finished goods. The chief exports are beef, pork, lard, fish, ice, woollens, cottons, paper, boots and shoes, cordage, hardware, and furniture; while the imports, wafted from all corners of the world, comprise nearly every article that has a name in commerce. While B. ranks as the second city in the Union for commerce, its charitable institutions, schools, and public libraries are in harmony with the city's importance in other respects.

The B. public library, with more than 300,000 volumes, is the largest in the United States after that of Congress. The *News Letter*, the first journal issued in North America, was published here in 1704; there were in 1880 about 150 periodical publications in B., nine of which were dailies. B. University, incorporated in 1869, has the following departments: college of liberal arts, music, agriculture, theology, laws, medicine, and sciences. In allusion to the good opinion which the natives of B. entertain of their prosperous and privileged city, it has been banteringly styled 'The Hub of the Universe.' In 1822, B. adopted a municipal organization. A great fire in the end of 1879 did damage to the amount of $1,000,000. See BOSTON in AM. SUPP.

BOSTON, THOMAS, a Scottish divine, once extensively popular, was born of poor parents at Dunse, Berwickshire, March 7, 1676. As early as his 12th year he was concerned about the state of his soul, and while only a boy at the grammar school, he formed a society of three for religious conference and social prayer. After a hard struggle, he succeeded in entering Edinburgh University in 1691. He received license as a preacher in 1697, and was greatly appreciated by the serious portion of the community; but his uncompromising character prevented him from receiving a clerical charge for two years. He was then ordained minister of Simprin, and in 1707 was translated to Ettrick, where he died on the 20th May 1732. Of his voluminous works the best known, but not the most agreeable, is the *Fourfold State*, published in 1720. It discourses of man's paradisaical integrity, his ruin by the fall, his begun regeneration on earth, and consummate bliss or woe hereafter. An excellent little treatise of B.'s is entitled *The Crook in the Lot*. As a pastor, B. was eminently laborious, and deservedly popular. In the ecclesiastical courts, he distinguished himself by his zeal in defence of the church's independence, and in the controversy regarding the *Marrow of Modern Divinity* (which was objected to as being too free in its offers of salvation), he was one of the ten ministers who declared their approval of that work. See MARROW CONTROVERSY. As a theologian, B. is perhaps the most 'Representative Man' in the whole list of Scottish divines. His language, sentiments, and peculiar modes of expressing the peculiarities of Calvinistic psychology, have colored the style of Scottish preaching more than any other writer of the same school has done. Although often displaying what we should now call narrowness and ignorance, B. exhibits also flashes of insight and beauty, quaint felicities of diction—as, for instance, when in *The Crook in the Lot*, he warns the profligate against the possibility of a 'leap out of Delilah's lap into Abraham's bosom'—and an occasional shrewdness of thought, which are even yet worth studying. B.'s autobiography used to be a great favorite with the Scottish peasantry.

BO'SWELL, JAMES, Esq., of Auchinleck, in Ayrshire, celebrated as the friend and biographer of Dr. Samuel Johnson, was born October 29, 1740, at Edinburgh, where his father was one of the judges of the Court of Session, and as such was styled Lord Auchinleck. He was intended by his father for the profession of an advocate, and studied first at Glasgow, and afterwards at the then famous university of Utrecht, to which he went in 1763.

When in London in that year he made the acquaintance of Johnson, an event of decisive importance for his whole subsequent life. The acquaintance was earnestly sought by himself, and originated in his strong literary tastes and his ardent admiration of Johnson's writings. He spent one winter at Utrecht, and then proceeded on a tour through Germany, Switzerland, and Italy, and visited Corsica with a letter of introduction from Rousseau to Paoli, with whom he contracted a warm and lasting friendship. He enthusiastically adopted the cause of Corsican independence; and after his return to Scotland, published an *Account of Corsica, with Memoirs of General Pasquale Di Paoli* (Glasg., 1768; 3d ed., Lond. 1769), which was speedily translated into several languages. B. became a member of the Faculty of Advocates in 1766, but never devoted himself with earnestness to the business of law. In 1773, he was admitted into the Literary Club instituted by Johnson, and of which Burke, Goldsmith, Reynolds, and Garrick were members. From this time he made it his principal business to note down the sayings and doings of Johnson, with whom he associated on most intimate terms, and whom he accompanied on his tour in Scotland and the Hebrides in 1773. Boswell was married in 1769 to a lady named Montgomery, by whom he had several children. Led by his taste for London society, he removed thither at a mature period of life, and entered at the English bar, but without attaining to any success in the profession. After Johnson's death in 1784, he employed himself in arranging the materials which he had collected, and preparing his long-contemplated biography. His *Journal of a Tour to the Hebrides* appeared in 1785, his *Life of Samuel Johnson*, in 2 vols., in 1791. Both have gone through many editions. Boswell has been emphatically styled by Macaulay 'the first of biographers.' His work is indeed full of details, but they are such as exhibit character, and are arranged in the most interesting manner. He neither conceals his own faults, nor those of Johnson, but presents a picture of which the truthfulness is too evident to be questioned; and Johnson is perhaps already better known by the pages of B. than by any of his own writings.

B. died in London, June 19, 1795. Besides the works already mentioned, he was the author of one or two minor productions of temporary interest. In December, 1856, there was published a posthumous volume of *Letters of James Boswell, addressed to the Rev. W. J. Temple, from the Original MSS.*, in which the gay, *insouciant* character of the man very strongly appears. His eldest son, SIR ALEXANDER BOSWELL, Baronet, of Auchinleck, born 1775, was the author of a number of Scottish songs, full of humor, which he collected into a volume entitled, *Songs, chiefly in the Scottish Dialect* (Edin. 1803), and some of which attained considerable popularity. He also wrote *Edinburgh, or the Ancient Royalty*, a picture of Scottish manners in the dialogue form, and edited many of the older productions of Scottish literature. A duel with Mr. Stuart of Dunearn, occasioned by personal allusions in a publication connected with a parliamentary election, resulted in his death on March 26, 1822.

BOSWE'LLIA, a genus of trees of the natural order *Amyridaceæ* (q. v.), having flowers with a small five-toothed calyx, five petals, and a crenulated glandular disk; a triangular capsule with three valves, three cells, and one seed in each cell; the seeds winged on one side; their cotyledons intricately folded, and cut into many segments. Two or three species only are known, of which the most interesting is *B. serrata* (or *B. thurifera*), the tree which yields OLIBANUM (q. v.), now very generally believed to have been the FRANKINCENSE (q. v.) of the ancients. It is a large timber-tree, with pinnate leaves, which have about ten pair of hairy serrated oblong leaflets, and an odd one, each leaflet about 1—1½ inch in length. The flowers are small and numerous, in axillary racemes, and of a pale pink color. When the bark is wounded, the olibanum flows out, of a delightful fragrance, and hardens by exposure to the atmosphere. The tree is found in the mountainous parts of Coromandel, and is supposed to be a native of other parts of India, and of Persia, Arabia, and perhaps Abyssinia. *B. glabra*, a very similar species, a native of India, also yields a resin, comparatively coarse, which is sometimes used for incense, and is boiled with oil as a substitute for pitch.

Boswellia serrata:
a, part of a branchlet, with leaf and raceme of flowers; *b*, a single flower; *c*, a capsule, cross section.

BO'SWORTH, or MARKET BOSWORTH, a market-town in Leicestershire, on an eminence in a very fertile district, 12 miles west of Leicester. Pop. in 1881, 6409, many of whom are employed in knitting worsted stockings. On the moor in the vicinity was fought, 1485, the battle in which Richard III. was slain, and which terminated the Wars of the Roses. On an elevation, called Crownhill, Lord Stanley placed the crown on the head of the Earl of Richmond, Henry VII. Here Simpson the mathemarician was born; Dr. Johnson was an usher in the Free Grammar School, in which Salt the Abyssinian traveler, and Richard Dawes the Greek critic, were educated.

BOSWORTH, JOSEPH, D.D., a distinguished philologist, was a native of Derbyshire, where he was born in 1789. He graduated first at Aberdeen, and afterwards at Leyden; he also took the degrees of B.D. and D.D. at Cambridge and Oxford. He obtained a curacy in the English Church in 1815, and two years afterwards the vicarage of Horwood Parva, Buckinghamshire. He now devoted such time as an active discharge of his parochial duties left at his disposal to literature, and especially to researches in Anglo-Saxon and its cognate dialects. The results of his labors appeared in 1823 in a work, entitled *Elements of Anglo-Saxon Grammar*. Fifteen years afterwards, he published the work by which his name is best known, *A Dictionary of the Anglo-Saxon Language* (Lond. 1838; of which a new edition by T. Northcote Toller was published in 1882). This was at the time a very valuable work; an abridged edition was afterwards issued by the author. B. resided in Holland eleven years, from 1829 to 1840, as British chaplain. He returned to England in 1840, and was presented to the vicarage of Waithe, in Lincolnshire. In 1858 he became rector of Water Stratford in Buckinghamshire, and also Professor of Anglo-Saxon at the University of Oxford. In 1865, he published the Gospels in Gothic of 360 A.D., and the Anglo-Saxon of 995 A.D., in parallel columns with Wycliff's version of the year 1389, and Tyndale's of 1526. He was author of various other works of a philological character. His death took place on May 27, 1876.

BOSZORME'NY, the chief of the six towns of the free district of Hajduk, in the east of Hungary, about ten miles north-northwest of Debreczin. It carries on an active trade in rye, tobacco, water-melons, soda, and saltpetre. The population in 1880 amounted to 20,000.

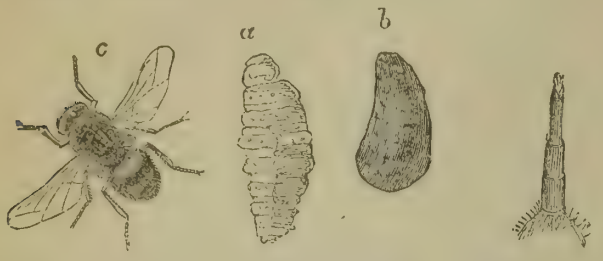
BOT, BOT-FLY, and GAD-FLY, names common to many insects of the family *Œstridæ* (q. v.) or *Œstracidæ*, the genus *Œstrus* of Linnæus. The name bot is sometimes restricted to the larvæ, which appears to have been its original use, the other names having been given to the perfect insects; the name gad-fly often to insects of the genus *Tabanus* (q. v.), to which some try to restrict it. The insects of this family are now supposed not to be those which were called *Œstrus* by the ancients, although, like them, extremely troublesome to cattle. They are Dipterous (two-winged) (q. v.) insects, nearly allied to the *Muscides* (House-fly, Flesh-fly, Blow-fly, &c.), with small 3-jointed antennæ, and mouth destitute of a proboscis.

Horse Bot-fly:
a, a horse-hair with eggs of bot-fly; *b*, one egg magnified; *c*, larva; *d*, pupa; *e*, perfect insect, a little larger than life.

—The Horse-bot, or Gad-fly of the Horse (*Gasterophilus*, or *Gastrus*, or *Œstrus Equi*), sometimes also called the *Breeze* and *Horse-bee*, is much less common in Britain than in some parts of the continent of Europe, and occurs chiefly in elevated and healthy districts. It is not quite half an inch in length, woolly, with yellowish gray head, rusty thorax, abdomen, and the wings whitish, with brownish-gray spots. The abdomen of the female terminates in a blackish horny tube. In the latter part of summer, the female hovers about horses, and deposits her eggs on their hairs, where they remain attached by a glutinous substance until they, or the larvæ just emerging from them, are licked off by the tongue of the horse, their destined place being its stomach. It is believed that the fly deposits her eggs only on those parts which are accessible to the horse's tongue, seeming to prefer the back of the knee-joint, where they may sometimes be found in hundreds. The larva is yellowish, without feet, short, thick, soft, composed of rings which have a double row of short teeth surrounding them; it is somewhat acuminated at one end—the head; and the mouth is furnished with two hooks, one on each side, for taking hold of the inner coat of the horse's stomach, to which the B. attaches itself, and from which it derives its subsistence, hanging in clusters sometimes of three or four, sometimes of more than one hundred. Here it spends the winter, and in the following summer, when it is about an inch long, it disengages itself, and being carried

through the horse's intestines, burrows in the ground; and changes into an oval black pupa with spiny rings, from which, in a few weeks, the perfect insect comes forth. Multitudes, of course, become the prey of birds, before they can accomplish their burrowing.—It has been disputed whether or not bots are very injurious to horses; and some have even maintained that, when not excessively numerous, their presence is rather beneficial, an opinion, which is certainly not recommended by its apparant probability, whilst it seems to be universally admitted, that in great numbers they are hurtful.—The Red-tailed Horse-bot (*G.* or *Œ. hæmorrhoidalis*), also a British species, deposits its eggs upon the lips of the horse, distressing it very much by the annoyance which it gives in so doing. The larvæ attach themselves chiefly to the surface of the intestine, about the anus of the horse, and sometimes cause an annoying irritation.

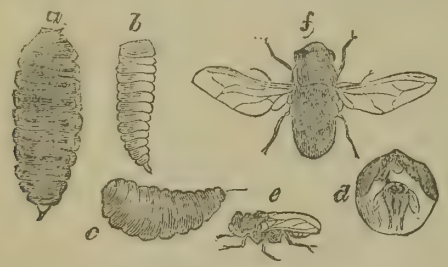
Linseed-oil is used for their removal.—The OX-BOT, or Ox Gad-fly (*Œstrus* or *Hypoderma Bovis*) is more troublesome than any other species of horse-bot. It is a beautiful insect, not quite half an inch long, and thicker in proportion than the horse-bots; it has brown unspotted wings; the face whitish, the crown of the head brown, the thorax black, the abdomen whitish, with a broad black band around the middle, and yellow hairs at the extremity, where also the female has an ovipositor—a remarkable organ, formed of a horny substance, and consisting of four tubes retractile within one another, like the pieces of a telescope; and the last



Ox Bot-fly:—*a*, larva, full-grown, natural size; *b*, pupa; *c*, perfect insect, a little larger than life.

Ovipositor of Bot-fly highly magnified.

of them terminating in five points, three of which are longer than the others, and hooked. By means of this organ, a small round hole is pierced in the hide of an ox's back, in which an egg is deposited. The fly is very quick in depositing her egg, not remaining upon the back of the animal more than a few seconds. Cattle exhibit great alarm and excitement at the presence of the gad-fly, and rush wildly about, with head stretched forward, and tail stuck out, to escape from their tormentor. The further injury done by this insect is not, however, usually great; the larva—a little pearl-white maggot (*warble* or *wormal*)—feeding upon the juices beneath the skin, causes a swelling, called a *warble*, forming a sort of sac, within which it lives and grows, amidst a kind of purulent matter suited to its appetite; and from which it finally emerges, leaving a small sore, and like the horse-bot, undergoes its further transformations in the ground. By pressure on the warbles, bots may be destroyed, and when they are numerous, assiduous oiling of



Sheep Bot-fly:—*a*, larva, full grown; *b*, larva, younger; *c*, pupa; *d*, the face of the perfect insect, magnified: *e*, perfect insect, natural size; *f*, perfect insect, magnified.

the back of the ox is resorted to for the same purpose.—The SHEEP-BOT (*Cephalemyia* or *Œstrus Ovis*) is a much more serious pest than any other British species, and is not unfrequently very destructive to flocks. The insect is smaller than either the ox-bot or horse-bot; it is of grayish color, with a large head and yellow face, and is most abundant in damp situations and woody districts. It is to be seen chiefly in the months of June and July. Sheep exhibit great alarm when it approaches them, and seem to seek, by keeping their noses close to the ground, and by incessant motion of their feet, to keep it from entering their nostrils.

It is in the nostrils of the sheep that this fly deposits its eggs, and the larvæ, when hatched, make their way into the maxillary and frontal sinuses, feeding upon the juices there, until they are ready to change into the pupa state, in April or May of the following year, when they find their way again through the nostrils to the ground. They seem to cause great irritation in their progress up the nostrils of the sheep, and the poor animals run hither and thither, snorting and in great excitement. 'The common saying, that a whimsical person is *maggoty*, or has got *maggots in his head*, perhaps arose from the freaks the sheep have been observed to exhibit when infested by their bots.' The bots cause considerable irritation in the cavities where they usually fix themselves, and sometimes get into the brain, and cause death.—These larvæ move with considerable quickness, holding on by the hooks with which their mouth is furnished, and contracting and elongating the body. It is said that flocks fed where broom is in flower are never infested with them; and when many cases arise in a flock, it is found particularly advantageous to remove it to a dry soil.—Goats, deer, and other quadrupeds are also liable to be assailed by different kinds of gad-fly. The eggs of one of the species which attacks the fallow-deer, are deposited in the nostrils, and the larvæ make their way in large numbers to a cavity near the pharynx. Rein-deer are excessively tormented by these insects, one kind depositing its eggs in their nostrils, and another in their skin; and it is no infrequent thing for a large part of a flock to be destroyed by them. When feeding where bot-flies are numerous, they keep such watch against them, that they neglect to eat, become emaciated, and often actually perish in consequence.—Even human beings have sometimes been afflicted by insects of this family. Humboldt saw Indians in South America having the abdomen covered with tumors produced by their larvæ.

BOTA'NIC GARDEN, a garden devoted to the promotion of botany, and in which plants are collected and cultivated in order to scientific study. The various economical applications of botany, however, in agriculture, manufactures, medicines, &c., are almost always kept particularly in view; and one great object of a B. G. is to bring to a country useful foreign plants, to determine the question of their suitableness to its climate, and to introduce those which may be cultivated with advantage. B. gardens are now deemed indispensable to universities; they are reckoned among the public institutions of great cities, and even of nations, and are established in new colonies, not only for the sake of science, but as one of the means of promoting their prosperity. They were utterly unknown to the ancients, although some of the secondary objects in which they are found most useful engaged the attention both of Greeks and Romans.

The first approach to a B. G. appears to have been made about 1309 A.D., in the garden of Matthaeus Sylvaticus, at Salerno; botanical science, however, being merely subservient to medicine. Of a similar character was the medical garden established at Venice, by the republic, in 1333. The example of Venice was followed by other Italian cities, and plants from different parts of the world began to be collected. At length, about contemporaneously with the revival of botanical science in modern times, the first true B. G. was formed in 1533 at Padua, by Musa Brassavola, for Gaspar de Gabrieli, a wealthy Tuscan noble; which was soon followed by those of Pisa, Florence, Bologna, and Rome. The first public B. G. was that of Pisa. A public B. G. was established at Padua in 1545, by a decree of the republic of Venice, at the request of the professors and students of medicine. The republic of Venice greatly encouraged the study of botany by sending persons to the Levant, to Egypt, and even to India, to procure plants for this garden.—The B. G. of Leyden was begun in 1577; it enjoyed in its infancy the care of Clusius, and was brought to great perfection by Boerhaave, who was professor of botany there.—The first public B. G. in Germany was established by the Elector of Saxony at Leipsic in 1580, and was soon followed by others.—France had no B. G. till Louis XIII. established the *Jardin des Plantes* at Paris, which was begun in 1610, but not completed till 1634.—Nor was there any public B. G. in England till 1632, when that of Oxford was founded by the Earl of Danby. Private B. gardens, however, had existed in England for the greater part of a century before.—The B. G. of Edinburgh, the first in Scotland, was founded about the year 1680, as a private B. G., by Dr., afterwards Sir Andrew Balfour, a zealous naturalist, who had inherited a collection of plants formed by a pupil of his own, Patrick Murray of Livingston, at his own country seat, and transferred them to Edinburgh; and the city of Edinburgh afterwards allotted to it a piece of ground, and allowed an annual sum for its support out of the revenues of the university.

The B. G. at Kew occupies a high place among British national institutions: it possesses one of the richest collections of plants in the world, and has been greatly improved under the care of Sir William Jackson Hooker and his son, who succeeded him in 1865. The *Hortus Kewensis* of Mr. Aiton, to whom the garden owed much of its prosperity in the 18th c., illustrates the greatness which it had even then attained. One of its chief glories is now its immense palm-house, finished in 1848, which is 362 feet in length, and the central part of it 100 feet wide, 66 feet high.—A palm-house has, in like manner, greatly added to the attractions and value of the B. G. of Edinburgh. It is 100 feet long by 60 feet wide, and 70½ feet high. These houses permit something of the

stateliness and magnificence of the palms of the tropics to be seen in Britain.

Of B. gardens on the continent of Europe, the *Jardin des Plantes* may be regarded as holding the first place, both with reference to the strictly scientific study of botany, and to the care bestowed upon the introduction and diffusion of useful or beautiful plants from all parts of the world. There exists in France what may be called a system of B. gardens—one at least in every department—to which plants are sent from the *Jardin des Plantes*, and from which, as they continue to be multiplied by propagation, they soon find their way into the hands of nurserymen and private cultivators. The B. G. connected with the imperial palace at Schönbrunn, in Austria, and that of Berlin, are the greatest in Germany. The former, which was begun in 1753 by the Emperor Francis I., was supplied with West Indian plants at enormous expense, the celebrated Jacquin being sent to procure them. The B. G. of New York is perhaps the most worthy of notice among the numerous botanic gardens of America; and that of Calcutta deserves to be mentioned as an important connecting-link between the B. gardens of Europe and the botany of India. It has enjoyed the care of a succession of eminent botanists, and has been very useful both in transmitting Indian plants to other parts of the world, and in introducing valuable productions of other countries into India.

In the laying out and arranging of B. gardens, different methods are adopted, mere convenience and beauty being in some cases primarily regarded, and these in other cases being sacrificed to the supposed interests of science in an attempted scientific arrangement. A perfect adherence to a botanical system is, for obvious reasons, impossible; but a scientific arrangement of the plants in natural groups, in so far as it can be conveniently accomplished, greatly increases the usefulness of a B. G., and facilitates the study of botany. Sometimes houses are devoted to particular orders of plants, as palms, heaths, or orchids; sometimes to plants of particular habit, as aquatic plants; and sometimes portions of the garden are advantageously devoted to the exhibition, at one view, of plants valuable for particular uses, as cereals or corn-plants, plants yielding fibre, &c.

BO'TANOMANCY, divination by means of plants. See DIVINATION.

BO'TANY (Gr. *botane*, an herb), the science which treats of the Vegetable Kingdom (see PLANT). Everything that relates to plants is included in this science; there are, therefore, several great branches of it, in many respects very different from each other. Of these branches of the science, some, relating to plants in general, rather than to particular kinds or species, are sometimes included under the designation of *General B.* (sometimes called *Phytonomy;* Gr. *phyton*, a plant, and *nomos*, a law); whilst those which relate to particular species, their distinctive characters, distribution, &c., are, in like manner, comprehended under the term *Special Botany*.—In the former of these departments, the first place must be assigned to *Structural B.*, also called *Organology*, or *Organography*, which has for its subject the structure of plants, the textures of which they are composed, and their various organs. Subordinate to this are the study of the elementary tissues of plants, sometimes called *Vegetable Histology* (see HISTOLOGY), and that of the anatomy of plants, sometimes called *Phytotomy* (Gr. *phyton*, a plant, and *tome*, a cutting); both of which have recently been prosecuted with great assiduity. In both, the microscope is an indispensable instrument, and by means of it all the important discoveries of modern times have been made. Intimately connected with these is *Morphology* (Gr. *morphos*, a form, and *logos*, a discourse), that branch of botanical science which relates to what has been called the *Metamorphosis of Organs*, or, in other words, the gradual transmutation of leaves by the processes of vegetable life into the various organs with which a plant is provided, and their consequent assumption of new forms and adaptation to new uses. This branch of B., entirely of recent origin, has been described as being in the vegetable what comparative anatomy is in the animal kingdom, and has now become the exposition of an admitted great general law, almost equally important in reference to structural B. and to vegetable physiology. *Vegetable Physiology* or *Physiological B.* treats of the various kinds of organic activity which are displayed in the life of plants. It is based upon *Structural B.*, an intimate acquaintance with which is indispensable to the study of it. The arguments or illustrations of natural theology, derived from B., are chiefly taken from structural B. and vegetable physiology considered together, the wisdom of the Creator appearing in his works equally in their structure and in the adaptation of all their organs to their respective wonderful functions.

In connection with vegetable physiology, another branch of science claims attention—VEGETABLE CHEMISTRY; of which there are two parts—an examination of the products of the living processes in plants, which, with all its well-known difficulty, is still comparatively easy; and an inquiry into these processes themselves, with respect to the chemical changes effected in them—an investigation of the secrets of that chemistry of nature which so far excels all that has yet been accomplished in laboratories. This is, however, a branch of the science of chemistry rather than of B.; but it so far belongs to the latter, that although only subsidiary, it is useful and indispensable. Even mathematics and natural philosophy, however, have been called to the assistance of the philosophical botanist in his attempts to explain the phenomena of his own science.

Special B. has been rendered subservient to the study of general B., and errors in the former are also guarded against by dependence, to a certain extent, on the well-ascertained principles of the latter. A comprehensive view of the vegetable kingdom is indeed impossible without an inquiry into the number and peculiarities of the different species which it contains; but the attempt to classify and arrange these can only be successful when it is founded upon a knowledge of general laws relating to all vegetable organisms. That the discoveries of a botanist may be made known, the description of species is necessary; and works devoted to this are sometimes called works of *Descriptive B.* or of *Phytography* (*phyton*, a plant and *graphe*, a writing). But in the description of plants, a multitude of terms must be employed, which almost exclusively belong to botanical science itself, whilst even those which are common to it with other departments of natural history, must be employed in senses modified by the peculiarities of the vegetable kingdom. Many of the terms used are such as belong to structural B. and vegetable physiology; but many also—for example, adjectives which designate the particular forms of leaves, &c.—become familiar only when an acquaintance with them is sought in order to descriptive B., and a knowledge of the different species of plants. Great precision is necessary in the use of these terms, and from the want of it, the descriptions of the ancients and of travelers unacquainted with B. often leave it impossible to determine the particular species intended. This gives rise to what is sometimes called in botanical works *Terminology*—an explanation of botanical terms, which, however, has no right to be regarded as a separate branch of science, or worthy of a distinct name; and the name which it has received is barbarous. When structural B. was little heeded, and little more was commonly supposed necessary for a botanist than a knowledge of species and the ability to distinguish them, 'terminology' was often separately taught, and the student was required to commit long tables of terms and their meanings to memory—a difficulty placed in his way at the outset which was both formidable and repulsive, like that which the student of the Chinese language must expect to encounter in its alphabet.

The necessity of classification and systematic arrangement in B. will be very obvious, if the multitude of different kinds of plants is considered, fully 120,000 species being already known and described, whilst great regions of the earth are still unexplored. The systematic arrangement of plants is sometimes called *Systematic B.*, sometimes *Taxological B.* (Gr. *taxis*, order, and *logos*, a discourse), sometimes, less properly, *Taxology* or *Taxonomy*. The history and progress of the science have been marked by the different systems which have been proposed, and have prevailed at different times. These have, however, been of two very distinct kinds founded upon very different principles, and are respectively designated *artificial* and *natural* or *physiological* systems. Artificial systems are based upon some single class of characters, in the external parts of plants, without reference to the importance of these characters in what concerns the life of a plant, or the purpose for which it exists, and are chiefly adapted to the convenience of the student desirous of readily distinguishing species among the multitudes with which he has to deal. A work of descriptive B. arranged according to an artificial system, has been aptly likened to a dictionary in which the words are alphabetically arranged.

An artificial system cannot, however, serve the highest purposes of the science. But in framing a natural system great difficulties are to be encountered, an imperfection of the system is necessarily to a certain extent involved in imperfection of the science. Based not upon one mere set of characters arbitrarily selected, but upon a consideration as far as possible of all characters which plants present, and not merely upon external forms viewed in themselves but upon these and internal organizations considered in their physiological relations, a natural system aims at exhibiting the real affinities which subsist in the vegetable kingdom; and evidently must be at all times liable to modification, and capable of improvement, as botanical science advances, either through the discovery of new plants or through phytotomical and physiological research; it also evidently requires the greatest scientific attainments and the highest powers of a philosophic mind. Nor is it one of the least of the practical difficulties, that the affinites of plants are not such as to constitute a simple lineal series, but that they may be viewed as a multitude of groups arranged around centers, and connected with each other upon different sides and by a great variety of ties.

Yet the rudiments of a natural system have always been sought after, and in some measure attained, when B. has been studied as a science—whenever it has become anything more than a mere acquaintance with a few plants and their names. The *genera* into which species are grouped by all botanists are natural, and are the basis upon which all classification proceeds in its further generalizations. So sensible was Linnæus of the importance of maintaining this character of the genera, that when a rigid adherence to his artificial system would have caused the division of a genus into parts, and the consequent separation of species very nearly allied, he kept the genus unbroken, and maintained the usefulness of his artificial system, to the student desirous of finding the names of plants, by referring from one of its classes or orders to another for species exceptional among those of their genus as to the number of their stamens or pistils, or their *diœcious*, *monœcious*, or *hermaphrodite* flowers.—The classification of species, however, in genera and larger natural groups, being a subject as much connected with other branches of natural history as with B., will more properly be treated in the article NATURAL HISTORY; and to that article also, and to the article SPECIES, we refer for all that our limits allow concerning some of the most interesting and difficult questions of science, the limits of species, the distribution of species, &c.

An important branch of botanical science is that which is called *Geographical B.*, or the *Geography of Plants*, and sometimes *Phytogeography*. It must be regarded as yet in its infancy, although a multitude of observations have been recorded in works of descriptive B., and by botanical travelers. It is the object of *Geographical B.* to connect with the occurrence or prevalence of plants in particular countries a great variety of facts as to climate, altitude, geology, &c., and even facts of history. It aims at the establishment of great general laws, which, however, it has not yet been able to establish. Some account of the progress which has been made in this branch of B., and of the imperfect generalizations which have been reached, will be found in the article GEOGRAPHY OF PLANTS.

Another branch of botanical science which has recently sprung up, and has acquired great magnitude and importance, is PALÆONTOLOGICAL B., or FOSSIL BOTANY. The petrified fruits and wood, the beautiful impressions of ferns and palms, and other traces and remains of former vegetation, which appear in vast numbers and great variety in different strata of the earth's crust, present a most interesting field of scientific research. The study of the different kinds of fossil plants, and the comparison of them with existing species, belong strictly to the science of B.; the study of their relations to particular strata or formations, and so to particular periods in the physical history of the globe, belongs to geology. The study of fossil plants has proved exceedingly useful in guiding to just and philosophic views of the mutual relations even of species and groups still existing. See PALÆONTOLOGY.

The subject of the DISEASES OF PLANTS must be regarded as falling within the province of Botany. It has scarcely yet been treated or studied as a distinct branch of science, although it has not been overlooked in its relation to Vegetable Physiology, with which its intimate connection is obvious, and it has received no little attention in its bearings on agriculture and other arts by which plants are made to supply the wants or minister to the comforts of man.

ECONOMIC B. includes all that relates to plants, considered with reference to these arts and to these uses. That part of it which relates to medicinal plants has been often separately and elaborately treated under the name of MEDICAL BOTANY. In the botanical articles of this work, will be found notices of the more important plants affording food to man, and therefore cultivated in fields or gardens, in warm or in cold climates, and of those valuable for their timber, their fibre, or the dye-stuffs or medicines which they yield.

Having thus endeavored to sketch an outline of the science of B., we must refer to the articles PLANT, VEGETABLE PHYSIOLOGY, instead of attempting here to fill up a part of that outline, by exhibiting the first principles of the science. It remains for us, in the present article, to give a very brief account of the history of B., and outlines of the systems of classification most deserving of attention.

We are informed that Solomon 'spoke of trees, from the cedar in Lebanon even to the hyssop that springeth out of the wall.' There is reason also to believe that Zoroaster devoted some attention to plants, and that this study early engaged some of the philosophers of Greece. The oldest botanical work which has come down to us is that of Theophrastus (q. v.), a pupil of Aristotle, who flourished in the 4th c. B.C. His descriptions of plants are very unsatisfactory, but his knowledge of their organs and of vegetable physiology may well be deemed wonderful, when we consider the low state of this branch of science throughout many centuries after his time. It was not, indeed, till after the revival of letters in Western Europe, that it was ever again studied as it had been by him. About four hundred years after Theophrastus, in the first c. of the Christian era, Dioscorides of Anazarbus, in Asia Minor—a herbalist, however, rather than a botanist—described more than 600 plants in a work which continued in great repute throughout the middle ages, a sure proof how destitute that period must have been of any botanical science of its own.

About the same time, the elder Pliny devoted a share of his attention to B., and his writings contain some account of more than 1000 species, but compiled from various sources, without much discrimination, and mingled with many errors. Centuries elapsed without producing another name worthy to be mentioned in a history of botany. It was among the Arabians that the science next began to be cultivated, about the close of the 8th century. The greatest name of this period is Avicenna. Centuries again elapsed, a longer period than before, during which it made no progress whatever. It was not till the beginning of the 16th c. that B. resumed its place as a science. The first to revive it was Otto Brunsfels, a German, who published in 1530 his *Historia Plantarum Argentorati*, or History of the Plants of Strasburg, in 2 vols., folio, illustrated with cuts. He was speedily followed by Bock or Tragus, Fuchs or Fuchsius, and other Germans; by Matthiolus and Cæsalpinus in Italy; Dodœns or Dodonæus in the Low Countries; De L'Obel or Lobelius, a Dutch physician at the court of England; Gesner in Switzerland; Dalechampa and Moulins, or Molinæus, in France, and by many others, for B. now began to be prosecuted wherever learning flourished, and with great zeal and success. Chairs of B. were founded in universities, botanic gardens (q. v.) were established in many places, and travelers began to explore even remote parts of the world. One of the greatest names of the latter part of the 16th c. is that of L'Ecluse, or Clusius, who traveled through many countries, encountering great perils and harships in pursuit of his favorite science, and was finally professor of B. at Leyden. The name of Dr. Turner, 'the Father of English B.,' belongs more to the 17th c. than to the 16th. The number of species known and described had increased, in the beginning of the 17th c., to more than 5000, but the study of them was much impeded by confusion of synonyms and by want of classification, whilst classification was rendered extremely difficult by imperfect knowledge of the structure and organs of plants. The foundations of a natural system of classification may be said to have been laid, in the latter half of the 17th c., by Dr. Robert Morison, a native of Aberdeen and professor of B. at Oxford, followed towards the close of the century by the celebrated Ray, one of the greatest naturalists that England has produced.

The application of the microscope in B. inaugurated a new epoch of the science, about the middle of the 17th century. Henshaw and Hook, both Englishmen, were among the first to employ this instrument to good purpose in the examination of the organs and structure of plants; but the greatest eminence belongs to the name of Grew, also an Englishman, a physician at Coventry, and to that of Malpighi, an Italian, perhaps still more celebrated for his anatomical than his botanical discoveries. Vegetable physiology now began to be recognized as the highest department of botanical science,

In the latter half of the century, perhaps the most eminent name after Ray is that of Joseph Pitton de Tournefort, a French gentleman, who devoted his whole life to the pursuit of botanical science, and who must be particularly noticed in a sketch of the history of B., on account of a system which he proposed, and which was more generally received and employed than any other till the time of Linnæus. Another botanist of the same period, Rivinus, professor at Leipsic, gave to the world a botanical system which was received to some extent in Germany. Tournefort's system was partly natural and partly artificial; that of Rivinus was perhaps the most perfectly artificial that was ever proposed.

The science of B. made rapid progress during the 17th and 18th centuries, both by the extension of botanical research in different parts of the world, and the careful study of particular groups or families of plants. Its progress was promoted by the publication of many valuable descriptive works. Important discoveries were also made in vegetable physiology.

About the middle of the 18th c., the wonderful genius of Linnæus effected a great change in B., as well as in zoology. His name marks an epoch in the history of the science; not chiefly, however, in consequence of the new system which he introduced, nor even because of the discoveries which he made, but rather because he was able very thoroughly to make himself master of all that had been ascertained by his predecessors, and to exhibit it in lucid order. He gave also a great impulse to botanical studies, by the enthusiasm with which he inspired his pupils. And among the benefits which he conferred on B., in common with zoology, not the least considerable was the introduction of trivial or specific names to be used along with the name of the genus as the designation of particular species.

From the time of Linnæus, the progress of B. during the remainder of the 18th c. became more rapid; and since the commencement of the 19th c., it has advanced with gigantic strides.

A large space would be occupied by a mere enumeration of the names of those who have promoted it by their labors and discoveries. Some notion of what botanical literature has become, may be formed from the fact, that Pritzel, in his *Thesaurus Litteraturæ Botanicæ* (Leip. 1847—1851), enumerates about 15,000 publications.

Von Haller, an anatomist and philosopher, as well as a botanist, was, of all the contemporaries of Linnæus, the only one who could be regarded as his rival. Of all the botanists of the latter half of the 18th c., the most deserving to be mentioned in the history of the science along with the great Swede, are Bernard de Jussieu, and his nephew, Antoine Laurent de Jussieu, who applied themselves with great earnestness to the study of the natural affinities of plants and the formation of a natural system, a work which Linnæus himself attempted, and of the importance of which he was so sensible, that whilst acknowledging the imperfect success of his endeavors, he declared his resolution to persevere in them to the end of his life. The Jussieus traced the outlines of a system which the greatest botanists since their time have not so much sought to change as to complete. Among those who have labored with greatest success in this work, must be mentioned De Candolle, Fries, Endlicher, Brongniart, Meisner, Von Martius, Lindley, and Brown. The botanist last named acquired by his work on the plants of New Holland, published in 1810, a high eminence, not on account of new plants which he described, but on account of the light which he threw upon the most difficult questions connected with the structure of plants and vegetable physiology. Many remarkable discoveries in vegetable physiology have recently been made by Link, Meyen, Schleiden, Von Mohl, Lindley, and others, some of them affecting what may be called the most fundamental principles of botanical science.

Since the days of Linnæus, great progress has been made in the examination of the B. of particular countries and districts, of which perhaps the least important result has been the discovery of very many plants unknown before. But our limits prevent us from noticing particular works in this department of botanical science, or those of botanical travelers, or of botanists who have devoted themselves to the study of particular groups of plants.

And we can merely allude to the scientific associations, continually increasing in number and resources, by which the interests of this science are promoted, and to the magazines and other periodical publications devoted to it.—However, we cannot but refer also to what may be deemed by some—but unjustly—matters of comparative insignificance, the introduction of B. into schools, and the publication of many works intended for the use of persons not very scientific. By the introduction of this or any other similar branch of science into schools, not only may important educational purposes be served, but the young may be led to form a taste for the science which will impel them to its subsequent prosecution. There are few branches of science so easily made popular as B.; but they very much mistake its nature who suppose it to consist in a mere knowledge of the names of plants, or in a familiarity with the classes of an artificial system. What B. really is, and to what the true study of it tends, is better perceived if we consider that 'there is not a flower that blows but has some beauty only unveiled to the minute inquirer, some peculiarity in structure fitting it to its destined place and purpose, and yet not patent to a casual glance.' There is perhaps no branch of science which demands more than B. the application of the highest mental powers; and like every other, to him who truly prosecutes it—whether little or much—it brings in due measure an immediate reward in his own improvement and delight.

We proceed to exhibit an outline of the Linnæan system, the only artificial system which it appears necessary further to notice, and of the natural sytem by which it has been to a great extent superseded. The Linnæan system, however, is not entirely artificial. Its foundation may be said to be laid in the perfectly natural distinction between Phanerogamous and Cryptogamous plants—the former of which Linnæus divided into 23 classes; whilst he constituted the latter, corresponding to the Acotyledonous plants of Jussieu, into his 24th and last class, *Cryptogamia*. In the other classes, he took the characters from the parts of fructification: this he defined as having no stamens or pistils distinctly visible, and gave it a name, *Cryptogamia* (Gr. *kryptos*, concealed, and *game*, marriage), in accordance with this definition, modestly refraining from a confident assertion of the absence of stamens and pistils.

Of the 23 classes of phanerogamous or phænogamous plants (Gr. *phaneros*, manifest, and *phaino*, to show), the characters of all are taken from the stamens; and those of Classes I.—XI., simply from the number of them; these classes, however, not including plants exhibiting the peculiarities with reference to which the remaining classes are constituted. Thus Class I., *Monandria* (Gr. *monos*, one, *aner*, a male), consists of plants the flowers of which have only one stamen; Class II., *Diandria* (Gr. *dis*, twice), of those with two stamens; Class III., *Triandria* (Gr. *treis*, three), of those with three stamens, and so on; Class IV., *Tetrandria* (Gr. *tetras*, four times); Class V., *Pentandria* (Gr. *pente*, five); Class VI., *Hexandria* (Gr. *hex*, six); Class VII., *Heptandria* (Gr. *hepta*, seven); Class VIII., *Octandria* (Gr. *octo*, eight); Class IX., *Enneandria* (Gr. *ennea*, nine); Class X., *Decandria* (Gr. *deka*, ten)—until, in Class XI., *Dodecandria* (Gr. *dodeka*, twelve), the number of the stamens is less definitely fixed, and plants are included in it having more than ten, and fewer than twenty stamens. Then follow two classes—Class XII., *Icosandria* (Gr. *eikosi*, twenty), and Class XIII., *Polyandria* (Gr. *polys*, many)—which have numerous stamens, but differ in their being inserted on the calyx in the former class, and on the receptacle in the latter, characters essentially natural, as are those also of most of the remaining classes. Classes XIV., *Didynamia*, and XV., *Tetradynamia* (Gr. *dynamis*, power), are distinguished by having the stamens of different lengths—the former having two long and two short stamens, the latter, four long and two short. Class XV. agrees with the great natural order *Cruciferæ*. Class XVI., *Monadelphia* (Gr. *adelphos*, a brother), has the stamens united by the filaments in one bundle; Class XVII., *Diadelphia*, has the filaments united in two bundles, or one free and the rest united; Class XVIII., *Polyadelphia*, has them united in more than two bundles. In Class XIX., *Syngenesia* (Gr. *syn*, together, and *genesis*, generation), the stamens are also united, but by the anthers instead of the filaments. This class nearly agrees with the great natural order *Compositæ*, and consists chiefly of plants having compound flowers. Class XX., *Gynandria* (Gr. *gyne*, a female), consists of plants in which the stamens grow out of, or are united with the pistil. Class XXI., *Monœcia* (Gr. *oikos*, a house), consists of plants having the stamens and pistils in different flowers on the same plant; Class XXII., *Diœcia*, of those which have the male and female flowers on different plants; Class XXIII., *Polygamia* (Gr. *polys*, many, *gamos*, marriage), of those having the stamens and pistils in the same or in different flowers on the same or on different plants.

The classes are divided into *orders*, which are constituted on various grounds. The orders of the first 13 classes are strictly artificial, their characters being found simply in the number of the pistils, according to which they are named *Monogynia* (Gr. *monos*, one, *gyne*, a female), *Digynia*, *Trigynia*, &c.; *Dodecagynia*, including all with 12—19 pistils, and *Polygynia*, all with 20 and upwards. The orders of Class XIV. are constituted on entirely different grounds, and are two in number, *Gymnospermia* (Gr. *gymnos*, naked, *sperma*, a seed), and *Angiospermia* (Gr. *angeion*, a vessel)—the former 'having naked seeds' (or rather the fruit formed of 4 *achenia*), the latter having the seeds in a capsule. The orders of Class XV. are in like manner founded upon the fruit; those of Classes XVI., XVII., and XVIII., upon the number of the stamens; as are also those of Classes XX., XXI., and XXII.; those of Class XIX., chiefly upon characters taken from the florets of compound flowers; those of Class XXIII., upon the circumstance of the hermaphrodite, male and female flowers being found on one, two, or three plants; whilst the orders of Class XXIV. are strictly natural—*Filices* (or Ferns), *Musci* (or Mosses), *Algæ*, and *Fungi*.

The student may acquire a pretty complete knowledge of the Linnæan artificial system, without knowing much in reality of B.; but, even in beginning to learn the natural system, he must learn some of the first principles of the science. Jussieu followed Ray in dividing plants into three great primary divisions—*Acotyledones* (q. v.), *Monocotyledones* (q. v.), and *Dicotyledones* (q. v.); having respectively no cotyledon or seed-lobe, one cotyledon, and two cotyledons. And, however the names may be changed, or characters assumed from other parts of the plant, these great divisions of the vegetable kingdom still subsist; the *Acotyledonous* plants being also, according to characters taken from the stem, *Acrogenous* (q. v.); the *Monocotyledonous* plants, *Endogenous* (q.v.); and the *Dicotyledonous* plants, *Exogenous* (q. v). Endlicher is the only botanist of great note who has attempted to make primary divisions of the vegetable kingdom essentially different from those indicated by Ray, and his attempt has not commended itself to general approval. De Candolle gave expression to an important truth in botanical science, when he united the two divisions of monocotyledonous and dicotyledonous plants under the common title of *Vascular plants*, in opposition to Acotyledonous or *Cellular* plants; the vascular plants being the *phanerogamous*, and the cellular the *cryptogamous*. Lindley has endeavored to modify the natural system by dividing the *asexual* or *flowerless* (cryptogamous) plants into the two classes of *Thallogens*—with the stem and leaves undistinguishable—and *Acrogens*, with the stem and leaves distinguishable, thus limiting the term acrogens to those which have a distinct stem; and in like manner dividing the *sexual* or *flowering* (phanerogamous) plants into five classes, viz., *Rhizogens*, with fructification springing from a thallus; *Endogens* and *Dictyogens*, with fructification springing from a stem, the wood of which is youngest in the center, and the seed with a single cotyledon—the former having parallel-veined permanent leaves, and the wood of the stem always confused; the latter having net-veined deciduous

leaves, and the wood of the stem when perennial arranged in a circle around a central pith; *Gymnogens* and *Exogens*, having the wood of the stem youngest at the circumference, and always concentric, the seed with two or more cotyledons; the former having the seeds quite naked, the latter having them enclosed in seed-vessels.

But others generally prefer the simpler division of phanerogamous or vascular plants into monocotyledonous or endogenous, and dicotyledonous or exogenous, the former including Lindley's endogens and dictyogens, the latter his exogens, gymnogens, and rhizogens; although the latter have only a provisional place assigned them, in the absence of well ascertained views of their structure.

One of the great advantages of the natural system is, that the plants which it brings together are very generally found to agree in their properties, as well as in their structural characters. There are, indeed, species which, in respect to their properties, are anomalous or exceptional in the genera or orders to which they belong; but these exceptions do not invalidate the general rule, according to which we expect the most deadly poisons in the order *Leguminacæ*, bland mucilage and useful fibre in *Malvaceæ*, wholesome succulent herbage along with a certain amount of acridity or pungency in *Cruciferæ*, &c., &c. The knowledge of the properties of genera and orders is of great use in guiding inquiry, and it is thus that modern science attains in rapid succession to discoveries important in their practical relations.

In the determination of the intermediate sub-divisions of the natural system, botanists have not yet been so successful as with regard to these primary divisions, and the ascertainment of the characters and limits of lowest subdivisions—orders, tribes, and genera. Great difficulty has been found in arranging the orders in natural groups, although the attempt, very necessary to a complete system and a just exhibition of nature, has been very assiduously and perseveringly made by Meisner, Endlicher, Lindley, and others of the greatest botanists of the present age.

BO'TANY BAY, a haven of New South Wales, in lat. 34° S., and long. 151° 15′ E., discovered by Cook, on his first voyage, in 1770, and named by him from the great number of new plants in its vicinity—a characteristic, however, rather of Australia in general than of this particular locality. In 1787, it received England's first penal colony in the east; and though it was supplanted the very next year by Port Jackson, a vastly superior harbor immediately to the north of it, yet it long continued to be the popular designation, not merely of this convict settlement, but of the Australian convict settlements generally. On the shore of B. B. there was erected, in 1825, a column to the memory of that eminent French navigator, the unfortunate La Perouse.

BOTH, JOHN and ANDREW, two celebrated painters, who, being united in their works like Beaumont and Fletcher, are, like them, usually spoken of together, were born at Utrecht, where their father was a painter on glass—John in 1610; the date of Andrew's birth is not known. After studying under Abraham Bloemart, the brothers went to Italy, where they soon won for themselves a high reputation. John painted landscapes, adopting Claude for his model, while Andrew filled in the figures after the style of Bamboccio, and in so careful a manner that the pictures looked like the work of one hand. John's landscapes are characterized by delicious warmth of sky, softness of distance, and general truthfulness to nature; even the different hours of the day may be distinguished in some of his best pictures, so careful are his tints. The works of the brothers are still in great repute, and bring high prices whenever they are offered for sale. One of the brothers was accidentally drowned in a canal in Venice in 1650; the other brother then settled in Utrecht, where he died six years afterwards.

BO'THIE (from the Gaelic *bothag*) signified originally a humble cottage or hut, but for a considerable number of years the term has been more popularly applied to a barely furnished, generally uncomfortable habitation for farm-servants. Though bothies are principally confined to the eastern and north-eastern counties of Scotland, a few have spread over a much wider area. The bothie, strictly speaking, of modern times is situated either under the same roof as the stable, or, oftener, at a short distance from the steading. While the cubic contents are invariably disproportionate to the number of inmates, the furnishings are of an uninviting, sometimes repulsive character. One long, roughly manufactured table, a few long stools, a chair or two, a number of victual bunks, a few wooden cups or bowls, and a pot or two, constitute the bulk of the fittings. The inhabitants are generally unmarried men, who frequently have their own food to prepare. Some of the larger farmers afford a woman for cooking and cleaning the bothie. Huddled together in this unnatural way, without the refining influence of the heads of families or the female sex, it is not surprising that the inhabitants of the bothie often acquire boorish, and sometimes immoral habits. Public moralists decry the bothie vehemently.

The men themselves do not raise their voices loudly, if at all, against it; and some influential farmers (amongst whom was the late Mr. M'Combie) seem to regard it, if an evil, as a necessary one, in present circumstances. The bands of Irish and Highland females living together in the East Lothian cottages, may be ranked as bothicites, and do not strengthen the argument for the general system. Though the bothie system is only one of several foul blots on the agricultural escutcheon affecting the laborers, it is diminishing, as farm cottages increase, and must soon, under the pressure of public opinion and the growing desire for social elevation, be reduced to a minimum, if not entirely abolished.

BO'THNIA, the name formerly given to a country of Northern Europe, extending along the east and west shores of the Gulf of Bothnia (q. v.), the eastern portion now being comprised in Finland (q. v.), and the western forming the Swedish governments of Pitea and Umea.

BOTHNIA, GULF OF, the part of the Baltic Sea which lies to the north of the isle of Aland, having on its eastern shore Finland, on the western, Sweden and Lapland, with Tornea for its northern limit. It extends from lat. 60° to 66° N., and long. 17° to 25° 35′ E., its greatest length being about 400 miles, and its average breadth 100 miles. Its depth varies from 20 to 50 fathoms, but both along its shores, and in the middle, are many small islands, sand-banks, rocks, and cliffs, called *skaers*, which render the navigation difficult; though on the whole it is less dangerous than other parts of the Baltic, and has many good harbors. The rivers which fall into this gulf, both from Sweden and Finland, are numerous; and the waters of the gulf itself are but slightly salt. In winter, it is usually so hard frozen that it can be crossed by sledges.

BOTHRIOCE'PHALUS (Gr. *bothrion*, a little pit, and *cephale*, a head), a genus of intestinal worms, belonging to the order of *Cestoid Worms* (q. v.), and included, until recently, in the genus *Tænia* (tapeworm, q. v.). The head in this genus is not furnished with four sucking disks, as in the true tapeworms, but with two lateral longitudinal hollows, which seem to serve only for adhesion by means of a partial vacuum, and to have nothing to do with nutrition. Nourishment is indeed supposed to be obtained entirely by the imbibing of fluids through the entire length of the worm; and whilst this process of imbibing takes place, there is also an exudation—as *exosmose* accompanies *endosmose* (q. v.) in the roots of plants—of peculiar oleaginous drops, which may probably be in part the cause of the injurious effects produced by these worms upon the health of the animals infested by them. The species of B. are very abundant in predaceous fishes, and occur more sparingly in fish-eating birds; the immature and sexless young being found in fishes and inferior aquatic animals, either in peculiar cysts, or in the intestinal canal. Sticklebacks are often seen distended to an unusual size by a species of B. which lies free in the cavity of the abdomen; but in the stickleback its joints and sexual organs always remain undeveloped; it is only when the stickleback has been digested in a bird's stomach, that the B. released, and finding itself at last in suitable circumstances, acquires its mature form, becoming an inhabitant of the bird's intestines. Only one species of B. occurs in man, *B. latus*, which is at once distinguished from the common tape-worm by the different form of its segments, but has been often confounded with another species of tape-worm, under the name of Broad Tape-worm. The segments are much broader than they are long, and each contains organs of reproduction. The worm is strictly androgynous. It is scarcely known in Britain, but is of frequent occurrence in some parts of Europe, and sometimes attains a length of fifteen feet or upwards; and a coil of these worms is not unfrequently expelled at once from a patient. The B. is, however, much more easily expelled than the true tape-worms. The same means are employed. The geographical distribution of this worm, which is most frequent in low marshy countries, has led to the conjecture, that its youngest brood may inhabit some of the smallest aquatic animals, and that it may find its way into human beings by their eating salads, fruit which grows near the ground, or the like.

A few Segments of Bothriocephalus latus.

BO'THWELL, a small village in Bothwell parish, in Lanarkshire, on the right bank of the Clyde, 8 miles east-south-east of Glasgow. The river is here crossed by the celebrated bridge, the place of the bloody encounter between the Covenanters and Monmouth in 1679, when the former were defeated. Near the village are the magnificent Norman ruins of Bothwell Castle, at the foot of which the Clyde washes the fine scenery of 'Bothwell Bank,' celebrated in Scottish song. Pop. (1881) 1520.

BOTHWELL, JAMES HEPBURN, fourth EARL OF, was born about 1526. On his father's death in 1556, he succeeded to the great inheritance which made the Earl of Bothwell the most powerful noble in the south of Scotland. At first, he opposed the

Reformation party, but on their accession to power he easily changed his politics; and, in 1561, formed one of the deputation of lords sent to convey the youthful Queen of Scotland to her kingdom. He was shortly after made a privy-councillor; but his violence and misconduct soon became intolerable, and he was ordered to quit Edinburgh. In March 1562, he and the Earl of Arran were committed to the castle for conspiring to seize the queen's person. B. made his escape, was recaptured at Holy Island, again got free, and sailed to France. He speedily returned, but finding Moray close on his trail, embarked for the continent. Not appearing at his trial he was outlawed. In 1565, after the queen's marriage with Darnley, he reappeared, and having strongly espoused her cause against Moray and his party, was suddenly restored to favor, and even high influence. In October 1566, while performing a judicial tour in Liddesdale, he was attacked and wounded, and the queen manifested her interest in his danger by riding twenty miles and back to see him, a journey which brought on a dangerous fever. At Craigmillar, some time after, B. attempted, unsuccessfully, to overrule her objections to a divorce from Darnley. A more thoroughgoing method was open to him, and on the night of 9th February 1567, Darnley was blown up at the Kirk of Field. The public voice loudly charged B. with the murder, but he was not formally indicted till the 28th of March. He came to the trial attended by 4000 followers, and received an easy acquittal. Two days after, he carried the sword of state before the queen at the opening of parliament, and at its close, all his lands and offices were confirmed to him, in consideration of his 'gret and manifold gude service done and performit not only to her hienes' honour, weil, and estimatioun, but alsua to the comone weil of the realme and leiges thairof.' At a supper on the following night, the leading nobles signed a bond approving of Bothwell's acquittal, and commending him as a fit husband to the queen, pledging themselves to stand by him.

On the 26th of April, B., accompanied by a strong force, carried off the queen to Dunbar Castle; on the 6th May he was divorced from his wife; and on the 15th his marriage with Mary was solemnized at Holyrood. He had previously been created Duke of Orkney. His guilty triumph was very short; the wrath of the nation was roused; at the end of one month, Mary was a prisoner in Edinburgh, and B., pursued, fled to Denmark. Imprisoned there, he died in 1576, leaving no heirs. His titles and estates were forfeited to the crown. See *Life* by Schiern, translated from the Danish by Berry (1880).

BOTONÉ, or BOTONNY. In Heraldry, a cross botoné is a cross of which the ends are in the form of buds or buttons.

BOTRY'CHIUM, a genus of Ferns, of the division *Ophioglosseæ*, having the *spore-cases* (or seed-vessels) distinct sub-globose, clustered at the margin, and on one side of a pinnated *rachis* (an altered frond), 2-valved, without any trace of an elastic ring, and opening transversely. The only British species is *B. Lunaria*, MOONWORT, a little plant, pretty frequent in dry mountain pastures, but not applied to any particular use. A species more worthy of notice is *B. Virginicum*, of which the geographical distribution is very remarkable. It abounds in many parts of the southern states of America, the mountains of Mexico, &c.; in Australia, in some parts of Asia, as the Himalaya Mountains; and is found also in Norway, although in no other part of Europe. It is large and succulent, and is boiled and eaten in the Himalaya, in New Zealand, &c. It is called RATTLESNAKE FERN in some parts of America, from its growing in places where rattlesnakes are found.

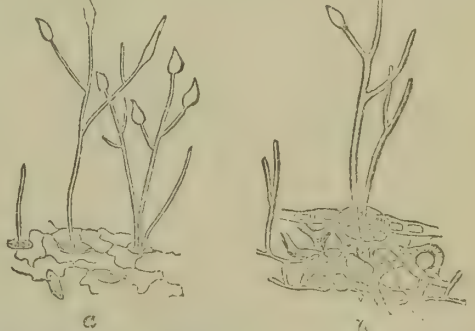
BOTRY'TIS, a genus of Fungi, of the division *Hyphomycetes*, containing many of the plants commonly called MOULD (q. v.) and MILDEW (q. v.). The plants consist of a *mycelium* (see FUNGI) of more or less entangled threads, which are composed of rows of cells with shoots of the same nature rising up from them, and bearing the fructification at their extremity. Some of them attack the fibres of vegetable fabrics, such as linen and cotton, in damp places, the decayed stems of plants, decaying fruit, &c. Some are found on living animal tissues, whether always previously diseased or not, is a question still unsettled, although the probability appears to be that they make their appearance only where there is already disease, which, however, they modify or entirely change. A remarkable species of this section of the genus is the MUSCARDINE (q. v.), or SILKWORM ROT.—A section of the genus, in many respects of particular interest, and which some botanists have endeavored to separate into a distinct genus, consists of species which grow among living vegetable tissues. The threads of the *mycelium* creep among the loose cells of the under side of the leaves, and end up their fertile shoots through the stomata (see LEAVES, and STOMATA).

Many of the species are extremely destructive to particular plants, as *B. parasitica* to turnips. But *B. infestans* is, of all the species, the subject of greatest interest, the potato disease being confidently ascribed to it by some observers, among whom is sometimes named Mr. Berkeley, and the opinion of no living botanist is entitled to greater respect upon a point connected with this branch of the science; but Mr. Berkeley himself states his opinion very guardedly. "The decay of the leaves and haulm in the potato murrain," he says, 'is certainly due to *Botrytis infestans;* and its appearance in the diseased tissues of the tubers, when exposed to the air, makes it at least probable that it has a close con-

Moonwort Fern (*Botrychium Lunaria.*).

Botrytis parasitica:—*a*, plant, with mycelium, magnified; *b*, extremity of branch, with fructification; *c*, fructification, more highly magnified.

nection with that destructive murrain, which, in many instances, does not appear alone, but accompanied by other diseases. The mould may be traced spreading round the edges of the brown spots on the leaves, and soon destroying the tissue on which it was developed.' (Art. *Botrytis* in Morton's *Cyclopædia of Agriculture.*) This destruction results not only from the fungus feeding upon the juices of the plant, but from its obstructing the elabora-



Botrytis infestans: *a*, Young plants proceeding from stomata. *b*, Section of potato-leaf, showing the mode in which the mycelium creeps among the loose tissue of the leaf.

tion of the sap and all the processes which in a healthy state take place at the surface of the leaf.—The whole subject of the propagation of fungi of this kind is involved in great obscurity. They are indeed seen to produce seeds (or spores) in great abundance, but the doubtful question is, how these reach the place where they are to grow, whether from the surface of the leaf, to which it is objected that the stomata are too small to admit them, or, as Mr. Berkeley thinks, from within the plant. See POTATO DISEASE.

BOTTA, CARLO GIUSEPPE GUGLIELMO, an Italian poet and historian, born 1766 at S. Giorgio del Canavese, in Piedmont. He studied medicine in Turin. In 1794, he became a physician to the French army, and in 1799, he, Carlo Aurelio de Bossi, and Carlo Giulio, were appointed the provisional government of Piedmont. They were known as *Il triumvirato de tre' Carli.* After the battle of Marengo, he became a member of the Piedmontese Consulta. In the *Corps Legislatif*, he gave offence to Napoleon, by designating his government as despotic. In 1830, he was allowed to return to his native town, and was pensioned by Charles Albert. He died in Paris 10th August 1837. Of his works of earlier date, the following may be mentioned, in which his admirable historic style is gradually developed: *Description de l' Ile de Corfu* (2 vols., Par. 1799); *Souvenirs d'un Voyage en Dalmatie* (Tur. 1802); *Précis Historique de la Maison de Savoie* (Par. 1803); *Histoire de l'Amérique* (Par. 1809). His epic poem in twelve books, *Il Camillo o Vejo Conquistata* (Par. 1816), was also favorably received. But his most

important works are his *Storia d' Italia dal* 1789 *al* 1814 (Par. 1824), which has gone through many editions, and for which he received the quinquennial prize of 1000 Tuscan dollars, founded by the Grand Duke Ferdinand II. in 1814, in the *Accademia della Crusca* at Florence; his *Histoire des Peuples d' Italie* (3 vols., Par. 1825), in which he denies to the Christian religion and to philosophy the credit of having civilized Europe, and ascribes it to the restoration of learning; and the *Storia d' Italia dal* 1490 *al* 1814 (20 vols., Par. 1832), which consists of Guicciardini's work (1490—1534), Botta's continuation of it (1535—1789), and the above-mentioned *Storia d' Italia*.

BOTTA, PAUL EMILE, a distinguished French archæologist and traveler, the son of the preceding, was born in 1805. While yet young, he undertook a voyage round the world, and remained long about the western coasts of America, where he zealously collected treasures of natural history. In the year 1830 he went to Egypt, where he entered into the service of Mehemet Ali as a physician, and in this capacity accompanied the Egyptian expedition to Sennaar. Here he formed a very considerable zoological collection, with which he returned to Cairo in 1833. The French government now appointed him consul in Alexandria, from which he undertook a journey to Arabia, the results of which he gave to the world in a work, entitled *Relation d'un Voyage dans l'Yémen, entrepris* 1837, *pour le Muséum d'Histoire Naturelle de Paris* (Par. 1844).

From Alexandria the government sent him as consular agent to Mosul, and at this place, at the instigation of the German orientalist Julius Mohl, he commenced a series of discoveries which form an epoch in archæological science. Early in the spring of 1843, B. began his diggings in the heaps of ruins near the Tigris, for monuments of Assyrian antiquity, and the *Journal Asiatique* soon contained accounts of the success with which his enterprise and perseverance were rewarded, and also disquisitions on the extremely difficult subject of the cuneiform writing of the Assyrians, which afterwards appeared as a separate publication under the title *Mémoires de l'Ecriture Cunéiforme Assyrienne* (Par. 1848). The French government took up the matter warmly; a practised draughtsman was sent out for the purpose of making sketches upon the spot of the sculptures on alabaster, so apt to fall to pieces; and a commission of learned men was appointed for the purpose of conducting the publication of a magnificent archæological work, which shortly afterwards appeared under the special superintendence of B. himself, with the title, *Monument de Ninive, découvert et decrit par Botta, mesuré et déssiné par Flandin* (Par. 1849—1850). In 1848, he published the *Inscriptions découvertes à Khorsabad*. In 1846, B. was appointed consul at Jerusalem, and in 1857 at Tripoli. He returned to France in 1868, and died at Achères, near Poissy, in 1870. Although in abundance of results B. was far exceeded by Layard (q. v.), yet he certainly deserves the praise of having laid the foundation of Assyrian archæology. See ASSYRIA.

BOTTARI, GIOVANNI, a learned Italian prelate, was born at Florence, January 15, 1689. He studied ancient literature and eloquence under Biscioni, and subsequently applied himself to mathematics, philosophy, and theology. He soon gained a great reputation for the delicacy and purity of his style. The Della Crusca Academy intrusted him with the care of a new impression of its famous dictionary. This extensive work occupied B. and his collaborateurs several years, and proved of extreme service to the Italian language. In 1730, he went to Rome, where he was made professor in the college of La Sapienza. He died in 1775.

BOTTGER, or BOTTCHER, or BOTTIGER, JOH. FRIEDR., improver of the porcelain manufacture, was born in 1682 in Reuss-Schleiz. He was apprenticed to an apothecary in Berlin, but became an enthusiast in the search for the philosopher's stone, for which he involved himself in many difficulties. He found patrons at the court of Saxony, and received large sums. Disappointment ensuing, as he did not succeed in making gold, he was called upon to reveal his secret in writing. The king, dissatisfied with this production, sought to avail himself of the skill which B. really possessed, with a view to the manufacture of porcelain. B. was compelled, accordingly, to enter upon these experiments, of which the celebrated Meissen Porcelain was the result. See POTTERY. To prevent the revelation of the art, he and his assistants were treated as prisoners; and when Saxony was invaded by Charles XII. of Sweden in 1706, they were removed from Dresden to Königstein. He died 13th March 1719.

BOTTICELLI, SANDRO, originally Alessandro Filipepi, an eminent painter of the Tuscan school of the 15th c., was born at Florence in 1447. He was at first apprenticed to Botticelli, a goldsmith, whose name he assumed; but as he showed evidence of his genius for painting, he was transferred to the school of Fra Lippo Lippi. In his youth and early manhood, B. felt the spell of classical mythology, and produced many works on classical subjects—the finest his Birth of Venus, now at the Uffizi, and his Venus with the Graces, now at the Florence Academy. Numerous devotional pictures from his hand exist also, most of them marked by much imaginative refinement. His coloring is rich and fanciful, the light often enriched by gold, and the minutest care is shown in all the details of the composition. His flowers, especially his roses, are painted with marvelous delicacy. In the countenances, whether of Madonnas and angels, or of Venuses and Graces, there is a fascinating expression of wistful melancholy. Perhaps B.'s greatest works are his three frescoes, representing the Life of Moses, the Destruction of Korah, Dathan, and Abiram, and the Temptation of Christ, in the Sistine Chapel at the Vatican. He was powerfully impressed by the teaching of Savonarola; and, according to Vasari, his later years were devoted to the study of mystical theology. He seems also to be in part the author of a series of engravings executed in a primitive style. B. died in 1515.

BOTTIGER, KARL AUGUST, one of the most erudite and thoughtful archæologists of Germany, was born 8th June 1760, at Reichenbach, in Saxony. He studied at Leipsic. In 1791, chiefly through the influence of Herder, he was appointed director of the Gymnasium, and consistorial councillor at Weimar. Here he enjoyed the stimulating society of Schiller, Herder, Wieland, Goethe, and others. His literary activity at this period was prodigious. He edited several journals, and wrote multitudes of reviews, biographical notices, &c., for the *Allgemeine Zeitung*. In 1804, B. was called to Dresden, where he began to deliver lectures on special branches of classical antiquites and art. The result of these was: *Discourses on Archæology* (Dresden, 1807); *On Museums and Collections of Antiques* (Leip. 1808); *Aldobrandinian Morriage Festival* (a mythico-allegorical interpretation of a picture discovered by a member of the Florentine family of Aldobrandini, representing a Roman marriage, Dresden, 1810); *Thoughts on the Archæology of Painting* (Dresden, 1811); and the *Mythology of Art* (Dresden, 1811). In 1814, appeared his *Lectures on the Dresden Gallery of Antiques* (Dresden); in 1821—1825, his *Amalthea*, or *Museum of Mythological Art*, &c. (Leip.); and in 1826, his *Thoughts on Mythological Art* (Dresden and Leipsic). In 1832, B. was elected a member of the French Institute. He died 17th November 1835. His works, both in Latin and German, have been collected and edited by Sillig.

BOTTLE (Fr. *bouteille*, which is the dim. of *botte* or *boute* [allied to Eng. *butt*], a vessel), a vessel, generally of a round shape, with a narrow neck, for holding liquids. Bottles are now usually made of glass or earthenware; but the first bottles were made of the skins of animals, mostly goats—of this kind were the bottles spoken of in Scripture. Skin bottles are still used in Southern Europe for the transport of wine, and by tribes of Africa and Asia for carrying water. The ancient Egyptians made bottles of most elegant form and exquisite workmanship of alabaster, stone, gold, ivory, and other substances. The Italian peasants carry, slung round their necks, bottles made of the rind of the gourd, which, when dry, is as hard as wood. Bottles made of glass will be treated of under GLASS.

BO'TTLE CHART, BOTTLE PAPERS. A bottle chart purports to show the track of sealed bottles thrown from ships into the sea. It is a well-known practice to throw sealed bottles containing some intelligence into the sea during long voyages, in the hope that these fragile messengers may be picked up, and their intelligence reach its proper destination. The frequency of these instances at length led to the inference, that by such means the determination of currents might be illustrated. Lieutenant Becher an English naval officer, has the merit of having constructed, in 1843, a chart of bottle-voyages in the Atlantic, his facts being drawn from the numerous cases that had occurred. The time which elapses between the launching of the bottle from the ship and the finding it on shore, or picking it up by some other ship has varied from a few days to sixteen years; while the straight-line distance between the two points has varied from a few miles to 5000 miles. Of the actual length of the curved line followed by the bottle, little or nothing is known; but some are believed to have exceeded 8000 miles. The Bottle Chart has been re-edited and re-engraved from time to time, and published in the *Nautical Magazine;* it is marked by several hundred straight lines, each drawn from the lat. and long. of immersion, to the lat. and long. of the finding.

BO'TTLE-GLASS. See GLASS.

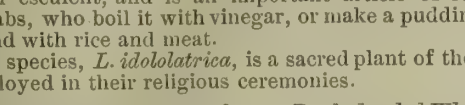
BO'TTLE-GOURD (*Lagenaria*, from Lat. *lagena*, a bottle), a genus of plants of the natural order *Cucurbitaceæ* (q. v.), nearly allied to the Gourd (q. v.) genus (*Cucurbita*), in which it was until recently included. One of the most marked distinctions between them is the very tumid border of the seeds of the Bottle-gourds, which have also all the anthers separate, and have white flowers, whilst those of the Gourds proper are yellow. The Common B., or False Calabash (*Lagenaria vulgaris*), is a native of India, but is now common almost everwhere in warm climates. It is a climbing musky-scented annual, clothed with soft down, having its flowers in clusters, and a large fruit, from 1 to 6 feet in length,

which is usually shaped like a bottle, an urn, or a club. The fruit has a hard rind, and when the pulp is removed, and the rind dried, it is used in many countries for holding water, and is generally called a *calabash* (q. v.). The B. in its wild state, is very bitter and poisonous, and even in cultivation, some of its varieties exhibit not a little of the bitterness and purgative properties of colocynth (q. v.). Other varieties, however, have a cooling edible pulp. This is most perfectly the case, in general, with those which attain the greatest luxuriance.

The B. appears to have been introduced into Europe about the close of the 16th c., but it requires for its advantageous cultivation a warmer climate than that of any part of Britain, where, although it succeeds well enough on a hotbed, it is chiefly known as an object of curiosity. It is, however, much cultivated in warmer countries as an esculent, and is an important article of food to the poorer Arabs, who boil it with vinegar, or make a pudding of it in its own rind with rice and meat.

Another species, *L. idololatrica*, is a sacred plant of the Hindus, much employed in their religious ceremonies.

BO'TTLEHEAD (synon. *Bottlenose*, *Bottle-headed Whale*, *Bottle-nosed Whale*, or *Beaked Whale*). a cetaceous animal occasionally but rarely met with on the British coasts, and on those of the continent of Europe. It was until recently placed in the genus *Delphinus* by naturalists, and is still ranked among the *Delphinidæ* or Dolphin (q. v.) family; but some of its characters appear to make it a connecting-link between them and the *Balænidæ*, or true whales. A new genus, *Hyperoödon* (the name of which is derived from the Greek, and refers to the peculiarities of the dentition), has been erected for it; but unfortunately several specific names have been adopted by different authors—as *H. Butzkopf*, *H. bidens*, and *H. Honfloriensis*—to the increase of difficulty and obscurity; whilst it appears that there is only one species to which they equally belong. The B. has the snout produced into a beak, as in the dolphins; the beak is short and strong; the forehead rises suddenly from the beak, and is remarkably elevated, a peculiarity which is owing to large bony crests rising over the bones of the upper jaw. The teeth are only two in number, and are situated in the fore-part of the lower jaw, pointed, but much enveloped by the soft parts, and sometimes completely hidden among them: the palate and upper jaw are furnished with little hard points or tubercles, not $\frac{1}{10}$th of an inch in height, which, however, have been doubtfully regarded as a kind of false teeth, and by Cuvier as rudimentary vestiges of whalebone. There is a dorsal fin, rather small in proportion to the size of the animal, and placed further back than in the common dolphin. The blowhole is crescent-shaped, the points of the crescent directed backwards. The skin is smooth and glossy, of a blackish lead color on the back, gradually becoming lighter on the sides, and whitish on the belly. The animal attains a length of about 25 feet.



Bottlehead

Skull of Bottlehead.

The B. has occasionally been caught in consequence of its having entered harbors or the mouths or rivers. One was caught above London Bridge, and figured and described by Hunter in the *Philosophical Transactions* for 1787. It is impossible that too great attention can be paid to specimens of the rarer cetacea caught or driven ashore on any part of the coast, and it is to be hoped that the obscurity and confusion still so much prevailing in this branch of natural history may soon be removed. Photography seems to afford new facilities for an exact comparison of specimens, of which advantage ought to be taken; and everything capable of being preserved should be so carefully, for the study of naturalists. There is a splendid skeleton of the B. in the Museum of the Royal College of Surgeons, London.

The name BOTTLE-NOSED WHALE has been also given to a species of dolphin (q. v.), *Delphinus Tursio*, which is occasionally met with on the British coasts.

BO'TTOM, in naval language, is either the whole ship itself, or that part of it which is under water when laden. Commodities are often said to be imported 'in foreign bottoms,' or in 'British bottoms:' in which cases, the phrase is applied to the whole ship. A 'full ship,' or a 'full B.,' denotes such a form given to the lower half of the hull as to allow the stowage of a large amount of merchandise. A 'sharp ship,' or a 'sharp B.,' implies a capacity for speed.

The word B. is also applied in an obvious way to the bed of the sea, which is characterized as rocky, stony, sandy, coral, muddy, oozy, &c., bottomed.

BO'TTOMRY, BOND OR CONTRACT OF, is a security by which a ship itself is expressly mortgaged and pledged by the owner or master, or *hypothecated* for repairs to the ship, or for money advanced for its outfit or otherwise with relation to it. It is called a security by *B.*, because the bottom or keel of the ship is figuratively used to express the whole of it. The loan or debt is repayable only in the event of the ship's safe arrival at the port or destination; and in consideration of this risk, the lender or creditor exacts a premium, the amount of which depends on the nature of the adventure. If the ship be totally lost, the lender loses his money; but if she returns safely, he recovers his principal, together with interest at the rate agreed upon. These contracts are not treated as ordinary mortgages, and preferred according to the order of date; but inversely, the latest is preferred to the preceding, because it is presumed that the last loan saved the ship, and in all cases necessity alone is the condition of the contract.

Such, generally, is the law of Great Britain; but the French law appears to be different. By that system, a ship, as movable property, cannot be hypothecated, but remains subject to the debts of the seller until it has made a voyage at sea, under the name and at the risk of the new purchaser, unless it has been sold under a decree; and it is a rule that the sale of a ship at sea shall never prejudice the creditors of the seller. See RESPONDENTIA, and MERCHANT SHIPPING ACT.

BO'TZEN, or BOZEN (Ital. BOLZANO), an important trading town of the Austrian Tyrol, about 32 m. N.N.E. of Trent. B. is a well-built town, with good streets and arcades; and streams of pure water are conducted through the principal thoroughfares, in little canals. It is protected from the inundations of a mountain-torrent in the vicinity by a strong wall about two miles in length. Its situation on the Brenner Railway and at the junction of the roads from Germany, Italy, and Switzerland, makes B. an important entrepôt. It has manufactures of silk, linen, hosiery, leather, &c.; and four extensive annual fairs. Wine and fruits in abundance are produced in the environs. Pop. (1880) 10,641.

BOUCHAIN, a fortified town of France, in the department of Nord, 12 miles south-east of Douai, intersected by the Scheldt, and possessing the means of laying the adjacent country under water, in the event of an attack. It was taken by the Duke of Marlborough in 1711, and recaptured by the French in the following year, to whom it was finally ceded by the treaty of Utrecht. Pop. (1872) 1039, who are chiefly engaged in extracting sugar from beet-root, and in refining salt.

BOUCHER, FRANCIS, a French painter of great note in his day, was born at Paris in 1704, and after studying there under Francis le Moine, he went to Rome to prosecute his art. After a short residence there, he returned to Paris, and on the death of Vanloo, was appointed principal painter to Louis XV. B. was an artist of much ability, and equally facile in the production of figure or landscape pictures—a facility, however, which was very fatal to the claims his genius might otherwise have had on posterity. In many of his paintings, picturesque effect is the only thing sought, no matter at what cost to truth. He has been called the Anacreon of painting, on account of the amorous character of many of his works: mythological and pastoral subjects were also great favorites with him. At his death in 1770, he was director of the French Academy.

BOUCHES-DU-RHONE, a department in the south-east of France, formerly a part of Provence, is situated at the mouths of the Rhone, in lat. 43° 10′—43° 56′ N., and long. 4° 13′—5° 40′ E. It has an area of 1970 square miles, and a population, in 1881, of 584,731. It is divided into three arrondissements—Marseille, Aix, and Arles—which are subdivided into 27 cantons and 108 communes. Through the northern and eastern districts, the Maritime Alps, which send out some calcareous ridges southward, slope gently down to the basin of the Rhone. Towards the sea-shore, there are several plains of considerable extent. About one-half of the department is under cultivation: heaths, wood, wastes, and water occupy the other half. The Rhone—which between Arles and the sea separates into several branches, forming a delta, called *Ile de la Camargue*—and its affluent, the Durance, are the principal rivers. The department is intersected by several canals of importance, and the aqueduct to convey the water from the Durance to Marseille, is one of the most extensive works of the kind in existence, being no less than 51 miles long, including 15 miles of tunnelling. The *Ile de la Camargue* produces corn and rice, and affords pasture for large numbers of sheep and cattle. The vine, olive, and mulberry also thrive here, and timber is plentiful. The soil in some parts, however, is strongly impregnated with salt. The great plain of Crau, which extends along the eastern branch of the Rhone, is stony and arid, except in a few spots, where the vine and olive are successfully cultivated. Besides the Etang de Berre (q. v.), there are numerous salt-lakes, communicating with

the sea by natural or artificial channels. Marble, limestone, and gypsum are found in the Bouches-du-Rhone. Leather, hats, perfumes, soap, olive-oil, vinegar, and chemical products are manufactured; there are extensive brandy-distilleries, sugar-refineries, and salt-works, and the produce of wine is large. B. has an active commerce with the Levant, Africa, Spain, and the W. Indies.

BOUCICAULT, Dion, dramatic author and actor, was born at Dublin on the 26th of December 1822. He was brought up under the guardianship of Dr. Dionysius Lardner, the well-known popular writer on science, and was educated at University College, London. He produced his first dramatic work very early—before he was 19 years old. It was signally successful, and its success determined his career. This was *London Assurance*. It was first performed at Covent Garden Theater in March 1841; and it has ever since remained a favorite with playgoers, both throughout Great Britain and in America. Much of the success it had in London must be ascribed to the admirable acting of Mr. Charles Matthews; but it had merits of its own sufficient to secure to it the favorable verdict of the public. The plot was slight, but ingenious; it abounded in comic situations; the dialogue was brisk and sprightly; there was no lack of wit, and there was perhaps somewhat too much of those flippancies and pleasant impertinences which average theater-goers prefer to wit. Once embarked in the career of a play-writer, B. produced piece after piece in rapid succession, and greatly increased the reputation which his first attempt had brought him. *Old Heads and Young Hearts*, *Love in a Maze*, *Used Up*, *Louis XI.*, and *The Corsican Brothers* were among the most popular of his early works.

Several of these are still stock pieces at our theaters; and to playgoers, the mere enumeration of their names will show that B. distinguished himself equally in comedy, farce, and melodrama. When he went upon the stage, as he soon did, he added a high reputation as an actor to the reputation he had previously gained as an author. From 1853 till 1860, he was in America, where his popularity was scarcely less than it had been in England. On his return to England in 1860, he produced at the Adelphi Theater, a play, *The Colleen Bawn*, which proved among the most successful of modern times, and which, if not the first of a new school, has at least supplied a new descriptive name to our dramatic literature. *The Colleen Bawn* was, happily enough, described as a 'sensation drama;' its interest depended largely upon scenery, mainly upon startling incidents and astounding stage-effects. It was not a high kind of work, or fit to stand the tests of a good dramatic piece, as nobody knew better than the author; but it suited the public taste, and the author made a fortune by it. It has been performed at almost every theater in the United Kingdom; it had a great run in America too; it was even translated into French, and brought out at Ambigu Theater at Paris. Mr. B. subsequently produced at the Adelphi—of which he was for some time joint-manager with Mr. B. Webster—another 'sensation' drama, *The Octoroon*, the popularity of which was only inferior to that of *The Colleen Bawn*. Having quarreled with Mr. Webster, he, in 1862, opened a new theater in London, the Westminster, erected on the site of what had been for generations known as Astley's Amphitheater; but this speculation turned out unfortunate, and B. was ruined by it. He afterwards re-established his fortunes by new plays, brought out at the Princess's, the Holborn, and other theaters, in some of which he and his wife—formerly Miss Robertson, a very popular actress—took the leading parts. *The Streets of London*, *Flying Scud*, *After Dark*, and the *Shaughraun* have been the most popular of his recent works, all of which are of the 'sensation' school, with which, it may be said, he first familiarized the public. He has written upwards of 150 dramatic pieces; and in illustration of the facility with which he has composed works which—all deductions made—are of considerable merit, it may be said that he lately stated to a royal commission that he would undertake to write plays for all the theaters in London. He is undoubtedly capable of writing better works than any he has yet written; but he found the public taste bad, and instead of making thankless attempts at improving it, he has been content to gratify it; and in fact has helped to debauch it. As an actor, B. has always been popular, without attaining to high excellence in his vocation. He wants some natural gifts, without which a man cannot be a great actor; he has an immobile countenance, an indifferent voice, and a too artificial manner. Any success he has had has been gained by the soundness of his judgment and his great cleverness. In 1876 he went to live in New York.

BOUDOIR (Fr. *bouder*, to pout—hence a retired corner), a lady's small private appartment, in which she receives only her most intimate friends. Boudoirs became particularly fashionable in France during the reign of Louis XIV., and so continued during the following reign. The example having been set by Madame Pompadour, Madame Dubarri, and other royal mistresses, it became indispensable for every lady of fashion to have her B., which was adorned with the most fantastic luxuriousness.

BOU'FARIK, a village of Algeria, in the province of Algiers, and 16 miles south of Algiers. It is an important military station on the road from Algiers to Blidah and Oran. It has well-frequented markets, and a considerable trade in corn, cotton, olives, oranges, tobacco, raisins, and cattle. Pop. 7650.

BOUVA'RDIA, a genus of plants of the natural order *Cinchonaceæ* (q. v.), and of the same tribe with the *Cinchona* (q. v.), or Peruvian Bark. The calyx is 4-partite, with teeth between the segments; the corolla tubular and 4-fid; the stamens 4, included within the corolla; the capsule 2-celled. The species are natives of Mexico. One of them, *B. triphylla*, with oblong ternate leaves and trigonous branches, has obtained a place among the favorite ornaments of flower-borders in Britain, but requires careful protection from frost. To preserve it, the roots are generally taken up, and are sometimes placed in a greenhouse or frame for the winter, sometimes in a dry cellar. Its beautiful corymbs of scarlet flowers are produced from June till November.

BOUFLERS, Louis Français, Duke of, peer and marshal of France, one of the most distinguished generals of his time, was born in 1644, and was descended from one of the most ancient and noble families of Picardy. He began his military career as a lieutenant, and rose very rapidly from one rank to another. Under the great Condé, Turenne, Crequi, Luxembourg, and Catinet, he fought with distinction in Germany and the Netherlands. His defences of Namur in 1695 and of Lille in 1708, are famous. The siege of the former place, conducted by King William III. of England, cost the allies more than 20,000 men; and although Louis XIV. sent to B. an order written by his own hand for the surrender of the place, yet he did not surrender it until all the means of defence were exhausted. After the defeat of Malplaquet, he led the French army so admirably, that the retreat seemed rather a triumph than the consequence of a lost battle. He was a man of highly honorable and upright character. He died at Fontainebleau in 1711.—His son, Joseph Marie, Duke of Bouflers, and also a marshal of France, born in 1706, died at Genoa in 1747.

BOUFLERS, Stanislas, Marquis de, commonly styled the Chevalier de Bouflers, was born at Luneville in 1737. He was the son of the Marquis Bouflers-Remiencourt, who was captain of the guard to Stanislas, king of Poland, and his mother was long one of the brightest ornaments of the Polish court. He himself was esteemed one of the most clever and agreeable men of his time. He entered the French military service, and was very soon made governor of Senegal, in which capacity he had the merit of introducing many regulations very useful to the colony. After his return, he devoted himself to the light literature for which the time of Louis XV. was distinguished. He was chosen a member of the National Assembly in 1789, in which he displayd great moderation, and made some most judicious proposals; but after the 10th of August 1792, he forsook France. He was hospitably received at the court of Prussia, and received the gift of a large estate in Poland, in order to establish upon it a colony of French exiles. Having returned to France, he again devoted himself, after the year 1800, entirely to literature. In 1804, he entered as an old academician into the Institute reorganized by Napoleon. He died 18th January 1815. The monument on his grave bears the following inscription, dictated by himself: *Mes amis, croyez que je dors* (My friends, believe that I sleep). A collection of his works was published after his death (8 vols. Par. 1815). His letters from Switzerland deserve to be particularly mentioned; and from this work an idea may be formed of the amiable character and intellectual liveliness of its author.

BOUGAINVI'LLE, a bay, island, and strait, so called from th. French navigator of the name (q. v.), a contemporary of Cook.—1. *Bay*, in Patagonia, on the north side of the Strait of Magellan, being in lat. 53° 25′ S., and long. 70° 13′ W.—2. *Island*, one of the Solomons, in the west section of Polynesia, sometimes distinguished from the east section as Melanesia. It is between lat. 5° 30′ and 7° 2′ S., and in long. 155° E., being mountainous, well wooded, and populous.—3. *Strait*, in the New Hebrides, between Mallicollo and Espiritu Santo.—Bougainvillea is the name given to a plant of the order *Nyctaginaceæ*, largely cultivated in green-houses for the beauty of its purple bracts: the name is also used of a genus of hydroid zoophytes.

BOUGAINVILLE, Louis Antoine de, one of the most famous navigators of France, was the son of a notary, and was born at Paris, 11th November 1729, studied there, and attained great proficiency both in languages and science. In 1754, he went as secretary of the French embassy to London. In 1756, he acted as aide-de-camp to the Marquis of Montcalm, to whom the defence of Canada was intrusted. At the head of a select detachment, he burned an English flotilla; and through his advice and example, a corps of 5000 French, in June 1758, successfully withstood an English army of 24,000 men. In the campaign of 1761 in Germany, he served with distinction. After the peace, he entered the

naval service, in which he soon signalized himself. After having been obliged to give up a project which he had formed of founding a settlement on the Falkland Islands, he undertook a voyage round the world (15th Dec. 1766, to 16th March 1769) with a frigate and a St. Malo transport, the first voyage round the world which the French ever accomplished. He gave an account of it in his *Description d'un Voyage autour du Monde* (2 vols., Par. 1771—1772). Geography and other branches of science were enriched by it with many discoveries. In the North America war, B. commanded several ships of the line, and in 1779, was made *chef d'escadre;* in the following year, he was made a field-marshal in the army. After the outbreak of the Revolution, he retired from public service, devoted himself entirely to scientific pursuits, and died 31st August 1811.

BOUGHT AND SOLD NOTES are notes of sale signed by a broker employed to sell goods, and by which the bargain through him is completed. The following is the form of the bought and sold note:

'Sold for A. B., to C. D., 250 firkins butter, at 100*s*. Shipped in the month of July, and payable by bill at two months.'

These notes are, in fact, transcripts from books, in which it is the practice of brokers to enter or register their transactions. The bought notes and the sold notes are respectively delivered to the principal parties; and as they contain the essential parts of the bargain, they will suffice, in the absence of a corresponding entry in the broker's books; but if they describe the particulars differently or incorrectly, as one species of goods for another, or erroneously state the terms, no contract arises, and a variation of this nature cannot be corrected by a reference to the broker's book.

In Scotland, there is no necessity for any such signed note, but the contract may be proved by any kind of evidence, verbal (see PAROLE EVIDENCE) as well as written, the only exceptions to this general rule being those contained in acts of parliament relative to ships, literary property, patents, and goods bonded in the Queen's warehouses. See BROKER, SALE OF GOODS.

BOU'GIES are rods of metal or other substances, used for distending contracted mucous canals, as the gullet, bowels, or urethra. See STRICTURE. For the urethra, they are frequently of German silver, or pewter, and vary from ·125 to ·25 inch in diameter. Still larger sizes are used by many surgeons. The following directions for making common non-metallic B. are taken from South's translation of Chelin's *Surgery:* 'A piece of fine linen, which has been already used, nine inches long, and half an inch in width, according to the thickness of the bougie to be made, is to be dipped into melting plaster, and, when a little cooled, spread flat and even with a spatula; it is then to be rolled together between the fingers, and afterwards between two plates of marble, till it is quite firm and smooth. The bougie must be equally thick throughout its whole length to about one inch from its point. Bougies are also made by dipping cotton threads into melted wax till they have acquired sufficient size, after which they are rolled between marble plates. Bougies are also made of a material termed "gum elastic;" and for very narrow strictures, catgut is often used.'

BOUGUER, PIERRE, one of the most eminent French mathematicians and natural philosophers of his time, was born at Croisic, in Bretagne, 16th February 1698, and studied in the Jesuit College at Vannes. In 1713, he succeeded his father as Professor of Hydrography in Croisic, from which he was removed to a similar office at Havre in 1730. In 1729 he published his *Essai d'Optique sur la Gradation de la Lumière*. His researches on other subjects of natural philosophy and astronomy continued to add to his fame; and in 1731, he was made Associate Geometer of the Academy of Sciences, and promoted to the office of pensioned astronomer in 1735. In that year, also, he was chosen to proceed, along with Godin and De la Condamine, to South America, in order to the measurement of a degree of the meridian at the equator. B. and his companions had to contend with many difficulties, and were more than seven years away from home, during which time B. made valuable observations on the length of the seconds' pendulum at great elevations, the deviation of the plumb-line from a vertical position through the attraction of a neighboring mountain, the limit of perpetual snow, the obliquity of the ecliptic, &c. He published an account of his labors and those of his colleagues in a magnificent work, entitled *La Figure de la Terre determinée par MM. Bouguer et de la Condamine* (Par. 1749), which, however, involved him in an unpleasant controversy with De la Condamine concerning their respective shares of merit in the researches in which they had been jointly engaged. B.'s investigations concerning the intensity of light laid the foundation of Photometry; and their results, which had been partly exhibited in the optical work already noticed, were more fully embodied in his *Traité d'Optique sur la Gradation de la Lumière*, which was edited after his death by Lacaille (Par. 1760). He invented the heliometer in 1748, which has of late been brought to greater perfection by Fraunhofer. He also published an excellent work on navigation (Par. 1753). He died in 1758.

BOUILLÉ, FRANÇOIS CLAUDE AMOUR, MARQUIS DE, a distinguished French general, was born in 1739 at the castle of Cluzel, in Auvergne, entered the army at the age of 14, and served with distinction in Germany during the Seven Years' War. In 1768 he was appointed governor of the island of Guadaloupe, and on the seeming approach of war with Britain, he was made governor-general of Martinique and St. Lucia, and commander-in-chief of all the French forces in the West Indies.

When the war really broke out in 1778, he took the island of Dominica from the British, the whole garrison falling into his hands. In conjunction with Admiral De Grasse, he took Tobago in 1781; and after De Grasse's departure, the British islands of St. Eustatius, Saba, and St. Martin. The humanity and generosity which he displayed were equal to his valor and skill. In 1782, B. captured the islands of St. Christopher's and Nevis. For this he was rewarded with the rank of lieutenant-general. In 1784, he visited England, and was received with extraordinary respect. Louis XVI. nominated him a member of the Assembly of Notables in 1787—1788; in 1790, he was made commander-in-chief of the army of the Meuse, the Saar, and the Moselle. His decision of character prevented the dissolution of the army and the outbreak of civil war; he also quelled the insurrection of the garrison of Metz and of the three regiments at Nancy. For this he received the thanks of the National Assembly and of the king. For his share in the attempted escape of Louis XVI. he had to flee from France. He repaired to Coblenz to the king's brothers, and in 1791 attended the conference at Pilnitz. In the same year he entered into the service of Gustavus III. of Sweden, and after the assassination of that monarch, he served in the corps of the Prince of Condé. He rejected a proposal which the French princes made to him in 1793, that he should take the chief command in La Vendée; and went to England, where his advice in West Indian affairs were useful to the government, and where he wrote his *Mémoires sur la Révolution Française*—a truthful and useful work, throwing much light on the transactions of that time. He died in London in 1800.

BOUILLON, a duchy, originally German, in the Belgian part of the grand duchy of Luxemburg, consisting of a woody and hilly district in the Ardennes, about 157 square miles in extent, and with a population of 21,000. This duchy was the possession of the famous crusader, Godfrey (q. v.) of Bouillon, who, in order to raise money for his crusade, pledged it, in 1095, to the Bishop of Liege. It was conquered by France in the war of 1672, and bestowed by Louis XIV., in 1678, upon his grand chamberlain, Latour d'Auvergne. By the peace of 1814, the greater part of it was included in the grand duchy of Luxemburg; and the sovereignty of it passed to the king of the Netherlands, who, in 1821, purchased the proprietary rights from the heir. By the revolution of 1830 B., along with Luxemburg, was separated from the Netherlands, and in 1837 united to Belgium.—The principal town is Bouillon, situated between steep hills on the Semoy, with a strong castle on a rock, formerly the residence of the Dukes of Bouillon. Pop. 4000.

BOUILLON, GODFREY. See GODFREY OF BOUILLON.

BOUILLY, JEAN NICOLAS, one of the most prolific of French dramatic authors, was born at Boudray, near Tours, in 1763, and at first studied law, but afterwards devoted himself to belles-lettres. At the commencement of the Revolution, he attached himself to Mirabeau and Barnave, and in 1790 produced a drama called *Pierre le Grand* (Peter the Great), in which he displayed very revolutionary sentiments. He afterwards filled important public offices in Tours during times of the most dangerous excitement, and conducted himself with great prudence and moderation. He took an active part in the introduction of the system of elementary schools in France. The greater number of his dramatic works were produced in the first decade of the 19th century. Many of them have been translated into other languages. He wrote also tales and other works for young persons, some of which acquired great popularity. He died at Paris, 24th April 1842.

BOULAC, or BOOLAK, the name of the port of Cairo, is situated on the Nile, about one mile distant from that city, and is supposed to be the site of the ancient Litopolis. It is a crowded town, extremely dirty, with very narrow and irregular unpaved streets. It contains the custom-house and warehouses of Cairo, cotton, paper, and sugar factories, a printing press, and the famous museum of antiquities. Pop. 10,000.

BOULAINVILLIERS, HENRY, COUNT, an eminent French author, descended from an ancient family in Picardy, was born 11th October 1658 at St. Saire, in Normandy. After studying at the College of Juilly, he embraced the military profession, but afterwards resigned it, and devoted himself to the investigation of the genealogy of the ancient families of France. He regarded the feudal system as the most perfect creation of human genius and

wisdom, and his writings are pervaded by the most extreme aristocratic sentiments. They were only circulated in manuscript during his life, and first published after his death, which took place on 23d January 1722. The most valuable of them are his *Histoire de l'Ancien Gouvernement de France* (3 vols. Hague, 1727), his *Histoire de la Pairie de France et du Parlement de Paris* (2 vols. Lond. 1753), and his *Abrégé Chronologique de l'Histoire de France* (3 vols. Hague, 1733). His philosophical writings have long ceased to have any interest, and the prejudices which appear in his historic works may afford amusement to his readers; but he deserves to be remembered as one of the first laborious investigators of the facts of history.

BOULAY DE LA MEURTHE, ANTOINE JACQUES CLAUDE JOSEPH, COUNT, a statesman of the French Empire, was born in 1761 at Chaumousey, a village in the Vosges. He espoused the cause of the Revolution, but held moderate principles. In 1797, he was elected to the Council of Five Hundred, in which he became the declared opponent both of Jacobinism and of the despotism of the Directory. He supported the *coup d'état* of the 18th Brumaire. Under the Empire, he accepted the post of president of the legislative section of the Council of State, in which capacity he had an important part in the preparation of the *Code Civil*. He afterwards labored with extraordinary zeal and energy in the administration of the national domains, which he regarded as affording the basis for a regeneration of France. He adhered to the cause of Napoleon with remarkable fidelity. After the second Restoration, he was conveyed by the Russians into Germany. He received permission to return to France in 1819, and lived in complete retirement till his death, which took place at Paris, 2d February, 1840. Napoleon had elevated him to the rank of a count of the Empire. In 1799, he published an *Essay on the Causes which led to the Establishment of the Commonwealth in England in* 1649, a work which had an extraordinary circulation, and did much to prepare men's minds for the revolution of the 18th Brumaire. He prosecuted the same general subject in his Political Picture of the Reigns of Charles II. and James II. (*Tableau Politique*, &c., 2 vols., Brussels, 1818). He wrote also Bourrienne and his Errors, Voluntary and Involuntary (*Bourrienne et ses Erreurs*, &c., 2 vols. Par. 1830), a work not without value in reference to the history of Napoleon.

His son, HENRY BOULAY DE LA MEURTHE, was born at Paris in 1797. He took an active part in the revolution of 1830, but became an opponent also of the government of Louis Philippe. He devoted great attention to questions of social economy, contributing much to promote the establishment of houses of refuge (*salles d'asile*), the extension of elementary education, and many improvements in the condition of the laboring classes. In the National Assembly of 1848, he associated himself with the modern republicans, and in January 1849 was elected vice-president of the republic. Nevertheless, he tacitly acquiesced in the *coup d'état* of December 1851, and became a member of the imperial senate. He died at Paris, 24th November 1858.

BOU'LDER-CLAY, DILU'VIUM, DRIFT, or TILL, is a post-pliocene bed of a remarkable character, and as yet somewhat mysterious history. It usually occurs as the lowest or first of that group of beds which geologists recognize as the post-tertiary, post-pliocene, or pleistocene, superficial formation. The only exception is when a bed of sand intervenes—as is rarely the case—over the surface of the subjacent rocks. It consists of a compact clay, blue or red, according to the prevalent character of the subjacent rocks, having boulders diffused throughout its mass, and with here and there thin lenticular beds of gravel and sand interspersed. In some places in Scotland it is not less than 70 feet thick. In America, it extends to about the 38th parallel; in Britain, it terminates a little to the north of London. The boulders, which are the most striking feature of this bed, differ in size from a small pebble to masses many tons in weight. They are portions of rocks of all ages, more or less worn. The older rocks, when from a distance are rounded, while those that have been broken from rocks in the district are more angular. These masses are scattered without order in the clay, the heaviest blocks occurring frequently in the upper portion of the bed. Nor is there any indication of their having sunk in the clay from gravity—the clay seems to have been so viscid when the materials assumed their present position, as to have successfully resisted the immense pressure of those enormous blocks. The boulders have not that rounded appearance produced by the action of water in a river-course or on the shore between high and low water marks. They have a greater or less number of *rubbed faces*, produced evidently by being forced, while held in one position, over the solid rocks beneath. The rubbed and scratched surfaces exhibited on these rocks, when the superincumbent clay is removed, plainly testify to their origin. Several interesting examples of such rubbed surfaces exist in the neighborhood of Edinburgh. They have been carefully examined and described by Fleming, Chambers, Milne-Home, and other local geologists. A careful observer can determine from the scratchings the direction of the current which bore with it the rubbing boulders. In the district to which we have alluded, these indicate a current from the west. The general direction, however, in America, in Britain, and in Scandinavia, seems to have been from the poles towards the warmer regions of the earth.

The B. contains no fossils strictly its own. Organisms exist in the boulders obtained from the older fossiliferous rocks, but no indications have hitherto been observed of a fauna or flora belonging to the period of the deposition of this bed. In the brick clays and gravels overlying it in Scotland, there are shells of arctic character.

The origin and structure of this remarkable bed have been a puzzle to geologists. That it was produced by the Noachian deluge, as was universally believed not many years ago, finds now no supporters. The present approved explanation assigns it as the product of a glacial ocean, in which the materials were borne violently along, pressing hard upon the sea-bottom, so as to wear and scratch it. But, while there is little room to doubt that such was the general fact, it remains to be shown how a merely ice-charged ocean could carry along such vast masses of clay and blocks, allowing them all the time to press so hard upon the sea-bottom as to mould its whole figure—for such appears to have been its work.

BOU'LDERS, ERRATIC, are large masses of rock found at a distance from the formations to which they belong. The term is generally applied when they are found lying detached on the surface; in which case they may either have been washed out

Erratic Bouider.

of the boulder-clay (q. v.), or have been carried separately by icebergs, and dropped in their present situations. Large blocks of Scandinavian rocks are scattered over the plains of Denmark, Prussia, and Northern Germany. From their magnitude and number, they frequently form a striking feature in the landscape. They abound on the shores of the Frith of Forth—a large one, locally known as the 'Penny Bap,' is the most prominent object on the beach a little to the east of Leith. The pedestal of the statue of Peter the Great, in St. Petersburg, was hewn out of a large erratic boulder, 1500 tons in weight, that lay on a marshy plain near that city. We give a drawing of a large one that forms a rocking-stone at Fall River, Massachusetts.

BOULEVARD, or BOULEVART (Ital. *Boluardo*), identical with Eng. *bulwark* (q. v.), the name given in France to the old fortifications, ramparts, &c., with which towns, or portions of them, were or still are surrounded. In France and Germany, these ancient works have generally been levelled, the ditches filled up, and the space thus obtained employed for the formation of parks, promenades, and streets lined with trees. These, however, in France, still bear the name of Boulevard. The boulevards of Paris are celebrated, and are of great service as open spaces promoting the circulation of air amidst the dense mass of habitations. Some parts of them present a very dazzling spectacle; and as a whole, they afford a striking exhibition of the life and character of the French capital in all the different classes of society. The *Boulevard des Italiens* is particularly known as the rendezvous of the fashionable, and the *Boulevard du Temple* as the place where the small theaters are to be found which are frequented by the common people and the inhabitants of the suburbs, for which reason the expression *Théâter de Boulevard* is often employed to denote a theater for the common people, or one of an inferior kind. The Thames Embankment is esentially a B.

BOULOGNE, a town of France, in the department of the Seine, on the right bank of the river of that name, about 5 miles west of Paris, from which it is separated by the Bois de Boulogne. A fine stone bridge of twelve arches crosses the Seine from B. to St. Cloud. Pop, in 1876, 21,556. The Bois de Boulogne is traversed by many walks, through the broadest of which the fashionable

world of Paris travels in Easter-week to the Abbey of Longchamp. At the entrance of the wood lies Auteuil (q. v.). During the Revolution, the trees of the older walks were mostly cut down. But when Napoleon chose St. Cloud, in the immediate neighborhood, for his summer residence, new walks were planted and laid off, and the enclosing walls were restored. This wood which from ancient times to the present day has been a place of enjoyment and recreation to the Parisians, was again much injured during the siege of 1870—1871.

BOULOGNE-SUR-MER, a fortified seaport in the department of Pas-de-Calais, France, situated at the mouth of the Lianne, in the English Channel, about 19 miles south-west of Calais, and 139 north-north-west of Paris. Lat. 50° 45′ N., long. 1° 36′ E. The town consists of two parts—Upper and Lower Boulogne. The upper town was, in former times, strongly fortified ; but its citadel was demolished in 1690, and its ramparts have been converted into beautiful promenades, with fine views, and from which, in clear weather, the spire of Dover can be seen. The upper town contains the Hôtel-de-Ville, and the Cathedral, a modern edifice with a conspicuous dome. The lower town, which is more properly the seaport, is newer, finer, more populous, and more lively, inhabited chiefly by merchants, mariners, and fishermen. It contains the barracks, the great hospital, the theater, the museum, and gallery of art. The streets have been much improved by side-pavement, and many new and elegant buildings have been erected. A large wet-dock was completed in 1872. B. has numerous churches and educational institutions ; is the seat of various associations ; has extensive and excellent salt-water baths ; and on account of its fine sands, is much resorted to for sea-bathing. Pop. (1881) 44,085, actively engaged in the boiling of sugar, in the manufacture of linen and sail-cloth, cordage, &c., and in fishing, the coast being productive in oysters, herring, cod, and mackerel.

B. has an active coasting trade, and ranks with Calais as one of the nearest and most frequented places of passage between France and England, steamers plying daily to London, which theyr each in from 9 to 10 hours, and twice a day to Folkstone, which they reach in about 2 hours. B. is much resorted to by the English, who form a large section of the population, and for whose accommodation there are numerous hotels and boarding-houses. Paris is reached by railway from B in 4½ hours. The harbor of B. is too shallow for large ships of war, which can only reach the wide and safe roads of St. Jean; it was, however, repeatedly enlarged and improved, so as to admit large merchant vessels at high water. A new and extensive deep-sea harbor was begun in 1879. The long pier forms a fine promenade. B. was anciently called *Gesoriacum*, in the country of the Morini; after the time of Constantine the Great, it was called *Bononia*, and after that of the Carlovingians, *Bolonia*. In 1435, B. came into the possession of the Duke of Burgundy, and was united with the crown of France by Louis XI. in 1477. B. was besieged by Henry VII. of England in 1492, taken by Henry VIII. in 1544, and restored to the French by Edward VI. in 1550. From this point Napoleon contemplated the invasion of England; and here he encamped 180,000 men and collected 2400 transports, ready at any favorable moment to swoop down on the shores of Britain; but after months' watching, the war with Austria created other employment for them. As a memorial of this great camp, a tall marble column was commenced on the higher grounds; but being incomplete at the restoration of the Bourbons, it was finished and inaugurated in honor of Louis XVIII. It has since been restored to its original object, and surmounted by a colossal statue of Napoleon. The poets Campbell and Churchill died at B.; and the house, or rather, the house occupying the site of that in which Le Sage, the author of *Gil Blas*, is said to have died, is shown to the visitor. Altogether, B. is to be described as a thriving and agreeable place of residence; and from its accessibility to English tourists, and rapid railway transit to Paris, it has greatly superseded Calais as a place of debarkation.

BOULTON, MATTHEW, a celebrated English mechanician, was born in 1728 at Birmingham, where his father, who had a steel manufactory, had acquired a considerable fortune. When still very young, he undertook, at his father's death, the business of the manufactory, which he carried on with great energy, and extended, in 1762, by the purchase of a piece of land, then a barren heath, at Soho, near his native town. One of his first inventions was a new mode of inlaying steel. He entered into partnership with James Watt (q. v.), who had obtained a patent for great improvements in the steam-engine which have immortalized his name, and they established a manufactory of steam-engines in 1769. They jointly contributed also to the improving of coining machinery, and so to the perfection of the coinage itself. B. died at Soho, 17th August 1809. His long life was devoted to the promotion of the useful arts and of the commercial interests of his native country. He was a man of extremely pleasing conversation, and of a most generous disposition.

BOUND, or BOUNDARY, the utmost limits of land by which the same is known and can be described; being in this sense synonymous with *abuttals*, which means the buttings and boundings of lands, east, west, north, and south, with respect to the places by which they are limited and bounded. The *sides* of the land are properly said to be *adjoining*, and the ends *abutting*, to the thing contiguous. For other applications of this term, see the articles that follow.

BOUNDARIES OF BOROUGHS, CITIES AND TOWNS in England are settled by the 5 and 6 Will. IV. c. 76, ss. 7 and 8, which refers to and adopts, for the purpose of such boundary, the regulations of the 2 and 3 Will. IV. c. 64—amended, however, by the 5 and 6 Will. IV. c. 103. These boundaries are generally the same as the parliamentary limits. The corresponding Scotch law on this subject is contained in the 3 and 4 Will. IV. c. 76, which adopts the limits prescribed in the 2 and 3 Will. IV. c. 65.

By the 7 Geo. IV. c. 64, is enacted that where, in England, any felony or misdemeanor shall be committed on the boundary or boundaries of two or more counties, or within the distance of 500 yards of any such boundary or boundaries, or shall be begun in one county, and completed in another—every such felony and misdemeanor shall be dealt with and tried in any of the counties.

BOUNDARIES OF PARISHES are determined by ancient and immemorial usage, as to which, see PARISH, and see BEATING THE BOUNDS. It may also be observed that by numerous acts of parliament lately passed, for extending church accommodation, and making more effectual provisions for the cure of souls, it is generally provided that any part or parts of any parish may be constituted a separate district for spiritual purposes, or parish *quoad sacra*, as it is called in Scotland; and that any parish may also be divided into two or more distinct and separate parishes for all ecclesiastical purposes, though for other purposes the old limits remain. The Church Building and Inclosure Acts contain many provisions as to boundaries.

BOUNDARY SURVEY OF IRELAND. This important subject is povided for and regulated by these acts of parliament—the 6 Geo. IV. c. 99, 17 Vict. c. 17, 20 and 21 Vict. c. 45, and the 22 and 23 Vict. c. 8, which are all to be read as one act. The boundary surveyor may alter the names of lands erroneously named in the ordinance map of any county, on the application of the owners of such land, who are to state the ground on which such application is made. And the same surveyor may define the boundaries of parishes divided under certain acts of parliament. The publication in the *Dublin Gazette* of the surveyor's report, referred to in the order of the lord-lieutenant in council, is to be discontinued, on the ground of its being unnecessary and expensive; and in lieu thereof, any person desirous of seeing the report and ordnance plans, may see them at the council office, in Dublin, at all reasonable hours, without fee or reward. See ORDNANCE SURVEY and SURVEY; and see IRELAND.

BOUND-BAILIFF, in England, is an officer of the sheriff whose duty is to discover and arrest debtors. As the sheriff is responsible for the misconduct of these bailiffs, they are annually bound in an obligation, with sureties for the due execution of their office, and are, in consequence, called *bound*-bailiffs, a name which Blackstone is at pains to inform us ' the common people have corrupted into a much more homely appellation '—*bum-bailiff*. See BAILIFF.

BOUNDING CHARTER, in the Scotch law, is an instrument of title which describes the lands thereby conveyed by their boundaries or limits. It gives right to everything within the bounds, and, on the other hand, it excludes what lies beyond these. If the boundary be the sea or the sea-shore, the right is extended or limited as the sea recedes or advances. If, again, it be a stream or river, the property may be subject to alteration, either extended by *alluvion* (q. v.), or by the gradual and imperceptible variation of the channel; or the stream may cease to be the boundary, in consequence of some violent change. But if the property described in the charter is bounded by walls, the walls, as a general rule, will not be held as included in the grant; and where it is intended that a wall is to be mutual, this must be expressed. When the grant is described both by boundaries and by measurement, the boundaries determine its extent, although containing a larger quantity of ground than the measurement. The lands, however, may be described simply by reference to a plan, and this is a conveyance which makes a valid bounding charter. By statute also a reference to a leading name in a prior deed is a sufficient description. The following articles should be consulted in connection with this subject—CHARTER ; CONVEYANCE; TITLE ; and GRANT.

BOUNTY is a sum of money given to encourage men to enter the army or navy. In time of peace, when there is little or no need to augment the forces, the B. sinks to a minimum; but in cases of exigency, it is raised according to the difficulty and urgency of the circumstances. In the British army, no B. was paid to recruits until about half a century ago; the temptations offered to them, if any, were of some other character. The high-

est B. ever paid during the great wars against Napoleon was in 1812, when it amounted to £18, 12*s.* 6*d.* for limited service, and £23, 17*s.* 6*d.* for life; but these sums were in great part nominal, being subject to many unfair and absurd deductions. Even so late as 1849, when the B. to an infantry recruit was nominally £4, he received little more than one-eighth of this amount, all the rest being swallowed up in fees and drawbacks of various kinds. The only B. which now exists is a free kit—no other being allowed.

The young men who used to enter the British army were supposed, for the most part, to have been tempted by immediate B. rather than by prospective pays and pensions; and thus it arose that the rate of B. varied frequently, while those of pay and pensions underwent very little change. In 1855, it was £7 per head (for line infantry); in 1856, only £2; in 1858, £3; and it afterwards underwent further changes. It was always higher to the cavalry and artillery than to the infantry; and in the latter it was higher to the Highland than to the other regiments, on account of matters connected with dress and personal ornaments. The relation which the B. bore to the other emoluments of the soldier are explained under ENLISTMENT, RECRUITING. In reference to seamen, the subject will receive elucidation under MANNING THE NAVY.—The term B. is also used in the navy to signify the payment and distribution of money to which the officers and crews of her Majesty's ships and vessels of war may, on particular occasions of active service, be entitled. See PRIZE, SALVAGE, BOOTY.

BOUNTY, a term applied to any sum granted by the legislature towards creating or encouraging some kind of undertaking believed to be of national importance. At one time there was no end to the giving of bounties in this way from the public purse—there were bounties on exporting corn, with a view to encouraging agriculture; there were bounties on the tonnage of vessels employed in the herring and whale fisheries; on the importation of materials of manufactures; on the importation of indigo from the colonies; on the exportation of Irish linen, &c. The fallacy of this costly and factitious process for fostering commerce, manufactures, and agriculture was amply demonstrated by Adam Smith in his *Wealth of Nations*; one of his more striking facts being, that every barrel of herrings which sold for 20*s.*, cost the government about 25*s.* The notion that bounties may properly be given as an encouragement in the infancy of undertakings, has been happily exploded. It is ascertained that, besides taxing the general community in order to reward or encourage individuals, bounties do no real good to the parties so favored; for by such inducements they engage in business for which they have no special vocation, or which, in existing circumstances, it would be preferable to let alone. Misdirection of capital, talent, and industry are, in short, the inevitable result of bounties, as of all measures alleged to be for the special protection of trade. The subsidies in the form of extra rates paid to certain steamboat companies for carrying the mails may be said to be the last remnant of British bounties. The carrying of the mails, as involving greater responsibilities than ordinary goods, is paid at much higher rates, even where the ordinary traffic is remunerative, as on the Atlantic route, which is crossed by the greatest number of steamboat lines. Here the Post-office, after a trial of open competition for the conveyance of the mails, in 1878 returned to the system of special contracts with certain of the most reliable companies at increased rates. These contracts have been objected to in the House of Commons as monopolies.

BOUNTY OF QUEEN ANNE. See QUEEN ANNE'S BOUNTY.

BOUQUE'T OF WINE is the peculiar flavor yielded by the better class of wines, and which is due principally to the presence of œnanthic ether. See WINE.

BOUQUETIN, or IBEX of the Alps (*Capra Ibex*), a species of goat, which inhabits the highest regions of the Alps, even higher and wilder than those inhabited by the chamois, up to the limits of perpetual snow. It is the *Ibex* of te ancients. See IBEX. In German Switzerland, its name is *Steinbock*. It was at one time found on all the higher Alps, but has disappeared from most of them, and exists chiefly on those between the Valais and Piedmont, where it is carefully protected by the Sardinian government. It is larger and more powerful than the common goat, and has a small head and great horns (those of the male 1½—2 feet long), which curve backwards, are directed a little outwards, and have prominent transverse knots or bands on the front. The horns of the females are only about 6 inches long. The hoofs are large, rough on the sole, and capable of being spread widely apart, to give greater security of footing. The general color is brown. The body is covered with two kinds of hair, the longer hair being mixed, at least in winter, with thick soft wool. There is no beard, except a few hairs in winter, although the animal has been often incorrectly figured as having one.

The B. feeds on the herbage and small shrubs which are found on the last confines of vegetation, and descends by night to browse in the highest forests, the lichens and branches of which supply much of its winter food. It is capable of enduring great cold, and will remain, with seeming indifference, for hours on the summit of a rock, motionless, during the most severe storm. It possesses an extraordinary power of bounding from crag to crag, and of ascending or descending almost perpendicular precipices. Even the projections of a wall of rough masonry have been seen to suf-

Bouquetin.

fice for the feet of a tame one to take hold of. One has also been known frequently to spring from the ground, without a race, and plant itself on a man's head. Tschudi rejects as a fable the statement which has been repeated by one naturalist after another, from the days of Gesner, that the B. throws itself down precipices, so as to fall upon its horns, their elasticity preserving it from injury.

When taken young, the B. is easily tamed. It readily associates with common goats, and breeds with them, and the hybrids produce young, of which, however, it does not appear that in any case both parents have been ascertained to be hybrids.

Whether this animal might not be made useful to the inhabitants of such countries as Iceland and Greenland, no one seems to have thought of trying.

BOURBON, ILE DE, or, as it is called at present, RÉUNION, an island in the Indian Ocean, the southernmost of the Mascarene Isles, lying about 100 miles south-west from Mauritius, and 360 miles east from Madagascar. It is one of the most important of the insular colonies of France. It has an area of about 950 square miles, being about 38 miles in length, and 28 in its greatest breadth. Pop. (1873) 193,362, including some hundreds of Chinese, 6000 negroes, 34,500 Indians, and a garrison, and other officials, to the number of about 2000. It may be described as one great mountain mass, of which the highest peaks are the Piton de Neiges—in the center of the island, rising more than 10,000 feet above the sea—the Grand Bernard, and the Cimandef, in the north, with respective heights of 9500 and 7300 feet, and in the south-east the Piton de Fournaise, 7200 feet high, one of the greatest volcanoes in the world, and one of the most active, its eruptions taking place at least twice every year, and its lava-streams sometimes reaching to the sea. This volcano occupies perhaps one-sixth of the island, often changes its crater, and is surrounded by a district of more than 10,000 acres, which is a dreary desert, and is called the *Pays Brûlé* (Burned Land). Except in this part, however, the soil is in general extremely fruitful. About a fourth part of the island is cultivated, chiefly along the coast, although much of the interior is of great natural fertility. The scenery is very beautiful. Streams, although not large, are very numerous and rush in cascades to the sea. The climate, which was once mild and salubrious, is now very unhealthy to Europeans, who cannot reside four or five years on the island without an attack of typhoid fever or dysentery. The south-east monsoon and hurricanes often make fearful devastation. The plants of Arabia, of the Asiatic Archipelago, and of the south of Europe, succeed equally well here; coffee and cloves are produced, along with the fruits of Italy and Spain. The trade is estimated at about two millions sterling.

By far the most important article of export is sugar; coffee, vanilla, cloves, saltpetre, wood for cabinet-making, and dye-woods, are the other exports. The value of the exports, which up to 1867 had been steadily increasing, has since then greatly declined, as the crops have repeatedly suffered from cyclones, persistent drought, and blight. The cereals grown in the island are not sufficient for its own wants. Cattle are imported from Madagascar. The capital of the island, and seat of government, is St. Denis, on the north-west coast, with 9000 inhabitants, a college, a botanic garden, &c. Lat. 20° 52′ S., long. 55° 30′ E. The mean

temperature here is 77° F. There is an almost total want of harbors, the whole coast of the island possessing only two tolerable anchoring-places—one at St. Denis, and another at St. Paul, 18 miles farther south. But France is now constructing at fabulous cost a new and great harbor, meant to be an eastern Cherbourg. B. and Mauritius were discovered by the Portuguese navigator, Mascarenhas, and named after him, the Mascarene Isles. After the French had begun their attempt to found a colony in Madagascar, they took possession of B. in 1649, giving it that name, which was changed to Réunion at the Revolution, and to Isle Bonaparte in 1809. The name has been varied according to the political changes in France. The French having in 1720 taken possession of Mauritius, which they named Isle of France, the Mascarene Isles were placed under one governor. In 1810 they were taken by the British, but B. was restored to France in 1814.

BOURBON, a French family of the highest note in history, and which came to possess several European thrones, derives its name from the castle and seignory of Bourbon, in the former province of Bourbonnais, in the center of France. The first lord or *sire* of this family, of whom history makes mention, was Adhémar, at the beginning of the 10th century. The fourth in succession from him, Archambauld I., added the name of the family castle to his own. Under his successors, who also bore the name of Archambauld, the family possessions were soon very much increased. At length the seignory of Bourbon having devolved upon an heiress, who, in 1272, married Robert, the sixth son of Louis IX. of France, thus passed to a branch of the royal family of the Capets, under whom it was converted into a duchy. The principal branch of this family was, in 1523, deprived of all its dignities and possessions, because the duke, Charles de B. (q. v.), the famous Constable, allied himself with Charles V. against Francis I. of France.

Of the collateral branches, that of Vendôme acquired great importance, first attaining by marriage, in the person of Antoine de B., Duke of Vendôme, to the throne of Navarre; afterwards by inheritance to the throne of France, in the person of Henry IV., on the extinction of the male line of the House of Valois; and by the fortune of war to the thrones of Spain and Naples. Among the numerous other collateral branches may be mentioned those of Montpensier, De la Marche, Condé, Conti, Soissons, and Orleans. Only a few members of the collateral lines, however, have borne the name of B.; for example, the Cardinal Charles de B., Duke of Vendôme, who, under the name of Charles X., was set up by the Catholic League as a rival king to Henry IV. The ducal dignity was revived by Louis XIV. in the House of Condé, so that the eldest son of that House should bear the title of Duke of Bourbon.

The dynasty of the Bourbons in France begins with Henry IV. (q. v.), who, after the assassination of Henry III., became, in virtue of the Salic Law (q. v.), the next heir to the French throne. Through his father, Antoine de B., king of Navarre and Duke of Vendôme, he was descended from Robert, son of Louis IX., and husband of Beatrix, heiress of Bourbon. On his assassination in 1610, he left, by his second wife, Mary de' Medici, five legitimate children: 1. Louis XIII. (q. v.), his successor on the throne; 2. J. B. Gaston, Duke of Orleans (q. v.), who died in 1660, and left no male heirs; 3. Elizabeth, married to Philip IV. of Spain; 4. Christina, married to Victor Amadeus, afterwards Duke of Savoy; 5. Henrietta, married to Charles I. of England.—Louis XIII., on his death in 1643, left two sons by his queen, Anne of Austria: 1. Louis XIV. (q. v.), his successor; and 2. Philip, who received from his elder brother the title of Duke of Orleans, and was the founder of the family which has become the younger B. dynasty.—The Dauphin Louis, styled Monsieur, the son of Louis XIV. by his marriage with Maria Theresa of Austria, died on 14th April 1711, and left three sons by his marriage with Maria Anna of Bavaria: 1. Louis, Duke of Burgundy (q. v.); 2. Philip, Duke of Anjou, who afterwards became king of Spain, as Philip V.; 3. Charles, Duke of Berri, who died in 1714.—Louis, Duke of Burgundy, died in 1712.

By his wife, Maria Adelaide of Savoy, he had three sons, of whom two died in early youth, the only one who survived being Louis XV., who succeeded his great-grandfather, Louis XIV. in 1715.—Louis XV. having married Maria Leszcynska, daughter of the dethroned king Stanislaus of Poland, had by her a son, the Dauphin Louis, who married Maria Josepha of Saxony, and died in 1765, leaving three sons: 1. Louis XVI. (q. v.), who succeeded his grandfather, Louis XV., in 1774; 2. Louis Stanislaus Xavier, Count of Provence, afterwards Louis XVIII.; 3. Charles Philippe, Count of Artois, afterwards Charles X.—Louis XVI. had three children by his queen, Marie Antoinette of Austria: 1. the Dauphin Louis, who died in 1789; 2. Louis, called Louis XVII. (q. v.), who died in 1795; 3. Marie Therese Charlotte, styled Madame Royale, afterwards Duchesse d'Angoulême (q. v.).—Louis XVIII. had no children; but Charles X. had two sons: 1. Louis Antoine de B., Duke of Angoulême (q. v.), who was dauphin prior to the Revolution of 1830, and died without issue in 1844; 2. Charles Ferdinand, Duke of Berri (q. v.), who was murdered in 1820. The Duke of Berri left two children: 1. Marie Louise Therese, styled Mademoiselle d'Artois, married to the Duke of Parma; 2. Henry Charles Ferdinand Marie Dieudonné, Duke of Bordeaux, now styled Count de Chambord, the representative of the elder branch of the Bourbons, till June 1871, exiled from France, and whom the French Legitimists sometime designate Henry V.

It has already been stated that the founder of Orleans or younger branch of the B. royal family of France, was Philip, Duke of Orleans (q. v.), the younger brother of Louis XIV. He died in 1701, leaving, by his second marriage with Elizabeth Charlotte of the Palatinate, a son of his own name as his heir, who was Regent of France during the minority of Louis XV. His son, Louis Philippe, Duke of Orleans (born 1703), married a princess of Baden, and died in 1752, leaving an only son of his own name (b. 1725, d. 1785), whose son and heir was that Louis Joseph Philippe, Duke of Orleans (q. v.), so notable in the French Revolution, who in 1792 renounced his rank, taking the name of Citizen Egalité, and died by the guillotine in 1793.

He left four children: 1. Louis Philippe (q. v.), who, before the Revolution, was styled Duke of Chartres—that being the ordinary title of the eldest son of the Orleans family—became afterwards Duke of Orleans, was King of the French from 1830 to 1848, and died in England on the 26th of August 1850; 2. the Duke de Montpensier, who died in England in 1807; 3. the Count de Beaujolais, who died at Malta in 1808; 4. Adelaide, styled Mademoiselle d'Orleans, b. 1777, d. 1847.—Louis Philippe left a numerous family by his queen, Amelia of Naples; but his eldest son, Ferdinand, Duke of Orleans, lost his life by an accident on the 13th of July 1842, leaving by his wife, the Princess Helen of Mecklenburg-Schwerin, two sons, the eldest of whom, Louis Philippe Albert, now styled Count of Paris, is the representative of the younger or Orleans B. family.—Concerning the other members of Louis Philippe's family, see the article LOUIS PHILIPPE.

Louis XIV. having succeeded in placing his grandson, Philip, Duke of Anjou, on the throne of Spain in 1700 as Philip V., this prince became the founder of the Spanish B. dynasty, as well as of the B. dynasties of Naples, Parma, and Piacenza. These dynasties endured only a temporary overthrow from the policy and arms of Napoleon Bonaparte. Philip V. was succeeded on the Spanish throne by his son, Ferdinand VI., who died without issue in 1759, and the crown fell to his brother, Charles III., whose son and successor, Charles IV., was compelled to resign it in 1808, in favor of a successor nominated by Napoleon, and died at Rome in 1811. The two eldest sons of Charles IV. by his marriage with Maria Louisa of Parma were—1. Don Fernando, Prince of Asturias, who, after the overthrow of Napoleon, reigned as Ferdinand VII. (q. v.), whose eldest daughter was Isabella II., the mother of Alfonso XII.; 2. Don Carlos (q. v.), who, on the death of his elder brother in 1833, became pretender to the Spanish throne until 1845, when he resigned his pretensions in favor of his son, Count de Montemolin. He died at Trieste, 1855. The Count de Montemolin died in 1861, and his claims to the Spanish throne are now represented by his nephew, Don Carlos, son of his brother Juan.

Philip V. did not succeed in keeping possesson of the crown of the Two Sicilies (see NAPLES) as of that of Spain; the House of Hapsburg being restored there in the person of a son of Leopold I., who in 1720 ascended the throne as Charles III.

But in consequence of the peace of Vienna, the son of Philip V. became king of the Two Sicilies, likewise by the name of Charles III. Upon his accession to the throne of Spain in 1759, he gave up that of Sicily to his third son, Don Fernando, called Ferdinand IV., with the express stipulation that it should never again be occupied by a king of Spain. Ferdinand IV. was compelled to yield to the French arms in 1806; but after the overthrow of Napoleon, he became king of the Two Sicilies as Ferdinand I. (q. v.). His son, Francis I., left the throne in 1830 to his son Ferdinand II. (q. v.), whose son, Francis II., was expelled in 1860, when Naples was incorporated with the new kingdom of Italy.

By the peace of Aix-la-Chapelle in 1748, Austria made over the duchies of Parma and Piacenza to Don Philip, the youngest son of Philip V. of Spain, but with stipulation of their reversion to Austria on the failure of his male descendants, or on his succeeding to the throne of Spain. He was succeeded in 1765 by his son, Ferdinand I., whose son, the hereditary Prince Charles Louis Ferdinand, was made king of Etruria in 1801, under the guardianship of his mother, Maria Louisa of Spain; but Etruria being soon incorporated with France, they were compietely dispossessed. The Congress of Vienna assigned Parma and Piacenza for life to Maria Louisa of Austria, the spouse of Napoleon, but meanwhile indemnified Maria Louisa of Spain with the duchy of Lucca. In 1847, Parma and Piacenza reverted to the B. family, in the person of the former king of Etruria, Charles Louis de B., who had suc-

ceeded his mother in Lucca in 1824. He abdicated on March 14, 1849, and was succeeded as Duke of Parma and Piacenza by his son, Charles III., and he in 1854 by his son Robert—born 1848—whose mother, Maria Louisa Theresa de B., daughter of the Duke of Berri, then became regent of the duchies. The B. family lost these duchies in 1859. See ITALY and PARMA; and see Coiffier-Demoret, *Histoire du Bourbonnais* (1828); Achaintre, *Histoire Chronologique et Généalogique de la Maison Royale de Bourbon* (1825); also histories by Mure (Par. 1860–68) and Dussieux (1869).

BOURBON, CHARLES, DUKE DU BOURBONNAIS, styled CONSTABLE DE BOURBON, born 1489, was the son of the Count of Montpensier; and in consequence of the death of his elder brother, and his marriage with the only daughter of the Duke of Bourbon, he united in his own possession the vast estates of both these branches of the Bourbon family.

Holding a very high position in virtue of his birth and wealth, he soon showed himself to be no ordinary character, by the brilliancy of his exploits in arms, and by his rigid morals and severe taciturn disposition. At the age of 26, he received from Francis I. the Constable's sword, and was sent to Italy at the head of an army, which he disciplined on the march; and crossing the Alps by passes previously deemed impracticable, he surprised the hostile generals, won the battle of Marignan (1515) and within a few days placed the keys of the citadel of Milan in the king's hand, acquiring for himself by these exploits the reputation of the greatest general of his time. But Maria Louisa, the king's mother, became enamored of the brave Constable; and he, although a widower, declined her hand, openly declaring that he deemed her a woman devoid of modesty, and not to be thought of for a wife. Her revenge led to the seizure, on behalf of the crown, of the estates which he had acquired through his wife, and the withholding of his pay as Constable. Thus deeply injured, he renounced the interest of France, and concluded a private alliance with the Emperor Charles V., and with Henry VIII. of England. The former agreed to give him in marriage his sister, Eleonora, who had Portugal as her jointure, and to make an independent kingdom for him of Provence and Dauphiné, with his own possessions of the Bourbonnais and Auvergne. The rest of France was to be apportioned between the two confederates. The king, who was engaged in an expedition to Italy, received intelligence of this conspiracy. Forthwith he proceeded in person to the Constable, and offered him restoration to favor and also of his estates. The Constable, however, did not trust him, but fled in disguise, and reached Franche Comté in 1523. In order not to appear as a fugitive to the Spanish army, which awaited him in Lombardy, he drew around him 6000 German lancers, and soon contrived to gain their entire attachment. He attacked, in 1524, the French army on its march over the Alps, and thought to have advanced to the heart of France with the Spaniards, whose general he had been appointed by the emperor. But Charles V. did not entirely trust him, and appointed the Marquis of Pescara to assist and watch him. He was compelled to relinquish the siege of Marseille, on the approach of Francis I. with a great army.

He repassed the Alps, and took his revenge in the battle of Pavia, 24th February 1525, where the king was made a prisoner. He now went to Madrid, but soon found himself entirely disappointed in his hopes, and was sent back to Lombardy by Charles V. Without money or support, surrounded by daring and mutinous bands, he conceived a plan to found for himself an independent dominion of his own, and to unite himself with France against Spain. Hastily gathering together the wild bands around Milan, he led them against Rome; and on 6th May 1527, unprovided with things necessary for a siege, appeared before the walls of that city. Resolved to conquer or die, he led up his troops in the most impetuous manner, and eagerly seized with his own hands a scaling-ladder, in order to make his way over a weak place of the walls, when he was mortally wounded by a bullet, which Benvenuto Cellini afterwards asserted that he had shot. His death was kept secret for a time from the storming army under his command. When it departed from Rome two months after, his corpse, which the soldiers would not part with, was taken with them, and buried at Gaeta, under a magnificent monument, which, however, was afterwards destroyed.

BOURBONNAIS, a gently undulating, terrace-formed district in the center of France, northward of the high lands of Auvergne, abounding in grain, fruits, wine, iron, marble and mineral springs. From 1327 to 1523, it formed the duchy of Bourbon, and afterwards, becoming a domain for the crown, it formed a separate province of France. It now constitutes the department of Allier, and part of the department of Cher. The capital was Moulins.

BOURBONNE-LES-BAINS, a town of France, in the department of Haute-Marne, about 20 miles east-north-east of Langres. It is pleasantly situated at the confluence of the Borne and the Aspance, and has some fine promenades and manufactures of cotton, hosiery and cutlery. Its chief feature, however, is its saline springs, which range in temperature from 121°—136° F., and are much resorted to by people suffering from chronic complaints or old wounds. Pop. (1876) 3705.

BOURDALOUE, LOUIS, one of the greatest pulpit orators of France, was born at Bourges, 20th August 1632, and having, at the age of 16, entered into the order of the Jesuits, obtained in succession the chairs of Humanity, Rhetoric, Philosophy, and Theological Ethics in the academy of his native place. He showed a great capacity for science, but his remarkable powers of eloquence led his superiors finally to determine upon employing him as a preacher. Disdaining the inflated style prevalent among the tasteless pulpit orators of his time, he assailed with manly vigor and truly religious earnestness the passions, weaknesses, and errors of men. The dignity of his manner and the fire of his eloquence made him famous even when the public mind was occupied with the festivities of Versailles, the victories of Turenne, and the literary masterpieces of Corneille and Racine. At the court of Louis XIV. he was remarkably well received. After the revocation of the Edict of Nantes, he was sent to Montpellier in 1686, to labor among the Protestants on behalf of the Roman Catholic Church. B. particularly understood how to accommodate his eloquence to the minds of those whom he addressed. Simple among the simple, a dialectician among ecclesiastics, he was equally a favorite with the common people and with the learned and the great. He was also much esteemed and beloved as a man; and in all circumstances, maintained unimpeached a high reputation for candor and honesty. In the later years of his life, he relinquished the pulpit, and devoted his time to hospitals, prisons, and pious institutions. He died at Paris 13th May 1704. How thoroughly his religious sentiments were governed by the theological tenets of his church, may be perceived from these remarkable words which he uttered on his death-bed: 'It is highly reasonable that God be fully satisfied; and at least in pugatory I will suffer with patience and with love.' Several editions have appeared of the collected works of B. (as 16 vols., Versailles, 1812, and most recently in the *Panthéon Littéraire*, 3 vols., Par. 1838). The best edition of his sermons is that published under the care of Bretonneau (16 vols., and 18 vols., Par. 1707—1734. His life was written by Madame de Pringy.

BOURDON DE L'OISE, FRANÇOIS LOUIS, a notorious character of the French Revolution, was born in the middle of last century at Saint Remy, near Compiègne, and became a procurator in the parliament of Paris. He helped to storm the Tuileries on 10th August 1792. He shortly afterwards obtained a seat in the Convention by a trick, presenting himself as the regularly elected deputy for the department of Oise, in which he had actually been defeated by a namesake who was elected also for that of Loiret. The trick was subsequently discovered, but he was not ejected. B. contributed much to bring about the execution of Louis XVI., the insurrection of 31st May, and the destruction of the Girondists. He was sent to La Vendée, where, however, he loudly condemned the revolutionary cruelties, and appeared in the character of a moderate. Obnoxious on this account to Robespierre and Hébert, and fearing for his head, he urged on with the greatest eagerness the overthrow of the Terrorists on the 9th Thermidor (27th July 1794). From this time forth, B. showed himself an enemy of the clubs, and a protector of the nobles and the priests. In consequence of the insurrection of 13th Vendémiaire (5 October 1795), he was sent as commissioner to Chartres, where he behaved harshly and brutally. He passed from the Convention into the Council of Five Hundred, became a prosecutor of the republicans, and joined a royalist club. The Directory placed him upon the proscription list after the 18th Fructidor (4th September 1797). He was transported to Cayenne, where, in a short time, he died in great misery, tortured with remorse.

BOURGELAT, CLAUDE, founder of the first veterinary school, and consequently the first to institute a distinct profession of veterinary surgeons. Born in Lyon in 1712, he died there in 1799. He was a learned lawyer, an able writer, and the bosom friend of the great D'Alembert, enjoying also the esteem of Pembroke, Voltaire, Buffon, and Haller. He was instigated to further the cause of veterinary science from a natural liking for horses, and conceived the idea of educating men to alleviate their infirmities and those of other domestic animals. In the execution of this project he found a friend and collaborator in a minister of Lyon, Bertin; and in 1761, the first veterinary school was opened in the suburbs of the city. It was patronized by royalty, and students flocked to it from all parts of France, Italy, Switzerland, Germany, Sweden, and Denmark.

Probably the only dark spot in B.'s veterinary career is his treatment of Vial de St. Bel, who, persecuted by his colleagues in France, came to England, and founded the St. Pancras College, Camden Town, London, in 1792. B. had, however, endowed the Lyon school with so much vital energy that it has maintained itself in the foremost ranks. From it all other colleges in Europe sprang, and with them it has kept pace, being superior to the majority, and rivaling the very best, even those of Paris and Berlin.

B. wrote much—his works on Farriery, Materia, Medica, External Form, Contagious Diseases, and on the various apparatus and bandages used for quadrupeds, being still highly esteemed.

BOURG-EN-BRESSE, a town of France, capital of the department of Ain, pleasantly situated on the left bank of the Reyssousse, about 20 miles east-south-east of Macon. It is well built, has several public fountains, a statue to Bichat, the celebrated anatomist, who was a student at the hospital here, a museum, a fine corn-market, and a public library of 19,000 volumes. The distinguished astronomer, Lalande, was a native of B. It has manufactures of linen, cotton, hosiery, and leather, and a trade in agricultural produce. The town was captured by the allies in 1814. Pop. (1876) 14,289.

BOURGEOISIE, a French term, but now not unfrequently employed in English, German, and other languages. It denotes the citizens of towns as a rank or class of society, including persons from the condition of heads of manufacturing or mercantile establishments, down to master-tradesmen. The French B. have long been extremely hostile to the aristocracy, but have themselves latterly become the object of attack on the part of the operatives and of the extreme radical or red republican party. The term *bourgeois*, from which B. is formed, is quite distinct in meaning from *citoyen*, the latter term designating a citizen of the state.

BOURGES, the capital of the department of Cher, in France, situated in a fertile plain at the confluence of the Auron and the Eure, 123 miles south of Paris. B. is divided into an old and new town, the latter being built around the former. Its houses are of antique architecture, and its streets crooked and dirty. It was formerly surrounded by ramparts flanked with high towers, some of which still remain; but the ramparts have been converted into promenades. B. has one of the noblest Gothic cathedrals in Europe, lighted by 59 splendid painted windows. Its university was suppressed at the Revolution. B. has greatly prospered since the railway has reached it. In 1861 it was chosen to be one of the militaay arsenals of France, and its strategical importance has become greater since the loss of Metz. Pop. (1881) 39,988. B. is of great antiquity, being the *Avaricum* of the Gauls, in the country of the *Bituriges Cubi*. Taken by Cæsar in 52 B.C., it was afterwards named *Bitu'rica*, and became the capital of the Roman province of *Aquitania Prima*.

In the middle ages, it was the capital of the province of Berri. Charles VII. had his residence at B., when almost all France had been taken from him by the English; and its Hôtel de Ville was originally the abode of his unfortunate minister, Jacques Cœur. Louis XI. was born at B. Of the seven ecclesiastical synods held at B., that of 1438—in which the Pragmatic Sanction of the Gallican Church was established with approbation of Charles VII., and the resolutions of the Council of Basel, relative to the papal power and the king's prerogatives, were confirmed—was the most important.

BOURIGNON, ANTOINETTE, a celebrated religious visionary, born at Lille 13th January 1616. Her father was a merchant, and she inherited from him a considerable patrimony. She was so ugly an infant, that there was some thought of killing her as a monstrous birth. Her intellect, however, was very acute, and its powers were early developed, along with a tendency to religious mysticism, which was much encouraged by the reading of mystic books, till her imagination became inflamed, and she began to fancy that she saw visions, conversed with God, received special revelations, and was called to restore the pure spirit of the gospel. By the good offices of the Archbishop of Cambray, she obtained admission into a convent, where she won over some of the nuns to her opinions, and soon found herself at the head of a considerable party. She afterwards had charge of a hospital at Lille, but from this position she was driven in consequence of her extravagant fancies. She now traveled through various countries, her enthusiasm gaining proselytes, whose conversion, she said, caused the pains of childbirth in her person. At last she was appointed head of a hospital in East Friesland. She died at Franeker, 30th October 1680. According to Madame B., religion consists in internal emotion, and not in either knowledge or practice. Her own character exhibited a strange combination of pride and avarice, with a sort of mystic piety. She never gave anything to the poor, alleging as a reason that she had consecrated all to God. Some of her pretended revelations were of the most indecent nature; many of them were extremely ridiculous; yet many persons of intelligence and learning believed in them, and adopted the peculiar form of mysticism which soon began to receive the name of Bourignianism. Among the chief expounders of it was Peter Poiret, a Calvanistic minister. It spread to a remarkable extent both among Roman Catholics and Protestants; and about the end of the 17th c., and beginning of the 18th, prevailed so much in Scotland, that a solemn renunciation of it was demanded from every entrant on the ministry at his ordination. A minister of Aberdeen was deposed for it in 1701. The formal renunciation of Bourignianism is still continued in the Established Church of Scotland, but has been given up as needless by other Presbyterian churches. The works of Madame B. were edited by Poiret (25 vols., Amst. 1676—1684; 2d edit. 1717). They exhibit not a little fiery eloquence.

BOURMONT, LOUIS AUGUSTE VICTOR DE GAISNE, COUNDE, a French marshal, and the conqueror of Algiers, was born in 1773 at his paternal castle of Bourmont, in Anjou, went into exile at the Revolution, served as an officer in the army of the Prince of Condé, and from 1793 to 1796 was actively engaged in the anti-revolutionary struggle in La Vendée. Subsequently, he obtained the favor of the First Consul. Under the Empire, he was appointed to a colonelcy in the army of Naples, and was soon raised to the rank of brigadier-general. In the campaigns of 1813 and 1814, he distinguished himself upon a number of occasions, particularly in the battle of Dresden, and by the defence of Nogent, upon account of which Napoleon promoted him to the rank of a general of division. On 31st March 1814, he declared for the Bourbons, and received the command of a military division during the first Restoration; yet, on Napoleon's return, he went over to him, and was intrusted with the command of a division of the army of the Moselle. On the evening before the battle of Ligny, he deserted, and betook himself to Louis XVIII., at Ghent. There can be no doubt that B. was singularly ungenerous in choosing such a moment to resign, nor is there anything in his career to make us suppose he was actuated by any high principle in what he did. His evidence went a considerable way in bringing about the condemnation and execution of Marshal Ney. He received high military employment under Louis XVIII. Distinguishing himself in the Chamber of Peers as a zealous supporter of the king, he was appointed minister of war in 1829, and in this office displayed great activity. When the expedition against Algiers was undertaken in 1830, he received the chief command of the troops, and the rapid success of the expedition was ascribed to his prudence and energy. For this he received the marshal's baton on 22d July, but on the revolution taking place in that month, he was superseded in his command, and went to England to share the exile of Charles X. Refusing to take the legal oath, he was struck off the lists of the French army and peerage in 1832. In 1833, Don Miguel of Portugal placed him at the head of his troops, but the campaign was brief and unsuccessful. B. finally settled on his estate in Anjou, and died there in October 1846.

BOURNE, HUGH, the founder of the sect of Primitive Methodists, was born 3d April 1772 at Fordhays, in Staffordshire. Originally a preacher among the Wesleyan Methodists, he distinguished himself by the fervor of his religious sentiments, and by the zeal which he displayed for the conversion of the ungodly. His enthusiasm for 'revivals' and open-air meetings, however, received no countenance from the leading clergymen of the denomination to which he belonged. In 1808, B. was cut off from the Wesleyan connection, strange to say, for following much the same course of earnest evangelization as Wesley himself had done. He was not, however, alarmed. His preaching was wonderfully acceptable, and he quickly gathered around him many devoted adherents. In March 1810, a committee of ten members was formed. This may be regarded as the first official organization of the body. In 1818, B. published in the *Primitive Methodist Magazine*, a narrative of his labors and of those of his coadjutors. In the course of his life he visited Scotland, Ireland, Canada, and the United States, where his ministrations were attended with great success. He died at Bemersley, in Staffordshire, 11th October 1852.

BOURNE, VINCENT, one of the most elegant Latin versifiers that England ever produced, was born about the close of the 17th century. In 1714, he entered Trinity College, Cambridge; in 1721 he took his degree of A.M., and subsequently he was appointed usher of Westminster School. He died December 2, 1747. It would be difficult to praise too highly B.'s exquisite contributions to Latin poetry. They will stand comparison, not only in point of Latinity, but also in point of originality, with the choicest productions of the ancient Roman poets. A gracefulness which pervades thought, sentiment, and expression, is their essential characteristic. The subject is indeed often insignificant, but the treatment is always perfect. His translations of English ballads and other lyrics into Latin are wonderfully felicitous, every beauty being retained with the most delicate skill, and every defect being most carefully remedied. Cowper, Beattie, Charles Lamb, and others have expressed their admiration of B.'s singularly fine *genius*, for assuredly a gift so rare as that which enables a man to find a complete utterance for his ideas in a dead tongue, deserves the name. The first edition of B.'s poems appeared in 1734. Their number was enlarged in a subsequent edition.

BOU'RNOUSE is the Arabic name of a garment worn in Algeria, Marocco, and other parts of North Africa. It is a large woollen mantle, worn above the other attire of the natives, and having a hood, which is thrown over the head in rainy weather. The B. is generally white, though distinguished individuals wear it of vari-

ous colors—blue, green, red, &c. It has been long in use among the Spaniards under the name of *albornoz*. Through the conquest of Algeria by the French, the B. was imported into France and England, although its original form has been considerably altered.

BOURRIENNE, Louis Antoine Fauvelet de, the secretary and early friend of Napoleon I., was born at Sens, 9th July 1769, and received his education in the military school at Brienne, where he formed the closest intimacy with the future emperor. He became, in 1792, secretary to the embassy at Stuttgart. Deprived of this office by the breaking out of war, he lived for some time a rather retired life, until, in 1797, his former school-fellow appointed him his secretary. He accompanied him to Egypt and to Italy, and in 1801 was nominated a councillor of state. In 1802 he was dismissed from his office, for being implicated in the dishonorable bankruptcy of the house of Coulon, army contractors; but in 1805 he was appointed ambassador to the States of the Circle of Lower Saxony, and in this capacity resided long at Hamburg. His tendency to peculation, however, necessitated his return to France, where he had to refund 1,000,000 francs into the public treasury. He now decidedly joined the party which sought the overthrow of the emperor and the restoration of the Bourbons. He was treated with little consideration by them during the first Restoration, yet he followed Louis XVIII. in his flight to the Netherlands upon Napoleon's return, and upon the second Restoration was honored with the title of a minister of state. As deputy from the department of Yonne in 1815 and 1821, he showed his weakness of character by opposing all liberal measures, and even institutions for the promotion of science and popular education.

The revolution of 1830, and the loss of his fortune (occasioned by extravagance), caused his reason to give way, and he died in a lunatic asylum at Caen, 7th February 1834. His Memoirs concerning Napoleon, the Directory, the Consulate, the Empire, and the Restoration (*Mémoires sur Napoleon*, &c., 10 vols., Par. 1829), gave many new explanations of the events of his time, but were declared by contemporaries to be in many respects untrustworthy. See the article Boulay de la Meurthe. The work, however, is one which must always constitute an important part of the materials of history. A work entitled *Histoire de Bonaparte par un Homme qui ne l'a pas quitté depuis* 15 *Ans*, has been erroneously ascribed to him.

BOU'SSA, a town of Soudan, Central Africa, capital of a district of the same name, is situated on an island in the Niger, in lat. 10° 14′ N., and long. 5° 20′ E. It is hemmed in by rocks, and being also surrounded by walls, is a place of very considerable strength. Population estimated at from 10,000 to 18,000. A melancholy interest attaches to B. as being the death-scene of Mungo Park (q. v.).

BOUSSINGAULT, Jean Baptiste Joseph Dieudonne, a French chemist, particularly distinguished for investigation relative to agriculture, was born at Paris, 2d February 1802, attended the mining school at St. Etienne, and went in the employment of an English mining company to South America; where, besides his professional and scientific labors, he served as a colonel under Bolivar in the South American war of liberty. Returning to France, he was appointed professor of chemistry at Lyon, and in 1839 was admitted into the Institute, and appointed to the chair of agriculture in the Conservatory of Arts and Measures, Paris. In 1848, he was elected a member of the Constituent Assembly, and voted with the moderate Republicans. After the *coup d'état*, he retired from political life. In 1857, he was made commander of the Legion of Honor. His *Economie Rurale* (2 vols., Par. 1844; 2d ed., Par. 1849) embodies the result of experiments and investigations which have won for him a European reputation. It contributed much to the promotion of the infant science of agricultural chemistry, and has been translated into English (Lond. 1845) and German. B. is the author of numerous valuable papers in scientific periodicals, which were collected and published in 1854, and he is also the author of *La Fosse à Fumier* (1858), and *Agronomie, Chimie agricole, et Physiologie* (1864),

BOUSSO'LE STRAIT passes through the Kurile Islands, uniting the Sea of Okhotsk and the Pacific Ocean. Lat. 46° 30′ N. It takes its name from one of the vessels of La Perouse, who, soon after Cook's death, nobly emulated, on the north-east coasts of Asia, that navigator's explorations on the north-west shores of America.

BOUSTROPHE'DON (Gr. *bous*, an ox, and *strepho*, I turn), a word used to describe a mode of writing practised by the Greeks in the earlier period of their history—viz., in which the lines did not proceed uninterruptedly from left to right, but alternately, the first line being written from right to left, the second from left to right, &c. Examples are frequently found in coins and inscriptions. The method received its name from its resemblance to the path made by oxen in ploughing a field.

BOUTERWEK, Friedrich, a German philosophical and æsthetical author of merit, was born on 15th April 1766 at Oker, near Goslar, in the Harz district. He at first devoted himself to the study of law; but in the second year of his academic course at Göttingen he relinquished it, imagining that his proper vocation was to be a poet. Besides poems, he wrote the romance of *Count Donamar* (*Graf Donamar*, 3 vols., Gött. 1791—1793; 2d ed., 1798—1800). Not finding, however, that success which he expected in this career, he renounced it, and devoted his whole energies henceforth to the study of philosophy and of the history of literature. In philosophy, he was at first a zealous follower of Kant, but afterwards adopted the system of Jacobi. He began to give lectures in Göttingen in 1791, and became extraordinary professor of philosophy in 1797, and ordinary professor in 1802. He produced several works on philosophy; but his great work, on which his reputation really depends, is his *History of Modern Poetry and Eloquence* (*Geschichte der neuern Poesie und Beredsamkeit*, 12 vols., Gött. 1801—1819), one of the best works of its kind which Germany has produced. The part relating to Spanish literature is especially valuable, and has been translated into Spanish and much enlarged by Jos. Gomez de la Cortina and Nic. Hugelde de Molinedo (3 vols., Madrid, 1828). B. died at Göttingen in 1828.

BOUTS-RIMÉS (Fr. 'rhymed endings') are a kind of verses the making of which forms a social amusement. Some one of the party gives out the rhymes or endings of a stanza, and the others have to fill up the lines as they best may. Suppose the rhymes prescribed are *wave, lie; brave, die;* the following are two of the ways in which the lines might be completed.

Dark are the secrets of the gulfing wave,
Where, wrapped in death, so many heroes lie:
Yet glorious death's the guerdon of the brave,
And those who bravely live can bravely die.

Whenever I sail on the wave,
O'ercome with sea-sickness I lie;
I can *sing* of 'the sea,' and look brave;
When I *feel* it, I *feel* like to die.

BOUVA'RDIA, a genus of plants of the natural order *Cinchonaceæ* (q. v.), and of the same tribe with the *Cinchona* (q. v.), or Peruvian Bark. The calyx is 4-partite, with teeth between the segments; the corolla tubular and 4-fid; the stamens 4, included within the corolla; the capsule 2-celled. The species are natives of Mexico. One of them, *B. triphylla*, with oblong ternate leaves and trigonous branches, has obtained a place among the favorite ornaments of flower-borders in Britain, but requires careful protection from frost. To preserve it, the roots are generally taken

up, and are sometimes placed in a greenhouse or frame for the winter, sometimes in a dry cellar. Its beautiful corymbs of scarlet flowers are produced from June till November.

BOUVET, JOACH., a learned French Jesuit, who was sent by Louis XIV. to China, to acquire information concerning that country, which he reached, along with five other missionaries, in July 1686. Being invited to Pekin, the missionaries received permission to disperse themselves over the whole Chinese empire, except B. and Gerbillon, who were required to remain in attendance upon the emperor, the famous Kanghi, whose respect and confidence they soon acquired in a high degree. He committed to them the erection of great buildings, and was so pleased with their performances, that he not only caused a church and a residence for them to be built within the bounds of his palace, but commissioned B. to return to his native country, and to engage as many missionaries as he could find. B. arrived in France in 1697, and brought with him, for the king, about fifty Chinese works.

He returned again to China in 1699 with ten new missionaries, amongst whom was the learned Parrenin. He died at Pekin, June 28, 1732, after having labored indefatigably in the cause of science, in that distant scene, for 50 years. He has left four different accounts of his various travels, and a work entitled *Etat Présent de la Chine, en Figures Gravées, par Griffart* (Par. 1697).

BOVEY COAL is a form of wood-coal or lignite, which derives its name from being found in Bovey, in Devonshire.

BO'VIDÆ (Lat. *bos*, an ox), a family of ruminating mammalia (see RUMINANTIA), to which different limits have been assigned by different naturalists, but which is generally regarded as equal in extent to the Linnæan genus *Bos*, or to what is popularly called the ox tribe. The B. are all large animals, with stout limbs and broad muzzle. The facial outline is nearly straight. Their dentition agrees with that of some of the other ruminants, as sheep, goats, and antelopes: they have eight cutting-teeth in the lower jaw, and none in the upper, but instead of them a fibrous and elastic pad, which covers the convex extremity of the anterior maxillary-bone; they have no canine teeth, but a large interval between the cutting-teeth and grinders, which are six on each side in each jaw. In eating, they collect and roll the grass together 'by means of the long and movable tongue; it is firmly held between the lower-cutting-teeth and the pad, the cartilaginous upper lip assisting in this; and then, by a sudden nodding motion of the head, the little roll of herbage is either torn or cut off, or partly both torn and cut.' Both sexes are furnished with unbranched tapering horns, which are directed more or less laterally, and generally upwards and forwards, and are usually curved throughout their whole length. There are, however, breeds of the common ox, in which both sexes are destitute of horns. The tail is rather long, and terminated by a tuft of long hair. The females have four teats. All the B. are gregarious. Native species are found in Europe, Asia, Africa, and North America. Fossil remains of species which no longer exist, have been found in pliocene and pleistocene deposits. The number of existing species is by no means certain; as, besides the difficulty of deciding in some cases what are to be deemed species and what merely varieties, there is still a great deficiency of accurate information concerning the B. of different parts of the world.

The very magnitude of the animals has probably prevented so frequent a comparison of the specimens as would otherwise have taken place. It has recently been ascertained that the number of species is more considerable than had been supposed. Attempts have been made to divide the genus *Bos* into several genera, but they are not very clearly nor strongly distinguished. All the B. are valuable to man, for their flesh, tallow, skin, &c.; but some of them, having long been reduced to domestication, are among the most valuable of all domestic animals, particularly the common ox, different kinds of buffalo, and the yak of Tatary.—See ARNEE, BANTENG, BISON, BUFFALO, GAUR, GAYAL, GALLA OX, MUSK OX, OX, PEGASSE, URUS, YAK, ZAMOUSE, ZEBU, &c.

BOVI'NO, a fortified town in the province of Foggia, South Italy, about 20 miles south-south-west of Foggia. It is the see of a bishop, has a cathedral, churches, and convents. The valley of B. was formerly notorious as the haunt of the brigands of Capitanata, and the town still enjoys the unenviable reputation of being the nursery of all the highway robbers of this portion of the Apennines. Pop. 7900. B. occupies the site of the ancient *Vebinum*. The Imperialists defeated the Spaniards here in 1734.

BOW, of a ship, is a general name for the fore-part, or that which breasts the waves. Very often the word is used in the plural, the ship being considered to have starboard and larboard, or right and left bows, meeting at the prow or figure-head. A narrow or *lean* bow, and a broad or *bluff* bow, are seamen's phrases for different shapes of bow, each of which has its own peculiar advantages at sea: a narrow bow will cut more smoothly through the water, but a broad bow bears up more firmly in a high sea.

'On the bow,' in sea-language, is the position of a distant object when seen over the bow; it implies a sweep of one-quarter of the horizon, embracing about 45° on each side of the prow or head.

BOW AND ARROW. In ARCHERS AND ARCHERY will be found a brief account of the military arrangements under which bowmen formed a component element in the armies of the middle ages; and under ARBALEST is a description of the cross-bow, which was once so favorite a weapon. We here describe the more effective, though simpler implement. The long-bow first gained ascendancy in England in the 14th century. It was found that a dozen arrows could be discharged from this weapon while the arbalester was winding-up his cumbrous cross-bow, and discharging one arrow or quarrel from it. Moreover, the long-bow being held vertically, the bowmen were able to stand in closer array than the arbalesters; they were enabled also to take a greater supply of the munitions of war into the field, seeing that the bow and arrows were much lighter in weight. In the time of Edward III., a bow was priced 1*s.* to 1*s.* 6*d.*, and a sheaf of arrows, 1*s.* to 1*s.* 2*d.*; in the time of Henry VIII., the price (fixed by law) of the bow varied from 6*d.* to 3*s.* 4*d.* The last-named monarch adopted extraordinary means for encouraging the use of the long-bow. Many ordinances were issued for insuring a good supply of bow-staves. The bowyers, string-makers, fletchers, and arrow-head makers were all placed under stringent regulations. Merchants were compelled to import good bow-staves with cargo, in certain proportions. Very long bow-staves were admitted duty-free. Yew was considered the best wood; but in order that the supply should not be too speedily used up, bowyers were ordered to use elm, ash, and wych-hazel in certain proportions to yew. The heads of families were bidden to provide bows for their sons and servants; and town-councils or officers were required to provide shooting-butts just outside each town. Some of the bows had two arches, connected by a middle straight piece. The best length was regarded as about 5 feet 8 inches from nock to nock; but in earlier times, some of the bows were much longer. The first arrows were made of reeds; these materials were afterwards superseded by cornel-wood; but the wood finally adopted as the best was ash. The arrows had heads pointed with steel, sometimes barbed to render their action more terrible. They were feathered with portions of goose-wing. The best length for a bow of the above-named size was set down at 2 feet 3 inches. Sometimes the arrows were tipped with combustibles. The best makers of arrow-heads, as well as bows, were compelled by law to go from town to town, to exercise their craft wherever it was most needed. The bowman usually carried 24 arrows, called a sheaf, or a quiver, at his right side or at his back; besides others in his girdle.

He kept his bow in a case; hence Falstaff's comparison of Prince Hal to a bow-case, in allusion to his slenderness. Bowmen in their hours of sport, used arrow-heads called *rigged*, *crossed*, *swallow-tailed*, and *spoon-handed*, according to the shape.

The circumstances attending the decline of the use of the long-bow are narrated in the articles above cited.

BOW ISLAND, an island of coral formation in the South Pacific, the largest in the Low Archipelago, being about 30 miles long and 5 miles broad. It can only be approached by a small opening in the reef at the north end. Within the lagoon, the anchorage is safe. The east side is well wooded, but the west is low and barren. Pearl-oysters and other shell-fish abound in the lagoon. The inhabitants are few, ill-looking, and indolent, with a partiality for raw food. The island was first discovered in 1768 by Bougainville, who gave it the name of La Harpe, which Cook, who visited it in the following year, changed to the name it now bears.

BOWDICH, THOMAS EDWARD, an enterprising African traveler, born at Bristol in June, 1790, was first engaged in trade in his native city, but afterwards appointed a writer in the service of the African Company. Selected, in 1816, to conduct a mission to the king of Ashantee, he published an account of it in 1819, 4to. On his return to Europe he resided for some years in Paris. To obtain funds for a new expedition into the interior of Africa, he published a translation of Mollien's *Travels to the Sources of the Senegal and Gambia*, and other works, and in August, 1822, sailed from Havre. He died of fever on the river Gambia, January 10, 1824. A profound scholar and accomplished linguist, B. was a member of several literary societies both in England and on the continent.

BOWDITCH, NATHANIEL, an American astronomer of some note, born 26th November, 1773, at Salem, in Massachusetts. He showed at a very early age a great inclination for mathematics, in which he afterwards made great proficiency, without ever attending a university. He was at first bred to his father's trade of a cooper, and afterwards apprenticed to a ship-chandler. He acquired Latin that he might study Newton's *Principia*. He particularly devoted himself to the study of the practical applications of science. He went as supercargo of a merchant-ship in several long voyages, and added a thorough practical acquaintance with navigation to a theoretical knowledge of it.

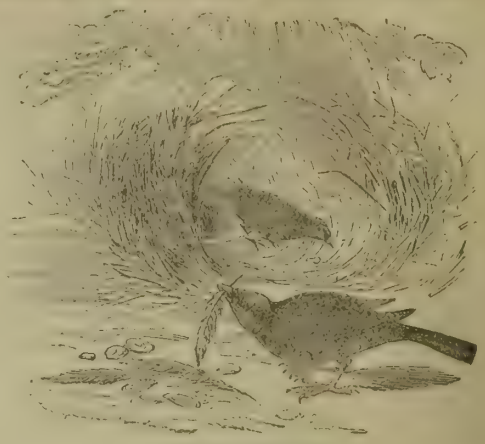
His work, *The American Practical Navigator*, was received with great favor. He published also an admirable translation of La Place's *Mécanique Céleste* (2 vols. Boston, 1829), to which he added valuable annotations. These works obtained for him marks of honor from scientific societies in Britain, and led to his being called to the professorship of mathematics and astronomy in Harvard College, in his native state, which situation, however, he declined, in order to enter the executive council of the state. He afterwards became manager of the Massachusetts Life Insurance Association, president of the Mechanics' Institute, and president of the Academy of Arts and Sciences in Boston. He died 16th March 1838.

BOWER (Ang. Sax. *bur*, a chamber). The 'ladies' bower,' a private apartment in ancient castles and mansions, used by ladies both as a parlor and sleeping-chamber.

> Up, then, rose fair Annet's father,
> Twa hours of it were day,
> And he is gane into the bower
> Wherein fair Annet lay.
> Ballad of *Lord Thomas.—Percy's Reliques.*

BOWER-BIRD, a name given to certain Australian birds of the Starling (q. v.) family, or *Sturnidæ*, remarkable for their habit of making bower-like erections, called *runs* by the colonists of New South Wales, and for adorning them with gay feathers, rags, bones, shells, and such other white or brightly colored objects as they can pick up. These bowers are not used as nests, but they appear to be places of much resort at the breeding-season in particular. The use made of them by the birds is very imperfectly understood; but their structure has been carefully examined, and fine specimens of them, transported with no little difficulty, have been deposited in the British Museum by Mr. Gould, in whose work on the *Birds of Australia* an account of them was first given to the world. The bowers of the Satin B. (*Ptilonorhynchus holosericeus*) are built among the branches of some tree, and appear to be repaired and frequented from year to year. The base consists of an extensive and rather convex platform of sticks, firmly interwoven, on the center of which the bower itself is built of more flexible twigs. It is chiefly at and near the entrance that the shells, feathers, &c., employed for decoration are placed. The bowers of the Spotted B. (*Chlamydera maculata*) are longer and more avenue-like than those of the Satin B.; they are placed upon the ground, and are outwardly built of twigs, and beautifully lined with tall grasses so disposed that their heads nearly meet. The decorative propensity appears in the highest degree in this species. 'In some of the larger bowers, which had evidently been resorted to for many years,' Mr. Gould says, 'I have seen nearly half a bushel of bones, shells, &c., at each of the entrances.' These are arranged in much the same at both entrances. Small pebbles are often transported by the birds from considerable distances.

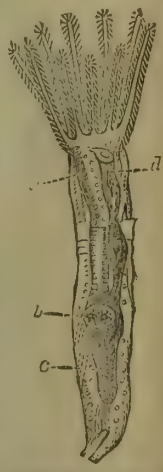
The Satin B. is particularly abundant in the mountainous districts of the west of New South Wales, and is found in all the



Spotted Bower bird.

'brushes' from the mountains to the coast. The adult male has the whole plumage of a deep, shining black. The colors of the female are grayish green and brown, curiously mingled.—The Spotted B., which is rather smaller than the Satin B., or about the size of a starling, has a general color of rich brown, beautifully marked with black and buff; a band of elongated feathers of light rose-pink crossing the back of the neck, and forming a broad, fan-like, occipital crest. It is exclusively an inhabitant of the interior of Australia.—Another species, the Great B. (*Chlamydera nuchalis*), considerably larger than either of the others, and very similar in form and plumage to the Spotted B., has been found in the north-west coast of Australia. Its bowers are always adorned with sea-shells, even when at a distance from the sea.

BOWERBA'NKIA, a genus of Zoophytes (q. v.), of the class *Polyzoa* or *Bryozoa*, order *Infundibulata*, the structure of which has been very carefully studied in the common British species, *B. imbricata*, one of the most abundant zoophytes on the coasts both of England and Scotland. It grows on sea-weeds, corallines, stones, &c., between high and low water mark, or in no great depth of water, and forms branching turfs sometimes 1½ inch in height. The branches are smooth and transparent, tubular, filled apparently with a granular fluid, and crowded with irregularly scattered clusters of delicate horny ovate or ovato-cylindrical cells, which are so transparent as to permit the most easy observation of their whole internal structure. The polypes which inhabit these cells are all connected with the tube of the branch, and so with the common life of the *polypidom*. Each, when fully expanded, is about one-twelfth of an inch in length, and has 10 finely ciliated tentacula. When alarmed, it contracts rapidly, the tentacula being first drawn in, and then the body of the polype retracted into its cell. The organization is higher than in many zoophytes. The mouth does not lead at once into the stomach, but into a funnel-shaped tube, which contracts into a gullet or *œsophagus*, *a*, in fig., and ends in a globular gizzard, *b*, apparently provided with radiating muscular fibres, and intended for trituration of the food. The gizzard opens below into a bag, which is regarded as the true stomach, *c*, and is supplied with a fluid, regarded as bile, from minute follicles or sacs in its sides, which follicles are therefore regarded as representing the liver. From the the upper part of the stomach, near the entrance from the gizzard, arises the intestine *d*, a straight tube which passes up by the side of the gullet, and terminates in an orifice outside the circle of tentacula; the structure thus exhibiting a strong resemblance to that of the Ascidian Mollusca.



Bowerbankia imbricata, greatly magnified.

When the polype is retracted, the gullet is bent upon itself, and the tentacula are enclosed in a tube or sheath formed by the inverted integument. When the polype is vigorous and lively, the cilia of the tentacula are kept in active motion, apparently quite under control of the will of the animal, forming a kind of whirlpool to bring animalcules or organic particles into the mouth.

BOWIE KNIFE, an American knife, so called from its inventor, Colonel Jim Bowie, a famous fighter with the rifle and other weapons, and altogether one of the most daring characters in the southern states of the Union. The B. K. is a sharp-pointed weapon, and is usually carried concealed in a sheath in the breast, or some other part of the person, ready for any encounter.

BOWING TOWARDS THE ALTAR is an ancient practice in the church, derived from a belief in the superior sanctity of the east. There are scriptural allusions to the east, from which notions of this kind may have been drawn. 'And, behold, the glory of the God of Israel came from the east.'—*Ezek.* xliii. 2. 'For we have seen his star in the east.'—*Mat.* ii. 2. There was also an early legendary belief that Christ would come to judgment in the east. For these, not to mention other reasons, it became customary to place the altar, with the crucifix and other symbols, at the eastern extremity of the church, to which all bowed. In the Romish Church, the practice is still kept up of bowing towards the altar, or more correctly towards the Host, on entering and departing from the church. Brand's *Popular Antiquities*, edited by Sir Henry Ellis, contains much curious antiquarian lore on this subject. It was further a custom in the early Christian Church to bow at the name of Jesus. This is still done in the Church of Rome, at whatever part of the service the name occurs. In the Church of England, it is customary to bow at the name of Jesus only in repeating the *creeds*. This ancient usage is traced to *Phil.* ii. 10, 'That at the name of Jesus every knee should bow.' Punctilious bowings and turning towards the east in repeating the *creeds*, have in late times given rise to dissensions in the Church of England.

BOWLES, WILLIAM LISLE, D.D., an English poet, was born 24th September 1762 at King's Sutton, in Northamptonshire, where his father was then vicar. He received his education at Winchester School, and at Trinity College, Oxford, and became at last a prebendary of Salisbury Cathedral in 1803, and Rector of Bremhill, in Wiltshire, in 1805. Here he spent, in comparatively affluent circumstances, the remainder of his long life. His poetical career began with the publication, in 1789, of *Fourteen Sonnets, written chiefly on Picturesque Spots during a Journey*. This unpretending little volume was received with extraordinary favor; the sonnets were fresh and natural, and to many minds, all the more charming because of the contrast which they presented to the style of poetry which had long been prevalent. Coleridge, Wordsworth, and Southey, were among their enthusiastic admirers; and through the influence which he exercised over them, B. may be regarded as the founder of a school of English poetry, in which their names soon became greater than his own. The subsequent poetical works of B. are very numerous, of which *The Spirit of Discovery* and *The Missionary* are generally regarded as the best of his longer blank verse poems. As a poet, B. shows a fine appreciation of the beauties of nature, and pleases by the expression of pure and generous sentiment, as well as by playfulness of fancy and perfect scholarly correctness, but he is greatly deficient in vigor and depth. He published an edition of Pope's works in 1807; and an opinion which he expressed on the poetical merits of Pope, led at a subsequent period to a rather memorable controversy, in which Campbell and Byron were his antagonists, and which turned chiefly upon the comparative value in poetry of images derived from nature and those derived from art. B. was generally admitted to have discomfited his opponents, B. frequently employed his pen in defence of the church of England, and endeavored to vindicate all the peculiarities of the older English educational institutions. Of his prose writings may be mentioned a volume of sermons (Lond. 1826), and a rather dry *Life of Thomas Ken, deprived Bishop of Bath and Wells* (2 vols. Lond. 1830—1831). B. died at Salsbury on 7th April 1850, in the 88th year of his age.

BOW-LINE, in a ship, is a rope fastened near the middle of the perpendicular edge of the square sails by three or four subordinate ropes called *bridles*. It is employed to tighten the edge of the sail in a particular direction during an unfavorable wind.

BOWLS, GAME OF. This is a favorite pastime throughout the British Isles. It is played upon a smooth, flat piece of turf, from 40 to 60 feet square, surrounded by a trench or ditch about half a foot deep. The players arrange themselves in sides, usually of four each, and each man is usually provided with two bowls. The bowls are made of lignum-vitæ wood, of 6 or 8 inches in diameter, nearly round, and with a bias to one side. A smaller ball, perfectly spherical, and white, is placed at one end of the bowling-green; this is termed the *jack*, and the aim of the players, who stand at the other end of the green, is to send their B. that they may lie as near as possible to the jack. The side whose B. are nearest the jack reckon one point for each bowl so placed. 7, 14, 21, or 31, make game, according to mutual arrangement beforehand. B. are biassed or weighted on one side, that the player may reach the jack by a curved instead of a straight course, an expedient which the nature of the game renders particularly desirable. Indeed, were it not for this, the game would lack half its charms. A bowl is played *forehand*, when it is so placed in the hand and delivered as to cause it to approach the jack with a curve from the right; and in order to attain this curve, the bowl must be held so that its bias is on the left or in-side. Backhand is the reverse. If a bowl goes into the ditch without touching the jack, it cannot count in the scoring of that end; but if it strikes the jack, and then rolls into the ditch, it reckons as if on the green. When the jack is carried by a bowl into the ditch, it is usually lifted, and placed on the green as near as possible to its position in the ditch. When the B. have so accumulated round the jack, that it is impossible to approach it from either *side*, without running the risk of touching an adversary's bowl, the last player frequently endeavors to *run* the jack, by playing straight at it with such force as to neutralize the bias, and, if fortunate, carry away the jack from the neighborhood of his opponent's bowls. A *skip* is appointed on each side, whose duty it is to direct each of his men.—For BOWLING at cricket, see CRICKET.

The game of B. was anciently unlawful, and was the subject of prohibitive legislation in England in the reign of Henry VIII.; but the law when enacted was repealed in 1845 by the 8 and 9 Vict. c. 109, s. 1, so that B. or other similar games of mere skill may be legally indulged in by the people.

BOWRING, SIR JOHN, an English politician, linguist, and author, was born at Exeter, 17th October 1792. He early devoted himself to the study of languages, in the acquisition of which he displayed an unusual degree of talent. The national poetry of different peoples had particular attractions for him, and he rendered great service to literature by collecting and translating both the more ancient and the modern popular poems of almost all the countries of Europe. His translations preserve remarkably well both the meaning and the spirit of the original ,and exhibit no mean powers of versification. B. was very intimately associated with Jeremy Bentham, who appointed him one of his executors, and intrusted him with the editing of his collected works. A descendant of the old Puritans, he early came forward in writing and speaking against the political disadvantages experienced by dissenters. He took part from the first in the *Westminster Review*, which was established in 1824, and edited it for about five years from 1825. In 1828, he visited Holland; and his letters—which appeared in the *Morning Herald*, and were shortly afterwards translated into Dutch—procured for him the degree of Doctor of Laws from the university of Groningen. Subsequent travels were undertaken by him, on a commission from the British government, to inquire into the commercial relations of certain states. He visited Switzerland, Italy, Egypt, Syria, and finally the countries of the German Zollverein, and everywhere found materials for valuable reports. He was a member of the House of Commons from 1835 to 1837, and again from 1841 to 1849, and actively promoted the adoption of free trade. In 1849, B. was appointed British Consul at Hong-kong, and superintendent of trade in China.

He returned in 1853, and in the following year was made knight, and governor of Hong-kong. In 1856, an insult having been offered to a Chinese vessel, said to have been under the protection of the British flag, B., without consulting the home government, ordered an attack on certain Chinese forts, a proceeding which excited considerable dissatisfaction in the country, and produced a ministerial crisis. B. afterwards returned to England. In 1855, he concluded a commercial treaty with Siam, and has given an interesting account of his visit in a work entitled *The Kingdom and People of Siam*. He retired on a pension in 1859, and afterwards published an account of the Philippine Islands. In 1861, B. was sent on an official mission to Italy. He died in 1872. His *Autobiographical Reminiscences* were published in 1877.

BOW'SPRIT is a large boom, spar, or mast, which projects over the stem or head of a ship. Its use is to carry sail forward, as a means of counteracting the effect of the after-sails, and keeping the ship well balanced. It is also the chief support of the fore-mast, which is fastened to it by large stays or ropes. In ordinary ships of war, the B. rises at an angle of about 45° from the horizon, and is generally about two-thirds as long as the main-mast; but in many kinds of vessels the position is more nearly horizontal.

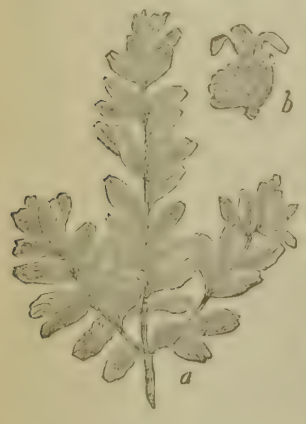
BOW'STRING HEMP, an English name, proposed by Dr. Roxburgh, and partially adopted, for the fibre produced by *Sansevie'ra Zeylanica*, a plant of the natural order *Liliaceæ* (q. v.), tribe *Hemerocalleæ*, a native of the East Indies. The employment of the fibre for making bowstrings led to this name. Dr. Royle prefers to use the Sanscrit name MOORVA, on account of the confusion apt to be caused by applying the term hemp to a variety of fibres. —The genus *Sanseviera* is distinguished by a colored funnel-shaped perianth, with a long tube, into the throat of which the stamens are inserted, and a 3-celled and 3-seeded, or abortively 1-celled and 1-seeded, berry. The plants have a general appearance much like that of many species of *Iris*, but their leaves are more fleshy; they have a thick creeping rhizome or root-stock; the rad-

ical leaves are long and narrow, and the flowering-stems have only scale-like leaves.—Very similar to *S. Zeylanica* are *S. Roxburghiana* and *S. lanuginosa*, also natives of India.—These plants grow under bushels in jungles near the sea, where the soil is salt, but may be easily propagated on almost any soil by the shoots which issue in great abundance from the root-stock. They are perennial.

The leaves are about 2 feet, or in cultivation 3 or 4 feet long; the fibres extend their whole length; and to separate the fibres from the pulpy part of the leaves, 'the natives place them on a smooth board, then press one end of the leaf down with one of their great toes, and with a thin bit of hard stick held between the two hands, they scrape the leaf from them, and very quickly remove every part of the pulp.' Steeping in water is also practised, but it discolors the fibre, which is beautifully white. One pound of clean fibre is obtained from about 40 lbs. of fresh leaves. Dr. Roxburgh calculated that 1 acre would yield 1613 lbs. of clean fibre at a gathering, of which two might be reckoned upon annually in good soil and favorable seasons, after the plants have reached a proper age. Moorva, or B. H., may well be supposed likely to acquire commercial importance. The fibre is hair-like and silky, elastic, and in strength apparently about equal to hemp. It does not rot in water so soon as hemp.—A species of *Sanseviera* very similar to the Indian ones, *S. Guineensis*, is found in abundance along a great extent of the west coast of Africa, specimens of the fibre of which, also fine and strong, have been brought to England under the name of AFRICAN BOWSTRING HEMP.

BOWYER, WILLIAM, an eminent English printer and classical scholar, born in London in 1699, was educated at Cambridge, and in 1722, joined his father in trade. Appointed, in 1729, printer of the votes of the House of Commons, he subsequently became printer to the Society of Antiquaries, and to the Royal Society. In 1767, he was nominated printer of the Rolls of the House of Lords, and the Journals of the House of Commons. He died in 1777. B. published several philological tracts, but his chief production was an edition of the New Testament in Greek, with critical and emendatory notes. He left a considerable sum in trust to the Stationers' Company, for relief of decayed printers. A small volume of anecdotes of B. and his learned contemporaries, published soon after his death by Mr. John Nichols, his apprentice and partner, was afterwards enlarged, under the title of *Literary Anecdotes of the Eighteenth Century* (9 vols., 8vo).

BOX (*Buxus*), a genus of plants of the natural order *Euphorbiaceæ;* evergreen shrubs or small trees, with opposite leaves, entire at the margins, and easily split into two plates. The greenish inconspicuous flowers grow in little axillary clusters, the male and female flowers distinct, but on the same plant. The male flowers consist of a perianth of four leaves, and of four stamens; the female flowers have a perianth of three or four leaves, and in addition, three small bracts at the base, an ovary surmounted by three styles, and two honey-secreting glands. The capsule has three beaks and three cells, and two or three black seeds in each cell.—The most important species is the COMMON BOX (*B. sempervirens*), which grows wild in the south of Europe, and in some parts of Asia. It is generally regarded as a true native of the south of England, where it grows on dry chalky hills; and is remarkable as the only arborescent species of *Euphorbiaceæ* found in such cold latitudes. In Britain, it seldom attains a height of more than 12 or 14 feet, but in warmer countries, it is often twice that height. Its leaves are oval, generally from half an inch to three-quarters of an inch in length, smooth and shining, of a deep green color. The box is remarkable for its compact habit of growth and densely crowded branches and leaves, presenting a very solid mass of foliage. There are several cultivated varieties, distinguished by differently variegated leaves—gold-edged, silver-edged, &c. The most interesting variety, however, is a very humble one, called DWARF BOX, which grows only to a height of two or three feet, and is very commonly used to form edgings for garden-plots, being kept down by clipping to the height of a few inches. These edgings—than which none are neater, or better serve the purpose of keeping gravel-walks free from earth—are generally formed by planting cuttings, which readily strike root. The box bears clipping remarkably well; and in a style of gardening once fashionable, but condemned by the taste of the present day, it occupied an important place, being cut into architectural and fantastic figures. The leaves of the box have a smell which is disagreeable to many people, and a very disagreeable bitter taste. When taken inwardly, they cause purging; an external application of them promotes the growth of the hair. In France, they are sometimes used instead of hops in making beer, but are extremely improper for the purpose. The wood of the box is heavier than that of any other European tree, and is the only European wood that sinks in the water. It is of a beautiful pale-yellow color, remarkably hard and strong, of a fine regular and compact texture, capable of a beautiful polish, and not liable to be worm-eaten.



Common Box:
b, *a*, female flower.

It is much valued for the purposes of the turner and the wood-carver; is preferred to every other kind of wood for the manufacture of flutes, flageolets, and other wind-instruments, as well as of mathematical-instruments; and is unrivalled for wood-engraving, admitting of a finish as sharp and fine as metal, whilst it *takes the ink* much better. See ENGRAVING. When scraped down and boiled, it can be used as a sudorific in many complaints, and as a substitute for guiacum. An empyreumatic oil, obtained from box-wood chips, is used for relief of toothache, and for other medicinal purposes.—Spain and Portugal send into the market large quantities of box-wood; also Circassia and Georgia, from which countries it finds its way to Odessa, and is again exported thence. In 1815, as many box-trees were cut down at Box Hill, in Surrey, as brought upwards of £10,000; but the tree is of so very slow growth, that it is seldom planted in Britain except for ornament.—The MINORCA BOX, or BALEARIC BOX (*B. Balearica*), a native of Minorca, Sardinia, Corsica, Turkey, &c., is a larger tree than the common box, and has leaves three times as large. It is much less patient of frost, but is occasionally seen in shrubberies in the south of England. The wood is of a bright yellow, and inferior to the true box-wood, but is brought in large quantities from Constantinople under that name, for wood-engraving.

BOX-DAYS. These are two days appointed by the judges of the Court of Session in Scotland, in the spring and autumn vacations, and one day in the Christmas recess, on which pleadings or other law-papers appointed by the court, or by one of the judges, towards the close of the preceding session, may be lodged or filed; the object being to expedite the procedure, notwithstanding the vacation or recess. These days are called B., in consequence of an act of sederunt or order of the Court of Session, dated the 29th November 1690, in which the evil custom of private solicitation of the judges is complained of: 'For preventing whereof,' says the order, 'and for easeing the leidges, themselves, and the lawyers, they, according to the example of the most famous judicatories abroad, have appointed *boxes* for every one of the lords, to stand on a bank in the Session-house from three o'clock till seven o'clock at night, each box having a slitt, in which the informations or bills may be lett in, and cannot be drawn out, untill the box be opened; the key whereof is to be keept by every judge himself, and to be committed to no other; and each lord is to send for his box at seven o'clock at night, that he may have competent time to peruse all the informations therein, and to consider the same, and the citationes alleged in the same, whereby none of the leidges can be put to trouble to attend any of the lords for giveing their informationes, bills, or answers.'

Further facilities for legal business in vacation-time are afforded in Scotland by the regulations of the *Bill-Chamber* (q. v.); and in England the equity and common law judges attend at chambers during vacation; but to English lawyers the use of B., or of any similar expedient, is unknown. See COURT OF SESSION and other COURTS.

BOX-HAULING is a particular mode of turning a ship, when the swell of the sea renders tacking impossible, or when the ship is too near the shore to allow room for veering. The operation is effected by a peculiar management of the helm and the sails. *Boxing-off* is an operation very similar to box-hauling. See further under TACK, VEER.

BOXING, or PUGILISM (Lat. *pugilatus*), fighting with the fists. It was practised as a manly exercise by the ancients, among whom it was an art so highly esteemed, that Pollux, Hercules, and some of the other gods were represented as having excelled in it. The pugilists of the ancient games had leather thongs on their hands, sometimes loaded with lead or iron; this armature of the hand was called the *cæstus*. Of course, their combats were not unfrequently attended with fatal consequences, which have resulted also in many instances of modern pugilistic encounters, although no armature of the fists is allowed. Among the Greeks, the practice of B. was at first permitted only to freemen, no slave, or person attainted with crime, being considered worthy to possess the high privilege of being beaten to the consistency of a jelly. Gradually, however, B. was taken up as a profession, and its character deteriorated. B. was a favorite amusement of Englishmen for centuries; it is even said to have had such distinguished patrons as King Alfred and Richard III. But the golden age of pugilism as a pro-

fession in England commenced with the accession of the House of Hanover; then men calling themselves professors publicly announced their intention of giving lessons in 'the noble art of self-defence.' One professor challenged another to combat in the most bombastic language.

In 1726, one Ned Sutton, who announces himself as 'pipemaker from Gravesend, and professor of the noble science of defence,' sneers at another professor, whom he calls 'the extolled Mr. Figg,' for having by 'sleeveless pretence' shirked a combat with him, 'which I take,' says the pipemaker and professor, 'to be occasioned through fear of his having that glory eclipsed by me, wherewith the eyes of all spectators have been so much dazzled.' He further assures the said Figg, that if he can muster enough courage to fight with him, he (Figg) 'will have the advantage of being overcome by a hero indeed!' Figg had an 'amphitheatre' in Oxford Road, wherein fights were held; and a larger one was erected in the same locality in 1742 for one Broughton, the funds being subscribed by some eighty noblemen and gentlemen. The pugilistic encounters that took place here were patronized by many of the nobility. Some faint protests against the brutality of the pastime now began to be made by the press, but these had little effect. Towards the end of the last century fights were patronized by princes of the blood-royal; and the Prince of Wales, afterwards George IV., was present at one at Brighton, in which one of the combatants was killed. When the allied sovereigns and their generals came over to England in 1814, Lord Lowther treated them to a series of B.-matches in his drawing-room, which were so highly relished that they were repeated a few days afterwards. One of the pugilists, called Jackson, became quite a hero, and made enormous sums by giving lessons to young noblemen, among whom was Lord Byron. In 1817, the Czar Nicholas of Russia witnessed a prize-fight at Coombe Warren. At the close, the victor was presented to him, with whom he shook hands. This was the last time that royalty was present at one of these disgusting spectacles.

The character of the prize-ring, or as it is called in the slang of its supporters, 'the P. R.,' had been for many years declining. People of influence and respectability seemed to have withdrawn their countenance from it. The lowest and least reputable class of the population furnished the fighters, and money was the only object of their backers. 'Fair-play' was no longer a 'jewel' in the P. R.; fights were sold, and the meanest and most disgraceful tricks resorted to, in order to win or to avoid the payment of bets. Prize-fights were under the ban of the law; in many counties of England, the police actively interfered to prevent them; and some railway companies refused to convey those taking part in them along their lines. The year 1860, however, witnessed a strange revival of the pugilistic spirit, on occasion of a fight between Tom Sayers, the 'champion prize-fighter of England,' and John Heenan, the 'Benicia Boy,' an American, for £200 a side, and the belt, a badge of honor won by the champion. The battle, which was elevated to the dignity of 'a great international contest' by sporting papers, took place at Farnborough, April 17, 1860. It lasted for more than two hours, in which time the American was beaten almost blind, and the Englishman dreadfully bruised. The continuance of the battle was prevented by the breaking in of the ring, caused by the interference of the police. After the fight the English champion was ranked by many newspapers—not sporting ones—with the heroes of the Crimea and of Lucknow; hundreds, if indeed not thousands, of pounds were subscribed for him, in admiration of his bravery, by persons of all conditions of life, and residing in all parts of the country; and he was fêted by merchants on the London and Liverpool 'Changes. His opponent received equally flattering and substantial testimonials from Americans. The fight formed the subject of discussion in the House of Commons, in which the home secretary announced that not only the principals, but all present at the spectacle were amenable to the law. Though no steps were taken to bring the offenders to justice, it was intimated to those chiefly concerned, that if a renewal of the fight were attempted, the law should be put in force against those aiding or abetting it.

The training which prize-fighters undergo for some months before a battle is of the most healthful kind; it rids them of every superfluous grain of flesh, braces their nerves, and makes their muscles like iron; yet, owing to the rude way in which the result of all this training is demolished in an hour's fight, professional boxers are usually very short-lived. With the exception of one, Gulley, who became M.P. for Pontefract, and the Jackson already alluded to, who made a fortune, few of them have ever risen to anything above the ownership of a low public-house, where they lay down the law on pugilism to their admirers, and take the chair at so-called 'harmonic meetings,' where B. is the entertainment. Prior to the decline of B. the doings of the prize-ring were duly chronicled by sporting papers. The following specimens of the slang will afford a sufficient idea of the character of this kind of literature. The mouth is called the 'potato-trap,' the 'kisser,' the 'whistler,' the 'grubber,' and the 'oration-trap;' the nose is variously described as the 'claret-jug,' the 'smeller,' the 'sneezer,' the 'snorer,' the 'sniffer,' the 'proboscis,' the 'nozzle,' the 'snout,' the 'scent-bottle,' and the 'snuff-box;' the ear as the 'conk,' and the eyes as the 'daylights,' the 'peepers,' the 'squinters,' the 'goggles,' &c. Instead of saying that the eyes did not swell up, the *littérateurs* of the P. R. would say that the boxer 'did not seem inclined to adopt the early-closing movement with either shutter!'

BOXING-DAY, the day after Christmas, and so called in England from being the day on which *Christmas boxes*, or presents, are given to servants and others. See CHRISTMAS BOX.

BOXING THE COMPASS is one among many sea-phrases not easily traceable to their origin. It means simply a rehearsal or enumeration of the several points, half-points, and quarter-points of the mariner's compass, in their proper order; and is among the lessons which a young sailor has to learn.

BO'XTEL, a busy town in the Netherlands province of North Brabant, is six miles south of Bois-le-Duc. Pop. (January 1, 1875) 5034, who are employed in agriculture and in manufactures. B. is famed for its table-linens, and beer, leather, paper, and salt are extensively made. It has connection with the leading railways. The Anglo-Dutch army, under the command of the Duke of York, was here defeated with great loss by the French in 1794.

BOX-THORN (*Lycium*), a genus of plants of the natural order *Solanaceæ*, having funnel-shaped or tubular flowers, and 2-celled berries. The species are pretty numerous, and found in different quarters of the world. Several are natives of the south of Europe, thorny shrubs, with long slender shoots and simple lanceolate leaves. *L. Europæum* may be trained to a height of 30 or 40 feet, and is often planted—as are also other species—for ornament, to cover walls, &c. It has pale violet-colored flowers, reticulated with red veins. Some of the species are almost trees. *L. fuchsioides*, although destitute of spines, is used as a hedge-plant in its native country, the Andes of Quito. Its flowers are orange scarlet, and grow in umbels.

BOYA'CA, a town of the U. S. of Colombia, near which, in 1819, Bolivar, by a victory over the Spaniards, secured the independence of Colombia. It gives name to the department, which stretches from the plateau of Bogota to the borders of Venezuela, being watered by the Magdalena, Sogamozo, Zulia, Cazanare, and Meta. The capital, however, is not B. itself, but the neighboring city of Tunja; which is about 70 miles to the north-north-east of Bogota.

BOYAR. See BOJAR.

BOY'AU, in military engineering, is a winding or serpentine trench, dug to form a path or communication between the different armed trenches of a siege-work, and to prevent them from being enfiladed, or fired upon in flank.

BOY-BISHOP. The custom of electing a B. on St. Nicholas's Day dates from a very early period. Warton thought he could find some allusion to it in one of the anathemas of the Constantinopolitan Synod, 867 A.D. It quickly spread over most Catholic countries, and in England seems to have prevailed in almost every parish. Although the election took place on St. Nicholas's Day (6th December), the authority lasted to Holy Innocents' Day (28th December). The B. was chosen from the children of the church or cathedral choir, or from the pupils at the grammar-school. He was arrayed in episcopal vestments, and, attended by a crowd of subordinates in priestly dress, went about with songs and dances from house to house, blessing the people, who, as Bishop Hall says, 'stood grinning in the way to expect that ridiculous benediction.' The B. exacted implicit obedience from his fellows, who, along with their superior, took possession of the church, and performed all the ceremonies and offices except mass. The custom found countenance not among the populace only.

In 1299, Edward I., on his way to Scotland, permitted a B. to say vespers before him at Heton, near Newcastle-on-Tyne, and gave him and his companions a present. At Salisbury—and perhaps in other places also—the B., it is said, had the power of disposing of such prebends as happened to fall vacant during the days of his episcopacy; and if he died during his office, the funeral honors of a bishop, with a monument, were granted him. What secular shows and entertainments accompanied this practice, history does not inform us. Probably dramatic exhibitions of a rude nature were the principal. In England, the custom of electing a B. was abolished by a proclamation of Henry VIII., dated July 22, 1542; restored by Queen Mary in 1554; and again abolished during the reign of Elizabeth, though it seems to have lingered here and there in villages till about the close of her reign.

BOYD, ZACHARY, an eminent Scotch divine, born before 1590, was educated at Kilmarnock, and studied at the universities of Glasgow, and Saumur in France, of which latter he was, in 1611, appointed a regent or professor, and is said to have declined the principalship. The persecutions of the Protestans in France

caused him to return to Scotland in 1621. In 1623, he became minister of the barony parish, Glasgow, and was thrice elected rector of the university of that place. His principal prose work, *The Last Battell of the Soule in Death*, published at Edinburgh in 1629 in two vols. was reprinted with a life of the author, by Grabiel Neil, Glasgow, 1831. He was author of eighteen other works, chiefly of a religious cast. The third edition of his *Psalms of David in Meeter* appeared at Glasgow, 1646. He died in 1653 or 1654, leaving numerous MSS. and his library, with a considerable legacy, to the College of Glasgow, over the court gateway of which is his stone bust, whilst his portrait is in the Divinity Hall of the same university. Among his MSS. is a collection of quaint poems on Scriptural subjects, entitled *Zion's Flowers*, usually called Zachary Boyd's Bible. As a specimen of his homely style, the following extract from Jonah's soliloquy within the whale's belly may be quoted here:

What house is this, where's neither coal nor candle,
Where I nothing but guts of fishes handle?
I and my table are both here within,
Where day neere dawned, where sunne did never shine;
The like of this on earth man never saw,
A living man within a monster's maw.
Buried under mountains which are high and steep,
Plunged under waters hundredth fathoms deep.
Not so was Noah in his house of tree,
For through a window he the light did see:
He sailed above the highest waves—a wonder;
I and my boat are all the waters under;
Hee in his arke might goe and also come,
But I sit still in such a straitened roome
As is most uncouthe, head and feet together,
Among such grease as would a thousand smother.
I find no way now for my shrinking hence,
But heere to lie, and die for mine offence
Eight prisoners were in Noah's hulk together;
Comfortable they were, each one to other.
In all the earth like unto me is none,
Far from all living, I heere lye alone.

BOYDELL, JOHN, a liberal patron of art in England, born in 1719. At the age of 21, he apprenticed himself for seven years to an engraver in London, and on the expiration of his apprenticeship, published, by subscription, a series of views in England and Wales, with the profits of which he set up a print-selling business in the metropolis. English engraving was at a low ebb when B. threw his money and intelligent energy into the work of its improvement. Under B.'s liberal patronage of native artists, the importation of foreign prints, for the most part, not only ceased, but English prints were exported to the continent. B. now determined to do for English painting what he had done for engraving. He accordingly selected Shakspeare's works for illustration; and in the carrying out of his object, secured the most eminent painters in the kingdom, including Opie, Reynolds, Northcote, and West. The result was the magnificent 'Shakspeare Gallery,' from which was engraved a superb volume of plates (Lond. Boydell, 1803). B. also published, at Bulmer's press, a splendid edition of Shakspeare's works in 9 vols. fol. (1792—1801). The immense sums of money he spent on the Shakspeare illustrations, and the commercial depression consequent on the French Revolution, brought him into difficulties, from which he was not wholly extricated before his death, in December 1804. An alphabetical catalogue of plates containing engravings by the best artists, from the finest works of the Italian, Flemish, German, French, and English schools; sketches from Claude Lorraine, &c., were among the collections published by Boydell.

BOYER, ALEXIS BARON DE, a French surgeon of the greatest eminence, was born at Uzerche, in Limousin, on 30th March 1757, or, according to others, in 1760. He was for some years in the service of a notary, before he began his medical studies. In 1787 he was appointed second surgeon to the Hôpital de la Charité at Paris, and afterwards professor, first of operative surgery, and then of clinical surgery, at the École de Santé. In 1804, he was appointed first surgeon to the emperor, who also raised him to the rank of baron. He accompanied the emperor on his campaigns and journeys. After the Restoration, B. became professor of practical surgery in the university of Paris, and first surgeon at the Hôpital de la Charité. In 1823, he was appointed consulting-surgeon to the king; and in 1825, was admitted a member of the Institute. He died on 25th November, 1833. His greatest works are his *Traité Complet d'Anatomie*, 4 vols. (Par. 1797—1799, and other editions), and his *Traité des Maladies Chirurgicales et des Opérations qui leur conviennent*, 8 vols. (Par. 1814—1822). From 1798 to 1817, he was engaged with Roux and Corvisart in conducting the *Journal de Médecine, Chirurgie et Pharmacie*.

BOYER, JEAN PIERRE, a mulatto, president of the republic of Hayti, was born 2d February 1776, at Port-au-Prince, capital of that part of the island then belonging to France. At a very early age he was sent to France, where he received a European education; and in 1792, entered the military service. He very soon became a *chef de bataillon*, and fought against the British on their invasion of his native isle. After further fighting against the British under General Rigaud, leader of the mulattoes, and afterwards under General Leclerc, he entered into a combination which had for its object the union of the negroes and mulattoes, and a complete emancipation of the colony. After the negro Dessalines had seated himself upon the throne, B., along with Péthion, took the lead of the colored people. They assisted Christophe to overthrow the bloody tyrant in 1806, but deserted Christophe when they saw that he wished to make himself sovereign. Péthion now established an independent republic in the western part of the island; and B. made himself indispensable to him by his military and administrative knowledge, so that he was invested by the new president with the command of the capital, Port-au-Prince, and the rank of a major-general.

In this capacity he endeavored to discipline his troops after the European manner; drove back, more than once, the black hordes of Christophe, thereby preserving Port-au-Prince from destruction; was recommended to the people by Péthion, when dying, as most worthy to be his successor; and was unanimously elected president of the republic. He arranged the financial affairs, collected funds into the treasury, improved the administration, and encouraged arts and sciences. After the death of Christophe, he united the monarchical part of the island with the republic in 1820; and in 1821, the eastern district also, which had hitherto remained under the dominion of Spain; and he urgently sought the recognition of the independence of the youthful state by France, which was obtained, in 1825, upon payment of an indemnity of 150 millions of francs. B. carried on the government of the republic of Hayti for fifteen years, from this time, with the most perfect peace; but his policy, which was rather arbitrary, and directed to the object of depressing the negroes in favor of his own race, the colored people, resulted in a victorious insurrection in 1843. B. fled to Jamaica, whence he announced his resignation to the Haytian revolutionary committee, and condemned himself to a voluntary ostratism. From the proclamation of the provisional government, it appeared that he was the victim of his aristocratic policy; but the provisional government, after it had obtained the upper hand, conducted itself very moderately towards the defeated party. See HAYTI. After a protracted stay in Jamaica, B. went to Paris, where he died in the beginning of July 1850. He was a man of great perseverance, and of captivating manners, but artful, and often harsh and cruel to those under him.

BOYLE, a town in Roscommon county, in a picturesque valley on both sides of the Boyle, one mile above its expansion into Lough Key, and 8 miles north-west of Carrick-on-Shannon. Pop. (1881) 2994. It has a large trade in corn and butter. Latin and English annals of B. date from 420 to 1245, and have been published. An abbey was built here in the 12th c., and was reduced to its present ruined state in 1595 by the Earl of Tyrone.

BOYLE, RICHARD, the founder of the House of Cork and Orrery, and fitly styled the Great Earl of Cork, was born in 1566, at Canterbury, of a good but not wealthy family. At the age of 22, after having studied at Cambridge and the Middle Temple, he went over to Ireland with a few pounds in his pocket, to hew his way to fortune.

His energy, prudence, and signal capacity for government, received their reward. He bought estates and improved them, promoting the immigration of English Protestants, and triumphed over the envy of his enemies, making good his cause before Queen Elizabeth, and winning her favor. Due honors flowed in upon him, and at length he was knighted. In 1620, he became Viscount Dungarvan and Earl of Cork. In 1631, he was made lord high treasurer, an office which remained hereditary in his family. In his old age, the Munster rebels compelled him to gird on armor, and turn his castle into a fortress. He soon raised a little army of his servants and tenants, and with an auxilliary force commanded by his four sons (and paid, when his money was spent out of his plate-chest), the noble old earl took castles, smote the rebels, and quenched rebellion in his borders. He died in 1644, at the age of 78.

BOYLE, THE HON. ROBERT, seventh son, and fourteenth child of the first Earl of Cork, was born at Lismore, Waterford, January 25, 1626. As a child, he was distinguished by precocity of intellect and a rare love of truth. After studying at Eton, and at home, he went to the continent, where he stayed for six years. On his return in 1644, he found himself in possession, by his father's death, of the manor of Stalbridge, Dorsetshire, where he took up his abode, and resided till 1650. He took no part in political strife, but devoted himself to cultivation of science, and particularly of chemistry and natural philosophy. He was one of the first members of that association of scientific men which about that time (1645) held private meetings at Oxford and London, and some years after, became better known as the Royal Society. In 1654 he settled at Oxford. Here he experimented extensively in pneumatics, and improved the air-pump. At the same time, he devoted considerable study to theology. After the Restoration, he was urgently advised by Lord Clarendon to enter the church.

but he thought he could do better service to religion as a layman. Among the proofs which he gave of this, besides his own theological writings and eminent example, were his exertions as a director of the East India Company for the propagation of Christianity in the East, as well as in procuring and circulating at his own expense translations of the Scriptures, and his bequest for the foundation of the 'Boyle Lectures' (q. v.), in defence of Christianity. In 1668, he took up his residence permanently in London, and was thenceforth able to devote much of his time to the business of the Royal Society. In 1680 he was chosen president, but declined the honor. A peerage had repeatedly been offered to him, and declined.

In 1688, finding his health decline, he shut himself up against all interruption, in order to husband his remaining time for the labor of repairing the loss caused by the accidental destruction of his MSS. In 1691, his health finally gave way, and on the 30th of December 1692 he died, seven days after his beloved sister, Lady Ranelagh. B. was tall and emaciated in person, and extremely temperate in his habits, often subject to low spirits, but naturally lively and of rare conversational powers. His piety, benevolence, and charity would have made him remarkable, apart from his scientific attainments and reputation. His complete works (including his very interesting correspondence), with a life by Dr. Birch, and an index, were published in 5 vols. fol. (Lond. 1744).

BOYLE, CHARLES, third Earl of Orrery, was born at Chelsea, August 1676, and entered Christ Church, Oxford, in his 15th year, where he had for his tutors Drs. Atterbury and Friend. His attainments as an undergraduate were respectable for a nobleman; and probably this circumstance induced the master of the college, Dr. Aldrich, to select the youth for the annual task of editing a classic. In B.'s case, it unfortunately happened that the *Epistles of Phalaris* were chosen, Sir William Temple having about that time passed the most extravagant encomiums upon them. In 1695 the work appeared. Two years later, Bentley published his famous *Dissertation*, in which he proved that the Epistle, instead of being composed in the 6th c. B.C., were the production of the 2d c. after Christ. B. in reality, had little to do with the unlucky performance to which his name had been attached. It was the work chiefly of Atterbury and Friend. Nevertheless, in the following year, and while B. himself was absent from the country, the wits and scholars of Christ Church again exposed him and themselves to the merciless criticism of Bentley by publishing *An Examination of the Dissertation*, &c., *by the Hon. Charles Boyle*. In 1699 Bentley once more replied, and sealed the lips of his adversaries for ever. But for this *Battle of the Books*, in which he only seemed to be engaged, B.'s name would have been forgotten. In honor of him, the name of 'Orrery' was given to the scientific apparatus of that name by its constructor, to whom B. had been kind. He fought, as major-general, at Malplaquet, was promoted to diplomatic and court appointments, wrote some literary pieces, and died in 1731. Of his poems, even Sir Richard Blackmore said:

> After his foolish rhymes, both friends and foes
> Conclude they know *who did not write his prose.*

BOYLE LECTURES, so called from the founder, the Honorable Robert Boyle (q. v.), who settled an annual salary, charged upon his dwelling-house in St. Michael's Crooked Lane, London, for 'some preaching minister,' who shall preach eight sermons in the year for proving the Christian religion against Atheists, Deists, Pagans, Jews, and Mohammedans, not descending to any controversies among Christians themselves. Archbishop Tennison procured a yearly salary of £50, to be charged upon a farm at Brill, Bucks, instead of the original charge for the endowment. The office is tenable for three years.

The first series of lectures, *A Confutation of Atheism*, was preached in 1692 by Richard Bentley (q. v.). In 1704, Dr. Samuel Clark preached the lectures, entitled *A Demonstration of the Being and Attributes of God*, in answer to the arguments of Hobbes, Spinosa, and their followers. In 1709, Dr. Lilly Butler lectured on *Religion no Matter of Shame*. All the lectures preached up to 1732 were collected into a fine folio edition, in 3 vols. (Lond. 1739); since that period, till recently, few of the lectures have been published. In 1846, the course of lectures was preached by the Rev. F. D. Maurice, and published under the title, *The Religions of the World*. The more eminent lecturers of recent years whose courses have been published are: Merivale, the historian (1864—1865), who lectured on *The Conversion of the Roman Empire and Northern Nations;* Professor Plumptre (1866); Professor Stanley Leathes (1868—1870); and Dr. Hessey (1871—1873).

BOYLE'S FUMING LIQUOR is the term applied to a concentrated solution of ammonia, saturated by a stream of hydrosulphuric acid, which combining with it, forms the sulphide of ammonium (NH_4S). Exposed to the air, it fumes, and evolves a very disagreeable odor, resembling, but in an intensified degree, ordinary bilge or sewerage water.

BOYNE, a river in the east of Ireland, rises in the Bog of Allan, and flows through Kildare, King's County, Meath, and Louth. It passes Trim, Navan, Slane, and Drogheda, and enters the Irish Sea 4 miles below the last town, after a course of 65 miles in a carboniferous limestone basin, its total descent being 336 feet. Its chief tributaries are the Deel, Mattoch, and Blackwater. It is navigable for vessels of 250 tons to Drogheda, and for barges of 70 tons to Navan, 19 miles up. Its banks are studded with many ruins of monasteries and castles. In 838, Turgesius the Dane sailed up the B., and plundered Meath. But this river is chiefly famous for the battle of the Boyne, which took place on its banks, near Oldridge, on the 1st of July 1690, and in which William III. defeated James II. An obelisk, 150 feet high, marks the scene of the battle.

BOYS, SHIPS'. In nautical language, all the young or green hands on board are called *boys*, without much reference to their age; but in recent times, arrangements have been made to give a more precise meaning to the term, by engaging boys or lads as part of the crew.

In the royal navy, boys were first voted for in the estimates in 1834. There were 1000 in that year; 7000 in 1876; 6300 in 1878; and 5300 in 1879. The Admirality has, in recent years, made many regulations for attracting boys into the navy. Most of the seamen at present in the service entered it as boys. They enter mostly at about 14 years of age, but some as late as 18, and they are bound for 7 years. There are schools established for them at Portsmouth, Plymouth, Cork, and one or two other places. The boys are ranked in two classes, according to age and experience. When out of their time, they have a tendency to enter the merchant service for two or three years; but they usually return to the navy, and enter as ordinary seamen. See further under MANNING THE NAVY.

In the merchant service, boys are apprenticed to the shipowners; they learn their duties by degrees; and constitute the source out of which mates, masters, and captains are ultimately supplied. By the Merchant Seamen's Act of 1844, every merchant-ship was bound to take a certain number of boys as apprentices, according to tonnage; the better hands were apprenticed by their friends; the worst were picked up by the Marine Society from the poor and wretched of the streets, and apprenticed as a means of setting them up in life. The indenture was from 12 to 18 months. The regulations have been modified in form, but not in substance, by the Mercantile Marine Act of later date.

BOZZARIS, MARCOS, a Greek patriot who distinguished himself in the early part of the modern War of Independence, was born at Suli, in the mountains of Epirus, towards the close of the 18th century. His youth was spent amid the din of arms. In 1803, he was forced to retreat to the Ionian Isles, by Ali Pasha (q. v.), who, in a series of bloody combats, had nearly exterminated the Suliotes. In 1820 two events occurred which called forth his patriotic energies: Hypsilanti summoned the Greeks to insurrection, and war broke out between Ali Pasha and the sultan. On learning the news, B. put himself at the head of some 800 expatriated Suliotes, and passed over into Epirus Ali, who dexterously endeavored to identify his cause with that of the Greeks, soon found means to secure B.'s services against their common enemy, the sultan. B. obtained several victories, and on the death of Ali at the taking of Janina in 1822, he continued the war successfully against Khurshid Pasha, the Turkish general. Shortly after, Prince Mavrocordato landed at Mesonlonghi, with a body of disciplined troops, and being joined by B., he engaged the Turks at Petta, on the 16th July 1822.

Through treachery the Greeks were overpowered, their best soldiers perished, and B., along with Mavrocordato, was compelled to retire to Mesolonghi. This place he skilfully defended against the Turks, until a Hydriote fleet forced them to retire. In the summer of 1823, a Turco-Albanian army of 20,000 men, under the command of the Pasha of Scodra, descended from the north of Epirus. B., who knew that the fortifications of Mesolonghi were too weak to withstand an assault, determined to surprise his enemies by a sudden blow. He advanced swiftly at the head of 1200 men, and on the 20th of August reached Kerpenisi, where the van of the Turco-Albanian army, 4000 strong, was encamped. At night, the Suliotes burst in upon their startled foes, who were routed with great slaughter. The victors captured their camp, standards, and a vast quantity of baggage. This triumph was saddened by the loss of the heroic B., who fell while leading on his men to the final attack. His body was solemnly interred at Mesolonghi, and he was honored with the title of the 'Leonidas of Modern Greece.'

BO'ZZOLO, a town of North Italy, province of Mantua, situated on the right bank of the Oglio, about 16 miles west-southwest of Mantua. B., which was at one time a small independent republic, has remains of old fortifications, some silk-weaving, and an annual fair. Pop. about 4500.

BRA, a town in the province of Cuneo, North Italy, 25 miles north-east of Coni. It has metal foundries and silk manufactures, and a good trade in cattle, grain, and wine. Pop. 10,500.

BRABANÇONNE, the patriotic song of the Belgians, originally sung by the insurgents during the revolution of September 1830. A young French player, by name Jenneval, at that time connected with the theater at Brussels, was the author of the song; it was set to music by a singer named Campenhout. Jenneval fell in a combat with the Dutch at Berchem. The Belgians allowed his mother a pension of 2400 francs. Campenhout received from King Leopold a golden snuff-box, and was appointed director of the royal chapel. Each verse of the B. ends with the refrain—

La mitraille a brisé l'orange
Sur l'arbre de la liberté.

BRA'BANT was the name formerly given to an important province of the Low Countries, extending from the left bank of the Waal to the sources of the Dyle, and from the Maas and the plain of Limburg to the Lower Scheldt.

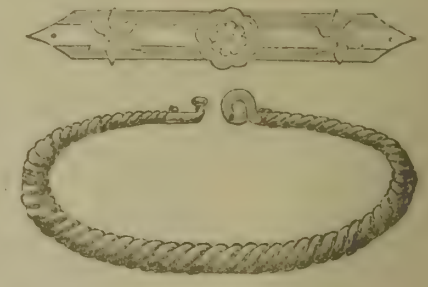
In the time of Cæsar, B. was inhabited by a mixed race of Germans and Celts; it afterwards came into possession of the Franks, and in the middle ages it formed a duchy by itself, dependent upon Lower Lorraine, with which, in 1107, the county of Antwerp was incorporated, and in 1347, for a time, the lordship of Mechlin or Malines, formerly connected with Liège. After many changes, B. (divided into the provinces of North and South B.) was made a part of the kingdom of Holland, at the Congress of Vienna; but at the revolution of 1830, South B. separated from Holland, and became part of Belgium (q. v.). Old B. is now divided into three provinces: 1. North or Dutch B., containing 1960 square miles, and (1875) 447,632 inhabitants; 2. The Belgian province of Antwerp which contains 1094 square miles, and (1873) 513,543 inhabitants; and 3. South B., also Belgian, containing 1260 square miles, and an extremely dense population of (1873) 922,468. The country consists of a plain gently sloping to the north-west, and rising in the south into gentle hills, which are offsets of those of the Ardennes. In the level northern part are many heathy and fenny tracts; one of them, a morass called the Peel, is 20 miles in length, and from 2 to 6 broad. In the hilly district of the south is the Forest of Soignies. The Maas and the Scheldt are the principal rivers; but some of their tributaries are also very useful for internal commerce, which is further promoted by canals and railways. The soil of North Brabant is fertile, and wheat, rye, oats, barley, beans, potatoes, beet, colza, madder, flax, and hay are extensively grown; also hops, tobacco, and chicory. Farm stock is large. Principal towns are 's Hertogenbosch, Tillburg, Breda, and Bergen-op-zoom. Soap-boiling, distilling gin, book-printing, refining salt, making beet-sugar, beer, cigars, thread, woollen cloths, leather, earthenware, weaving and printing cottons, Turkey-red dyeing, are chief industries. B. lace has long been celebrated. The inhabitants in the north are Dutch; in the middle district, Flemish; and in the south, of Walloon race. The boundary between the languages is a few leagues to the south of Brussels, the Walloon French being spoken to the south, and Flemish and Dutch to the north of this line.

BRACCIO, FORTEBRACCI, COUNT OF MONTONE, a celebrated condottiere (see CONDOTTIERI), born at Perugia in 1368, of an old patrician family, was, in early youth, the leader of a troop of mercenaries in the service of the Count of Montefeltro, against the Malatesti, lords of Rimini. He became the champion of the Perugian nobles who were driven into exile in 1393; and after serving in Lombardy under Alberico da Barbiano, he carried on a partisan warfare in the Marches of Ancona against the Marquis Ludovico Migliorati, nephew of Pope Innocent VII. In 1408, he entered the service of Ladislaus, king of Naples, who had designs on Central Italy, and, with his condotta, crossed the Apennines, scoured the valley of the Tiber, and took several towns. In June of the same year, the people of Perugia offered the dominion of their city to the Neapolitan king on condition that he would prevent the nobles from returning. He accepted it, and ungenerously sent a large force against B., who retired to the Marches. In 1416, however, B. obtained the sovereignty of his native city, when the banished nobles, after an exile of twenty-four years, were restored. In 1417, B. got possession of Rome by capitulation, but was soon obliged to evacuate it. He afterwards made terms with the pope (Martin V.), with whom he had a conference at Florence in February 1420, and subsequently accepted from Joanna, queen of Naples, the command of her land-forces, with the rank of high constable of that kingdom. Entering the Abruzzo, he surprised Capua, and having relieved Naples, then besieged by the queen's enemies, was created by her Count of Foggia and Prince of Capua. In 1423, B. was, by her order, crowned at Perugia, as Prince of Aquila and Capua. Aspiring to the throne of Naples, he overran Campania and Apulia with a considerable army, took Bari, and advanced into Calabria. In a battle which ensued for the relief of the strong town of Aquila, besieged by him, B. was wounded and taken prisoner. After lingering for three days, refusing food, he died June 5, 1424, in his 56th year. His deeds, in chronological order, and those of his contemporary, Piccinino, are commemorated by Lorenzo Spirito, in a poem of 101 chapters, in terza rima, entitled *L'Altro Marte* (Vicenza, 1489).

BRACE, in Carpentry, an oblique piece of wood used to bind together the principal timbers of a roof or other wooden structure. See ROOF, BORING.

BRA'CELET (Fr. *brachiale*, from Lat. *brachium*, the under part of the arm), an ornament worn on the arm, generally at the wrist. Bracelets and armlets (Lat. *armillæ*) have been used by every nation, both savage and civilized, from the earliest periods to our own. They are frequently mentioned in Genesis, as worn both by men (xxxviii. 18) and by women (xxiv. 30); both by the Hebrews and the surrounding nations (Numb. xxxi. 50). Similar ornaments were worn round the ankles, but they are stigmatized by Isaiah as marks of luxury (iii. 16). The Medes and Persians were remarkable, even amongst the Asiatics, for their love for ornaments of this class. They wore not only bracelets and armlets, but earrings, collars, and necklaces, which often consisted of strings of valuable pearls, or were enriched with other jewels. These ornaments were used to indicate the rank of the wearer, and this use has continued to be made of them in the East down to the present day. In Europe, bracelets and armlets were worn both by the classical nations and and barbarians from the earliest times. The Gauls wore them; and the Sabines, as early as the foundation of Rome, had ponderous golden armlets on the left arm. The same was the case with the Samians about the same period. It does not appear that armlets were worn by men during the historical period of Greece, but ladies wore both armlets and bracelets of the most various materials and forms. Both generally passed round the arm several times, and the form of B. now most in fashion has been accurately copied from those twisted spirals described by Homer in the eighteenth book of the *Iliad*, line 401. Many examples of this kind of B., as represented on painted vases, will be found in Sir William Hamilton's work. We are indebted to the Greeks even for the idea of giving to these spiral bracelets the form of a snake, the best models of our present goldsmiths being exact copies of antique bracelets. The goddesses of the Greeks, like the blessed Virgin in Roman Catholic countries, were represented as attired in the style of ladies of the highest rank; and the celebrated marble statue of Aphrodite, preserved at Florence, exhibits traces of a metallic armlet. Amongst the Romans, armlets were frequently conferred upon soldiers for deeds of valor, of which an instance is mentioned by Livy (x. 44). Roman ladies wore bracelets, not only for ornament, but also for the purpose of containing amulets, which wese supposed to effect miraculous cures. On this principle it is said that the Emperor Nero wore on his right arm the skin of a serpent, enclosed in a golden armilla. But at Rome also, it was chiefly an indication of rank or wealth that these ornaments were worn.

Many Roman bracelets have been preserved, and the accompanying wood-cuts, taken from Smith's *Dictionary of Greek and Roman*



Antiquities, to which we have been indebted for much of the information contained in this article, exhibit two antique bracelets of different forms.

BRACES, on shipboard, are ropes attached to the yard-arms, and employed to shift the sails in a horizontal direction round the masts, so as to receive advantageously the wind that may be blowing at any particular moment. The phrases, 'to brace to,' 'to brace about,' 'to brace the yards sharp up,' &c., apply to this operation.

BRACHE (Fr. *braque*, diminutive *brachet*), a term frequently employed by the older English authors to designate some kind of dog. To what kind this name belonged, is, however, not very certain. The probability appears to be, that it was applied to hounds or hunting-dogs in general. The term is believed to be of Celtic derivation (from *bracach*, grayish, badger-colored, or *breac*, spotted), and to have originally signified gray or spotted dog.

BRA'CHIAL A'RTERY is that portion of the great arterial trunk supplying the upper extremity between the armpit and the elbow; in other words, it is the continuation downwards of the axillary artery. The B. A. runs along the inner side of the arm, just behind the inner margin of the biceps muscle, and behind the great median nerve. Here it may be pressed against the bone, in cases of bleeding from any point below. In its course, the B. A. gives off, 1*st*, the superior profunda branch, which winds round the back of the arm-bone, and reappears on the outer side, where it joins some twigs coming up from the radial artery; 2*d*, an artery which enters the bone to supply its medullary membrane; 3d, the inferior profunda, which, running down behind the internal condyle (the funny bone) of the humerus, joins branches coming from the ulnar artery; 4*th*, a short branch, the anastomotica magna, which breaks up into numerous branches inosculating round the elbow.

Brachial Artery: *c*, brachial artery; *d*, superior profunda branch; *e*, inferior profunda; *f*, anastomotica magna.

BRACHIO'PODA (Gr. arm-footed), or PA'LLIO-BRANCHIA'TA (Gr. mantle-gilled), a class of molluscous animals, having bivalve shells, but differing in important points from the vast majority of recent mollusks with bivalve shells, the *Lamellibranchiata* (q. v.). The chief differences existing in the shelly covering itself have been already pointed out in the article BIVALVE SHELLS (q. v.), but those of internal structure are still more important. The mantle or *pallium* (see MOLLUSCA) in the B. consists of two broad expansions or lopes, covered by the two valves of the shell, and enclosing all the other soft parts of the animal; whilst respiration or the aëration of the blood is carried on by the surface of these lobes themselves, traversed by minutely ramifying blood-vessels, extended into processes, and furnished, especially along the edge, with vibratile cilia which create a continual current in the surrounding water, and thus keep up a fresh supply, from which the necessary air may be obtained.

The organs by which food is procured are also remarkable—two long arms arising from the sides of the mouth, and disposed wholly or partly in spiral curves, when not extended to seek or seize prey. These arms are usually furnished with numerous vibratory filaments, which are supposed not only to aid in the capture of prey, but in the maintenance of the current necessary for respiration. The B. are attached to solid bodies either by a footstalk or by one of the valves of the shell. Of existing species, the *Terebratulæ* or Lamp-shells (q. v.) are by far the most numerous; but even these appear to have existed in far greater numbers in former geologic periods, and of some of the other families of B. only a single species is known to exist, or the existing species are very few, whilst the fossil species are very numerous. The existing species are very widely diffused over the globe. All of them are marine, and one (*Crania personata*) has been brought up from the depth of 255 fathoms. The B. are regarded as exhibiting structural affinities not only to the *Ascidia* (q. v.) and the *Lamellibranchiata*, between which they are commonly placed, but also to the class *Bryozoa* or *Polyzoa* (q. v.).

BRACHY'PTERÆ, or BRACHY'PTERES (Gr. short-winged), in Ornithology, that section of the order of *Palmipedes* (q. v.), or web-footed birds, in which the wings are short, and the feet are placed far back, so as to compel the birds to assume a nearly erect posture when on land. They are all very aquatic in their habits, and excel in diving, so that the name DIVERS is sometimes used as equivalent to B.; but that name is also not unfrequently applied to other aquatic birds, and is sometimes restricted to the genus *Colymbus*. Auks, puffins, penguins, grebes, guillemots, and divers (*Colymbus*) are among the Brachypteræ.

BRACT, or BRA'CTEA, in Botany, a leaf from the axil of which a flower or a floral axis is produced, instead of an ordinary leaf-bud or branch. Bracts are sometimes called floral leaves. The term B. is not, however, generally employed when, as is often the case, there is no marked difference from the ordinary leaves of the plant; but the flowers are said to be axillary, or in the axils of the leaves. On the other hand, the term B. is very frequently applied to all altered leaves interposed between the ordinary leaves and the flower or flowers. In this case, they are sometimes very small and scale-like. The ordinary leaves often pass, by imperceptible gradations, into bracts, diminishing in size, becoming more simple, and often also scariose. Bracts are generally entire, even when the ordinary leaves are divided. They are sometimes colored so as apparently to form part of the flower, and sometimes crowded, so as to resemble an involucre o an outer calyx. They appear to serve purposes analogous to those of leaves, or, when colored, of petals. When the primary floral axis is branched, bracts (sometimes distinguished as *bracteoles* or *bractlets*) are often to be ssen at its ramifications. Bracts sometimes fall off at an early stage, sometimes they are more permanent, and sometimes they even remain to cover and protect the fruit

BRA'CKET, an ornamental projection from a wall, used for the purpose of supporting a statue, bust, or the like. See CORBEL. Brackets may be either of stone or wood, and they are sometimes

Ornamental Brackets.

elaborately designed and carved. The term B. is also employed in joinery, &c., to designate supports, in the form of a bent knee, or shelves, galleries, &c. B. is also generally applied to such gaslights as project from the wall.

BRA'CKLESHAM BEDS, a group of highly fossiliferous strata in the middle Eocene formation, included in the Bagshot series (q. v.).

BRADDOCK, EDWARD, a British major-general, commander against the French in America in 1755, arrived in February of that year at Richmond, Virginia, and with a force of 2000, British and provincial troops, reached the Monongahela, a branch of the Ohio, on July 8. Leaving the baggage behind, on the 9th his force moved forward to invest Fort du Quesne, now Pittsburg, Pennsylvania, when, from his slighting the warning of his American officers, of the probability of a surprise, the troops, in passing through a deep forest ravine, fell into an ambuscade of Indians, while they were attacked in front by the French, and half of them slain. The rest made a hasty retreat under Colonel, afterwards General Washington, B.'s aide-de-camp, the only one of his officers who escaped with life. B., mortally wounded, was carried on a tumbril 40 miles to where the baggage had been left, and there he died.

BRADDON, MISS MARY ELIZABETH, one of the most popular novelists of the day, was born in London in the year 1837. Her father, Mr. Henry Braddon, was a solicitor. She very early showed a turn for literature, which she indulged in the usual manner, by sending verses and other trifles to the magazines and newspapers. In 1860, she essayed a somewhat more sustained effort in a little *commedietta* called *The Loves of Arcadia*, which was brought out at the Strand Theater; and the year after, she published a volume of verse entitled *Garibaldi and other Poems*. Neither these, however, nor the tales which she now began to issue through the medium of the *Temple Bar* and *St. James's Magazine—Lady Lisle, The Captain of the Vulture, Ralph the Bailiff*, &c.—in any decisive way succeeded in drawing to her the attention of the public. Her first great success came with the publication, in 1862, of *Lady Audley's Secret*, which instantly attained a great popularity. This has since been extended by the appearance of *Aurora Floyd, Eleanor's Victory, John Marchmont's Legacy, The Trail of the Serpent, The Ladies' Mile, Sir Jasper's Tenant, Only a Clod, The Doctor's Wife, Run to Earth, The Lovels of Arden, Birds of Prey, Dead Sea Fruit, To the Bitter End, Strangers and Pilgrims, Weavers and Weft, The Cloven Foot, Mount Royal* (1882), &c. Miss B. has contributed very extensively to *Belgravia*, a magazine which she conducted for a time. Few books of the period have secured a wider circle of readers than Miss Braddon's. They mainly depend for their interest on good bold effects of what is termed, in the slang of the day, *sensation*, and the art of their appeal to 'that low vice, curiosity,' in the conduct of a story, carefully leading up to some suspended and unforeseen *dénouement*. In their particular way, though without much claim to attention as regards either character or sentiment, they display undoubted talent: in style, they are fresh and vigorous, and their narrative power strongly excites the reader's interest. Miss B. is still in uninterrupted literary activity.

BRA'DFORD, an important manufacturing town in West Riding, Yorkshire, on a tributary of the Aire, at the meeting of three vales, 8 miles west of Leeds. Pop. in 1871, 145,827; in 1881, 180,459; of whom more than half are immigrants from other districts. The area of the parish is 34,146 acres, extending to the confines of Lancashire. It returns two members to parliament, having been created a parliamentary borough in 1832. It became a municipal borough in 1847. B. is the chief seat in England of

the spinning and weaving of worsted yarn, and the great mart for the long wools used in worsted fabrics. Cottons are also manufactured. There are more than 200 mills, employing 40,000 persons.

Notwithstanding the large population, and the nature of their employment, the annual rate of mortality is now only 24 per thousand. Twenty years ago, the rate was 30. The Saltaire alpaca and mohair mills, on the Aire, 3 miles from B., cover more than 6 acres. This establishment, erected by Sir Titus Salt, Bart., is the most splendid manufacturing concern in England. Here is also the largest silk-mill in England, built by Mr. S. C. Lister. Coal and iron mines occur near Bradford. There are over twenty churches belonging to the establishment in the borough, and many Dissenting and R. C. churches. The gross estimated rental of the borough is £600,000, and the rateable value £500,000. It has two public parks, each containing more than 50 acres, besides smaller ones, and also many excellent charities. The Romans seem to have worked iron-mines here, Roman coins having been found in foundry refuse near the town. The early history of B. is connected with the castle of the Laceys here. In the civil wars, the people of B. took the parliament side, and twice defeated the royalists, but were afterwards themselves defeated by the Earl of Newcastle. In a riot at B., against the introduction of worsted power-looms, in 1826, two of the rioters were shot dead by the defenders of the mill which contained the obnoxious machinery, and many more were wounded. In 1825, a strike for increased wages, in which 20,000 persons were concerned, lasted six months. The Baptists, Independents, and Wesleyans have colleges near Bradford. This town is the seat of the first English temperance society. At Fulneck, 3 miles east of B., is a Moravian settlement, founded in 1748, where Montgomery the poet was educated. B. has been latterly much improved in its buildings, and possesses a spacious and elegant public hall, in which the National Association for promoting Social Science met in 1859, and the British Association in 1873. The merchants of B. are distinguished by their liberality and enterprise. Their warehouses form the great wholesale market in the worsted and alpaca trade.

BRADFORD, GREAT (Sax. *Bradanford*, broadford), a town in the county of Wilts, on both sides of the Avon, and on the Kennet and Avon Canal, six miles E.S.E. of Bath. Pop. (1871) 4871. It has been noted for many centuries for its manufacture of fine broadcloths. Kerseymeres were first made here. An India-rubber manufactory has been also lately established. The remains of a monastery, founded in the 7th c. by St. Aldhelm, are still visible.

BRADFORD CLAY, a member of the Lower Oolite, is a blue unctuous clay, occurring at Bradford near Bath, and extending for a few miles around: it is never more than 40 or 50 feet in thickness. It is remarkable for the occurrence in it of large numbers of a crinoid (q. v.), (*Apiocrinites Parkinsoni*). The upper surface of the calcareous rock on which the clay rests is completely incrusted over with a continuous pavement formed of the stony bases of this crinoid. It had once formed the bottom of a sea, in which these animals lived, their stems bending with every motion of the water, and their star-like crown of arms outstretched in search of food. At length, however, the clear water was invaded by a current largely charged with mud, which broke most of their stems off near the base. The stem, body, and arms have been dismembered, and are confusedly scattered through the clay.

BRADLEY, DR. JAMES, one of the most distinguished astronomers and discoverers of any time or country, was born at Sherborne, in Gloucestershire, in 1692. He received his early education at a boarding-school at North Leach, whence, being destined for the church, he proceeded to Oxford. Soon after graduating, he obtained successively the livings of Bridslow and of Welfrie, in Pembrokeshire; but there is reason to fear that his mathematical pursuits considerably distracted his attention from his clerical duties. Devoting himself to mathematics and astronomy, he soon exhibited such a genius for these pursuits as to win the friendship of all the leading mathematicians of his time, among others, of the great Isaac Newton, and to get elected a member of the Royal Society. About the time of his election, 1721, he became, in his 29th year, Savilian professor of astronomy at Oxford, resigned his livings, and devoted himself wholly to science. In 1727, he published his theory of the aberration of the fixed stars, containing the important discovery of the aberration of light, to which, it is related, he was led somewhat by accident, as Sir Isaac Newton was to the theory of gravitation. What suggested this discovery to B., it is said, was the observation that the vane of a yacht in which he was sailing never lay in the line of the wind, but was always inclined to it at an angle depending on the line and amount of the yacht's motion. This led him to a train of thought resulting in the proposition, that the direction in which we see a star is not that in which it actually lies, but inclined to it by an angle depending on the direction of the earth's motion around the sun at the time of the observation, and the ratio of its velocity to that of light. See ABERRATION.

Three years after this publication, B. became lecturer on astronomy and physics at the Oxford Museum. His next discovery was that the inclination of the earth's axis to the ecliptic is not constant, a fact including the explanation of the precession of the equinoxes and the nutation of the earth's axis. This discovery constitutes a great epoch in astronomy. Latterly, B. became Regius Professor of Astronomy at Greenwich, where, by his observations, he still further enriched the science. He declined the living of the parish of Greenwich, which was offered to him, and was favored by the crown with a pension of £250 a year for his services to commerce and navigation. Towards the end of his life, B. was elected member successively of almost all the leading scientific societies in Europe. He died on the 2d of July 1762, in his 70th year. B. is described as having been gentle, modest, compassionate, and liberal; little given to speaking or writing, from diffidence and the fear of hurting his reputation. No man ever better merited the title of a great astronomer.

BRADSHAW, JOHN, an eminent Puritan, was born in 1586, of a good family in Cheshire, and studied law at Gray's Inn. Called to the bar, he gained a good practice by his ability and learning, especially as a chamber counsil. In October 1646 he was appointed a commissioner of the Great Seal, and in February 1647 chief-justice of Chester. In October 1648 he received the degree of serjeant, and in the following January, was elected president of the high court of justice for the trial of King Charles I. As the reward of his services on that solemn occasion, he was made President of the Council of State, and Chancellor of the Duchy of Lancaster, besides the grant of estates worth £4000 per annum, the deanery house of Westminster for a residence, and £5000 to furnish it. B., however, refused submission to the Protector. He was an able lawyer, but not an able politician. His mind was rigid rather than broad, and, in consequence, he was unable (like so many others of the stern fanatical republicans of his time) to see or comprehend the necessity for a great iron rule like Cromwell's. He even engaged in some Fifth Monarchy and other plots against Cromwell, but his respectable character and past services saved him from molestation. He was deprived, however, of his office as chief-justice of Chester. After Oliver's death, he was Lord President of the Council of State, and a commissioner of the Great Seal under Richard. His last public act was to protest against the violent seizure of Speaker Lenthall by the army. He died November 22, 1659. His body was buried with pomp in Westminster Abbey, but it was afterwards exhumed and hung on a gibbet, with those of Cromwell and Ireton.

BRADSHAW'S RAILWAY GUIDE, the pioneer, and still the type, of that now extensive class of publications whose object is to convey all necessary information in regard to traveling. It derives its name from George Bradshaw, originally an engraver and printer in Manchester, who in 1839 issued an occasional work called the *Railway Companion*, which was corrected by means of another work, in the form of a broad sheet, styled the *Monthly Time Tables*. This sheet was frequently delayed to the 5th or 6th of the month, and was subject to changes made by the Companies, perhaps in the middle, or even the latter end of the month. By great efforts, the Railway Companies were induced to consent to adjust their tables, once for all, for the beginning of each month; and Mr. Bradshaw having established an agency in London, the first number of the monthly *Railway Guide* was brought out in December 1841. The second number now before us, published '1st month (January), 1842,' runs to 32 pages, and contains 42 or 43 lines of railway, in England only, without any advertisements. Through the suggestions and exertions of Mr. W. J. Adams, the London agent and publisher, the plan was gradually enlarged and perfected, and resulted in the *Railway and Steam-navigation Guide* for Great Britain and Ireland, so well known to the public. The *Guide* now extends to upwards of 450 pages, which comprise the needful knowledge regarding all lines and branches in the three kingdoms; besides copious steamboat information; full details regarding coaching in Scotland; and numerous advertisements—price 6*d*. The information is obtained from the Companies, at the last moment, in time to appear on the 1st of the month. The *Guide* has attained an immense circulation, and given birth to many publications of a similar character. Its plan has been imitated in France and Germany, in America, and even at the antipodes, where a *Bradshaw* is published at Sydney; and in spite of many rivals, the original work has always maintained its place in general estimation.

In 1847, the first number of *Bradshaw's Continental Railway Guide* was issued, which has prospered no less than the British *Guide*. In addition to the tables, as furnished by the companies abroad, it contains a large quantity of topographical information. A series of *handbooks* was also projected by Mr. Bradshaw, which includes Great Britain, France, Switzerland, &c., but is still incomplete. The handbooks of the *Overland Journey*, and to the

Presidencies of India, were published after Mr. Bradshaw's death, which occurred in 1853.

BRA'DYPUS. See SLOTH.

BRAEMA'R (including the united parishes of Braemar and Crathie), an extensive Highland district, occupying the south-west corner of Aberdeenshire, in the heart of the Grampian Mountains, and intersected by the upper part of the Dee and its tributaries. The chief mountains are Ben Macdhui (q. v.); Cairntoul, 4220 feet; Braeriach, 4225; Ben-a-Buird, 3851; and Ben Avon, 3826, on the north; and Lochnagar (q. v.), on the south. Patches of snow lie on these mountains all the year round. The rocks of B. are granite, gneiss, and quartz, with beds of primary limestone, and masses of serpentine, trap, and porphyry. Most of the district is uncultivated, and consists of heathy tracts, while about a twentieth of the surface is in wood. The natural woods are birch, alder, poplar, and rowan, and the planted chiefly larch and Scotch fir. The fir-timber of the ancient Caledonian forest of Mar, now nearly all cut down, is, for size and quality, the best in the kingdom. Red-deer, roes, grouse, ptarmigan, and alpine hares abound. Many rare alpine plants are found on the mountains and in the glens. Black-faced sheep and small black-horned cattle are reared. Here the Earl of Mar first raised his standard for the Pretender in September, 1715. The district is intersected by the great military road from Blairgowrie to Fort George, made by General Wade. In the east part of the district is Balmoral (q. v.); and near its center is the small village of Castleton of B., a favorite resort for travelers, sportsmen, and lovers of grand scenery. Pop. (1881) 1611, many of whom still speak Gaelic.

BRA'GA, a city of Portugal, capital of the province of Minho, is situated on an eminence between the rivers Cavado and d'Este, about 35 miles north-east of Oporto. The neighborhood is charming, especially along the banks of the river Cavado. B. is surrounded by old walls, flanked with towers, and defended by a castle. It is the residence of the primate of Portugal, who has a palace here. It has also a fine Gothic cathedral, several spacious squares; and manufactures of linen, hats, cutlery, firearms, jewelry, &c. Pop. (1878) 20,258.

It is a very ancient place, being supposed to owe its origin to the Carthaginians. In the time of the Romans, the city was named *Bracara Augusta*, and the ruins of a temple, an amphitheater, and an aqueduct, belonging to that era, still remain. Not far from B. stands the celebrated *Sanctuario do bom Jesus do Monte*, which is still a place of pilgrimage. After the Suevi had taken Lusitania from the Romans, B. was made the metropolis; and here, at a council held in 563 A.D., the Suevi, with their king, renounced the errors of Arianism, and submitted to the teaching of the Roman Catholic Church. After the fall of the Suevian and West-Gothic kingdom, B. fell into the hands of the Arabs, from whom it was taken by the forces of Old Castile in 1040. After the establishment of the Portuguese dynasty, it was annexed to the crown of Portugal.

BRAGA'NÇA, the name of two considerable towns in Brazil.—1. B., a seaport of about 6000 inhabitants, at the mouth of the Caite, which enters the Atlantic about 100 miles to the east-south-east of the Amazon.—2. B., an inland city of about 10,000 inhabitants, 50 miles to the north-east of San Paulo, and about 200 to the west of Rio de Janeiro.—The first is about a degree to the south of the equator, and the second about a degree to the north of the Tropic of Capricorn.

BRAGA'NZA, or BRAGANÇA, a city of Portugal, capital of the province Tras-os-Montes, is situated in a pleasant and fertile district, on the river Fervença, an affluent of the Sabor. The city is surrounded with walls; has two castles, partly in ruins, of which one was the ancestral seat of the Dukes of Braganza; and has manufactures of silk and velvet. Pop. 5000. This city gives its name to the House of Braganza, the present ruling dynasty in Portugal. John, eighth Duke of Braganza, having ascended the throne as John IV., when the Portuguese liberated themselves from the Spanish yoke in 1640. See PORTUGAL.

BRAGI, son of Odin and Frigga, in the Norse or Scandinavian mythology, was the god of poetry and eloquence. Upon his tongue were engraved the runes of speech, so that it was impossible for him to utter a sentence that did not contain wisdom.

According to the older or poetic Edda, he was the most perfect of all scalds or poets, and the inventor of poetry, which is designated by a kindred word, *bragr*. Unlike Apollo, who, in the Greek mythology, is represented as enjoying eternal youth, B. was supposed to be an old man with a long flowing beard; but his brow was always mild and unwrinkled. B.'s wife was Idunna. Together with Hermothr or Hermode, he received and welcomed all those heroes who had fallen in battle, on their arrival in Valhalla. On festive occasions, as well as on the burial of a king, a goblet, called Bragafull (B.'s goblet), was presented, before which each man rose up, made a solemn vow, and emptied. Several German periodicals and works, intended to cherish a national spirit, have taken the name of Bragi.

BRAHAM, JOHN, a celebrated tenor-singer, of Jewish origin, was born in London in 1777, and died February 15, 1856. He had an unusually long professional career, having sung on the stage at the age of ten, and continued to make occasional appearances at concerts until within a few years of his death. About the close of the 18th c. he visited France and Italy for improvement; returning to London, his triumph was transcendent, and from that time, for half a century, he held the reputation of one of the greatest tenor singers in Europe. It was as a concert singer that he excelled most, and his great declamatory power and florid execution made his singing of the national songs wonderfully effective.

BRAHÉ, TYCHO, one of the most distinguished names of which astronomical science can boast, was born at Knudsthorp (a place near the Baltic), in Denmark, in 1546. He was descended from a noble family, originally Swedish, and sent, at the age of 13, to the university of Copenhagen, where he had not been more than a year, when an eclipse of the sun turned his attention to astronomy. His uncle, who destined him for the law, furnished him with a tutor, and sent him to Leipsic in 1562; but B., who cared nothing for that study, devoted just so much time to it as would save appearances, and while his tutor slept, busied himself nightly with the stars. By these surreptitious observations of the heavens, and with no other mechanical contrivances than a globe about the size of an orange, and a pair of rude compasses, he succeeded, as early as 1563, in detecting grave errors in the Alphonsine and Prutenic tables, and set about their correction.

The death of an uncle, who left him an estate, recalled him to his native place in 1565; but he very soon became disgusted with the ignorance and arrogance of those moving in the same sphere with himself, and went back to Germany. At Wittenberg, where he resided for a short time, he lost part of his nose in a duel with a Danish gentleman; but for the lost organ he ingeniously contrived one of gold, that fitted so admirably, and was so naturally colored, that few could have detected that it was artificial. After a couple of years spent in Augsburg, he returned home, where, in 1572, he discovered a new and brilliant star in the constellation Cassiopeia. In 1573, he married a peasant girl, which his fellow-noblemen thought even more undignified than being addicted to astronomy; and that they considered very degrading in a gentleman, whose only becoming qualification was, in their estimation, expertness in the use of arms. After some time spent in travel, B. received from his sovereign, Frederick II., the offer of the island of Hven or Hoëne, in the Sound, as the site for an observatory, the king also offering to defray the cost of erection, and of the necessary astronomical instruments, as well as to provide him with a suitable salary. B. accepted the generous proposal, and in 1576 the foundation-stone of the castle of Uraniberg ('city of the heavens') was laid. Here, for a period of 20 years, B. prosecuted his observations with the most unwearied industry—with a zeal, in fact, sufficient to create a new epoch—one of the three great epochs indeed—in astronomy as a science of observation. See ASTRONOMY. The scientific greatness of B. was no protection against the petty prejudices of the nobles, who could not bear to see honor heaped on one who, according to their notions, had disgraced their order, nor against the meaner jealousies of physicians, who were annoyed at his dispensing medicine gratis to the poor. So long as his munificent patron, Frederick II., lived, B.'s position was all that he could have desired, but on his death in 1588, it was greatly changed. For some years under Christian IV., B. was just tolerated; but in 1597, his persecution had grown so unbearable, that he left the country altogether, having been the year before deprived of his observatory and emoluments. After residing a short time at Rostock and at Wandsbeck near Hamburg, he accepted an invitation of the Emperor Rudolf II.—who conferred on him a pension of 3000 ducats—to Benatek, a few miles from Prague, where a new Uraniberg was to have been erected for him; but he died at Prague on the 13th October, 1601. At Benatek he had Kepler as his assistant, and to the advice of B. that celebrated astronomer owed much. The scientific publications of B. are numerous.

BRAHILO'V, IBRAI'L, or IBRAILA, is a free port of the principality of Rumania, on the left bank of the Daunbe, about 99 miles from its mouth, and the chief shipping port in Walachia, whence large quantities of corn and other products are exported. The sturgeon fisheries on the Danube are a source of considerable profit to B. A railway from Galatz to B., thence to Bucharest, was completed in 1873. Pop. about 30,000. During the war of 1854—1856, B. was occupied by Russian troops.

BRAHMA. In the religion and philosophy of the Hindus, this word has two meanings. The crude or undeclined form is *brahman*, the etymological signification of which is doubtful; when declined as a neuter noun, it has the nominative Brahma (with the final syllable short); as a masculine, it is Brahmā with the

a long). Brahmă (neuter) designates the universal Spirit, the ground and cause of all existence; which is not, however, conceived as an individual personal deity to be worshiped, but only as an object of contemplation. It is spoken of as 'that which is invisible, unseizable, without origin, without either color, eye, or ear, eternal, manifold (in creation), all-pervading, undecaying—the wise behold it as the cause of created beings.' The human soul is a portion of this universal Spirit, and a man can only be freed from transmigration, and be reunited to Brahmă, by getting a correct notion of it and of the soul.—Brahmā (masculine) is one of the three chief gods of the Hindu pantheon, and is specially associated with the function of creation. See TRIMURTI. Yet he himself is a creation of or emanation from Brahmă, the First Cause. The origin of Brahmā, and the way in which he created heaven and earth, is thus narrated by Manu:

'This universe was enveloped in darkness, unperceived, undistinguishable, undiscoverable, unknowable, as it were entirely sunk in sleep. Then the irresistible self-existent Lord, undiscerned, causing this universe with the five elements, and all other things, to become discernible, was manifested, dispelling the gloom. He who is beyond the cognizance of the senses, subtile, undiscernible, himself shone forth. He, desiring, seeking to produce various creatures from his own body, first created the waters, and deposited in them a seed. This [seed] became a golden egg, resplendent as the sun, in which he himself was born as Brahmā, the progenitor of all the worlds. Being formed by that First Cause, undiscernible, eternal, which is both existent and non-existent, that Male (purusha) is known in the world as Brahmā. That lord having continued a year in the egg, divided it into two parts by his mere thought. With these two shells he formed the heavens and the earth; and in the middle he placed the sky, the eight regions, and the eternal abode of the waters.'—See Dr. J. Muir's *Original Sanscrit Texts*, vol. iv., 31.

In later times at least, B. has had few special worshipers; the only spot where he is periodically adored being at Pushkara in Rājputana. He sometimes receives a kind of secondary homage along with other deities. B. is represented with four heads. See INDIA (section on *Religion*), TRIMURTI, VISHNU, SIVA.

BRA'HMAN, or BRAHMIN, the name of the highest Caste (q. v.) in the system of Hinduism.

BRAHMANBE'RIA, a town of India in the presidency of Bengal, division of Chittagong. It has sea and railway communication with Calcutta. Pop. (1872) 12,364.

BRAHMAPU'TRA, a river which rises in Tibet, and, after partially mingling with the Ganges, flows into the Bay of Bengal by three mouths. It is formed by the junction, in Assam, of two main branches—the Brahmaptura, from the north-east, and the Sampoo, from the north-west; the entire length rather exceeds 900 miles from the one source, and 1700 from the other. The B. proper rises about lat. 28° 30' N., and long. 97° 20' E.; while the Sampoo springs from the same swamp as the Sutlej and the Indus. About 360 miles below their confluence, the B. leaves Assam, near Goulpara, and after 60 miles more in a south-west direction, takes a sweep round the west extremity of the Garrow Mountains. In lat. 25° 10' N., and long. 89° 43' E., it throws off the Konaie, and after a course of 180 miles, is named the Meghna. Ninety miles from the sea, it combines with the Ganges in cutting up their common delta into a network of inland navigation.

BRAHMIN OX. See ZEBU.

BRAHMO SOMAJ (*Theistic Church*) is a religious and social association in India, originated by the celebrated Hindu Rajah, Rammohun Roy, in 1830, under the title *Society of God*. The accession of Debendra Nath Tagore, a wealthy Calcutta Brahman, in 1842, gave the movement a great impetus, which was also much aided by the spread of the English education. Its latest and most advanced development took place under Keshub Chunder Sen, who joined it in 1858, and whose visit to Europe in 1870 created so much interest. It has been Sen's aim to apply the principles of the church to practical life, and under his leadership the progressive party have seceded from the original church, and assumed the title of 'Bramo Somaj of India.' Their fundamental principles are that there is but one Supreme God, the object of worship; that nature and intuition are the sources whence our knowledge of God is derived; and that religion admits of progressive development.

They ignore all distinctions of caste, and consider all men as God's children; they abjure all idolatrous rites, and acknowledge no sacred books or places, but value what is good and true in all religions, and recognize the necessity of public worship. They have about a hundred branches throughout India, and maintain two periodicals and several schools.

BRAIN is the nervous center in which reside consciousness and power over the voluntary movements of the body. It consists of one or more masses of *gray* and *white* nervous matter, or what are technically called vesicular and tubular neurine. When these substances are blended together, the mass is termed a *ganglion*, and from it proceed prolongations of the tubular matter, which are called nerves, and are conductors of impressions to or from the vesicular neurine. The number and size of these ganglia vary with the powers of the animal. In the lowest forms of mollusk, we find a single ganglion, from which proceed all the nerves of the animal; in the higher, there are two ganglia, joined by a nervous cord round the gullet, and distinct from, though connected with, the ganglion which supplies nerves to the foot, and the one for the respiratory apparatus. In the common slug, we have these cephalic ganglia united so as to form one bilobed mass or B. above the œsophagus.

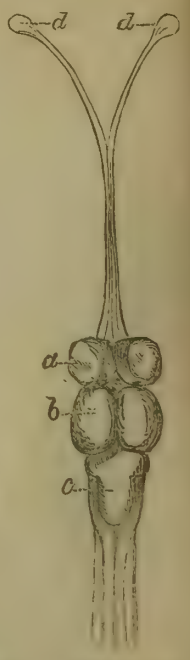


Fig. 1.—Brain of Cod: Drawn *in situ* – shown by removing roof of skull.

a, cerebral lobes, or hemispherical ganglia; *b*, optic ganglia; *c*, cerebellum; *d*, *d*, olfactory ganglia, or bulbs, connected to brain by long prolongations or roots.

In the ARTICULATED ANIMALS (q. v.), the B. consists of two cephalic ganglia over the œsophagus; there are also two nervous cords, one on each side of the body connected with each other. In the *Cephalopoda*, as the pearly nautilus, the B., or mass of nervous matter situated over the gullet, is a transverse *cord*-like ganglion; in the cuttle-fish (*Sepia officinalis*) we find a distinct rounded mass, supported by a rudimentary skeleton. In FISHES, we find, instead of one supra-œsophageal mass of ganglion, several separate masses, the nerves ending in their own special ganglia; i. e., where each nerve ends or begins in the B., there is a collection of vesicular neurine. In addition to these ganglia in fishes, there are parts corresponding to the cerebral lobes or hemispheres of the human brain. There is also a cerebellum.

Suppose we examine a cod's brain (fig. 1). Removing the roof of the skull, we see three pair of neurine masses; two small and round in front, *a*, the hemispherical ganglia; two larger in the middle, the *optic* ganglia, *b*; and a little triangular appendage behind, the cerebellum, *c*. From just in front of the anterior of those three pairs of masses diverge nervous prolongations, which end in two bodies, *d*, *d*, called the *olfactory* ganglia. On lifting the appendage we have named cerebellum, we see on each side of the spinal cord a deposition of neurine, which represents the *auditory* ganglia of more fully developed brains. The olfactory ganglia vary in their distance from the general mass. In REPTILIA, they are placed very near the cerebral hemispheres, which are small, as is also the cerebellum. But when we reach the BIRDS (fig. 2), the size of the cerebral lobe *a*, in proportion to all the other parts is much increased, so that they overlay the different ganglia, which are not placed one in front of the other, as in fishes and reptiles, but packed one above the other. We now begin to find some indications of *convolutions*.

On the surface of the B. in the parroquet, Leuret describes the furrowing as distinct, though many birds have perfectly smooth hemispheres; these also are not hollow, as in fishes and reptiles; and it will be seen that the convoluting or folding of the B. substance backwards and forwards, must allow of more being packed into the space than could be admitted by any other arrangement. The middle part of the cerebellum is very large, *c*, and divided into laminæ or leaflets; its laternal portions are much smaller than in Mammalia; the olfactory ganglia are small, *b*, and close to the cerebral hemispheres. The optic ganglia and other nerves rising from them are very large, and the wedge-shaped portion, called *medulla-oblongata*, connecting the B. with the spinal cord, is also large. We now approach the MAMMALIA, and in the *Monotremata*, which in some important respects resemble birds—the *Ornithorhynchus paradoxus*, for instance—we find small smooth hemispheres in a B. which to the whole body bears only the proportion of 1 to 130. Even this is greater in the Marsupials; the kangaroo's B. is as 1 to 800.

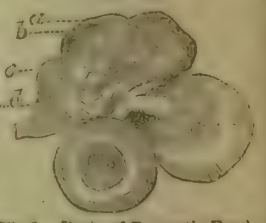

Fig 2.—Brain of Domestic Fowl: *a*, cerebral ganglia; *b*, olfactory ganglia; *c* cerebellum; *d*, optic ganglion of the right side, seen under cerebral ganglion. The optic nerves and eyeballs have been left in the preparation.

If we examine a rabbits's B., we find it to consist, apparently, of three parts—the *olfactory bulb*, the *cerebral hemispheres*, and the *cerebellum*. The cerebral hemispheres are connected by a transverse band of union, or what is technically termed a *commissure*

Continuing the dissection, we turn aside the hemispheres, and find they have concealed *four ganglia*, which represent the single pair of optic ganglia we found in birds. There are two other bodies in front of those just alluded to—viz., the *optic thalamus*, and in front of it another (inferior) *longitudinal commissure*. This forms a communication between the anterior and posterior portions of

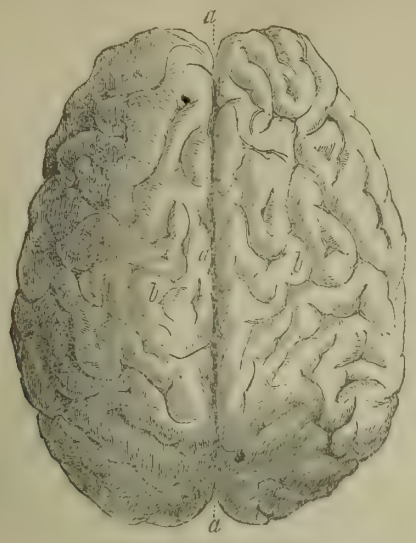

Fig. 3.—Human adult Brain.
Seen from above—membranes removed.
a, a, a. the longitudinal fissure, separating the two hemispheres, *b, b.*

the hemisphere, on the same side. Two little white lines, running from the back of the thalami, join a little body called the *pineal gland*, interesting in connection with some fantastic physiological theories. It will be observed that the hemispheres lie over these structures like a cap; the space between the two, on each side, is termed the *lateral ventricle*.

We have now the most complicated B. before us, the human encephalic mass of ganglia (figs. 3, 4, 5), and include with it the *medulla oblongata*, the link which unites the B. to the spinal cord. First viewing the B. from its upper surface (fig. 3), we see that it is divided by longitudinal fissure into two equal halves or hemispheres, which are broader behind than in front. They are irregularly marked by convolutions, *b*, and a smooth appearance is given to the whole surface by the glistening arachnoid membrane (q. v.). On slicing them transversely with a knife, the section appears white in the center, and gray at the margins, of the *convolutions*, which are now seen penetrating to various depths below the surface. The white substance is dotted with the blood-vessels which supply the brain. On drawing the hemispheres asunder from each other with the fingers, the great commissure, or uniting band, is seen, the *corpus callosum*, which is streaked both longitudinally and transversely. The hemispheres should now be completely sliced off on a level with this commissure, and its transverse fibres will be seen to extend into their substance, constituting a large white surface, called by anatomists the *white oval center*.

If we take the handle of the knife, and scratch with it through this white substance, the instrument soon opens a cavity, which is the *lateral ventricle* (fig. 4). Let this be done on both sides, and the ventricles exposed to view. They are shaped somewhat like the italic *S*.

Their extremities are termed cornua, and the anterior look from each other, and are nearer than the posterior, which are turned the opposite way. We have now removed the hemispherical ganglion, and uncovered the others. The pia mater, which supports the vessels bringing blood to the B. substance, is seen in a purple wreath lying in each ventricle, and passing down into a depression termed the *middle horn* of the ventricle. This is the *choroid plexus*, and, if lifted, it will be found continuous with that on the opposite side, through an aperture called the Foramen of Monro, *e*, after the great Scotch anatomist of that name. If the remains of the corpus callosum are now scraped away, the choroid plexus will be found continuous with a web of pia mater called the *velum interpositum*, which lies over the central cavity of the B., or third ventricle. In front and behind will be seen portions of the inferior longitudinal commissure or *fornix*, *h*, the body of which has been removed to show the velum; but, placed vertically between its anterior part and the under surface of the corpus callosum, are two layers of gray matter, between which is a narrow space termed the *fifth ventricle*, *g*. Behind, there will be seen a small hole, through which a probe will pass into the *fourth ventricle*, *l*.

The accompanying cut (fig. 4) shows the parts now exposed. The mass most in front is the *corpus striatum*, *d*, behind it is the *optic thalamus*, *e*. Through the former, motor fibres pass from the anterior columns of the spinal cord into the hemisphere; through the latter, the sensory fibres from the posterior columns of the cord. These are by some considered to be the ganglia of motion and *common* sensation.

Behind these are the *corpora quadrigemina*, *n*, which are analogues of the optic ganglia of the lower animals. Upon them lies the *pineal gland*, *m*, and behind them, projecting into the fourth ventricle *q*, some gray matter, said to be the auditory ganglia. We now come to the upper surface of the *cerebellum*, consisting of two hemispheres split transversely into leaflets, and connected by a central portion to each other, and by two bundles of white fibres to the corpora quadrigemina, *p*. Between these is the *fourth ventricle;* and stretched across between them is a thin layer of gray matter, called the *valve of Vieussens*, *o*.

We now turn what remains of the B. upside down, and examine the base or under surface. It is very irregular in outline. The cerebral hemispheres are now found to be divided on each side by a *fissure* (*Sylvian*), *f*. The part in front is called the *anterior lobe;* that behind the *middle*, as far as the cerebellum, when it is called the *posterior lobe*.

The diagram (fig. 5) gives a better idea of the appearance than words could possibly do. The olfactory lobes, *h*, *h*, are now seen lying in a fissure in the anterior lobes. The optic tracts are seen meeting at their commissure, *i*, interchanging fibres, and passing on as the optic nerves to the orbit. The larger bundles behind, and directed outwards, are the *crura cerebri*, *p*, passing towards the hemispheres, emerging from the transverse mass called the *pons varolii*, *s*, which lies like a clamp between the two halves of the cerebellum, *d*. From the inner side of each crus arises the third nerve, *o*, destined to supply four of the muscles which move the eyeball. The fourth nerve *q*, comes from the valve of Vieussens, and is seen on its way to supply the superior oblique muscle which turns the eye upwards and outwards, hence called *patheticus*. From each side of the pons the fifth pair, *r*, arises; the sixth, *t*, between the pons and the anterior pyramids of the medulla oblongata; *w* is the eighth, consisting of: 1. The Glossopharyngeal, or nerve of deglutition; 2. The Pneumo-gastric distributed to the respiratory apparatus and stomach; and with it, 3. The Spinal Accessory.

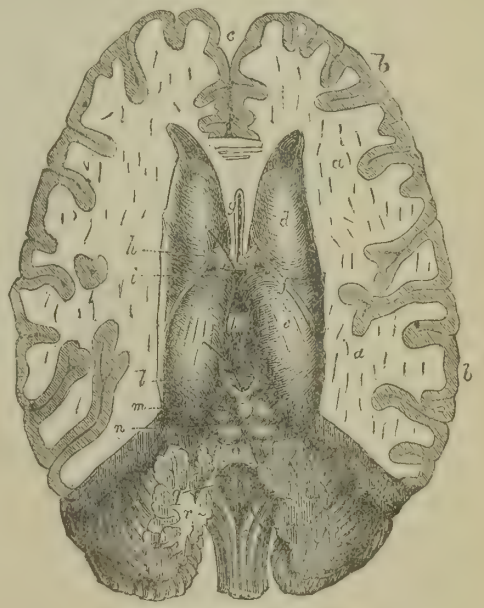

Fig. 4.—Human adult Brain:

In this dissection the cerebral lobes have been sliced off, and the lateral ventricles opened; to allow a view of the cerebellum, the posterior part of the cerebrum has been cut off opposite *n*.

a, a, remains of white oval center; *b. b*, gray outer portion of hemispheres; *c*. longitudinal fissure; *d*, corpus striatum, or streaked body, lying in lateral ventricle; *e*, optic thalamus; *f*, tænia semicircularis, or worm-like body; *g*, the two layers of septum lucidum, open to show fifth ventricle; *h*, anterior crura, or portions of the fornix, one of the great antero-posterior commissures; *i*, points to the foramen of Monro, a bristle is sticking down into the third ventricle; *k*, is the middle or soft transverse commissure, joining the two optic thalami—sometimes absent, and easily destroyed; *l*, a bristle passed from the third to the fourth ventricle (*q*), the transverse lines beneath it indicate the posterior transverse commissure; *m*, the pineal gland, lying on *n*, the corpora quadrigemina; *o*, valve of Vieussens a layer of gray matter from cerebellum; *p*, processes which connect the cerebellum to corpora quadrigemina; *q*, section of cerebellum line, points to gray matter in fourth ventricle; *r*, white matter projecting into the gray, giving a toothed or arborescent appearance, hence the name, arbor vitæ; *s*, posterior pyramids, or back of medulla oblongata.

The chemical composition of B. matter averages in 100 parts—

Water	75½ parts.
Albuminous matter	7 "
Fat	11½ "
Salts (containing 1½ of phosphoric acid)	6 "

The proportion of these constituents varies not only in different species of animals, but also in different members of the same animal group, and appears to be much influenced by the age, temper, and intellectual capabilities of each individual. Thus, the normal quantity of salts in the B. of a healthy man is 6 per cent., and in the B. of an insane patient, only 2¼ per cent. were found.

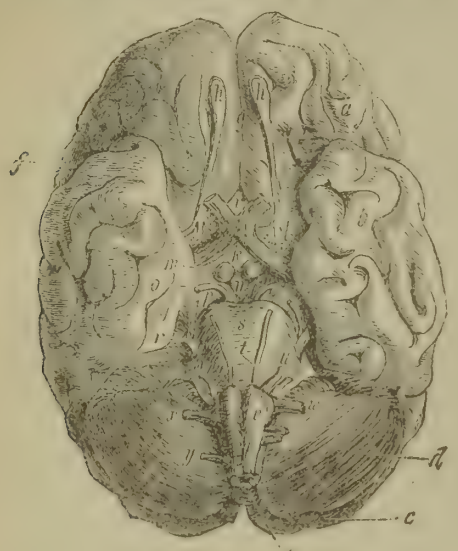

Fig. 5.—Human adult Brain:

a, anterior lobe of cerebrum; *b*, middle lobe; *c*, posterior lobe of cerebrum, appearing behind; *d*, cerebellar hemisphere; *e*, medulla oblongata; *f*, fissure of Sylvius; *g*, longitudinal fissure; *h*, *h*, olfactory bulbs; *i*, optic commissure—the optic nerves are seen interchanging fibres; *l*, three roots of olfactory process; *m*, white round bodies (*corpora albicantia*), the terminations of the anterior portions of fornix; *n*, where the vessels perforate the brain substance, hence called posterior perforated space; *o*, third pair of nerves coming to supply muscles of the eyeball, from *p*, the crus-cerebri; *q*, fourth nerve, turning round from the valve of Viensens; *r*, fifth pair; *s*, pons varolii; *t*, sixth pair of nerves; *u*, seventh pair, portio dura for muscles of face, and portio mollis for hearing; *v*, posterior pyramids of cerebellum, seen to interchange fibers; *w*, and two below, are eighth pair—viz., glosso-pharyngeal, vagus pneumo gastric, and spinal accessory nerve; between *w* and *v* is the small prominence called olivary body; *x*, *y*, two roots of ninth pair of nerves, motor, nerve of tongue.

Softening of the Brain (ramollissement) is a frequent result of chronic inflammation of the brain. The patient has been for some time in low health, troubled with headaches, loss of appetite, depression of spirits, and a gradual loss of memory, and acute perceptions of things in general. Then a spasm may occur, followed by paralysis, or the legs and arms may be bent up, and remain in that position. This condition of B. may be caused by want of proper nourishment to the cerebral substance, owing to plugging up, or from disease of its arteries. When the softening is caused by inflammation, we frequently find pus forming an abscess of the brain. Induration may also occur as the result of inflammation.—The other diseases, as hydrocephalus, will be treated under their own names.

Diseases of the Brain.—Inflammation (acute) of the B. (*phrenitis*, or popularly, *B.-fever*) rarely occurs separately, and can scarcely be distinguished from inflammation of its membranes (meningitis). According to Dr. Watson of London, when the disease begins in the latter, the first remarkable sympton is a convulsion fit; when in the B. substance itself, nausea and vomiting generally usher in the attack.

In the first stage there is rapid pulse, severe headache, the eyes suffused, and their pupils contracted to a small point, very intolerant of light. The patient is constantly watchful, and much annoyed by even ordinary sounds. Then furious delirium sets in, and lasts for a period, varying with the case, generally from twelve to forty-eight hours; when it is succeeded by collapse, in which the patient lies—his face devoid of color, and covered with cold sweat—in a state of stupor. If roused, he now speaks with slow, indistinct utterance; his pupils are now dilated, and indifferent to the brightest light; and the loudest speaking ceases to annoy him. The stupor increases with the general prostration, and continues till death. After death, we find serous fluid upon and in the B., deposits of lymph, thickening of the membranes, and softening of the B. substance itself.

General and local bleeding, with antimony and digitalis, to subdue the pulse; mercury, to prevent the deposit of lymph; blisters, as counter-irritants, to the back of the head and neck, are the usual remedies for this rare, but terrible disease. The younger school of practitioners, however, as Dr. Tanner expresses it, prefer waiting to see if nature unaided, or only *gently guided*, will not carry the patient through a disease where the efforts of art are notoriously futile, and are rather content to *watch the symptoms*, to calm excitement by sedatives, to lessen increased heat of body by diluents and tepid sponging, to prevent accumulations in the intestines by purgatives, and to diminish maniacal delirium by the application of cold to the head.

BRAINE-LE-COMTE, a busy town of the province of Hainault, Belgium, about 13 miles north-north-east of Mons. It is an ancient place, and formerly belonged to the monks of St. Waudru at Mons, from whom it was bought by Count Baldwin in 1158. It has an old church of the 13th c.; and cotton and corn mills, dyeworks, breweries, &c. Some of the finest flax that can be produced is grown in the district. Pop. (1870) about 6400.

BRAINSTONE CORAL, the popular name of certain kinds of Coral (q. v.) or Madrepore (q. v.), included in the Linnæan genus *Madrepora*, but now forming the much more restricted genus *Meandrina*. They derive their name from the general resemblance to the brain of man or of a quadruped exhibited in their large rounded mass, and numerous winding depressions. Perhaps the true B. C. is *Meandrina cerebriformis*, a species always nearly hemispherical. When the hemispherical mass is broken, the ridges which bound its furrows may be traced inwards through its substance, even to the central nucleus from which they commenced. The mouths of the polypes, in all the species of this genus, are in the furrows or elongated hollows, in which they are ranged side by side, in sinuous series. The brainstone corals are very common in collections, and are much admired for their beauty. They are found chiefly in the seas of warm climates, particularly in the Indian and South Atlantic Oceans. They sometimes attain a large size. Ehrenberg noticed single masses (polypidoms) in the Red Sea, from six to nine feet in diameter. Their rate of growth, however, appears to be slow. The fossil species are few, and chiefly belong to the oolitic formation.

BRAI'NTREE, a market-town of Essex, about 40 miles north-east from London. It is an old place, having been constituted a market-town by King John. Its streets are narrow, and many of its houses are of wood. It has manufactures of silk, crape, and straw-plait. It is one of the polling-places of North Essex, and has obtained some notoriety in connection with political and ecclesiastical proceedings. Pop. of parish (1871) 4790.

BRAKE, a genus of Ferns of the division *Polypodeæ*, distinguished by spore-cases in marginal lines covered by the reflexed margin of the frond. The COMMON B. or BRACKEN (*P. aquilina*) is very abundant in Britain and in most parts of the continent of Europe, growing in heaths, parks, &c., often covering considerable tracts. It is a widely distributed plant, and is found in many parts of Asia, and in some parts of Africa. It has a long, creeping, black rhizome, or root-stock, from which grow up naked stalks of 8—18 inches in height; each stalk divides at top into three branches; the branches are bipinnate, the inferior pinnules pinnatifid. The root-stock, when cut across, exhibits an appearance which has been supposed to resemble a spread eagle, whence the specific name *aquilina* (Lat. *aquila*, an eagle). The root-stock is bitter, and has been used as a substitute for hops; it has also been ground, mixed with barley, and made into a wretched bread in times of distress. The plant is astringent and anthelmintic; and as such, it had at one time a high reputation, although it is now little used, at least by medical practitioners. It is employed in dressing kid and chamois leather. The ashes, containing a large quantity of alkali, were formerly used in the manufacture of soap and of glass, so that the collecting of them for sale was a considerable resource of the poor in some parts of the Hebrides. B. is also employed for thatching, for littering cattle, &c., and occasionally chopped up with straw or hay, for feeding cattle. It is a favorite covert of deer and of other game. The abundance of this plant is sometimes regarded as a sign of poor land, although, probably, its absence from the richer soils is very much a result of cultivation. To extirpate it, nothing more is necessary than a few successive mowings of the young shoots as

Common Brake:

a, end of a branch, much reduced; *b*, end of pinnule, the lower side, showing fructification.

they appear. The annual growth of B. is killed by the first frosts of autumn, but remains rigid and brown, still affording shelter to game, and almost as characteristic a feature in the landscape of winter as in that of summer, perhaps adding to its general desolateness.—*Pteris caudata*, a large species of B. very similar to that of Europe, is one of the worst pests which the farmer has to contend with in the south of Brazil.—*Pteris esculenta*, a native of New Zealand, Van Diemen's Land, &c., has a more nutritious rhizome than the common brake. See TARA FERN.—Rock B. (*Cryptogamma crispa* or *Allosorus crispus*, formerly *Pteris crispa*) is a pretty little fern, common on stony hills in the northern parts of Britain.

BRAMA, a genus of fishes of the family *Chætodontidæ* (q. v.). *B. Raii* is common in the Mediterranean, and occasionally found on the British shores. It is one of the fishes to which the name Bream (q. v.) or Sea-bream has been given; and it has also been described as a Gilt-head (q. v.); but these names belong to fishes of other families, with some similarity of general appearance. The genus B. has the body very deep and compressed, the head rather obtusely terminated, a single elongated dorsal fin, and the anal fin with a very lengthened base. The tail is forked, its points extremely divergent. This fish is sometimes more than two feet in length. Its flesh is of exquisite flavor.

BRAMAH, JOSEPH, an eminent practical machinest, the son of a farmer, was born at Stainborough, Yorkshire, April 13, 1748, and early exhibited an unusual talent for mechanics. Incapacitated in his 16th year from agricultural labors by an accidental lameness, he was apprenticed to a carpenter and joiner, and afterwards obtained employment with a cabinet-maker in London. Subsequently, he established himself in business in the metropolis, and became distinguished for the number, value, and ingenuity of his mechanical inventions, such as safety-locks, improvements in pumps and fire-engines, in the construction of boilers for steam-engines, in the process of making paper, in the construction of main-pipes, wheel-carriages, the beer-machine used at the bar of public-houses, and many others. In the year 1795 he patented the hydrostatic press known by his name. See HYDRAULIC PRESS. In all, he took out about twenty patents. He died 9th December 1814.

BRAMA'NTÉ, DONATO LAZZARI, one of the most celebrated Italian architects, and also distinguished as a painter, was born at Monte-Asdroaldo, in the duchy of Urbino, 1444. From 1476 to 1499, he resided in Milan, where he studied geometry and perspective, neither of which sciences was well understood by artists in his day. He was noted as one of the best painters in Lombardy; but his success in architecture eclipsed his fame as a painter. In Milan, he built the choir of Santa-Maria delle Grazie, and the church of Santa-Maria presso San-Satiro. After the fall of Ludovico Sforza, B. went to Rome, where he was first employed by the pope Alexander VI., and afterwards by Julius II. The first great work which he undertook for the latter was to connect the Vatican palace with the two pavilions of the Belvedere by a series of immense galleries; the second was the rebuilding of St. Peter's Church, of which he laid the new foundation in 1506.

When only a small portion of his plans had been realized, B. died at Rome, 1514, and succeeding architects departed widely from the original design of a grand cupola over a Greek cross. Among other works of B. in Rome may be mentioned the palaces Cancellaria and Giraud (now Torlonia), in which he adhered more strictly than in other works to antique forms, but not without a characteristic grace in his application of these.

BRAMBANA'N, a district of the province of Soorakarta, Java, rich in remains of Brahmanical temples, which are superior in magnificence to any in India. The edifices are composed entirely of hewn stone, and no mortar has been used in their construction. In all, there are 296 temples, disposed in five parallelograms one within the other. The outer one consists of 84 temples; the second, of 76; the third, of 64; the fourth, of 44; and the inner one, of 28. In the center stands the largest and most imposing structure of all. It is 90 feet high, and profusely decorated with mythyological figures, which are executed in a very fair style of art. On the south face of the outside parallelogram, there are two monstrous figures, with uplifted clubs, kneeling in a threatening attitude. The great temple is pretty entire, as are also about a third of the others, but the rest lie strewn upon the ground.

BRA'MBLE (*Rubus fruticosus*), a plant common in Britain and most parts of Europe, having prickly stems, which somewhat resemble those of the Raspberry (q. v.). The flowers do not appear till the summer is considerably advanced, and the fruit ripens towards the end of it, continuing to be produced till the frosts of winter set in. The fruit (brambleberry or blackberry) is too well known to need description. Besides affording much enjoyment to children, who collect it from hedges and thickets, it is sometimes offered for sale in towns, and jelly and jam are prepared from it of very delicate flavor, besides a wine, which, both in strength and flavor, is held by many to excel all products of similar native fruits of Britain. The B. is rarely cultivated, perhaps because it is in most districts so abundant in a wild state; but it seems to deserve attention at least as much as the raspberry, and might probably be as much improved by cultivation.

A slight rail on each side of a row of brambles, to restrain the straggling stems, affords the necessary security for neatness and order, and the care bestowed is repaid by abundance of fruit, very acceptable where wild-brambles are not plentiful, and at a season when there is no other small fruit in the garden.—There are many different species of B., according to some—varieties according to other botanists—to which the name is indiscriminately given, and which may almost all be regarded as belonging to the Linnæan *Rubus fruticosus*. From this was separated *R. corylifolius* of Smith, a common British plant, and from these some German and British botanists have separated many other alleged species. *R. suberectus* has more the habit of the raspberry than most of the other kinds, but even its claims to be received as a species are not admitted without doubt by some of the most eminent botanists. A variety of B. with white fruit is occasionally met with.—Species of *Rubus* very similar to the common B., or varieties of it, abound in the northern parts of Asia, the Himalaya Mountains, and North America. See RUBUS.

Bramble.

BRAMBLING, BRAMBLE FINCH, or MOUNTAIN FINCH (*Fringilla Montifringilla*; see FINCH and FRINGILLIDÆ), a bird nearly allied to the Chaffinch (q. v.). It is a little larger than the chaffinch, which it much resembles in its general appearance, its bill, and even the disposal of its colors. The tail is more forked. In the males, the crown of the head, the cheeks, the back and sides of the neck, and the upper part of the back are mottled in winter with brown and black; but in spring, the whole of these parts become of a rich velvety black; the throat and breast are of a rich fawn color, which is also the prevailing color of the wings, but they are crossed, when closed, by an oblique band of jet-black, and by another oblique band of white. The quill-feathers are also black, edged with yellow on their outer webs; the tail-feathers black, edged with reddish white; the rump and the belly are white; a small tuft of feathers under each wing and some of the lower wing-coverts are bright yellow.

The B. is a mere winter visitant in Britain, and the period of its arrival appears to vary according to the severity or mildness of the weather in the more northerly regions. The B. has never been known to breed in any part of the British islands, and even in the south of Sweden it is a mere winter visitant. It breeds in the more northerly parts of Scandinavia. It has no song, its call-note is a single monotonous chirp. It is a very widely distributed species, being found as far east as Japan, and, in its winter migrations, visiting Italy, Sicily, Malta, Smyrna, &c.

Brambling, or Mountain Finch.

BRA'MPTON, a very ancient town in the county of Cumberland, near the Arthing, 8 miles E.N.E. of Carlisle. It is surrounded by hills; and the Castle-hill commands a very extensive view. Pop. (1871) 2617. The chief manufacture is the weaving of check and ginghams; and there are coal-mines in the vicinity. On a rock, two miles to the south, is a Roman inscription, supposed to have been cut by one of Agricola's legions in 207 A.D. Two miles to the east stands Lanercost Abbey, founded in 1116.

BRAN is the material obtained from the outer covering or husk of grain during the process of grinding, and which is separated from the finer flour before the latter is made into bread (q. v.). It is generally met with in commerce in thin scaly yellowish-brown particles, with sharp edges, and its composition in 100 parts is as follows:

Water	13·1
Albumen (coagulated)	19·3
Oil	4·7
Husk, with a little Starch	55·6
Ash or Saline matter	7·3
	100·0

Bread made of flour, containing B., is known as *Brown Bread*. See BREAD. The main uses to which B. is put are in the feeding of horses and cattle, and poultry, and in clearing and brightening goods during the processes of Dyeing (q. v.) and Calico-printing (q. v.). In the practice of medicine, B. is employed as a warm poultice in abdominal inflammation, spasms, &c., and an infusion is used as an emollient footbath. It is also used internally in catarrhal affections.

BRANCH, in Botany, is a part of a tree or other plant not taking its rise immediately from the root, but rather forming a sort of division of the stem, and which is often divided into secondary branches, again, perhaps, to be further much ramified into *branchlets* and twigs, the ultimate ramifications producing leaves, flowers, and fruit. Branches originated in leaf-buds, which are produced at the *nodes* of the stem, or of the already existing branches. See BUD, PLANT, and STEM. The buds being formed in the axils of leaves, the arrangement of the branches, as alternate, opposite, whorled, &c., varies like that of the leaves, but buds often remain dormant, according to a regular law of alternation. The angles of ramification are very different in different plants, producing great variety of appearance, and giving marked characteristics to different kinds of trees. The great difference between the ramifications of the *Coniferæ* in general (Pines and Firs) and that of other trees must have attracted the attention of every one. In many herbaceous plants whose axis is scarcely developed into a stem, instead of branches there proceed from the lateral buds *runners*, which lie close to the ground, send down roots and produce new plants, as in the strawberry.

BRA'NCHIÆ. See GILLS.

BRANCHIO'PODA (Gr. gill-footed), an order of *Crustacea* (q. v.) of the division *Entomostraca* (q. v.) deriving this name from the distinctive peculiarity of having the *branchiæ*, or gills, which are numerous, attached to the feet. They are all small creatures, many of them almost microscopic, and chiefly abound in stagnant fresh waters. Some are popularly known by the name of Water-fleas (q. v.); the Brine-shrimp (q. v.) is another example; and the genera *Cyclops* and *Cypris* may be mentioned, the former on account of its great frequency in stagnant fresh waters, the latter because its hard shells resist decomposition, and are therefore abundant in a fossil state.

BRA'NCO, RIO, a river of that portion of Brazil which, originally comprised within the understood limits of Guiana, lies to the north of the Amazon. It rises in the Parime Mountains, on the very borders of Venezuela; and after a southerly course of about 400 miles, it joins, near lat. 1° 20′ S., and long. 62° W., the Rio Negro, of which it is the principal tributary, on its way to the Amazon.

BRA'NCURSINE. See ACANTHUS.

BRAND, a name given in some parts of Britain to some of those diseases of plants, especially of corn-plants, which are also called BLIGHT, BUNT, MILDEW, RUST, and SMUT.—See these heads.—It is the German name for the disease, generally known in Britain as BUNT, and sometimes as *Pepper-brand*. Both as a German and an English word, it appears to be derived from the verb *brennen* to burn, and to refer to the burnt appearance which characterizes the diseases to which it is applied.—Its most common application in Britain, however, is not to any of the diseases already mentioned, but to a peculiar spotted and burned appearance often seen on the leaves, and sometimes also on the bark of plants which does not seem to be in any way connected with the presence of parasitic fungi, but which sometimes becomes so extensive as to cause the death of the plant. The nature of this disease is still somewhat obscure. Occurring most frequently when warm sunshine succeeds to moist weather or to hoar-frost, and frequently affecting plants in hotbeds upon which drops of condensed moisture fall from the frame, it has been ascribed to the concentration of the sun's rays by the drops of water on the leaf or bark—a theory utterly untenable, as no concentration can take place in such circumstances. The probability appears to be, that the action of the moisture unequally distributed, and particularly when sudden changes of temperature take place, deranges the vegetable functions, and destroys the fine tissues.—BRAND, a mark made on a cask for trade or Excise purposes. See FISHERIES, and TRADE MARKS.

BRA'NDENBURG, a province of Prussia, in the center of the kingdom, in lat. 51° 30′—53° 45′ N., long. 11° 13′—16° 8′ E. B. has an area of 15,350 sq. m., pop. (1871) 2,863,229; (1880) 3,389,155. It formed the neucleus of the Prussian monarchy, but the modern province does not quite correspond with the old *Mark* of B., which included also a part of the province of Saxony and of Pomerania, while it lacked certain small portions of territory now contained in the province of Brandenburg. Almost the whole province is a plain, so low that at Potsdam the surface of the river Havel is only 14·6 Prussian or about 15 English feet above the level of the sea. The ground becomes slightly hilly towards Silesia. In general, the soil is sandy and naturally unfruitful. Without its numerous rivers and canals, B. would be one of the most barren tracts on the continent.

The inhabitants are mostly Germans, mixed with French and Dutch colonists, who, however, are almost completely Germanized; and in the south of the province, with people of Wend extraction. With the exception of 87,000 Roman Catholics, and 41,000 Jews, they belong to the Protestant Church. Agriculture and the rearing of cattle afford occupation for a considerable number of the inhabitants. The manufactures are silk, cotton, wool, linen, sugar, leather, paper, metals, &c. There are also numerous distilleries throughout the province. B. is divided into the governments of Potsdam and Frankfurt—Berlin, which is the capital, forming a separate jurisdiction. In the beginning of the Christian era, B. was inhabited by the Suevi, and afterwards by Slavonic tribes. It was subjugated by Charlemagne in 789, but it again acquired independence under his weak successors, and remained free until 928, when Henry I. possessed himself of it. After passing through numerous changes in connection with the general history of the German empire—of which we need here mention only the facts that Albert the Bear (q. v.) became the first Markgraf of B. in 1142, and Frederick of Nürnberg the first elector in 1417—it became associated with the rise of the Prussian state into a monarchy under Frederick I., Elector of Brandenburg, in 1701. See PRUSSIA.

BRA'NDENBURG (the ancient *Brennaborch* or *Brannabor*), the town from which the province Brandenburg is named, is situated on the line of the Berlin and Magdeburg Railway, about 37 miles west-south-west of Berlin. The river Havel divides it into two parts, Old and New B., which are both surrounded with walls. On an island in the river there is a third quarter, containing the castle, cathedral, equestrian college, &c. The cathedral has a fine old crypt, and several interesting antiquities. The inhabitants, amounting in 1880 to 29,066, inclusive of the garrison, are engaged in the manufacture of woollen, linen, hosiery, paper, leather, beer &c. Boat-building is also carried on to a considerable extent.

BRANDENBURG, NEW, a walled town in the grand duchy of Mecklenburg-Strelitz, North Germany, is situated near the north end of Lake Tollen, about 50 miles west-north-west of Stettin. It is a beautiful town, with regular, broad, and well-built streets The grand duke has a palace in the market-place. It has manufactures of woollen, cotton, damask, leather, paper, tobacco, &c., besides corn-mills, oil works, and a trade in hides and horses, and is altogether a very thriving place. Pop. (1880) 8406.

BRANDING was a mode of punishment practised in England for various offences. It was effected by the application of a hot iron, the end of which had the form which it was desired should be left imprinted on the skin. But B. by such means has long ceased, and now it is practically confined to the case of desertion from the army—the B. or marking being not done by a hot iron, but with ink, or other similar preparation. By the Mutiny Act of 1858, 21 Vict. c. 9, it is enacted by section 35 as follows: 'On the first, and on every subsequent conviction for desertion, the court-martial, in addition to any other punishment, may order the offender to be marked on the left side, two inches below the armpit, with the letter D, such letter not to be less than an inch long, and to be marked upon the skin with some ink or gunpowder, or other preparation, so as to be visible and conspicuous, and not liable to be obliterated.' Formerly, B. was employed in the case of all *clergiable* offences by burning on the hand (see BENEFIT OF CLERGY); and with a view still further to repress theft and petty larceny, the 10 and 11 Will. III. c. 23, s. 6, provided that such offenders as had the benefit of clergy allowed them should be '*burnt in the most visible part of the left cheek, nearest the nose.*' This additional severity, however, not having the desired deterrent effect, but the reverse, was repealed by the 5 Anne c. 6, which nevertheless provided for offenders being burnt on the hand as formerly. The latter punishment, however, was entirely abolished by an act passed in 1822, the 3 Geo. IV. c. 38. Brawling in church (q. v.) was, by the 5 and 6 Edw. IV. c. 4, made an offence punishable by having one of the ears cut off, or, the offender having no ears, by B. with the letter F on the cheek. This punishment

was repealed by the 9 Geo. IV. c. 31. B., therefore, in the case of felonies, has been entirely abolished.

BRANDIS, Christian Aug., professor of philosophy in Bonn, was born at Hildesheim, 13th February 1790, his father being J. D. Brandis, one of the most distinguished physicians of his time. Having studied philology and philosophy at Kiel and Göttingen, he began lecturing in the university of Copenhagen, from which he removed to Berlin (1816). Here he was soon called upon to take part in the preparations for the great critical edition of the works of Aristotle, contemplated by the Berlin Academy of Science, 4 vols. (Berlin, 1831–1836); and with this object, spent several years, along with Immanuel Bekker (q. v.), in exploring the chief libraries of Europe In 1821, he resumed his academic career in the university of Bonn, where he edited Aristotle's *Metaphysics* (vol. ., Berl. 1823), *Scholia in Aristotelem* (Berl. 1836), and *Scholia Græca in A. Metaphysicam* (Berl. 1837). He accepted, in 1837, a call from the young king of Greece, and spent several years in that country as cabinet counsellor. As a result, we have his *Mittheilungen über Griechenland*, Communications on Greece (3 vols., Leip. 1842). Other works of his are—*Handbuch der Geschichte der Griech.-Röm. Philosophie* (3 vols., Berlin, 1835—1866), and *Geschichte der Entwickelungen der Griech. Philosophie und ihre Nachwirkungen im röm. Reiche* (Berlin, 1862—1864). He died July 24, 1867.

BRANDLING. See Par, and Salmon.

BRA'NDON, a town on both sides of the Little Ouse of Brandon River, where it separates Norfolk from Suffolk, 78 miles north-north-east from London by road. Pop. (1871) 2116. It has a considerable corn-trade. Great rabbit-warrens occur near Brandon. There was formerly an extensive manufactory of gun-flints here, the army being exclusively supplied with these articles from B. before the introduction of percussion-caps.

BRANDT, Sebastian, the author of a very popular German book, the *Narrenschiff*, or Ship of Fools, was born at Strasburg, 1458; studied law and the classics with zeal at Basel, where he received permission to teach; and soon became one of the most influential lecturers in that city. The Emperor Maximilian showed his regard for B. by appointing him an imperial councillor. He died at Strasburg in 1521. His Ship of Fools, a satire on the follies and vices of his times, which was published at Basel, 1494, is not very poetical, but is full of sound sense and good moral teaching, and was so much esteemed that the German popular preacher Geiler occasionally took his texts from it. It was translated into Latin by Locher (1497); and into English by Henry Watson, *The Grete Shyppe of Fooles of the Worlde* (1517); partly translated and partly imitated by Alexander Barclay, *The Shyp of Folys of the Worlde* (1508); and imitated by W. H. Ireland in the *Modern Ship of Fools* (1807). It has also appeared in French, and indeed in almost all European languages.

BRANDY (Ger. *Branntwein*, Fr. *eau de vie*) is a term sometimes applied generically to all kinds of ardent spirits, but usually restricted to the liquid obtained by distilling the fermented juice of the grape. See Distillation. The fermented liquors or wines which are employed for that purpose are various, and contain a proportion of alcohol (q. v.), which runs from 10 to 25 per cent. of their weight. The red wines are generally preferred, as containing most alcohol; but though they yield a larger amount of B. than the white wines, yet the latter afford a spirit which possesses a finer flavor and more agreeable taste. 1000 gallons of wine give by distillation from 100 to 150 gallons of B., which varies in strength, but is commercially judged of according to the quantity of *eau de vie* or B. *à preuve de Holland* which it contains, and is generally diluted with water till it contains from 50 to 54 per cent. by weight of absolute alcohol. When originally distilled, B. is clear and colorless, and if wished to remain so, is received and kept in glass vessels; but when placed in wooden casks, the spirit dissolves out the coloring-matter of the wood, and acquires a light sherry tint, which is deepened by burnt sugar and other coloring-matter, intentionally added by the dealers. The pleasant aroma of B. is due to the presence of more or less fusal oil (q. v.) accompanied by œnanthic ether (q. v.). The most famous B. is that distilled in Cognac, a district in the west of France, from the choicest wines, but comparatively little of that sold under the name of *Cognac* comes from the district. A second class B. is obtained from the red wines of Portugal, Spain, &c., as also from the refuse (*marc*) of the grapes left in the winepress, the scrapings of wine-casks and vats, the deposits in wine-bottles, &c.; and very much of the B. sold in Great Britain and Ireland is prepared at home from ordinary grain alcohol, by adding thereto argol (q. v.) bruised French plums, some French wine-vinegar, a little good Cognac, and redistilling, when the spirit which passes over may be colored with burnt sugar, or by being kept in an empty sherry cask.

Occasionally, grains of paradise and other acrid matters are added, to give the B. a fictitious strength; and catechu or oak-bark, to give it an astringent taste. B. is the form in which alcohol is administered medicinally either internally or externally. It is distinguished from other ardent spirits by its light, cordial, and stomachic properties, and especially when set fire to for a minute or two, forming what is known as *Burnt B.*, it is valuable as a household remedy for diarrhœa. B. is administered internally (1), in *mild cases of diarrhœa*, unaccompanied by inflammation, but attended with griping pain, and the addition of nutmeg is productive of good; (2), as a *powerful excitant* for restoring patients who are suffering from suspended animation, and to relieve those who are laboring under fainting symptoms during an operation in surgery; (3), as a *stimulant and restorative*, where patients are much depressed in the ultimate stages of fever; and (4), as a *general stomachic stimulant* in indigestion after taking food, in the relief of flatulency and spasms of the stomach, and to check vomiting, especially in sea-sickness. Externally, B. is employed (1), in healing sores, and in stopping hemorrhage or the oozing out of blood from bruised or injured parts, and is generally applied by soaking linen or cotton with it, and laying the cloth on the part; and (2), in hardening the skin or cuticle over tender parts, the soles of feet which have been blistered, and the nipples of females for several days before delivery. The action of B. externally appears to be strictly chemical, as it coagulates the albumen of blood, and otherwise tends to render more solid all flesh tissue.

The duty on B. imported into Great Britain, which from 1814 had been as high as 22*s.* 10*d.* a gallon, was reduced in 1846 to 15*s.*, and in 1860 to 8*s.* 2*d.*, but was soon afterwards raised to 10*s.* 5*d.* The consumption in the United Kingdom from 1822 to 1862 averaged about 1,400,000 gallons. From 1862 to 1872, it averaged 4,600,000 gallons. The import in 1880 was 3,006,335 gallons.

BRA'NDYWINE CREEK, a stream 36 m. in length, rising in Pennsylvania, and flowing through Delaware. In the latter state, it enters Christiana Creek, about 2 m. above its confluence with the Delaware River, and immediately below Wilmington, a port of entry. It possesses a historical interest in connection with the War of Independence—a battle, in which the British had the advantage, having been fought on its banks in Sept. 1777.

BRANK, or BRANKS, an instrument formerly used for the punishment of scolds in England and Scotland, and often in the former country called 'the scold's bridle.' It seems to have come in place of the ducking-stool or cucking-stool (q. v.). 'I look upon it,' says Dr. Plot in his *Natural History of Staffordshire*, published in 1686, 'as much to be preferred to the cucking-stool, which not only endangers the health of the party, but also gives the tongue liberty betwixt every dip: to neither of which is this at all liable; it being such a bridle for the tongue as not only quite deprives them of speech, but brings shame to the transgression, and humility thereupon, before it is taken off.' The B., in its simplest form, is a hoop of iron, opening by hinges at the sides, so as to enclose the head, and fastened by a staple with a padlock at the back; a plate within the front of the hoop projecting inwards, so as to fit into the mouth of the culprit, and by pressing upon the tongue, be an effectual gag. There must have been difficulty in keeping such a hoop in its place; and so it received the addition of a curved band of iron, having a triangular opening for the nose, passing over the forehead, and so clasping the crown of the head that escape from it was scarcely possible. This may be regarded as the second form of the brank. In the third form, the curved band was hinged in the middle, and, passing over the whole head, was locked into the staple at the back of the hoop. The next addition seems to have been a second band crossing the first at right angles, so as to clasp the sides of the head, and keep the B. still more firmly in its place. In its last more complicated shape, the B., by the multiplication of its hoops and bands, took the form of a conical cage or lantern, with a door behind opening by a hinge and fastened by a staple, the front being fashioned into a rude mask, with holes for mouth, nose, and eyes. In one instance, the mask quite covers the face, the iron plate being hammered out to fit the nose, with apertures for the nostrils and the eyes, a long hollow conical peak, perforated with holes being affixed before the mouth. The way in which the punishment of the B. was inflicted, may be described in the words of an eye-witness, reported by a country gentlemen of Northumberland, Ralph Gardiner of Chriton, in a work, called *England's Grievance Discovered in Relation to the Coal Trade*, published in 1655, and dedicated to Cromwell: 'John Willis of Ipswich, upon his oath, said that he was in Newcastle six months ago, and there he saw one Anne Bidlestone drove through the streets by an officer of the same corporation holding a rope in his hand, the other end fastened to an engine called the branks, which is like a

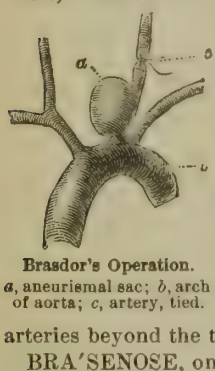
Branks.

crown, it being of iron, which was muzzled over the head and face, with a great gap or tongue of iron forced into her mouth, which forced the blood out; and that is the punishment which the magistrates do inflict upon chiding and scolding women, and that he hath often seen the like done to others.'

When the B. first came into use is unknown. It is found at Edinburgh in 1567, at Glasgow in 1574, at Stirling in 1600, and at Macclesfield, in Cheshire, in 1623. One B. in the church of Walton-on-Thames, in Surrey, has the date of 1633. In another, called 'the witches' bridle of Forfar,' dated in 1661, the gag for the mouth is not a flat plate, but a long piece of iron with three sharp spikes. Of two examples in private custody in England, one has the date of 1688, the other the crowned cipher of King William III. The B. was used at Langholm in Dumfriesshire, in 1772; it was used still more recently at Manchester and at Macclesfield; and in the *Archæological Journal* for 1856, it is stated that at 'Bolton-le-Moors, in Lancashire, the iron bridle was still in use, not many years since, for the correction of immorality: it was fixed in the female's mouth, and tied at the back of the head with ribands, and thus attired, the offender was paraded from the cross to the church steps, and back again.' Examples of the B. may be seen in the Ashmolean Museum at Oxford, in the National Museum of the Antiquaries of Scotland at Edinburgh, in the county hall at Forfar, in the Guildhall at Litchfield, in the town hall at Macclesfield, in the parish church of Walton in Surrey, and in St. Mary's Church at St. Andrew's in Fife.—Brank was at one time a common name in Scotland for any sort of bridle. The word is supposed to be derived from the Teutonic *pranghe*, a bridle. In the Dutch Netherlands, the pillory was called *pranghe*, from the yoke or collar in which the neck of the culprit is held. An instrument resembling the B., in its simplest form, is said to have been in use among the Spaniards in the West Indies for the punishment of refractory slaves. See JOUGS.

BRANTOME, PIERRE DE BOURDEILLES, SEIGNEUR DE, was born at Perigord, in Gascony, about 1527. He traveled in several countries in the capacity of chamberlain to Charles IX. and Henry III.; fought against the Huguenots (1562), in Barbary (1564), and went in 1566 to Malta, to fight against the Turks. After his return to the court of France, he retired into private life, and wrote his *Mémoirs*, full of self-praise but very interesting, as they afford a lively portraiture of the manners and morality of his times, the women in particular, being very severely handled. The style is charmingly piquant, full of ingenious turns of expression, sudden sallies of wit, occasional flashes of eloquence, and withal so naïvely simple, that if the author cannot on account of the abundance of his gossip be reckoned a grave historian, he must needs be considered a most fascinating chronicler. B. died July 15, 1614. His complete works were published at the Hague (10 vols. 1740), and were republished by Buchon in the *Panthéon Littéraire* (2 vols., Paris, 1837).

BRASDOR'S OPERATION. It is stated in the article ANEURISM, that a cure is effected in that disease by successive layers of the fibrine of the blood being deposited in the aneurismal sac, and that surgeons bring about this desired end by tying the artery at some point between the heart and the aneurism. In some situations it is impossible to do this, and therefore it was suggested by Brasdor that the course of the blood should be impeded *beyond* the aneurismal sac. This has not been tested to any great extent, but most surgeons think favorably of it; and the same principle can be carried out by pressure, without any cutting operation, as was shown by Mr. Edwards of Edinburgh, who succeeded in obliterating aneurisms at the root of the neck by pressure applied to the arteries beyond the tumor.



Brasdor's Operation.
a, aneurismal sac; *b*, arch of aorta; *c*, artery, tied.

BRA'SENOSE, one of the colleges of Oxford University, sometimes called King's Hall and College of Brasenose, was founded in the year 1509, by the joint benefaction of William Smith, Bishop of Lincoln, at one time Chancellor of the University, and Sir Richard Sutton, Knight of Prestbury, in Cheshire. The original foundation was for a principal and twelve fellows. Eight fellowships were afterwards added by various benefactors, from 1522 to 1586. This college is also very rich in scholarships and exhibitions; more particularly the Hulme exhibitions, 15 in number, of value £135 per annum each, besides £20 to be spent in books, to be approved of by the principal. The statutes of this college which were issued in 1520, three years after the publication of Luther's theses, seemed to have been framed by a person warmly attached to the Roman Catholic faith. They enjoin devotional exercises of a peculiarly popish character, such as repeating five times each day the Lord's Prayer in honor of the five wounds of the crucifixion, of the angelic salutation in honor of the five joys of the blessed virgin, &c. These devotions were in some cases enforced by fines and whipping. The origin of the name of the college is obscure.

Legends say that it was originally 'Brewing-house,' which became corrupted into the present appellation; but Anthony Wood tells us that the college was 'near finished out of the ruins of several hostels, the chief of which was Brasenose Hall, so called, without doubt, from such a sign, which was in ancient time over its door, as other halls also had viz., Hawk or Hieron Hall, Elephant, Swan, or Bull Hall.' The former theory is supported by the fact, that B. has always been celebrated for the excellence of its beer; the latter is borne witness to by a nose in brass, curiously fashioned, which is now conspicuous over the great gateway. Till lately, all the fellowships were confined to natives of certain counties. The senior fellowships, owing to the appropriations of fines to the seniors, were very valuable, about £500 per annum; while the junior fellowships were about £80. By the commissioners appointed under 17 and 18 Vict. c. 81, many important alterations have been introduced. Five out of the twenty fellowships have been suppressed, one being elevated to the endowment of a professorship, the remaining four to the establishment of additional scholarships. All the remaining fellowships have been thrown open. The senior fellowships have been limited to £300 per annum; the junior raised to £150. Various oaths, previously taken by the fellows, committing them to statements which were untrue, and binding them to duties impossible to be performed, have been by the same authority abolished. B. presents to 24 benefices, besides 29 pieces of preferment vested in the trustees of the Hulme exhibitions, for behoof of the exhibitioners. Though considered what is commonly called a 'good college,' B. has never attained much distinction in the 'schools.' In all probability this has been owing to the restrictions subject to which its endowments were so long administered. The number of names on the books is about 500; the number of resident undergraduates is considerably over 100.

BRASH. See PYROSIS.

BRASH, SHIVERS, BLAZE, and RUBBLE, are names given in different districts to layers of broken and angular fragments of rock. They occasionally form the basement bed of alluvial deposits. At Canonmills, and other places near Edinburgh, the boulder-clay rests on a bed of shivers composed of fragments of the subjacent bituminous shale.

BRASIDAS, the bravest and most energetic Spartan general in the earlier years of the Peloponnesian war. Having distinguished himself (B.C. 431) by the courage with which he relieved the town of Methone from a hostile attack, he was made one of the chief-magistrates of Sparta. In 424 he relieved Megara; and in his expedition to Macedonia, in the same year, to aid the states which had thrown off their allegiance to Athens, he was completely successful. In 422, B., who could obtain no reinforcements from Sparta, had to encounter with his helots and mercenaries the flower of the Athenian army under Cleon. A battle took place at Amphipolis, in which both Cleon and B. were killed, but the army of the former was completely beaten. He was buried at Amphipolis, within the walls, and for long after his death his memory was honored as that of a hero, by the celebration of yearly sacrifices and games. The Greek writers speak highly of Brasidas. Thucydides notices his eloquence, unusual in a Spartan, his justice, liberality, and wisdom, while Plato compares him to Achilles; but circumstances are not wanting to show that he was as much endowed with Spartan duplicity as with Spartan courage.

BRASS is an alloy of copper and zinc, largely used for household furnishings, certain parts of machinery, and other ornamental and useful articles. Technically, the term B. is extended so as to include compounds of copper and tin, as in *brass-ordnance*, the *brasses* or bearings of machinery, &c., but such alloys of copper and tin, though styled *hard* B., are more strictly varieties of BRONZE (q. v.), and the present notice will be confined to the alloys of copper and zinc, or *yellow* brass. In ancient history, biblical and profane, frequent allusions are made to the employment of B. in the construction of musical instruments, vessels, implements, ornaments, and even gates; but as no mention is made of its mode of manufacture, or even of its composition, it is doubtful if the B. of the ancients was composed of copper and zinc. In the manufacture of B. on the large scale, two parts by weight of copper to one part of zinc are used, the zinc being one-half the weight of the copper; but alloys are made for particular purposes with less or greater proportions of zinc.

Thus, where a material of more than ordinary tenacity is required, the zinc is reduced to one-fourth the weight of the copper; and where an alloy of a hard and brittle nature, possessing little resisting power, is wished for, the zinc is increased to an amount equal with the copper, or greater. In the manufacture of B., either of two processes may be followed. The direct method is to fuse the zinc in a crucible, and gradually add the copper in pieces. But this process is attended with disadvantage, owing to the vola-

tile and oxidizable nature of zinc. The indirect method of forming B. is that which is generally followed in England and elsewhere, and consists in heating in crucibles or pots a mixture of calamine (carbonate of zinc, $ZnOCO_2$), charcoal, and thin pieces of scrap or grain copper. The calamine (q. v.) is generally first calcined or roasted, so as to expel any traces of sulphur, then mixed with one-fourth of its weight of charcoal, and this mixture introduced into the crucible, after which the metallic copper is diffused through the mixture by being beaten in with hammers or mallets. The proportions employed are 3 parts of the mixture of calamine and charcoal to 2 parts of copper; and when introduced into a furnace, and subjected for 5 to 24 hours to the action of a white heat, the charcoal reduces the calamine and separates the zinc, which, combining with the copper, forms 3 parts of B., containing about 2 of copper to 1 of zinc.

For ordinary purposes, B. is first cast into plates of about 100 lbs. weight, and ¼ to ½ inch thick, which can be readily broken up, remelted, and cast in a mould of any desirable shape or size. The crude casting so obtained is generally screwed to a turning-lathe, and turned and bored into the required form with iron tools. B. is very largely employed in the construction of door-handles, window-shutter knobs, &c.; and since the introduction of gas, though the brazen candlesticks have almost ceased to exist in towns, yet the immense number of stop-cocks, and brass-pendants and brackets required, has given a considerable impetus to the brass manufacture. The proportion of copper and zinc in the alloys resembling B., and which are known as *gilding metal*, *Mannheim gold*, *pinchbeck*, *bath metal*, *Bristol brass*, *Muntz sheathing metal*, *spelter solder*, and *Mosaic gold*, have already been noticed under ALLOY (q. v.).

BRA'SSARTS, the name of the pieces which, in plate-armor, protected the upper part of the arms, and united the shoulder and elbow pieces. Brachiale was the ancient name for brassarts. When the front of the arm only was shielded, the pieces were called demi-brassarts.

BRASSES (*sepulchral*), large plates of brass, or of the mixed metal called *latten* or *laton*, inlaid on slabs of stone, and usually forming part of the pavement of a church. The figure of the person intended to be commemorated was generally represented either by the form of the brass itself, or by lines engraven on it. Such, however, was not always the case, an ornamented or foliated cross, with other sacred emblems, being frequently substituted for the figure. Nor was the practice of imbedding them in the pavement uniform, as we sometimes find them elevated on what were called altar-tombs. It has been ascertained that the incised lines on these B. were originally filled up with some black resinous substance, and that in the case of armorial decorations, and the like, the field or background was often cut out by the chisel, and filled up with some species of coarse enamel, by which means the appropriate tinctures were produced. In England, the brass was usually of the form of the figure, the polished slab forming the ground, and the ornaments, arms, inscription, &c., were also inserted each as a separate piece. On the continent, where the metal was more abundant, the B. were one long unbroken surface, formed of plates soldered together, on which were engraved all the objects represented, the portions of the plate not so occupied being ornamented by elaborate flower-work. B. are known to have been used for monumental purposes from a very early period, though there are no existing traces of them in England previous to the middle of the 13th century. There is reason to think, that if not imported from France, they were at first executed by French artists. Latterly, the art took root in England, and English B., like English architecture, acquired a distinctive national character. The oldest complete specimen in England is that on the monument of Sir John d'Aubernoun, at Stoke Dabernon. The knight died in 1277, and it is probable that the brass was executed shortly after that date. Next in antiquity are those of Sir Roger de Trumpington, who died in 1289, and of Sir Richard de Buslingthorpe, 1290; the former at Trumpington in Cambridgeshire, the latter at Buslingthorpe in Lincolnshire. In addition to the interest which they possess from their age, these B. are remarkable as being still unsurpassed in the beauty of the workmanship and the spirit of the design.

As regards the earliest English B., it is further worthy of note, that they are so similar, both in design and execution, as to lead to the conjecture that they are the work of one artist; whilst from their differing in many respects from the B. which were executed on the continent at the same period, it would seem that this artist, if not an Englishman, at all events worked exclusively in this country. In the following century (1325), on the brass of Sir John de Creke, at Westley Waterless, in Cambridgeshire, the artist's mark is affixed by a stamp—a fact which has been regarded as a proof that his craft had attained to some importance, and that his services were pretty frequently called into requisition. But in this case, as in every other, with one exception, the name of the artist has perished. The exceptional case is that of the brass which once covered the tomb of Bishop Philip, in the church of the Jacobines at Evreux, in Normandy, where the inscription ended with the words, 'Guillaume de Plalli me fecit.' Many of the B. executed in England in the 14th c. are probably Flemish; and in the churches at Bruges some exist which appear to be by the same hand with others which are found in England. There can be little question, indeed, that for this, as for most of the other departments of the arts, which were afterwards successfully cultivated in England, we were indebted to continental artists. Nor will it surprise those who know the results of recent archæological investigations in similar subjects, to learn that the artists of France and Flanders in their turn were debtors to those of the worn-out empire of the East. As in painting, sculpture, and architecture itself, so in the art of working in brass, the sparks of antique genius which smouldered in Byzantium were the means of kindling those which afterwards burned so brightly in modern Europe. The taste for lingering

> Among the knightly brasses of the graves,
> And by the cold *hic jacets* of the dead,

has grown to something like a passion of late, and there are few subjects which have been more carefully illustrated than that of sepulchral brasses. References to most of the leading works, too numerous to be mentioned here, will be found in Parker's *Glossary of Architecture*, in an article in which their results have been carefully condensed. Of modern B., the most remarkable is that in the Cathedral of Cologne, engraved in 1837, as a monument to the late archbishop.

Inlaid brass Monument of Eleanor Bohun, Duchess of Gloucester. About 1400.

BRASSICA, a genus of plants of the natural order *Cruciferæ* (q. v.), distinguished by a round and tapering 2-valved pod (*silique*), of which the valves have each only one straight dorsal rib and no lateral veins, the seeds globose, in one row in each valve, and the cotyledons (q. v.) conduplicate (folded laterally). The species are chiefly natives of the temperate and colder regions of the old world; several are British plants. A number of species are very extensively cultivated, both in field and gardens, and are of great importance in an economical point of view, particularly the CABBAGE (q. v.), of which Kale, Borecole, Colewort, and different kinds of Greens, Savoy, Cauliflower, Broccoli, Brussels Sprouts, and Kohl Rabi are varieties; TURNIP (q. v.); RAPE (q. v.) (Colza, Cole-seed) and NAVEW (q. v.). Among the British species is one, called Isle of Man Cabbage, or Wallflower Cabbage (*B. monensis*), which differs from all these, and in some measure departs from the strict generic character, in having the valves of the pod 3-nerved, and one or two seeds in its beak. It has deeply pinnatifid leaves. It is found on the sandy shores of the west of Scotland, the Isle of Man, the north of Ireland, &c. Sheep and oxen are very fond of it, and it has been suggested that it might be profitably cultivated for feeding cattle. Its peculiar adaptation to sandy soils ought to recommend it to attention.

BRAUN, AUG. EMIL., an eminent archæologist, was born 19th of April 1809, at Gotha, in Germany. He studied at Göttingen and Munich, where he made the friendship of his teachers, Schelling and Gerhard; with the latter of these he went to Rome in 1833, and in a short time was made librarian, and subsequently secretary, to the Archæological Institute. He died at Rome, on the 12th September 1856. B. wrote many valuable works on art in German, Italian, and even English. Among these may be mentioned, *Il Giudizio di Paride* (Paris, 1838), *Kunstvorstellungen des geflügelten Dionysus* (Munich, 1839), *Griechische Mythologie* (Hamburg and Gotha, 1850), *Griechische Götterlehre* (Gotha, 1851—1855), *Vorschule der Kunstmythologie* (Gotha, 1854, with 100 copperplate engravings), translated into English by Mr. Grant; and an admirable guide-book, *Die Ruinen und Museen Roms* (Brunswick, 1854), translated into English, 1855. B. also executed numerous electrotype copies of ancient works of art.

BRAUNSBERG, a walled town of East Prussia, in the government of Königsberg, about 35 miles south-west of the city of that name. It is situated on the Passarge; contains a Catholic seminary and gymnasium; and has manufactories of woollen and linen, and a considerable trade in yarn, grain, ship-timber, &c. Pop. (1876) 10,796.

BRAUWER, or BROUWER, ADRIAN, a painter of the Flemish school, was born at Oudenarde (or as others say, at Haarlem) in 1608. He was apprenticed to the well-known artist Franz Hals, who made profitable use of his pupil's great talents; keeping him in a garret like a prisoner, and making him work almost night and day, in painting small pictures, which Hals sold at very good prices. By the advice of a fellow pupil, Adrian Van Ostade, young B. ran away from his hard taskmaster, and going to Amsterdam found, to his own astonishment, himself famous as a painter. He now worked for himself, and might soon have made a fortune; but his intemperance was so extreme, that, it is said, he would never apply himself to painting, while he could have credit or be supplied with liquor at a tavern. During the war in the Netherlands he went to Antwerp, where he was seized as a spy, and taken to the citadel. Here, to prove himself a painter, he executed a sketch of the guards who had him in their custody. This picture was shown to Rubens, who immediately exclaimed: 'That is the work of Brauwer! no other artist could treat the subject in that style.' B. was liberated through the interposition of Rubens, who gave him a lodging, supplied him with clothing and food, and in every way acted as a generous friend. But the sole return for all this kindness was, that B. secretly fled from the house of his patron, in order to renew his career of low dissipation. After visiting Paris, and failing to find work, he returned to Antwerp, where he died in the hospital (1640), and was interred, at the cost of Rubens, in the Carmelites' Church. All B.'s paintings are marked by power and harmony of coloring, and clearness of chiaroscuro. They are pervaded by a jovial humor, and betray the favorite haunts and associations of the painter.

BRA'VI, were those individuals in Italy, but especially in Venice, who undertook to perform any dangerous deeds for money. It is now employed chiefly to designate hired assassins. The Italians also gave the name of B. to those fanatics in the Turkish army, who, after maddening themselves by opium, rushed upon the ranks of the enemy, and so met death.

BRA'VO, 'Excellent!' 'Well done!' an Italian exclamation of praise, the superlative form of which is *Bravissimo!* It is commonly used in England without distinction of number or gender; but the Italians say *bravo!* to a male singer or actor, *brava!* to a lady, and *bravi!* to a company of actors or singers.

BRA'VO DEL NO'RTÉ, or RI'O GRA'NDÉ, the largest river in the Gulf of Mexico next to the Mississippi. It is politically important, as being throughout its whole course the boundary between Texas and Mexico; while physically its mouth may perhaps be regarded as that point on the coast where Central America, in its geographical aspect, begins to taper itself off towards the south. It rises in the Rocky Mountains, near lat. 38° N., and long. 106° 30' W.; and after a course of 1800 miles in a generally south-east direction, it enters the sea near lat. 25° N., and long. 97° W. The commercial value of the river is not great, for, besides being for the most part very shallow, it is here and there beset by rapids and sand-bars. Small steamers, however, have got up as far as Kingsbury's Rapids, about one-fourth of the entire length of the stream.

BRAVU'RA, an Italian word, in music applied to a composition as well as style of performance. As a composition, the B. is an air or song, with many difficult passages and divisions of notes, requiring great spirit and volubility of execution. The intention of merely astonishing by execution has brought this species of composition into undeserved discredit. The B. style first came from the Neapolitan school. Rossini, Bellini, &c., united the B. with the cantabile style; and instead of leaving the embellishments to the taste of the singer, wrote the whole of the notes in the music. The compositions of Mozart, Beethoven, &c., give abundant proofs of how they united true artistic merit with the B. style.

BRAWLING IN CHURCHES, in the law of England, is an offence against the public peace. This offence may generally be described as quarrelling or creating a disturbance in a church; therefore, mere quarrelsome words, which are neither an affray nor an offence in any other place, are penal here. It was enacted by 5 and 6 Edw. VI. c. 4, s. 3, that if any person shall, by words only, quarrel, chide, or brawl in a church or churchyard, he might be prohibited from entering the church; and persons assaulting others there might be excommunicated, or have an ear cut off and be branded in the cheek. But that statute was repealed in 1860 as regards laymen, and justices of the peace, under the statute 23 and 24 Vict. c. 32, now deal with riotous, violent, and indecent behavior in churchyards or in churches and dissenting chapels, by finding the offender £5, or committing him to prison for two months. This enactment protects all kinds of religious services, though the jurisdiction of the Ecclesiastical Courts continues to some purposes. Constables and church-wardens may immediately apprehend and remove the offender. Other regulations respecting the disturbance of a congregation, or molestation of a clergyman during divine service, will be found in the 1 Mary, c. 3 (1553), which, although the Roman Catholic origin and application, is still held to be the law for the protection of the Protestant Established Church. It enacts (section 2) that if any person or persons shall willingly and of purpose, by overt word or deed, molest or disquiet any preacher . . . . in any sermon, preaching, or collation, that he shall make in any church, chapel, *churchyard*, or in *any other* place or places, used or appointed to be preached in; or (section 3) if any person or persons shall molest a priest preparing or celebrating mass, 'or *other such* divine service, sacraments, or sacramentals as was most commonly frequented and used in the last year of the reign of the late sovereign lord, King Henry VIII., or that *at any time hereafter* shall be allowed, set forth, or authorized by the queen's majesty; or shall abuse the blessed sacrament—such person or persons shall be liable to be committed to gaol, there to remain without bail or mainprize for the space of three months then next ensuing; and further, to the next quarter-sessions, at which the persons so offending shall only be delivered and discharged out of prison upon sufficient sureties for their good behavior during one whole year. The act contains other regulations for the protection of the ministration of the church, and it saves the jurisdiction of the ecclesiastical law.

By another act, 1 Will. and Mary, c. 18, s. 18, passed in 1688, it is provided that if any person or persons shall disquiet or disturb any cathedral or parish church, chapel, or other congregation, or misuse any preacher or teacher, such person or persons may be committed to prison, and on conviction, be fined £20.

It remains to be added, that reviling church ordinances subjects to fine and imprisonment—and profaning the Christian religion, and depraving the Book of Common Prayer, are also subjects of penal legislation. See on this subject 1 Eliz. c. 2, and the 14 Chas. II. c. 4. See also BLASPHEMY and RELIGION, OFFENCES AGAINST, in which latter, the Scotch law on the subject of this article will be found stated.

BRAWN, a preparation of meat made from the head and belly-piece of a young pig, with the addition of ox-feet, to render it gelatinous. The whole is rolled up tight in sheet-tin, and boiled for four or five hours. The moisture is then well pressed out of it, and having been allowed to stand for some ten or twelve hours, the meat is put into cold salt and water, and is then fit for use. B. seems to have been a well-known dish as early at least as the latter part of the 15th c., for in Tyndale's version of the Book of Common Prayer, revised by Cranmer, and still in use, in the 70th verse of the 119th psalm, we find the words: 'Their heart is as fat as *brawn*.' The B. of Wiltshire is celebrated, and it is also a famous dish in Canterbury.

BRAXY, BRAXES, BRAXIT, BRACKS. These words are given as synonymous in Jamieson's *Dictionary*, indicating a disease in sheep. In the dialect of Angus, it is called braik and bracks. The derivation of the word is uncertain. The vague way in which the term braxy is used, renders it difficult to define the disease, for in different parts of the country, totally different disorders are included under this head. Of the two most generally recognized as braxy, the one is an intestinal affection attended with obstinate diarrhœa, the other is a blood disease, and the result of plethora or fulness of blood. The second, which is spoken of by the better informed shepherds as the true braxy, may best be described here.

Causes.—A very lean flock of sheep placed on rich food is very apt to be decimated by braxy. By rich food is meant more particularly these substances containing an abundance of nitrogenous principles, such as luxuriant heather, strong and succulent grass, the best turnips, &c. Hilly land is favorable to the production of braxy, from the firm nature and nutrient qualities of food growing on it. We find the disease in such situations in the winter season. About the month of November, many of the well-fed hogs placed on turnips died suddenly from braxy; and, again, when farmers resort to the forcing-system towards spring, the mortality is great, particularly when, in addition to much artificial food, sheep are allowed rich pasture. The mortality is greatest at the period of full moon, from the sheep grazing during the light nights as well as by day. The shepherd very frequently at these times finds one or two dead in the morning. Some assert that, in the winter, exposure induces braxy; and it is very possible that it may be produced by any sudden check to the exhalations, which tend so much to maintain the balance of the functions and purify the blood.

Symptoms.—The animal, in full health, suddenly ceases to eat, has a staring look, is peculiarly excitable, and separates itself from the flock. The head is lifted high, the breathing becomes labored,

the countenance appears anxious, and the animal loses the power of its limbs. It totters, falls over, is seized with convulsions, and dies within five or six hours, and often within an hour from the first symptoms of the disease.

Cadaveric appearances.—If the sheep's throat is cut before it dies, the absence of any peculiar appearances within the body is very remarkable: the flesh appears of a dark-red color, and the veins are charged with dark blood, but, on the whole, the body of the sheep looks so well that the mountain-shepherd cuts it up to make 'braxy mutton.' If the sheep is allowed to die of itself, the body soon swells, putrifies, and is rendered useless.

Treatment.—The prevention of the disease alone affords hope, and it consists in regulating the animal's diet, to prevent sudden transitions from low to rich keep; to mix food so as to modify the action of the more highly nitrogenized kinds; and to check the development of plethora or fulness of blood by saline purgatives and diuretics, such as Epsom and Glauber salts or nitre. The principles to be followed out in preventing this disease are precisely similar to those referred to under the head BLACK QUARTER in cattle. Shelter during severe winter weather is insisted on by shepherds as essential to prevent the malady.

Braxy mutton, above alluded to, is, as a general rule, not unwholesome; though in warm climates the same disease in sheep assumes a very malignant type, and indeed constitutes one of the carbuncular diseases. Though the flesh can be eaten with impunity in the mountains of Scotland, it is most dangerous and condemned in Southern Europe.

BRAY, a maritime town, situated partly in the county of Dublin, partly in that of Wicklow, 13 miles S.E. from Dublin, with which city it is connected by the Dublin, Kingstown, and Bray Railway, and the Dublin, Wicklow, and Wexford Railway. The pop. in 1861 was 4182, and in 1871 had risen to 6087, of whom 4562 were Roman Catholics, and 1315 Protestant Episcopalians; in 1881 the pop. was 6090. Some years since, B. was a small fishing-village; but the beauty of its situation has made it a popular watering-place, as well as a favorite position for villa residences; and under the enterprise of a few active speculators, it has not only grown in its dimensions, but the extensions have been carried out with excellent taste and spirit. The most striking buildings are the new hotels, and a Turkish bath, recently diverted to other purposes. The affairs of the municipality are administered by town commissioners. B. has a weekly newspaper.

BRAY, MRS. ANNA ELIZA, an authoress, is daughter of the late John Kempe, Esq., of the New Kent Road, Surrey, and was born towards the end of last century. At an early age, she showed much of the imaginative faculty, and a taste for design, which later brought her the acquaintance of the celebrated Mr. Stothard, R.A. From Stothard she took lessons in drawing; and in February, 1818, married his second son, Charles Alfred Stothard, also an artist, and author of a well-known work entitled *The Monumental Effigies of Great Britain, selected from our Cathedrals and Churches, &c.* In July 1818, she accompanied her husband to France. Their tour and residence in France lasted until about the middle of November in the same year; and Mrs. Stothard wrote an agreeable and lively account of her first foreign experiences, under the title of *Letters written during a Tour through Normandy, Brittany, and other parts of France, in* 1818, *with Numerous Engravings after Drawings by C. Stothard, F.S.A.* (Lond. 1820, 4to) Subsequently, Mrs. Stothard accompanied her husband on a similar tour in the Netherlands. In May 1821, however, she had the severe misfortune to lose her husband, who was killed by falling from a ladder. In 1823, Mrs. Stothard wrote a life of her husband, entitled *Memoirs, including Journals, Letters, Papers, and Antiquarian Tracts of the late C. A. Stothard, with Connective Notices of his Life, and some account of a Journey in the Netherlands.*

Distress of mind brought on ill health, and Mrs. Stothard suffered from an affection of the eyes, which obliged her to give up literary labor altogether for more than two years. In 1825, she married the Rev. E. A. Bray, vicar of Tavistock; and in the following year, published a historical romance entitled *De Foix*, which she had begun during her first husband's lifetime. The idea of this romance was conceived during the tour in Normandy; and similarly, that of her second romance, *The White Hoods*, during her tour in the Low Countries. This was published in 1828, and was followed by *The Protestant*, also in 1828: *Fitz of Fitz-Ford, a Legend of Devon* (1830); *The Talba, or Moor of Portugal* (1830); *Warleigh, or the Fatal Oak, a Legend of Devon* (1834); *Trelawny of Trelawne, or the Prophecy, a Legend of Cornwall* (1837); *Trials of the Heart* (1839); *Henry De Pomeroy* (1842); and *Courtenay of Walreddon, a Romance of the West* (1844). A collective edition of all these romances were published in ten volumes in 1845. Her letters to Southey were published, and reached a second edition in 1879. Mrs. B. who died in January 1883, was also the author of *The Borders of the Tamar and the Tavy* (1836), *The Mountains and Lakes of Switzerland* (1841), *Trials of Domestic Life* (3 vols. 1848), *Life of Thomas Stothard, R.A.* (1851), *A Peep at the Pixies* (1854), and *Händel, his Life, Personal and Professional, with Thoughts on Sacred Music* (1857). In July 1857, Mrs. B.'s husband died; and in 1859, she published his *Poetical Remains*. In 1870, appeared *The Good St. Louis and his Times*, and *The Revolt of the Protestants of the Cevennes*. In 1871 came *Hartland Forest: a Legend of North Devon;* in 1873, *Joan of Arc, and the Times of Charles VII., King of France;* and in 1874 *Roseteague.*

BRAYERA. See CUSSO.

BRAZI'L, the most extensive state of S. America. Towards the interior, it borders on all the other states of S. America except Chili and Buenos Ayres—on Uruguay, the Argentine Confederation, Paraguay, Bolivia, Peru, Ecuador, the U.S. of Colombia, Venezuela, and Guiana, English, Dutch, and French; while its sea-board, beginning about 200 miles to the north of the Amazon, and reaching to within the same distance of the Plata, projects into the Atlantic fully 1000 miles to the east of the direct line—pretty nearly a meridian—between the two extremes. This immense country extends between lat. 4° 30′ N. and 33° S., and between long. 35° and 70° W., being, in round numbers, 2600 miles long and 2500 broad. The area, according to official accounts, is 3,200,000 square miles. But B. was not always, in point of extent, what it is now.

The Portuguese, who, in 1500, accidentally discovered the south-east coast of the country (but that only after one of the Pinzons had, on behalf of Spain, followed the shores of the continent from its eastern angle to the mouth of the Orinoco), claimed all between the Plata and the Amazon. Soon, however, the Spaniards of Buenos Ayres, feeling that the complete command of their mighty river was to them a necessary of life, colonized the left bank by founding Monte Video. But nearly twenty years earlier, B. had acquired more territory on the Amazon than it was to abandon on the Plata, having, in 1509, wrested from France, then at war with Portugal, what may now be designated Brazilian Guiana. It was only in 1531 that the Portuguese, busy as they were in India, here planted their first settlement. In 1578, B. fell, along with Portugal itself, under the power of Spain—a connection which, besides being essentially detrimental, speedily threw it as a prey into the hands of the Dutch Republic; and though Portugal regained its own independence in 1640, it was not until 1654 that B. was entirely recovered from the Hollenders. Thenceforward, the colony entered on a new era. Supplanted, in a great measure, throughout the east by the Dutch, the mother-country was now directing most of its attention to its possessions on either side of the Atlantic. About a century and a half later, a still more beneficial change—and that, too, arising from the mother-country's own disasters—was inaugurated in the colony. In 1808, under the pressure of French invasion, the monarchy, in the persons of the royal family, was virtually transferred from Portugal to B., an event, which, doubtless through British counsels and influence, was immediately followed by the opening of the ports to foreigners. As a remoter benefit, too, of an incident which had no parallel either in English or in Spanish America, B., on shaking off, like its neighbors, the European yoke altogether, found a merely nominal revolution sufficient for its purpose, establishing, or rather accepting, an hereditary empire instead of restless and precarious republicanism; and ever since the transition-period of 1821—1825, this consolidated government, with subordinate institutions for local objects, has secured to B.'s twenty vast provinces comparative unity and peace. A war was undertaken in 1865, in concert with the Argentine Republic and Uruguay (formerly a province of B.) against Paraguay, which terminated in the defeat of the Paraguayans; and in 1872 Paraguay ceded to B., as a war-indemnity, the long disputed territory comprised between the Paraguay and the Paraná, north of the Apa and Igatim. This territory has an extent of about 16,000 square miles.

The executive authority is vested in the emperor, who, besides being aided by a council of state, must act through responsible ministers. The legislature consists of two chambers, which sit four months every year. Both the deputies and the senators, who must have annual incomes respectively of 800 milreis and 1600 are indirectly elected by voters who must possess 200 milreis per annum—the former for four years, and the latter for life. The senate, however, appears to represent the crown as well as the people, inasmuch as each constituency merely nominates three individuals for his majesty's choice of one. Justices of peace, also, are appointed by the respective communities; and in the courts generally, whether civil or criminal, there prevails trial by jury. The budget of 1882–83 gave a revenue of 127,483,000 milreis (£12,748,300), more than half of which comes from the heavy custom-duties, and about one-fifth from direct taxes; and an expenditure of 127,443,000 milreis; the public debt in 1882 was 818,574,800 milreis—nearly £82,000,000. The standing army is fixed at 3000 men on the peace-footing, and at 32,000 on the war-footing; and the standing naval force is 4000 men (8000 in time of

war). The navy in 1880 consisted of 57 vessels, including 39 steamers and 18 ironclads.

The population in 1872 amounted to 10,108,291 negroes, mulattos, and Europeans, besides about 1,000,000 aboriginal Indians, who are here proportionally fewer than in most parts of South America. Of the total population, 1,119,168 were slaves in 1880. The Africans continued to be imported till 1854, and their amalgamation with the Europeans produced perhaps the finest variety of the mulatto in the world. A law for the gradual emancipation of the slaves was passed in 1871. It enacts that henceforth the children born of slave women shall be 'considered of free condition,' but bound to serve the owners of their mothers for the term of 21 years, under the name of apprentices. Roman Catholicism is the prevailing religion. Notwithstanding the recent efforts of the legislature for the advancement of education, it is still very defective. In 1874, the attendance at the public schools was only 140,000.

But physically, as well as politically and socially, B. differs in many respects from most of the other divisions of the new continent. It knows nothing of the volcanoes and earthquakes of the Pacific coast; with winds blowing constantly from the Atlantic Ocean, it is exempted from those droughts which are always blighting one or other of the slopes of the Andes, the remoter slope in Peru and Chili, and the nearer in Buenos Ayres, and Patagonia; its mines, again, are as famous for gold and diamonds as those of the Western Cordilleras for silver. In its hydrography, B. contrasts unfavorably with the other divisions. While the Amazon and the Plata, the Mississippi and the St. Lawrence—not to mention countless rivers of inferior magnitude on both shores—are for the most part practicable almost to their sources, the streams of B., with the exception of the Amazon, are mostly impeded throughout by cataracts and shallows, thus counterbalancing, as it were, its matchless seaward facilities by the deficiencies of its inland communications. Further, the most navigable of these streams, instead of entering the open sea, mingle their waters with those of the Plata or of the Amazon—the Parana and the Uruguay joining the former, and the Madera, the Tapajos, the Zingu, and the Tocantins, the latter; and even among those that do send their tribute at once to the ocean, a similar direction is sometimes impressed by the dividing ridges—the San Francisco, for instance, by far the largest of them, running to the northward parallel with the south-east coast through 11° of lat., and leaving only 4° of long. for its remaining course to the Atlantic. A humid surface and a luxuriant vegetation conspire to render ordinary roads all but impossible. B. possessed, at the commencement of 1878, railways of a total length of 791 miles, and it has also a system of telegraphs, the lines at the same date being 3875 miles in extent. Telegraphic communication has been established between B. and Europe; the first message was despatched by the cable to Lisbon, June 23, 1874.

Among the mineral treasures, besides gold and diamonds already mentioned, iron of superior quality is abundant; and salt, also, is extensively produced in saline marshes by the alternate processes, according to the season, of inundation and evaporation. The productions of the soil, which are, of course, equally various and rich, will be more satisfactorily considered under the heads of the respective localities.

Suffice it to say, that the cotton is naturally excellent, and that the tea-plant of China has been introduced, but hitherto with indifferent success. The exports are necessarily different from the different sections. From the north, they are india-rubber, cotton, cocoa, sugar, and tobacco; from the south, coffee, hides, tallow, horns, &c.; and from the middle, drugs, diamonds, gold-dust, dyes, rice, manioc, tapioca, spirits, and rosewood. Their value in the last years of the decade, 1870–80 was close on £17,000,000 a year; that of the exports was between £20,000,000 and £22,000,000. More than half the value of the exports is for coffee. The imports from the United Kingdom in 1872–81 were valued at from £4,500,000 to £9,500,000 a year; the exports hence, from £5,560,000 to £7,550,000. The chief cities of B. are Rio de Janeiro (the capital), Para, Maranhão, Bahia, Pernambuco, and San Paulo in the interior.

BRAZIL CABBAGE, or CHOU CARAIBE (*Caladium sagittifolium*, or *Xanthosoma sagittifolia*), a plant of the natural order *Araceæ*, nearly allied to Cocco (q. v.), and very similar to it, although it differs in having arrow-shaped pointed leaves. It is supposed to be originally a native of tropical America, but is now in common cultivation throughout the whole tropics; not only the root being used for food like that of cocco, but also the leaves, boiled as greens. Both root and leaves are almost entirely destitute of the acridity so generally characteristic of the order.

BRAZI'L NUTS are the seeds of the *Bertholletia excelsa*, a majestic and beautiful tree of the natural order *Lecythidaceæ* (q. v.). The tree grows to the height of 100 or 120 feet, and abounds on the banks of the Orinoco and in the northern parts of Brazil. It produces a round woody pericarp or seed-vessel, almost as large as a man's head, within which are many of the seeds or nuts. The pericarp is very heavy and solid, requiring a blow of a sledge-hammer to break it; and at the time when this great fruit is ready to fall, it is dangerous to walk under the tree. The seeds, which are popularly called nuts, and much resemble fruits of that description, are wrinkled and triangular, having a hard shell and a pure white kernel, which, when fresh, is very agreeable. They are chiefly exported from Para and French Guiana, and are well known in our shops. They yield a large quantity of oil, which is good for burning.

The nuts or seeds of the *Lecythis ollaris*, or POT TREE, are produced in a pericarp which resembles a rusty iron pot with a lid, the lid dropping off and letting the seeds out, which are oblong,

Brazil Nut:
a, the fruit; *b*, the same, with half of the pericarp removed to show the nuts or seeds; *c*, a single seed or nut; *d*, a nut cut across; *e*, a kernal of a nut; *f*, the central placenta, to the lower end of which the nuts are attached in the pericarp; *g*, a leaf.

grooved, and esteemed of a very superior quality to the common B. N.; but they have not yet become an article of commerce, as the tree grows chiefly in the interior parts of the country, from which the nuts are only occasionally sent to the coast.

BRAZI'L WOOD, a dark-red or yellowish-brown dye-wood, which forms a considerable article of export from Brazil, where some of the trees which yield it are very abundant. It is the prod-

Brazil Wood:
a, a branch with leaves and flowers; *b*, a pod.

uce of different species of *Cæsalpinia* (q. v.). The best kinds are those called Pernambuco Wood, All Saints' Wood, and St. Martha Wood. Much of the B. W. of commerce is obtained from *Cæsalpinia Brasiliensis*, a tree which is a native of the West Indies,

commonly growing in dry places and among rocks, and seldom exceeding 30 feet in height. It has bipinnate leaves, with many smooth, obtuse, oblong leaflets, and no terminal leaflets flowers in pannicles, with downy stalks. The heart-wood alone is of any value. —PERNAMBUCO WOOD is the produce of *Cæsalpinia echinata*, a prickly tree, with prickly pods, and of which the red and yellow flowers have a delicious smell, resembling that of the lily of the valley. The sap-wood is extremely thick, and the valuable heart-wood bears a small proportion to the whole diameter of the stem. —The Sappan Wood (q. v.) of the East Indies nearly approaches B. W. in quality. It is the produce of *Cæsalpinia Sappan*, a small thorny tree.—The BRAZILETTO WOOD, sometimes also called B. W., which is brought from the Antilles, is much inferior. *Cæsalpinia crista*, probably yields some of the inferior West Indian Brazil-Wood.—It is a curious circumstance, that B. W. is said not to take its name from Brazil, but to be mentioned under the name *Braxilis* in documents much older than the discovery of America, the Sappan Wood of the East Indies being probably intended, and the name of Brazil has even been supposed to be derived from that of this product of its soil.

When freshly cut, the color of B. W. is yellow; but when exposed to air, moisture, and light, it becomes red, and is generally sent into market ground down to the size of ordinary saw-dust. When treated with water, alcohol, or ether, the weathered B. W. readily yields up its red coloring matter, called *Brazéléin*. The latter is supposed to be produced from the oxidation of a colorless substance called *Brazilin*, which exists in the original yellow wood of the tree. Strong decoctions of B. W. are used by the dyer and calico-printer in the fabrication of reds, browns, &c.; it is also used in the manufacture of red ink. See INK.

BRAZI'LIAN GRASS, an incorrect popular name applied to a substance used in the manufacture of a very cheap kind of hats, known as B. G. hats, and also as *chip* hats. It consists of stripes of the leaves of a palm, *Chamærops argentea*, which are imported into Britain for this manufacture, and chiefly from Cuba. See CHAMÆROPS.

BRAZI'LIAN PLUM. See HOG PLUM.

BRAZING, or BRASS SOLDERING, is the process of uniting together two pieces of brass, two pieces of copper, or one of each, by means of a hard solder, partaking more or less of the composition and properties of ordinary *brass*. The edges or parts of metal to be joined are first filed bright, so as to be thoroughly clean, then there is strewed over the gap or crevice a mixture of the solder and borax. The solder employed varies in composition according to the kind of work, and may be rendered more fusible by the addition of a larger amount of zinc, but the general proportions are (1) 16 copper, 16 zinc, and 1 tin; (2) 12 brass, 4 zinc, and 3 tin; or (3) 18 brass, 3 zinc, and 2 tin. When the whole has been fused together, it is allowed to cool, and is then filed down to a coarse powder, in which state it is used. The borax is employed to form a glaze over the brightened surfaces, and thus prevent the oxidation of the metal, which would seriously interfere with B., and even stop the operation. An outward coating or layer of charcoal is likewise serviceable in the exclusion of the air during the B. of large pieces of metal. Where a very high heat is required in the process, a little powdered glass is mixed with the borax. The mixture of solder and borax may be applied dry, but it is better to moisten it with water, and to lay it on the filed surfaces with a spoon.

The whole is then gently heated, when the water evaporates and leaves a crust of borax and solder. The work may now be strongly heated before the blow-pipe, or over a clear fire, and at a bright red heat the solder fuses and the zinc begins to burn with a pale-blue flame. At this stage, the solder *flushes* or becomes liquid enough to permeate the joint or crevice; but should it be tardy in acting thus, several slight taps will insure the proper result. The whole is now cooled, and towards the close, the articles may be introduced into cold water for more rapid reduction in temperature. Pieces of metal which have undergone the process of B. are so firmly united that they may be rolled and re-rolled without the parts yielding. See SOLDER.

BR'AZOS DE DI'OS, a river of Texas, North America, the second, if not the first, in magnitude that flows within the state. It runs towards the south-east, rising in the table-land of Bexar County, and falling into the Gulf of Mexico about 40 miles to the south-west of Galveston. With a course of about 900 miles it is navigable at all times to a distance of 40 miles from its mouth, and at certain seasons to a distance of 300 miles. The valley of the river, the lower half being merely an alluvial plain, presents extensive forests, interspersed with plantations of maize, sugar, and cotton.

BRA'ZZA, an island in the Adriatic, belonging to Dalmatia, Austria, in lat. 43°—44° N., and long. 16°—17° E. It has an area of about 170 square miles, and a population of 16,000; and is separated from the mainland by a channel of some 8 or 10 miles in breadth. Its surface is mountainous, and extensively wooded; vines, yielding excellent wine, are grown in the valleys, and figs, saffron, almonds, and oil are produced in considerable quantities, but not much grain is raised. Bees and silk-worms are reared in large numbers. B. is also celebrated for its cheese, and the delicacy of the flesh of its lambs and kids. Excellent building-stone, which is largely exported, is found in the east part of the island. St. Pietro di Brazza is the chief town.

BREACH, in siege-works, is a gap in any of the defensive walls or gates of a city; and *breaching* is the operation by which the gap is produced by the guns of the besiegers. *Breaching batteries* are employed, consisting of several pieces of ordnance, so chosen as to kind and size, and so placed as to distance, as to burst a hole through the defences in the shortest practicable time.

The greatest effect is produced by lodging the balls in two vertical lines, from the parapet of the wall downwards, and in a horizontal line, connecting the lower ends of those vertical lines; and then overturning the mass of material thus loosened by an irresistible salvo or volley. When a hole has once been made, by thus knocking away the masonry or earthwork, the breaching is continued until the crumbling mass has so accumulated as to form a practicable slope, up which the storming-party of the besiegers may run. See ASSAULT. During the Peninsular war there were some formidable examples of breaching. At Badajoz, 14,000 shot brought down 180 feet of wall in 104 hours, from a distance of 450 yards. At Ciudad Rodrigo, 6700 balls brought down 105 feet of wall in 32 hours, from a distance of 560 yards. At St. Sebastian, 13,000 shot brought down 100 feet of wall in 62 days, from a distance of 620 yards. It was calculated, from these and other instances, that 10,000 24-lb. shot, or 240,000 lb. of iron, will breach 100 feet of wall from a distance of 500 yards—the wall being of fair average masonry, and the height and thickness a fair average of those used in fortified towns. It must be remembered, however, that this estimate was made before the days of rifled cannon and Armstrong guns; and, on the other hand, that the walls adverted to were not constructed of granite.

BREACH, in law, signifies a breaking or violation of a right or of an obligation or engagement legally binding; and in this sense it has numerous applications, of which the following are those more particularly treated in law-books:

BREACH OF ARRESTMENT, in the practice of the Scotch law, is the disregard or violation of the process of arrestment, or attachment, by the arrestee, or party in possession of the arrested or attached property, but who, notwithstanding, pays the sums or delivers the goods arrested; and such B. is viewed by the courts as a contempt. But at present the only consequence of the B. is, that the person guilty of it, where it is a question as to *money*, is liable in damages to the extent of the funds paid away, and the costs. Where goods are arrested, and the arrestment is removed on bail (or 'loosed on caution,' as the Scotch lawyers say), if the goods themselves cannot be recovered, or their value cannot be clearly ascertained, the surety or 'cautioner' is held to be liable for the original debt. See ARRESTMENT. In England, the disputing or disobeying a rule or order by a judge for attachment of a debt very nearly means the same thing. See ATTACHMENT, GARNISHEE.

BREACH OF CLOSE is a trespass by which an unwarrantable entry is made on another man's land for satisfaction of which injury an action will lie to recover damages. It is called a trespass for breaking a man's *close*, because every man's land is, in the eye of the law, enclosed and set apart from his neighbors; and that either by a visible and material fence, as one field is divided from another by a hedge; or by an invisible boundary, existing only in the contemplation of the law, as when one man's land adjoins to another's in the same field. The liability to this injury attaches not only to the party himself trespassing, but also to trespass by his cattle. And the law gives the party injured a double remedy in this case, by permitting him to distrain the cattle till the owner small make satisfaction, or else by leaving him to the ordinary remedy by action for the damage done.

But in some cases this trespass is justifiable; as where it is done in exercise of a right of way, a right of common, or the like; or where a man comes to demand or pay money payable on the particular land; or to execute, in a legal manner, the process of the law; or by the license of the plaintiff himself. Also, a man may justify entering into an inn or public-house without the leave of the owner first specially asked; because when a man professes the keeping of such an inn or public-house, he thereby gives a general license to any person to enter his doors. So a landlord may justify entering to distrain for rent; and a reversioner to see if any waste be committed on the estate, for the apparent necessity of the thing; and it has been held that the common law warrants the hunting of ravenous beasts of prey, as badgers and foxes, in another man's land, if no greater damage be done than is necessary, because the destroying such creatures is said to be profitable to the public. But in cases where a man misdemeans himself, or

makes an ill use of the authority with which the law intrusts him, he is accounted a trespasser *ab initio;* as if one comes into a tavern, and will not go out in a reasonable time, but remains there all night, contrary to the inclinations of the owner; such wrongful act is held to affect and have relation back even to his first entry, and make the whole a trespass. But a bare nonfeasance, as not paying for the wine he calls for, will not make him a trespasser, for this is only a B. of contract. See Blackstone and Stephen's *Com.* respecting 'civil injuries.'

In the Scotch law, the term *close* is not used, and not known—but there any violation of a right of property in land may be redressed by legal process, and in many cases form the ground of an action for the recovery of damages. See CLOSE. The term *Inclosure*, in Scotch law, has a different meaning, although the penalties for breaking such inclosure are somewhat analogous to those for breach of Close. See below, BREAKING INCLOSURE, and see TRESPASS.

BREACH OF COVENANT is one of those civil injuries by which is meant a violation of a covenant or agreement contained in a deed of conveyance, either to do or omit to do something, and which B. gives a right of action against the party who made the covenant and his representatives. See COVENANT.

BREACH OF CONTRACT is a general description of injury, by which is understood the violation of any contract or legal engagement, and for which, at law, damages may be recovered, according to the nature of the breach and character of the contract. In 1854, jurisdiction was conferred upon the courts of common law, by which a plaintiff can compel a defendant to fulfil any actual duty. But till the constitution of the new High Court of the Justice in 1873, it was only in the courts of equity that complete relief was given by enforcing the specific performance of contracts. See CONTRACT; DAMAGES; SPECIFIC PERFORMANCE; EQUITY, COURTS OF; CHANCERY, COURT OF.

In Scotland, although there is no distinction between law and equity, the remedy for this injury is very much the same. The party wronged may either conclude for damages, or *ad factum prestandum*, or for both of these remedies.

BREACH OF DUTY, may be legally defined as either the non-execution of an office, or the performance of it in such a way that the conditions on which it was undertaken are violated. Such misconduct may either violate the conditions of an express contract, or it may be equally opposed and do equal violence to any implied engagement or *assumpsit*, as it is technically called in the law of England, not from the express determination of any court or the positive directions of any statute, but from natural reason and the just construction of law, which assumes and intends that every man has engaged what his duty or justice requires at his hands. And he must do this with integrity, diligence, and skill; for if by his neglect injury accrues to individuals, they have their remedy against him in damages. See CONTRACT, DUTY, OBLIGATION, DAMAGES, EQUITY, PERFORMANCE OF CONTRACTS.

BREACH OF THE PEACE is an offence against the public tranquillity and safety, and is either felonious or not felonious. But the law on this subject will be best considered under PEACE, OFFENCES AGAINST THE PUBLIC.

BREACH OF POUND is an indictable offence, and means the breaking any *Pound* (q. v.), or place where cattle or goods distrained are deposited, in order to rescue them. When once impounded, such goods or cattle are understood to be in the custody of the law, and an action for treble damages will lie for illegally taking them out of pound upon a distress for rent. Further, it is enacted by the 6 and 7 Vict. c. 30, that if any person shall release, or attempt to release, cattle lawfully seized by way of such distress, from the pound or place where they shall be impounded, or on the way to or from such pound or place, or shall destroy such pound—he shall be liable to a penalty not exceeding £5, and in default may be committed to the house of correction. See Stephen's *Com.*, vol. iii., and see DISTRAIN, DISTRESS, POUND.

BREACH OF PROMISE TO MARRY. See PROMISE and MARRIAGE.

BERACH OF TRUST. See TRUST.

BREAD. The earliest and most primitive way of making B. was to soak the grain in water, subject it to pressure, and then dry it by natural or artificial heat. An improvement upon this, was to pound or *bray* the grain in a mortar, or between two flat stones, before moistening and heating, and from this *braying* operation some etymologists propose to derive the word *bread* (as if *brayed*). A rather more elaborate bruising or grinding of the grain leads to such simple forms of bread as the *oat-cakes* of Scotland, which are prepared by moistening oatmeal (coarsely bruised oats) with water containing some common salt, kneading with the hands upon a baking-board, rolling the mass into a thin sheet, and ultimately heating before a good fire, or on an iron plate, called a girdle, which is suspended above the fire. In a similar manner, the barley-meal and pease-meal *bannocks* of Scotland are prepared; and in the East Indies (especially the Punjab and Afghanistan), as well as in Scotland, flour is kneaded with water, and rolled into thin sheets, as *scones*. The *passover cakes* of the Israelites were also prepared in this way. A similar preparation of wheat-flour, but where the sheet of dough is made much thicker, forms the *dampers* of Australia.

The Indian corn-meal, kneaded with water and fired, affords the *corn-bread* of America. The kinds of B. referred to above are designated *unleavened*, as no leaven has been added to the dough to excite fermentation. Even in the time of Moses, however, *leaven* was employed in making bread. It is held probable that the Egyptians were the first to use leaven; that the secret afterwards became known to the Greeks; and that the Greeks communicated the process to the Romans, who spread the invention far and wide in the northern countries during their campaigns.

The grain of wheat is generally employed in the manufacture of B. among the better classes, and more advanced nations, though rye, barley, Indian corn, and rice are also extensively used. The average composition of the grain of wheat when dried, so as to evaporate about 14 per cent- of moisture, is

Gluten and albumen	13½
Starch	54½
Gum, sugar, oil, and fibre	30
Saline matter	2

The proportion of these ingrediants varies, however; and though the native country of wheat is unknown, yet it is found that, within the wheat zone (see WHEAT), the quality improves as we travel south. Thus, Scotch wheat is inferior to English, the latter to French, that to the Italian; and the finest wheat in the world is grown in Barbary and Egypt. The principal constiutents of wheat may be separated from each other without much difficulty. Thus, if wheat-flour be placed in a cloth-bag with the mouth well closed, and the whole introdnced into a basin of water and pressed by the fingers for some time, the starch is squeezed through the cloth as a fine white powder, and the gluten is left in the cloth as a viscid or sticky substance. Again, if wheat-flour be burned on a porcelain plate on a fire, or oven, or gas-lamp, till it can burn no longer, it leaves behind a small amount of ash or saline matter.

Previous to being employed in the fabrication of B., the grain of wheat undergoes the process of *grindiug*, with the double object of reducing it to a fine state of division, and separating the more hard and indigestible parts. See MILL. During the grinding operations, the wheat, as it passes from grain to flour nearly doubles its bulk. The products come from the dressing-machime divided into different qualities, a qnarter of wheat yielding—

	Bushels.	Pecks.
Fine flour	5	3
Second flour	0	2
Fine middlings	0	1
Coarse middlings	0	0½
Bran	3	0
Twentypenny	3	0
Pollard	2	0
	14	2½

In the making of bread in Great Britain, the finest flour is employed in making *firsts* or *the fine 4-lb. loaf;* a coarser flour is made into *seconds* or household B.; and a still coarser into *thirds* or coarse bread. There is no bran in *firsts*, but a greater or less proportion of the finer bran in *seconds* and *thirds*. In the making of good B. three things are absolutely requisite: flour or meal, yeast or leaven, and water containing salt. The yeast (q. v.) or leaven (q. v.), is added to give a start to the fermentation (q. v.) process, thereby supplying carbonic acid, which communicates a spongy or light texture to the bread. Leaven is the more primitive ferment, and is simply a portion of moistened flour or dough in which the putrefactive agencies have begun to work. It may be procured by allowing moistened flour to lie in a warm apartment (summer heat) for six or eight days, and when sufficiently formed has an acid taste and reaction, and a somewhat fusty odor. When brought into contact with a new portion of flour and water, and incorporated therewith by kneading, it very quickly acts as a ferment, and develops partial fermentation in the whole. Hence it is that where leaven is used, it is customary to retain a portion of the leavened dough for the next baking. On the continent, leaven is still very extensively employed, especially in districts far from breweries. In Britain, yeast is generally used as the ferment.

The materials being at hand, and the proper benches, utensils, and oven being within reach, the baker takes a quantity of water and adds to it the yeast and salt; after which the flour is added, and the whole thoroughly and laboriously kneaded together till it assumes a ropy consistence. It is then called the *sponge*, and is placed in a kneading-trough in a warm place, which is styled *setting the sponge*. In a short time, the yeast begins to act on the gluten, starch, and sugar of the flour, compelling the latter to pass into alcohol and carbonic acid gas in every part of the dough,

which thereby becomes inflated with innumerable air cavities. When the fermentation has sufficiently advanced, the baker takes the sponge, adds more flour, water, and salt, and a second time subjects the whole to a thorough process of kneading, to prevent portions being so far fermented as to become *sad*, and again allows the mass to lie in a warm place for a few hours. The dough swells considerably from distension by gas, and is weighed out into lumps of the proper size, which are shaped into loaves, constituting the *batch*, or placed in tin pans, and are allowed to lie for a short time till they get further distended.

The oven has been previously been heated by flues, by heated air, or by wood being burned within it, to a temperature of at least 320° F., which is the lowest temperature at which B. can be baked, and ranging up to 572° F.; and when it has been thoroughly cleaned out, the loaves are introduced and placed on the floor, and the oven shut up. The heat acts in dissipating much of the water from the dough, in distending the air cavities more fully, and in partially *boiling* the starch and gluten of the dough, and developing some gum from the starch. Indeed, though the temperature of the oven is much higher, yet the loaves beyond the mere crust are bathed in an atmosphere of steam, and are never heated above 212°, as has been proved by direct experiments with the thermometer. One effect of the heat is to arrest any further fermentation (q. v.; see also YEAST). After several hours' baking in the oven, the length of time being determined by the temperature, the loaves are withdrawn, and allowed to cool. The brown appearance of the crust of loaves, and the pleasant taste of the crusts, are due to the action of the heat on the starch and the formation of dextrine (q. v.), a sort of gum. The number of quartern (4 lb.) loaves which a sack of flour weighing 280 lbs. yields, is 90. It will be apparent, therefore, that as 280 lbs. of flour yield 360 lbs. of B., that a good deal more water must be present in the latter than in the former ; and, indeed, ordinary good wheaten B. contains about 45 per cent. of water. This water is retained even after the loaf is apparently dry, and even mealy, as the gum and gluten have a great affinity for water.

Improvements in the process of making B. are occasionally effected. Thus a form of yeast, called German barm or yeast (q. v.), has been introduced, which is more cleanly than ordinary yeast or leaven, but appears to be too rapid in its power of causing fermentation to be manipulated easily in the making of ordinary loaves, though it does well for pan-loaves and fancy B. in general. Ovens heated by flues are being constructed, instead of the primitive method of heating them by wood, which smokes the whole oven.

Instead of raising the dough by the action of yeast, which decomposes a part of the flour and causes the loss of about 2 per cent., bicarbonate of soda and hydrochloric acid are sometimes employed. The proportion by this process are 4 lbs. of flour intimately mixed with 320 grains of bicarbonate of soda; to this is added a mixture of 300 grains of common salt in 35 ounces of water and 6½ fluid drachms of hydrochloric acid, sp. gr. 1·16, and the whole is kneaded and placed in the oven. When the mixture is made, the acid acts on the bicarbonate of soda, forming common salt, which is left in the dough, and carbonic acid is liberated at every point, and communicates a spongy texture to the dough. The disadvantage attended on this mode of raising the dough is, that it is apt to leave too much common salt in the B. This is obviated by using water charged with carbonic acid, as described under AERATED BREAD. Sesquicarbonate of ammonia is employed to some extent in the preparation of rusks, ginger B., and other light fancy B.; when heated, it entirely passes into gas, and thus yields a very spongy mass. *Short-bread* is prepared from flour which has been incorporated with butter. See UNFERMENTED BREAD.

The appearance which good wheaten B. ought to present, is that of a vesicular or spongy mass, from which layers can be readily detached; and this, known to bakers as *piled B.*, is the best index of good wholesome and easily digested bread. When the layers cannot be detached, and the loaf cannot be crumbled down by the fingers into a coarse powder, or the fragments be thoroughly soaked and be readily diffused through water, but become a permanent tough mass of dough, the B. is imperfectly made.

Rye B. is very extensively used in northern European countries, where the soil being sandy is admirably adapted for the growth of that grain. It yields a flour darker than wheat-flour. It is almost equal in nutritive value to wheaten-bread. Barley and oats, which when used as B. are generally made into cakes or bannocks, possess also a composition not unlike wheat. Indian corn, which thrives luxuriantly on the American soil, and is largely used there for B., as also to a considerable extent in the Old World, is little different from wheat in the proportion of its ingredients. Rice is occasionally employed in making B., but it is not nearly so nutritious as wheat.

But although, with the exception of rice, the various kinds of grain do not sensibly differ in the amount of nutritious matter contained in the meal, yet there is a great difference as to the quality of yielding a light, spongy bread. In this respect, the flour of wheat excels all others. This quality seems to depend upon the mechanical structure of the gluten of wheat, which gives a glutinous, sticky consistency to the dough, rendering it impervious to the carbonic acid gas formed in it during the fermentation, so that the gas thus imprisoned swells it up. The meal of other grains forms a more granular and less tenacious dough, which allows the gas to escape with more or less ease as it is formed. It is thus impossible to make a light, spongy loaf of oatmeal, however finely it might be ground. In the case of whole-meal B. or brown B., the rough, hard particles of the bran interfere with the ordinary tenacious quality of wheaten-flour, and make the dough slightly porous, so that much of the gas escapes, and thus this kind of B. is never so much raised as B. of fine flour.

BROWN, COMPOSITION, or WHOLE FLOUR B. is made from the ground but undressed wheat, and therefore contains the bran as well as the flour. Some years ago it was suggested, that as the bran contained more nitrogenized matter than the flour, the whole meal must be more nutritious than the finer flour alone. But that opinion is now considerably modified: for while it is true that the whole meal (bran and fine flour) contains chemically more nutritive matter than the fine flour alone, yet the gritty particles that are present in the former, cause an unnatural irritation in the alimentary canal, and lead to a quicker evacuation of the but partially digested and absorbed food. This explains why brown B. possesses laxative properties, and why laborers fed on it consider that it makes them hungry soon again; they feel that it does not last in the stomach, and consequently think it has little nourishment in it.

The *adulterations* of B. are various. Very commonly boiled potatoes are added to the flour and water in the making of the dough, and some consider that this yields a lighter and more palatable bread. It must be remembered, however, that the addition of any substance of a nature foreign to the composition of any material is an adulteration (see next article); and that though potatoes may be supposed to improve the B., yet good B. can be made without them, and the addition of the potatoes lessens the nutritive value of the wheat-flour.

Alum is occasionally added to the dough, to increase the whiteness and improve the general texture of the B.; and this it appears to do by arresting the passage of the starch into gum and sugar, which tends to take place during the process of baking. In Belgium, sulphate of copper is often used for a similar purpose, but it is not employed in this country. All such admixtures are destructive of the nutritive value of a certain part of the B., and are injurious to the animal system. For the nutritive qualities of B. see NUTRITION and FOOD, and for biscuit-bread, see BISCUIT.

The *law* on the subject of bread, so far as relates to England and Scotland, is regulated by a local act for London, the 3 Geo. IV. c. 106, the provisions of which are imitated by a general act for the country, the 6 and 7 Will. IV. c. 37. These provisions are as follow : B. may be made of flour or meal of wheat, barley, rye, oats, buckwheat, Indian corn, pease, beans, rice, or potatoes, or any of them, or with any common salt, pure water, eggs, milk, barm, leaven, potato or other yeast, and mixed in such proportions as bakers may think fit, and with no other ingredient or matter whatsoever; and with the exception of French or fancy B. and rolls, the B. so made must be sold by weight, and in no other manner. It has been settled by many recent cases that bakers must weigh the bread before selling it, whether asked by the customer or not to do so. For this purpose, they must provide in their shops, on or near the counter, a beam and scales, with proper weights, or other sufficient balance, in order that the same may be weighed in the presence of purchasers—a regulation that also applies to delivery of B. by cart or other conveyance, it being directed that the scales and weights shall be constantly carried in the cart or other conveyance, under a penalty, in either case, not exceeding £5. From this regulation, however, fancy B., or French B., or rolls, are also excepted. The act further provides that B. made of mixed meal or flour—that is, B. made wholly or partially of pease, or beans, or potatoes, or of any sort of corn or grain other than wheat—shall be marked with the large Roman letter 'M,' under a penalty, in case this rule be neglected, of a sum not exceeding 10*s*. for every pound weight of such mixed B. sold, and so on in proportion for any less quantity. From this regulation, however, is excepted B. made of the meal or flour of wheat, in the making of which potato-yeast shall be used.

The following are the enactments against the adulteration of B.: 1. No baker shall, in the making of B. for sale, use any mixture or ingredient whatsoever other than those above mentioned, under a penalty for every offence not exceeding £10, or less than £5, with the alternative of imprisonment, with or without hard labor, for any time not exceeding six calendar months; for the offender's name, place of abode, and offence may be published in the local newspapers. 2. Any person adultering corn-meal or flour,

by the introduction of any ingredient not being the real produce of the corn or grain; or any person selling meal or flour of one sort of corn or grain as the meal or flour of another sort, whether separate or mixed, shall forfeit and pay, according to the discretion of the magistrates or justice, a sum not exceeding £20, nor less than £5. 3. Magistrates or justices of the peace, and also peace-officers authorized by warrant, may, at seasonable times in the daytime, enter a baker's premises, and search for adulterated flour or B.; and if any be found, the same may be seized, and carried with all convenient speed to the nearest resident magistrate or justice of the peace, to be disposed of as he may think proper, the penalties varying from £2 to £10, with alternative imprisonment for six months; the offenders' names may also be published. Parties obstructing such search of bakers' premises, or upon the occasion of the search, carrying away the adulterated flour or B., are liable to a penalty not exceeding £10. Should it, however, appear that any offence against the act shall have been occasioned by the wilful act or neglect of the baker's journeyman or other servant, the magistrate may issue his warrant for bringing such servant before him, and, on conviction, may adjudge him to pay a reasonable sum to his master, by way of recompense. The Adulteration of Food Act gives a more efficient mode of prosecuting these offences, and exposing them when detected.

The act further provides that bakers shall not bake bread, rolls, or cakes on the Lord's Day; or, on any part of that day, after half-past one o'clock in the afternoon, sell such bread, rolls, or cakes; or bake meat, pies, or other victuals; or in any other manner exercise the trade of a baker, save and except so far as may be necessary by way of preparation for the following day's baking. For a first offence against this regulation, a penalty of 10*s.* shall be paid; for a second offence, 20*s.*; and for a third and every subsequent offence, respectively, the penalty of 40*s.*, together with the costs of prosecution, a portion of the penalty to be paid to the prosecutor, and the residue to be applied towards the poor-rate of the place. This regulation as to Sundays does not extend to Scotland.

The law of Ireland on the subject of this article is contained in several acts of the Irish parliament, the leading provisions of which are similar to the above.

BREAD, Army. In camps and in barracks of any size, the bread for the army is baked on the spot by bakers of the supply sub-department of control organization. Though perhaps a little rough in its manufacture, the article supplied is made from the best ingredients, and is genuine and wholesome. On a march, the control bakeries supply bread at the several halting-places. In smaller barracks, bread has to be obtained by contract, but the most vigorous supervision is exercised to secure proper quality. Formerly, army bread was notoriously bad. A contractor would sometimes send in a tender so low, in order to obtain the contract, that he could not possibly make good bread at a profit; and then he relied on small fees paid him by the soldiers as a means of obtaining better. This discreditable state of things was ascertained by a committee of inquiry some years ago; it was found that the average of army bread was not equal in quality to that of workhouse bread. Steps were forthwith taken to remedy the evil; experiments were made to determine whether troops could bake their own bread in the field, and the result was the adoption of the present system of army baking. With the improvement of the bread, a visible amelioration in the health of the soldiers has taken place.

BREA'D-FRUIT TREE (*Artocarpus incisa*), a tree of the natural order *Artocarpaceæ* (q. v.), a native of the islands of the Pacific Ocean and of the Indian Archipelago—one of the most important gifts of nature to the inhabitants of these regions, its fruit supplying the principal part of their food, and its inner bark a considerable part of their clothing, whilst its timber and its milky juice are also employed for economical purposes. The genus to which it belongs (*Artocarpus*, Gr., Bread-fruit) is distinguished by having the male flowers in catkins, with a 2-leaved perianth and one stamen; the female flowers naked; the fruit roundish, fleshy, and tuberculated. The B. T. is a rather slender tree, of 40—50 feet high, often rising almost half its height without a branch. It has large, pinnatifid leaves, frequently 12—18 inches long, dark green, and glossy. The fruit is generally oval, or nearly spherical, and about the size of a child's head. It is a *sorosis*, a compound or aggregate fruit formed from numerous flowers on a common axis, and is covered with a roughish rind, which is marked with small square or lozenge-shaped divisions, having each a small elevation in the center; is at first green; when imperfectly ripened, brown; and when fully ripe, assumes a rich yellow hue.

It is attached to the small branches of the tree by a short thick stalk, and hangs either singly or in clusters of two or three together. It contains a somewhat fibrous pulp, which, when ripe, becomes juicy and yellow, but has then a rotten taste. At an earlier stage, when the fruit is gathered for use, the pulp is white and mealy, and of a consistence resembling that of new bread. In a still less mature state, the fruit contains a tenacious white milk. The common practice in the South Sea Islands is to cut each fruit into three or four pieces, and take out the core; then to place heated stones in the bottom of a hole dug in the earth; to cover them with green leaves, and upon this to place a layer of the fruit, then stones, leaves, and fruit alternately, till the hole is nearly filled, when leaves and earth to the depth of several inches are spread over all. In rather more than half an hour, the bread-fruit is ready; 'the outsides are, in general, nicely browned, and the inner part presents a white or yellowish cellular pulpy substance, in appearance slightly resembling the crumb of a wheaten loaf.' It has little taste, but is frequently sweetish, and more resembles the plantain than bread made of wheat-flour. It is slightly astringent, and highly nutritious. Sometimes the inhabitants of a district join to make a prodigious oven—a pit 20 or 30 feet in circumference, the stones in which are heated by wood burned in it, and many hundred bread-fruits are thrown in, and cooked at once. Baked in this manner, bread-fruit will keep good for several weeks. Another mode of preserving it is by subjecting it in heaps to a slight degree of fermentation, and beating it into a kind of paste, which, although rather sour, is much used when fresh bread-fruit cannot be obtained. There are numerous varieties of the B. T. in the South Sea Islands, and they ripen at different seasons. The tree produces two, and sometimes three, crops a year. In the West Indies and South America, into which it has also been introduced, the bread-fruit has not come much into use as an ordinary article of food; but various preparations of it are reckoned delicacies.—The fibrous inner bark of young bread-fruit trees, beaten and prepared, is used for making a kind of cloth, which is much worn by the common people in the South Sea Islands, though inferior in softness and whiteness to that made from the paper mulberry (see Mulberry Paper).—There exudes from the bark of the B. T., when punctured, a thick mucilaginous fluid, which hardens by exposure to the air, and is used, when boiled with cocoa-nut oil, for making the seams of canoes, pails, &c., water-tight, and as bird-lime.—The timber is soft and light, of a rich yellow color, and assumes, when exposed to air, the appearance of mahogany. It is used for canoes, house-building, furniture, and many other purposes. It is durable when not exposed to the weather.—The Jack (q. v.) or Jaca (*A. integrifolia*), and the Dephal (*A. Lakoocha*), both large East Indian trees, belong to the same genus with the bread-fruit tree.

BREA'D-NUT, the fruit of *Brosimum alicastrum*, a tree of the natural order *Artocarpaceæ*, and therefore allied to the bread-fruit, a native of Jamaica. The genus *Brosimum* is distinguished by male and female flowers on separate trees, in globose catkins, with peltate (shield-like) scales for perianth, and the fruit a one-seeded drupe. The B. tree has ovate-lanceolate evergreen leaves; it abounds in a tenacious gummy milk. Its leaves and young shoots are much eaten by cattle but deleterious qualities are developed in them as they become old. The nuts, boiled or roasted, form an agreeable article of food, and are eaten instead of bread. Their taste resembles that of hazel-nuts.—To this genus the *Palo de Vaca*, or Cow Tree (q. v.), of Demerara is supposed also to belong.

BREA'D-ROOM. In the navy, the biscuits are called *bread*, and the place where they are stored is the bread-room; it is carefully constructed, warmed before being filled, and kept as much as possible free from damp.

BREA'D-ROOT. See Psoralea.

BREA'D-TREE. See Caffer Bread.

BREADTH, in art, is a term which, though often used in a very indefinite manner, is not without a definite meaning. It signifies that peculiar disposal of the background of a picture which, without sacrificing or even concealing details, gives to the whole unity and harmony of effect. With the older landscape-painters, it was a common fault to produce the effect of distance either by a certain trick of light and shadow, or by one uniform hazy color in which the individual objects were entirely lost to view, and *breadth became vacancy*. In this respect, their pictures contrast unfavorably with those of such modern painters as Turner, of whom Mr. Ruskin has very truly said that 'the conception of every individual inch of distance is absolutely clear and complete in the master's mind—a separate picture fully worked out; but yet, clearly and fully as the idea is formed, just so much of it is given, and no more, as nature would have allowed us to feel or see; just so much as would enable a spectator of experience and knowledge to understand almost every minute fragment of separate detail, but appears to the unpractised and careless eye just what a distance of nature's own would appear—an unintelligible mass. Not one line out of the millions there is without meaning, yet there is not one which is not affected and disguised by the dazzle and indecision of distance. No form is made out, and yet no form is unknown.'

On the subject of breadth Mr. Ruskin has, moreover, the fol-

owing very judicious remarks: 'It were to be wished that our writers on art would not dwell so frequently on the necessity of breadth, without explaining what it means, and that we had more constant reference made to the principle, which I can only remember having seen once clearly explained and insisted on—that breadth is not vacancy. Generalization is unity, not destruction of parts; and composition is not annihilation, but arrangement of materials. The breadth which unites the truths of nature with her harmonies is meritorious and beautiful, but the breadth which annihilates those truths by the million is not painting nature, but painting over her; and so the masses which result from right concords and relations of details are sublime and impressive, but the masses which result from the eclipse of details are contemptible and painful.'

BREAKERS, in maritime language, are the waves that break violently over rocks lying a short distance under the surface of the sea. They cover that particular part of the sea with a foam, and produce a hoarse and often terrible roaring. 'Breakers a-head' is one of the most alarming announcements made by the look-out men of a ship, seeing that the B. denote the existence of sunken rocks which may, perchance, pierce the hull of the vessel.

BREAKING BULK, in the Scotch law, signifies making use of an article supplied in bulk, or in quantity; by which act one is said to break bulk, and is in consequence, prevented from afterwards objecting to it, and returning it to the seller. See SALE OF GOODS.

BREAKING IN'CLO'SURES is an expression to be found in Scotch law-books, and means the destruction or invasion of planting and inclosures by persons or their cattle. The punishment for this offence is provided by several old Scotch statutes, the principal of which are two passed in 1661 and 1685. The penalities are pecuniary, with right to detain the cattle found trespassing, until such penalities, along with the damage and costs, are paid. See PLANTATION.

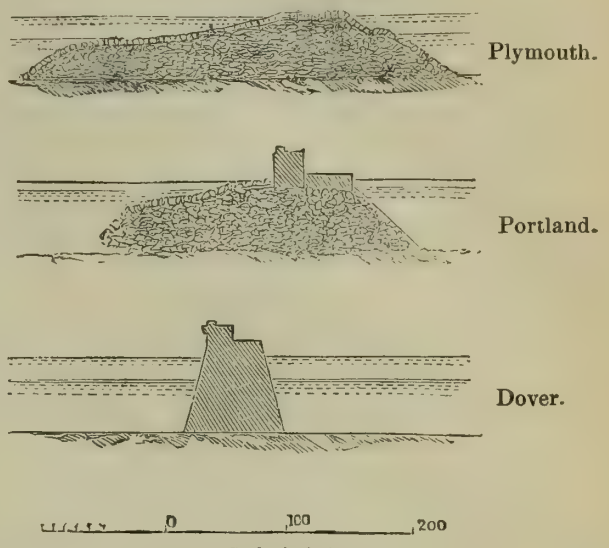
BREA'KWATER is a barrier intended for the protection of shipping in harbors or anchorages. It sometimes happens that, in front of a semicircular bay, a small island is so situated as to form a natural breakwater. This is to some extent the case with the Isle of Wight, which occupies such a position as to protect Portsmouth and Southampton from the south. In many other places, however, bays and harbors are without such screens. A pier may be so placed and constructed as to serve also the purpose of a B., but the term B. is generally confined to a structure used solely for protection, and not for berthage or traffic, and breakwaters are frequently insulated, so as to be cut off from any communication with the shore unless by water.

Plymouth B. is the best known of these engineering works. The sound or harbor, being open to the south, was so much exposed to storms that, early in the present century, it was determined to construct a B. across its mouth, with openings between it and the shore, on either side, for the ingress and egress of shipping. The works were commenced in 1812. The operations consisted in transporting along a tram-road large blocks of limestone got from a neighboring quarry, shipping them in vessels fitted with trap-doors, and by means of these depositing them in the shape of a huge mound in the required situation. As soon as the stones began to appear above water, a perceptible benefit resulted in the relative calmness of the sound during the prevalence of storms; but the structure was frequently very roughly handled by the waves, which altered and flattened its shape. A severe storm in November 1824 threw a great portion of the stones over into the sound. It was not until 1841 that the works were finally completed, by the deposition of more than 3,000,000 tons of stone, and the expenditure of nearly £1,500,000. The B. is nearly a mile long, the central portion is 1000 yards; and two wings, of 350 yards each, extend from the ends of this at a slight angle. The open channels at each end, between the B. and the shore, are each about half a mile wide, and their depth is respectively 40 and 22 feet, at low water. The B. is 133 yards wide at the base, and 15 at the top—the two sides being made very sloping for the security of the stones. The slopes and top are faced with masonry. The water-space protected by this B. comprises 1120 acres, and it is generally admitted that the money has been well spent on the work.

Holyhead B. is formed of stone quarried in Holyhead mountain, drawn along a tramway on a timber structure, and cast into the sea. It more resembles a pier than the B. at Plymouth, for it is attached at one end to the shore, and is intended to convert Holyhead Bay or roadstead into a harbor of refuge. The works consist of a mound of loose stones up to low-water, and ashlar upright walls with a parapet above that line, with a railway on the top for trains.

Portland B. is of very great value, in converting into a harbor of refuge the expanse of water between the Dorsetshire coast and the isle, or rather peninsula of Portland. An act of parliament was obtained in 1847, authorizing the works. The B., starting from the north-east point of the isle, stretches nearly due north for more than two miles, with one or two intervening openings for the ingress and egress of shipping. The works were conducted more easily than those of any other great B.; for the isle contains an abundance of stone easily quarried, and the steep shores afforded facility for transporting the stones by their own gravity to their destination. The work, finished in 1872, is for the most part a rough rubble stone-bank, the part next the island having, however, an ashlar superstructure and parapet; the depth is about 50 feet at low-water. From the nature of the operation, any part of the B. became useful as soon as constructed, increasing the safety of Portland Bay as a harbor of refuge.

BREAKWATERS.—SECTIONS.



Scale, in feet.

Dover B. progresses slowly, and has involved an enormous outlay. There is no stone near to form a mound, as in the other breakwaters spoken of, and, in consequence the work requires to be brought up in solid ashlar from the bottom by the diving-bell, with the interior formed of blocks of concrete. It has never been clearly stated whether the government regards this B. as a protection to a great naval station and fortified harbor, or as a chief feature as a harbor of refuge for commercial fleets. In 1844, a commission of inquiry recommended that £2,500,000 should be laid out in forming a harbor of refuge here. The works connected with it have not been finished, the great depth and frequent storms constituting terrible obstacles. The water is very deep—viz., 42 feet at low water; the accumulation of shingle very troublesome; and many years must elapse before it can be made evident whether the Dover B. is worth the national money expended upon it.

Alderney B. is a great work, consisting of ashlar walls and parapet, built on a stone mound up to low-water from a depth of 72 feet. Small breakwaters have been constructed at Cette near Marseille, at the mouth of the Delaware in the United States, and at Buffalo in Lake Erie; but they do not call for description.

Cherbourg B. is the greatest and the most costly ever constructed. Nearly 100 years ago, M. de Cessart proposed to the French government the formation of a B. at Cherbourg, to be commenced by the construction of a number of hollow cones formed of timber-framing, sunk in a line as close as they could be placed to each other, and then filled with stones. These cones, of which there were to be 64, each about 70 feet high, 150 feet in diameter at the base, and 60 feet at the top, were intended to form a nucleus to the stone breakwater, to prevent the stones, during its formation, being knocked about and too much spread out by the action of the waves.

In 1784 to 1788, 16 cones were constructed, and 13 of them sunk; but so great was the destruction which they underwent during stormy weather, that the government at length abandoned the plan, and carried on the stone breakwater without the aid of the cones. It was completed under Napoleon III. at a cost exceeding £2,500,000. The B. itself was finished in 1853, but since that year large fortifications have been built upon the upper works. The length is nearly 2¼ miles; the B. is 300 feet wide at the bottom, and 31 at the top. The chief mass consists of rubble or unshaped stones, thrown down from ships; but there is a larger ratio of wrought and finished masonry than in the Plymouth B., consisting of granite blocks imbedded in cement. The depth of water is about 60 feet at low-water spring-tides; and the B. rises to 12 feet above high-water level. The water-space included within and protected by the B., is about 2000 acres, but two-thirds of this has scarcely depth enough for the largest sized ships. The relation

which this B. bears to the vast military and naval arrangements of the place will be noticed under CHERBOURG.

Many substitutes have been proposed for solid breakwaters, such as floating breakwaters constructed of timber framework, open iron screens, &c., but none of them have been shown to be suitable for actual practice. Close timber-work, filled in with stones, is found to be quite efficacious; but on most of our coasts the timber is liable to be eaten by the marine worm, which is an almost insuperable objection to its being used under water.

BREAM, a name which is apt to occasion some confusion to beginners in ichthyology, being applied equally to certain fresh-water fishes of the family *Cyprinidæ* (q. v.), and to certain sea fishes of the families *Sparidæ* (q. v.) and *Chætodontidæ* (q. v.) or *Squamipennes*, among which the resemblance is a mere general one of outward form, the first of these families belonging to the order of *Malacopterous*, or soft-finned, the other two to that of *Acanthopterous*, or spiny-finned fishes

The breams of the family *Cyprinidæ* were included in the genus *Cyprinus* (see CARP) by the older naturalists, but are readily distinguished from that genus as now defined, and from other allied genera, by their deep and compressed form, by the great convexity of both the dorsal and the abdominal outline, by the want of spiny rays in the dorsal and anal fins, by the great length of the base of the anal fin, and by the want of cirri or barbules at the mouth. They form the genus *Abramis* of Cuvier.—The COMMON B., or CARP B. (*A. Brama*), is an inhabitant of many rivers and lakes of Europe, even as far north as Norway and Sweden, and of some of those of Britain and Ireland. It thrives best in still waters, and in some of the Irish lakes attains a large size; it has been known to reach 12 or even 14 pounds. The tail is very broad and much forked, the head small and acuminated, the eyes very large, the scales very small, the general color yellowish-brown, the cheeks and gill-covers silvery white.—The WHITE B., or BREAMFLAT (*A. Blicca*), differs from the Common B. in its silvery color, the smaller number of the rays in the pectoral and anal fins, and other particulars. It has never been taken of so large a size. It is found in many parts of the continent of Europe, and in some of the British lakes and rivers.—The POMERANIEN B. (*A. Buggenhagii*) differs much more widely from the Common B.; the body is much thicker in proportion to its depth, the scales larger, the base of the anal fin shorter, the tail less forked. This fish is known to occur in a few places of England and Ireland, and is said to abound in Pomerania.

Common Sea Bream (*Sparus centrodontus*).

The acanthopterous Breams, or SEA BREAMS, are mostly of the family *Sparidæ*, and nearly allied to the Gilthead (q. v.), in connection with which they may most properly be noticed. The Common Sea B., indeed, often receives the name of gilthead. Only one of the British sea fishes called B., *Brama Raii* already noticed (see BRAMA), belongs to the family *Chætodontidæ*.

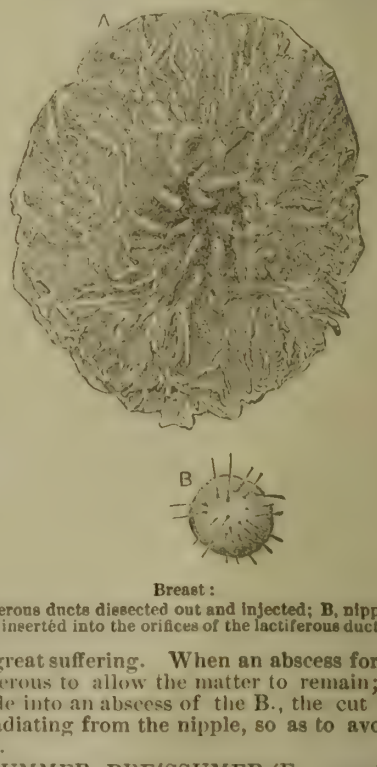
Angling for Bream.—Of the two kinds of B. known to anglers, the carp B. is much the best for sport. The flesh of the B. is not held in much estimation, though the carp B. is infinitely to be preferred of the two. B. are found in both ponds and rivers. They prefer deep, still holes, or quiet, well-sheltered eddies in the bends of rivers. Here the angler will find them in large numbers. They are rather capricious in feeding; at times they will not bite for weeks together. Being a sly, shy-biting fish, the tackle required for them must be fine. They may be taken by means of the ledger (q. v.) in rivers, where they should be fished for in the same way as directed for barbel, save that it will be found advisable to use another hook, which should be fastened on to the line about eight inches or a foot above the ledger lead, as B. often take their bait some inches off the bottom. The hooks should be No. 7. In float-fishing for B. in holes or eddies, a stout swan-quill float and half-a-dozen No. 1 shot below it, will be found sufficient for the purpose; and having ground-baited as directed for barbel, put on two small red worms for the angling bait, or about an inch of the tail of a bright, well-scoured lob-worm. The former is preferable. Two hooks, one to rest on the bottom, and one 6 or 8 inches off it, will be found useful, for sometimes one will be taken, and sometimes the other. The fish being tender-mouthed, should be played gently. After the first rush, a B. soon tires, for his form is not fitted or shaped for a prolonged resistance.

The B. has an unpleasant practice of boring downwards and rubbing the line with his tail, and the line often comes up covered with a thick slime from his body, for a foot or more above the hook. It is needless to remark that this must be cleared off before the tackle is again used. The rod should be a light cane-rod, moderately stiff, and some twelve or thirteen feet long for float-fishing for B. from a boat or punt. Of all baits, worm is decidedly the best. Some recommend bullock's blood and grains to ground bait with, but worms are found to answer all purposes. B. spawn about the end of May, choosing the most weedy spots for that purpose; and after scouring and cleansing in some gentle gravelly stream for a week or two, they return to the deep still holes again. A clay or sandy bottom is preferred to any other. The presence of B. may always be detected by their fondness for coming at times to the top of the water, or, as anglers term it, 'primeing.' Early in the morning, or late in the evening, the whereabouts of B. may always be discovered by their rising then. In Lough Erne the shoals are prodigious, and cause a ripple on the water like a stiff breeze of wind.

BREAMING, in nautical affairs, is a cleansing process which a ship undergoes after a voyage, or after lying for a long time in harbor. The ship's bottom, under such circumstances, often becomes covered with grass, ooze, shells, or sea-weed; and B. consists in the removal of these impurities. The ship is laid aground after the tide has ebbed, or is docked, or is careened (see CAREENING); furze and fagots are placed under it; fire is applied; the heat melts the pitch, &c., of the hull; and the pitch and filth can then be scraped and brushed off.

BREAST, THE FEMALE, or mammary gland, consists of a series of tubes, radiating from a common center, the nipple which is situated in an areola or dark-colored patch. On the surface of the latter are several (from 4 to 10) sebaceous glands, which secrete an unctuous fluid to protect the skin of the nipple, which is very thin, from the saliva of the sucking infant. The milk-*tubes* (15 to 18 in number) enlarge into *sinuses*, and pass each to a separate lobe or subdivision of the breast, where they divide into twigs and branches (the *lactiferous ducts*), which end in minute vesicles. The lobes are held together by fibrous tissue, and are well packed in fat, which increases sometimes to an enormous extent the apparent size of the organ.

The accompanying cut shows the structure of the gland; and with a little consideration, it will be readily understood how over-distension of these delicate tubes, from whatever cause, must be productive of great suffering. When an abscess forms in the B., it is very dangerous to allow the matter to remain; but when an opening is made into an abscess of the B., the cut must be made in some line radiating from the nipple, so as to avoid division of the milk-tubes.

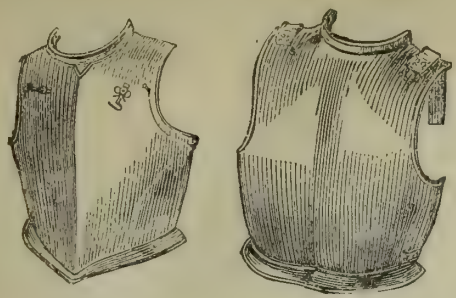


Breast:
A, lactiferous ducts dissected out and injected; B, nipple, with bristles inserted into the orifices of the lactiferous ducts.

BREA'ST-SUMMER, BRE'SSUMER (Fr. *sommier*, a lintel), a beam supporting the whole front of a building, in the same way in which a lintel supports the portion over an opening. They are seen in England and on the continent in old houses that are built partly of wood and partly of stone, brick, or mud.

BREA'STPLATE, in ancient armor, was a plate of iron, steel, or other metal, so fastened as to protect the chest or front of the wearer. The back-plate, in like manner, was worn to protect his

from attack from behind. In modern European armies, almost the only representative of the B. is the front half of the *cuirass*,



Breastplate. Backplate.

worn by the *cuirassiers* in certain foreign states, and by the household cavalry (Life-guards and Horse-guards) in England.

BREA'ST-WORK, in Fortification, is a hastily constructed earthwork; not so high as to need a *banquette* (q. v.) for the defenders to stand upon, but sufficient to afford shelter when they are standing on the level of the ground, and firing over the crest. The dry ditch or trench from which the earth has been taken to form the B., affords an additional defence. A B. is midway between a *parapet* and an *épaulement*, in size and importance.

BREATH AND BREATHING. See RESPIRATION.

BREATH, OFFENSIVE, may depend upon some cause limited to the mouth or nose, or it may arise from diseased conditions of the respiratory or digestive apparatus. If, from want of proper attention, the teeth have collected a quantity of putrescent particles around them, they must be well scrubbed with a brush and tepid water, with some powdered carbonate of magnesia mixed with it. A wash composed of a teaspoonful of tincture of myrrh in a pint of water is also very useful. Occasionally, the secretion from the tonsils (q. v.) is very offensive; and then a solution of nitrate of silver, 4 grains to 1 ounce of water, should be applied to them every morning, with a camel-hair brush, and small alterative doses of medicine administered.

Solutions of soda in water are also very useful. Should the fetid smell arise from a portion of dead bone, the latter must be removed whenever its becomes loose. Inhalations of steam from hot-water into which some creasote has been dropped, is much recommended for cases in which the cause resides in the nose and respiratory passages. When, however, it is caused by digestive derangements, the treatment should consist in purging, to empty the intestinal canal, followed by soda, to correct acidity and tonics, of which the bitter infusions and tinctures, and the dilute mineral acids, are among the best.

All medical treatment is unavailing to correct the foul odor which rises from the stomach of the habitual drunkard, or from the victim of gangrene or abscess in the lungs.

BRE'CCIA, a term adopted from the Italian to designate a mass composed of angular fragments of rock of the same or different kinds, cemented together by an enveloping paste, or by infiltrated iron or carbonate of lime.

BRECHE-DE-ROLAND, a defile of the Pyrenees between France and Spain, about 11 miles southwest of St. Jean de Luz, with an elevation of about 9500 feet above the sea. It is a difficult passage of from 200 to 300 feet in width, between precipitous rocks rising to a height of from 300 to 600 feet.

BRE'CHIN, a town of Forfarshire, on the left bank of the South Esk, 8 miles west of its junction with the sea at Montrose. Pop. (1881) 9031. It unites with Montrose, Arbroath, Forfar, and Bervie in returning one member to parliament. Spinning, bleaching, distilling, and brewing are carried on here, as also the manufacture of linens and sailcloth. B. was once a walled town, and contained an abby of Culdees, instituted, it would seem, about the end of the 10th century. David I. founded a cathedral and bishopric here in the 12th century. Part of the cathedral, built chiefly in the 13th, 14th, and 15th centuries, is now the parish church. Close to the church is a round tower, similar to the Irish ones and to the one at Abernethy, the only other example in Scotland. The tower is 85 feet high, 25 feet in diameter at the base, and 12½ feet at the top, and it is surmounted by a 15th c. spire of 25 feet. B. Castle, the ancient seat of the Maules (now of their representative the Earl of Dalhousie), was taken by Edward I. in 1303, after a siege of 20 days. B. was burned by Montrose in 1645; and near it, Huntly, on the part of James II., defeated the Crawfords in 1452. Gillies, the historian of Greece; Maitland, the topographer; and Dr. Guthrie, the famous Scotch preacher, were natives of Brechin.

BRE'CKNOCKSHIRE, or BRE'CON, an inland county of South Wales, to the south of Radnor, from which it is separated by the Wye. Length, about 35 miles; average breadth, 20. Area, 719 square miles, of which two-thirds are cultivated. B. is one of the most mountainous counties in South Wales, and has deep, beautiful, and fertile valleys. Two principal mountain-chains, the highest in South Wales, rising with Brecknock Peaks to a height of 2862 feet, intersect the country in the north and south, and occupy, with their offshoots, a great part of the surface. Old red sandstone occupies the south and middle of the country, and Silurian rocks the north. The chief rivers are the Wye, Usk, Yrfon, Elan, Claerwen, and Tawe. The climate is severe and rainy but healthy among the mountains, and in the valleys comparatively mild. The agriculture, though still defective, especially in the higher districts, was greatly improved by the Brecknockshire Agricultural Society, instituted in 1755. The chief crops are oats and barley, but much wheat is also grown in Talgarth and Crickhowell, the most fertile districts of the country. In the valleys in the east some hops are raised, and some orchards are seen. The native small black-cattle are reared in the hills, while in the lowlands the Hereford breed predominates. The mineral produce is small, consisting of iron, especially along the south border; coal and limestone are also found in the south and west. The Brecon canal connects the county with the Bristol Channel, and many railways have been constructed throughout the country. There are several small factories of woollens and worsted hosiery; also several important iron-works, but the ore is chiefly obtained from adjoining counties. B. returns one member to parliament. Pop. in 1871, 59,901; in 1881, 57,735. The chief towns are Brecon (the county town), Builth, Crickhowel, Hay, and Llanelly. There are many remains of British and Roman camps, Roman roads, cairns, cromlechs, mounds, and castles throughout the county. B. formed part of the territory of the Silures, who bravely withstood the Romans. The Normans, under Barnard Newmarch, wrested the county from the Welsh princes in 1092. Llewelyn, the last British prince of Wales, was killed in this county in 1282, and by his fall the native mountain-chiefs were entirely subdued. Half the people in B. still speak Welsh.

BRECON, BRECKNOCK, or ABERHONDDU, the capital of Brecknockshire, South Wales, is situated in an open valley in the middle of the county, at the confluence of the Usk, Honddu, and Tarell, 171 miles west-north-west of London. It lies in the midst of fine mountain scenery, and has beautiful public walks. South of B. lie the three mountain-peaks, the Brecon Beacons. Pop. (1881) 6372. It returns one member to parliament. Flannels, coarse woollens, and hats are manufactured. Barnard Newmarch, a relative of William the Conquerer, founded the town, and built a castle here in 1094. He also founded two priories here in the reign of Henry I. Henry VIII. turned one of the priories into a college, still existing; the other is now the parish church. B. was formerly surrounded by a wall having ten towers and five gates. Hugh Price, founder of Jesus College, Oxford, and Mrs. Siddons, the celebrated actress, were natives of Brecon.

BREDA' a town of North Brabant, Holland, situated at the confluence of the navigable rivers Merk and Aa, and containing (Dec. 31, 1879) 17,109 inhabitants. It formerly possessed the means of laying the surrounding country under water in the event of an attack, but the importance of the town, as a military position, has passed away, and in 1876 the fortifications were removed. It has a Gothic cathedral, with a lofty tower, and several interesting monuments; also an old castle built in 1350, which was for some time the residence of Charles II. of England, and is now a military academy. There are manufactures of carpets, linen, hats, soap, leather, &c., and dye-works, breweries, and rope-walks. It is celebrated as the place where, in 1566, the protest of the Dutch nobles, known as the 'Compromise of Breda,' against the measures of Philip II. of Spain in the Netherlands, was presented and rejected. During the subsequent centuries, it was the scene of much conflict and diplomatizing until 1813, when the French were finally driven out. B. is now a station of the railway net.

BRÉE, MATTHÆUS IGNAZIUS VAN, an excellent Flemish painter, born at Antwerp 22d February 1773, and educated partly there, and partly under Vincent in Paris. As early as 1798, he attracted attention by his 'Death of Cato,' and several other excellent pictures soon followed. A peculiar talent for rapid and vivid sketching enabled B. to execute for Napoleon, in a few hours, 'The Manœuvring of the Fleet before Antwerp on the Scheldt,' and, with equal celerity, Napoleon's 'Entrance into Amsterdam, at the Moment when the Magistrate presents him with the Keys of the City.'

In 1816, he painted the famous Leyden burgomaster, Van der Werff, in the act of addressing the famished and murmuring populace during the siege of 1576: 'Take my body, and share it among you.' This great work—now in the town-house of Leyden—is marked by a felicitous arrangement of the figures, and

by a bold and lively coloring, after the style of Rubens. Other celebrated pictures of B.'s are: 'Count Egmont receiving Spiritual Consolation before his Execution,' 'Reubens dictating his Dying Testament,' 'The Tomb of Nero at Rome, with a Group of Lazzaroni and Musicians.' B. died 15th December 1839. In the latter part of his life, he was Director of the Academy of Fine Arts at Antwerp.

BREE, PHILIPP JACOB VAN, brother of the preceding, born 1786, also acquired some reputation as a historical painter.

BREECH, of a gun, is the end furthest removed from the muzzle. It always contains a great mass of metal, to enable it to withstand the shock occasioned by the explosion of the gunpowder. For details, see CANNON, HOWITZER, &c.

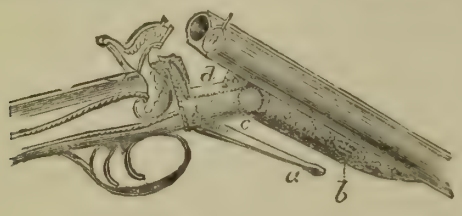
BREECHES BIBLE. See BIBLE.

BREECHING, of a naval gun or carronade, is a strong rope by which the recoil of the gun is checked at such a point that the muzzle is brought wholly within the port-hole, where the seamen can sponge and reload it.

BREECH-LOADING, in Artillery, relates to a mode of constructing large pieces of ordnance, and small-arms, or hand-fire-arms, the peculiar manner of charging which the term describes. This subject is now occupying much attention, and the patented inventions relating to it are very numerous. The Armstrong gun (see ARMSTRONG), among others, is a breech-loader; and so is the Whitworth gun. A considerable amount of additional mechanism is necessary for this purpose; seeing that the breech must be so far opened as to admit of the introduction of a ball or shell, and a cartridge, and then so firmly closed as to resist the immense pressure occasioned by the explosion. The objects sought to be attained by this change from the old system are many—quickness in loading, ease in cleaning after firing, accurate adjustment of the diameter of the ball to the caliber of the gun, facility in making the ball accommodate itself to the spiral rifle-grooves of the piece, &c.; but it is still a contested question, especially between the rival inventors of breech-loaders and muzzle-loaders, to what extent these objects are attained.

In relation to muskets and fowling-pieces, Mr. Greener, of Birmingham, who has written much on the subject, disputes the usefulness of B.; he denies that it is more safe, more accurate, or more forcible than muzzle-loading; while certain advantages which it may possess are, he thinks, counterbalanced by the greater cost of the weapon.

The annexed cut—for which, together with the description, we are indebted to Stonehenge's excellent work, *The Shot Gun and Sporting Rifle*—represents part of the mechanism in one of the many kinds of breech-loaders—viz., the Le Faucheaux or French



Breech-loading Gun (pin cartridge, 14 gauge).

crutch gun, invented about 20 years ago, and now largely made in England as well as in France: *a* is a lever which opens the mechanism, but which lies flat against the gun at other times; *d* is a notch which, when a hook is liberated from it, allows the barrels to be so adjusted as to be easily loaded at their breech end; *c* is a central pivot around which the movement is made; *b* is a slide that assists in the opening and closing. At 14 is a pin which, when struck by the hammer, transfers the blow to a cap inserted in the cartridge. The relative merits of breech and muzzle loading fowling-pieces were tested in 1859—60 by various trials, under the management of the editor of *The Field*, and resulted in favor of the breech-loaders. The demand for the latter has, in consequence, enormously increased.—This subject receives further notice in various parts of the Encyclopædia, in relation to certain kinds of ordnance and small-arms expressly constructed on the B. principle.

BREECH-LOADING ARMS AND NEEDLE-GUNS. To be loaded at the breech, and to be fired by the penetration of a needle into, or the impinging of a piston on, a detonating cap within the cartridge, are distinct attributes in a weapon; and although it is only within the last forty years that the system has been carried out with success, breech-loading arms have been tried, accepted, and abandoned without number during the last three centuries. Indeed, a sort of instinct dictates that loading at the breech is the preferable course; and all the earliest muskets were so made, the system being doubtless abandoned from the difficulty of accurately closing the breech, in those days of rough workmanship. The extraordinary efficacy of breech-loading arms for military purposes was brought prominently forward during the wars of the last few years, and notably in the Prussian campaigns of 1864 against Denmark, and of 1866 against Austria. The successes of the Prussian arms were attributed in no small degree to the rapidity with which their troops could fire as compared with the enemy. They had, in greater or less numbers, borne these same rifles since 1835, but these were the first opportunities of using them in warfare. To all the other powers, whose men still carried muzzle-loading rifles, and who had debated, without practical result, for years past the question of armament with breech-loaders, soldiers thus armed appeared irresistible. From July 1866 to the present moment, the hammer and the anvil have been busy night and day throughout the civilized world in making the weapons of death yet more deadly. Scarcely two countries seem to have adopted the same plan: each nation has elaborated a system from among its own inventors. Those possessing no great reserve of rifles have prepared new arms; but the majority of governments have been content, in the first instance, to convert their existing stock into breech-loaders of as good a construction as circumstances would permit. Thus, Britain, after offering a handsome prize for the best design, selected one said (subject to some controversy) to be the invention of the late Mr. Snider. As this weapon had ere long been produced to the number of a million, and as it quite confirmed the favorable auguries entertained of it by accuracy of fire, and by loading thrice to the muzzle-loader's once, much of the following article will be devoted to a consideration of it. At the same time, it is to be borne in mind that the British Government only regarded the Snider arm as a make-shift for the conversion of the enormous stock of Enfield rifles then in hand, reserving to itself the ultimate selection of a pattern on which to manufacture new weapons. It is not to be understood from what is said above that Britain adopted a breech-loading arm in a sort of panic *after* the battle of Sadowa. It was after the Danish campaign, on the 11th July 1864, that it was decided as an abstract question to arm the British infantry with breech-loaders; a portion of the cavalry having for a number of years previously been armed with Sharp and Westley Richards carbines, loading at the breech. The selection of an arm took longer; but by the beginning of 1865 it had been decided to convert our great stock of rifles on the 'Snider' system. In 1869 it was determined that new arms should be on the Martini-Henry system—i.e., with the Henry barrel, and the Martini breech-action. A description of this rifle will be given farther on.

Breech-loading.—The advantage of breech loading is obvious: to be able to insert the charge at the breech end instead of the muzzle, is to save time, and to avoid exposure to hostile fire during the operation of loading and ramming home, which involves considerable outstretching of the limbs. The great condition of success is, that the bullet shall be propelled with equal force and accuracy, and with equal safety to the rifleman, as from the muzzle-loader.

When a charge is ignited, the constituents of the gunpowder, assuming a gaseous condition under the heat engendered, expand into a volume of light gas many times greater in bulk than the powder before occupied. On the amount of this expansion, and its sudden action on the projectile, the force of the shot depends. Any joint in the breech-piece through which a portion of this gas can escape, without having imparted its thrust to the ball, tends, therefore, to lessen the range and penetration; while the shock of the explosion falling more severely on this than on any other part of the barrel, tends yet more to dislocate the breech-piece, and diminish the closeness of the joint's fit. In weapons which do not call for a long range, as revolver pistols, a perceptible interval is left between the chamber and barrel, through which much gas escapes; but in rifles, which have range and penetration as principal objects, there is a *primâ facie* ground for preferring a muzzle-loader. The gas, however, is far from pure, as generated in the barrel, for much water is produced and held in suspension, while there is also a solid residuum consisting of unburned materials of the powder. In the muzzle-loader, these clog (or, technically, foul), the barrel, filling the grooves, and rendering the ramming home of succeeding charges more and more difficult. The effect is, that a solid mass of unburned matter is gradually forced by ramming into the head of the barrel, destroying the accuracy and usefulness of the weapon. In the breech-loader, this solid deposit must be provided against both ways. The backward throw on firing (for, of course, the charge explodes with equal power in every direction) tends to force it into the mechanism of the joints, preventing their proper fit, and continually augmenting the escape of gas; and on the other hand, the deposit in front is most detrimental to accuracy of fire. This protection of the breech apparatus, the prevention of fouling, and the retaining and if possible improving the force and accuracy of fire, were the problems which inventors have had to solve.

A moderate escape of gas in front of the first position of the ball, is not found to be any material disadvantage. If, then, the

barrel could have an opening, as in fig. 1, at *a*, where the cartridge could be inserted, and then pushed backwards towards *b*, an escape of gas through the joints by which *a* might be subsequently closed would be comparatively immaterial; but this formation would be impracticable, because the explosion of each cartridge would drive

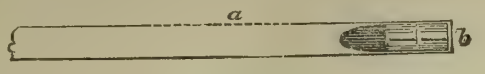


Fig. 1.

the fouling more and more towards *b*, till ultimately the chamber between *b* and *a* would be unable to contain the cartridge. It is clear, therefore, that the charge must be inserted either at the barrel's head *b* (in fig. 2), or, if the barrel be opened, in space close to that head, as *c*. In either of these cases, the breech at *b* must

Fig. 2.

be solidly closed to resist the explosion. A third case, as in the Snider, is where the cartridge is inserted, as at *c*, and then pushed forward to the position *d*, the aperture *c* being closed by a solid breech-piece which completely fills that portion of the barrel, and forms, with the barrel's head, a massive foot to resist the backward pressure of the fired powder. No breech action can be made to fit so accurately as to prevent a backward escape of gas unless a properly constructed cartridge case is used. A perpendicular moving joint is found, in practice, to be the best adapted for preventing a serious escape of gas: such a joint is shown in fig. 3, and is naturally the most convenient in an arrangement like the Snider, where the breech-piece turns on a hinge. In the Prussian needle-gun, the end of the barrel is the frustum of a cone, which fits into a corresponding cavity in the fore-end of the breech-piece *a*, as in fig. 4; but in practice this joint is not sufficiently tight to prevent an escape of gas from the self-consuming cartridge used with this gun, which becomes inconveniently great after long use of the weapon, and it is only available when the breech-piece is pushed up from the rear. In the Snider and several other breech-loading weapons, the cartridge is made itself to close hermetically the aperture between the barrel and the fore-end of the breech-piece. This is effected by the expansion of the cartridge case *d*, fig. 5, which being composed of metal, or a combination of metal and paper, is driven out by the force of the explosion till it completely fills the chamber *b*, and prevents any escape backwards be-

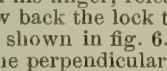

Fig. 3.

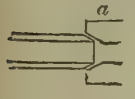

Fig. 4.

Fig. 5.

tween the sides of the case and the chamber. The cartridge *d* has a portion of its case at the base flattened out into a rim which fits into a corresponding recess, *a*, in the end of the barrel; and to prevent expansion backwards, which would fracture the cartridge case and injure the breech or the firer, the breech-piece, *c*, is made to fit as closely as possible against this base. This rim is seen on the Snider cartridge at fig. 9.

The remainder of the article will be devoted to a description of the three most prominent breech-loaders—(1) the Prussian Zündnadelgewehr; (2) the British Snider; and (3) the Martini-Henry.

The Prussian gun, although it may be said to be now obsolete (having been superseded by the Mauser, a bolt gun on much the same principle, but using a metallic cartridge case), was first in the field. As regards its breech apparatus and needle-lock it consists of three eccentric hollow cylinders, with a solid cylindrical bolt inside the last (see figs. 6, 7). The rear end of the barrel is firmly screwed into the head of the chamber, *a*, which is fixed to the stock of the piece, and is open at the rear end. The upper half of the cylinder is cut away at the front-end for rather more than the length of the cartridge; this constitues the opening in which the musketeer inserts the cartridge. From the rear of this opening to the back, a groove is cut, sufficiently wide to allow the square pillar of the breech-handle, *c*, to pass along it. In the middle of this groove is a right-angled shunt, offering a stop to the breech-handle when drawn backwards, unless it be likewise turned downwards, when it may be passed completely out at the rear-end.

Next within the chamber is the breech-piece *d*, which to admit the cartridge, is drawn back for a sufficient distance by the breech-handle along the groove. When the cartridge is deposited in the recess in the chamber, this breech-piece is closed against the heel of the barrel by moving up the handle to the front-end of the groove, and then turning it down to prevent it from being driven back on the explosion of the charge; representing indeed, the resistance offered by the heel of an ordinary muzzle-loading barrel. Firmly screwed within the breech-piece, at a short distance from its front, is a solid block of metal, *f*, on which impinges the first force of the explosion. Projecting from this block to the base of the cartridge, is a strong *tige*, or pillar, *g*, around which a space containing air is left. Through this pillar is the channel for the needle to work. Fitting within the rear-end of the breech-piece is a smaller cylinder *h*, constituting the lock of the gun. It slides within the breech-piece, and is retained from falling out backwards by the spring *i*, which catches in a notch at the end of *d*. Along the bottom of this cylinder, is a groove to admit the passage of the trigger *k*; and at the back is a short upright handle, by means of which the weapon is cocked. Lastly, within the lock is a bolt *l*, pressed forward by a spiral spring, and having the needle, *m*, rigidly fastened to its front end.

Having now described the several parts of the rifle, it is easy to follow it from the moment of a shot being fired until the next is ready for discharge. The soldier first presses down the spring *i* with his finger, releasing the catch below it, and enabling him to draw back the lock to the next catch on the spring, into the position shown in fig. 6. Having done so, he raises the breech-handle to the perpendicular, and passes it along the groove to open the breech. This done he places the cartridge in the opening thus made in the chamber, and again moving up the breech-piece to close the breech, the tige in it pushes the cartridge forward into the barrel, and the rifle is at once at 'half-cock,' as in fig. 6; for in drawing back the lock, the front point of the spring *i* forced the bolt *l* (including the needle *m*) with it, and the projection *n*, on it having passed over the head of the trigger *k*, is caught by the latter in a way which can only be released by the falling of the trigger. It will be observed that at half-cock the needle is ready to penetrate the cartridge, but that the spiral spring is loose and without power. To 'full-cock,' no more is necessary than to push *h* back to its original position. It cannot take the bolt *l* with it, as the trigger retains it to the rear. The position (fig. 7) is now obtained, in which the bolt, *l*, projects at the back, and the spiral spring is compressed into a state of passive strength. All that is now needed to fire the gun is to press upon the trigger, until the point *o* bears, when the bolt *l*, being released by the depression of *k*, the spiral spring asserts its power, and drives the needle into the heart of the cartridge, the parts all resuming their origiual positions. At first sight, one cannot help exclaiming: 'What a complicated apparatus with the four cylinders and the springs!' but, in reality, it is as simple as almost any other gun, for the whole mechanism of the lock (q. v.) is dispensed with. If it be desired to take the needle-gun to pieces, press the trigger till the point *p*, bears. If the breach-handle be then in the hinder part of its groove, the breech-piece with its contents will slip ont of the chamber.

Pressing down, next, the spring *i*, until the second catch is

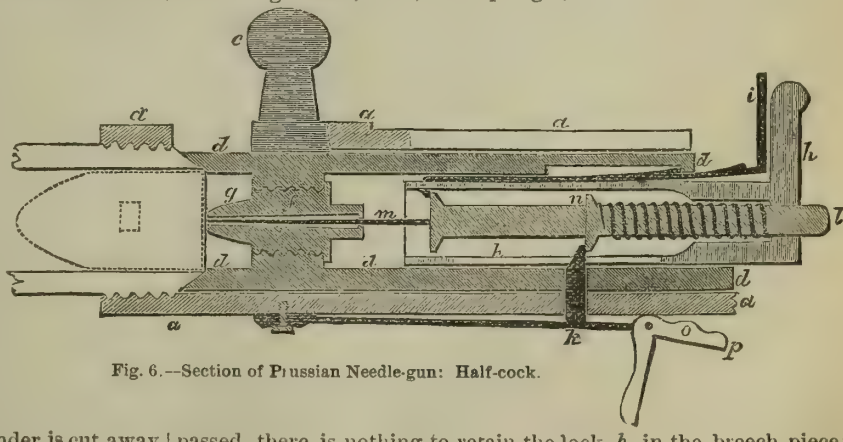

Fig. 6.—Section of Prussian Needle-gun: Half-cock.

passed, there is nothing to retain the lock, *h*, in the breech-piece; and the lock being free, the needle, with its attached bolt and spring, falls readily out of its fore-end. The gun is thus taken to pieces in a few seconds, and as many suffice to put it again in fighting order. The most delicate portions are the needle and the spiral spring; but in case of accident to these, there is a spare one

in a small cavity opening by a spring in the butt-end of the stock. The worst feature about this celebrated gun is its weight, 12 lbs., or 33 per cent. heavier than the Enfield or Snider rifles.

The converted Enfield or 'Snider' rifle was selected in 1865—1866 by the British government from the specimens submitted at an open competition of inventors. It is an extremely simple weapon, and though by no means free from faults, has given very satisfactory results up to this time. The ordinary Enfield barrel is shortened by about two and a half inches, and the heel of the remainder is screwed in to a strong shoe, *a* (fig. 8), with which is connected by a powerful hinge, *b*, the solid breech-piece, *c*, which, when shut, completely closes the breech. Through this passes the piston or striker from *d* to *e*; the normal position of the piston is maintained by a spiral spring within the nipple (which screws into the upper side of *c*), and is such that the piston does not project at *e*, while it does project at *d*. Given the breech open as in fig. 8, the cartridge is inserted and pushed forward into the barrel, where its metal rim fills the groove left around the barrel's heel. The breech-piece, *c*, is closed down, the hammer, *i*, drawn to full-cock, and the piece is ready for discharge. The breech-piece is securely locked by the spring bolt, which enters a recess in the false breech at *g*, and can only be withdrawn on the lever thumb-piece, *h*, being pressed by the thumb in the act of again lifting the breech-block. On the trigger being pulled the hammer falls, drives in the piston at *d*, and out against the detonating cap of the cartridge, with a sharp blow at *e*, firing the charge.

The hammer is drawn back to half-cock, the piston flies up to its former position; the breech-piece, *c*, is thrown back, and slid on its hinge *b*, along the pin *k*, until the part *b* touches the part *l*, a process during which a small catch, *m*, hooks back into the breech, by its projecting rim, the empty cartridge-case. The canting of the rifle to one side now throws this out, a spring within the hinge moves the breech-piece to its former place, and the gun is ready for another charge.

The cost of altering an 'Enfield' to a 'Snider' varied from 15*s*. to 20*s*. During the transition period, upwards of a million were converted in this way, besides a large number of new arms made for our own government; but conversion and manufacture are now suspended both in the government factories and by the large small-arms companies. The government factories were capable of converting 1100 rifles daily.

At first, the firing of the Snider was inferior to the old Enfield; but, by alterations in the bullet, effected by Colonel Boxer, in the direction of decreasing the specific gravity at the apex by the insertion of a wooden plug (which is now, however, dispensed with, and the point of the bullet spun over the mouth of the cavity), this condition has been reversed, and the Snider now fires 30 per cent. better than the old Enfield. Of course, these changes add to the cost of the cartridge, which has, however, these great perfections—first, that it is nearly impervious to wet; and second, that fire can scarcely be communicated to it otherwise than through the detonating cap. A single cartridge has been fired within a barrel of loose cartridges without exploding any of the others.

Adverting to the Snider cartridge, fig. 5, the whole is enclosed in a roll of thin brass foil, outside which is a covering of paper, and having for its base an iron disc, in front of which is a double cup of thin brass, while a round of millboard or pulp encircles the chamber containing the percussion cap, which communicates with the powder. Between the powder and ball is a layer of wool.

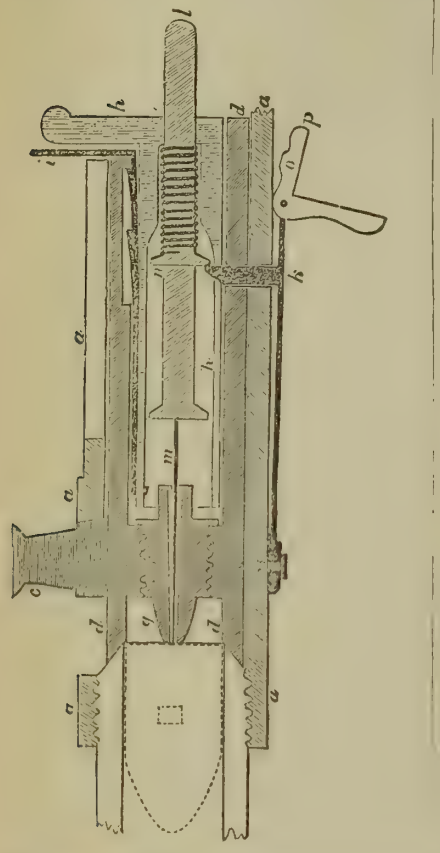

Fig. 7.—Section of Prussian Needle-gun—Full-cock.

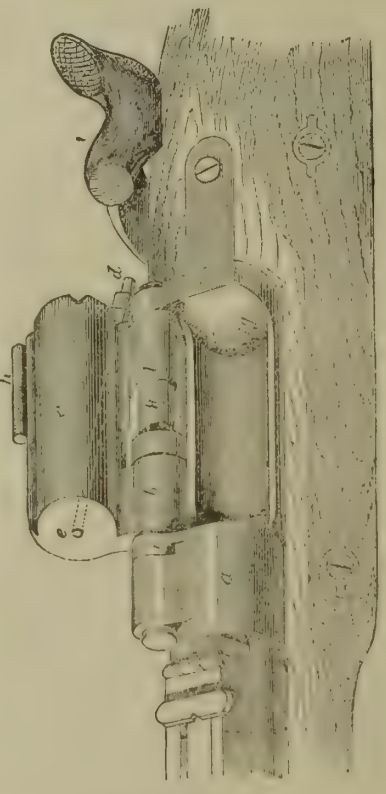

Fig. 8.—Snider—Open.

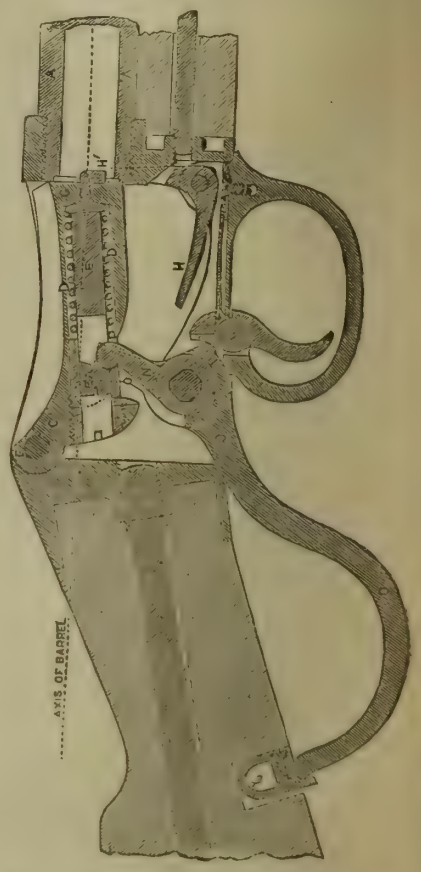

Fig. 10.—Section of Martini Breech Action—Closed.

The ball has, as explained above, the point spun over a cavity in its front, and a conical hollow is made at the base; into the wider part of this is dropped the wooden plug, while on the circumference of the bullet, and outside this conical hole, are four small cannelures or cuts in the lead. When the powder explodes, the wooden plug is driven forwards to the head of the hollow, driving the base of the bullet outwards till the lead completely fills the grooves of the rifle—a process aided by the comparatively less resistance at the cannelures.

These cannelures are also receptacles for a wax lubrication which prevents fouling, interposing always a film of wax between the bullet and the barrel. The charge and bullet are held together by the copper sheathing being pressed into the cannelures. Returning to the percussion-cap, we should find, if it were enlarged, an apparatus—as in fig. 9—where the cap is a thin copper cylinder open at front and closed at the rear end, where there is contained a deposit of detonating powder, *c*, of great sensitiveness. A brass bead, *b*, called the 'anvil,' is contained within the cap, the sharp point being next the detonating powder, and its broader end resting at the bottom of the cap-chamber on each side of the hole *d*. The cap itself fits tightly into the chamber, leaving no opening for the escape of gas backwards from the explosion, and is fired by the external blow of the piston or striker, which drives the base of the cap down upon the point of the an-

Fig. 9.—Snider Cap.

vil, by which means the detonating powder is exploded, and the flash, passing down the sides of the anvil, communicates through the opening, *d*, with the powder in the cartridge. The weight of the bullet is 480 grains; of the powder, 70 grains; the cost being about £3 per thousand.

From this description, it is evident that the Snider cartridge is a complicated arrangement; but it is not much more so than that of the Zündnadelgewehr, though vastly more efficient.

In comparing the Snider and the late Prussian gun, the former had certainly the greater simplicity; while its smaller weight (9 lbs. to 12 lbs.) was an immeasurable advantage. Of the two it is probably the less likely to get out of order. In the Prussian arm,

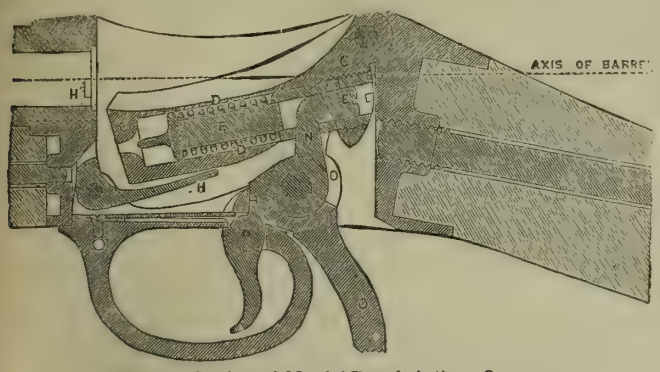

Fig. 11.—Section of Martini Breech Action—Open.

the needle, by its own mechanism, fired the charge; while in the Snider, it is a mere medium for conveying the blow of the hammer.

The breech-action of the Martini-Henry rifle, which came to be adopted as the pattern for new rifles for the British army, will be understood from figs. 10 and 11. There have been improvements of various kinds made upon it since it was first introduced, but the main principles are unaltered.

The principle of the action consists in closing the breech by a falling block, C, working in a mortised breech body, and hinged on a pin, F, at the back end, and falling in front sufficiently when open to clear the opening of the barrel; the top of the breech-block forms an inclined groove, along which the cartridge is slipped into the barrel A. The ordinary gun lock is replaced by a direct acting striker E, impelled by a spiral spring, D, both being contained within the breech-block. The act of opening the lever, O, draws down the breech-block, simultaneously drawing back the striker, and compressing the spiral spring; at the same time the toe of the cranked extractor, H, is struck by the breech-block, thus throwing its upper claws, which encircle the base of the cartridge-case, backward, and jerking out the used case. On a fresh cartridge being inserted, the lever, O, is drawn back and fixed to the stock by the spring Y. This closes the breech, but the spiral spring is kept compressed, and the striker at the full-cock position, by the tumbler, N, into the bent of which the point of the trigger and the tumbler-rest entered when the breech was opened. The trigger being pulled, the tumbler, N, is let loose, and the spiral spring discharges the pointed end of the striker, E, on to the cap in the rear-end of the cartridge, which is thus fired.

Fig. 12 represents, in section, the Boxer-Henry cartridge for Martini-Henry rifle.

The following table shows the breech-loading rifles in use in 1883 by the principal powers:

Country.	*System adopted.*	*Bore.*	*Weight of Rifle.*	*Weight of Bullet*	*Weight of Powder.*
		Inch.	*Lbs.*	*Grains.*	*Grains.*
Austria	Werndl	.450	9.88	318	65
Belgium	Albini-Braendlin	.433	10.14	386	77
Denmark	Remington	.450	9.08	370	66
England and Turkey	Snider	.577	9.05	480	70
	Martini-Henry	.450	8.75	480	85
France	Gras	.433	8.93	386	75
Germany	Mauser	.433	10.75	385	74
Holland	Beaumont	.433	9.59	336	66
Italy	Vetterli *	.412	6.61	308	58
Russia	Berdan	.420	8.48	370	78
Sweden	Remington	.480	9.55	370	66
United States	Springfield	.450	9.13	370	78

* Switzerland has also adopted the Vetterli, but in the form of a *repeating*-arm.

Of all the above-named systems, the Martini-Henry fires the most powerful cartridge, and in consequence possesses the advantage at long ranges. In addition to what are known as breech-loaders proper, there are repeating-arms, one of which, the Spencer Magazine Rifle, may be taken as a type of those arms

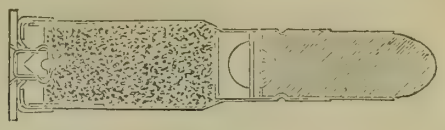

Fig. 12.

carrying, in a tube in the stock, a series of cartridges, which by a simple action, pass into the barrel for discharge. As the gun can ordinarily be loaded at the breech without drawing on the magazine, it is doubtless that this reserve would be a powerful means of defence in a moment of danger, as in receiving an attack; but among its drawbacks are weakening of the stock, serious increase of weight, and complexity and delicacy—objections in the rough usage of active service. Another type of these weapons are fitted with *attachable* magazines, which are carried on the shoulder when not in use. No nation, except Switzerland, had in 1883 decided upon a Magazine Breech-loader wherewith to arm the *whole* of their military forces. See RIFLED ARMS.

The various forms of breech-loading arms used for sport—both shot-guns and rifles—may be shortly described as follows: *For loading*, the barrels (generally double) fall forward on a hinge when a bolt is moved by a lever working horizontally either in front of the trigger, or on top of the 'head' between the hammers. The former is the Lefaucheux system, the latter the Westley-Richards, both having many modifications. *For firing*, the front part of the barrels is raised up, and the open ends of the chambers containing the cartridges are closed by being brought in close contact with the face of the iron block, or 'head,' which receives the recoil, the lever instantly locking the barrels in position by a snap action.

BREED, in domestic animals, a variety, or often merely a race distinguished by the possession of particular qualities, but not differing from the ordinary type of the species so as to constitute what naturalists usually designate a variety. The peculiarities of breeds in animals find an exact counterpart in the cultivated plants, the value of particular kinds often depending, in a great measure, upon characters scarcely capable of being defined in the language of scientific description, but to the production and perpetuation of which the attention of the cultivator cannot be too earnestly directed. These, also, in plants, as in animals, have of themselves little permanence, and the preservation or perpetuation of them depends upon the same assiduous attention and high cultivation from which, more frequently than from any mere accidental circumstances, they have originated. Thus it happens that the most improved varieties of garden-plants usually degenerate even under ordinary horticultural treatment, and the choice pansies of the florist lose their characteristic excellences if a place is simply assigned to them in a common flower-border. The improvements which cultivation has effected in the productions of the fruit, flower, and kitchen garden do not, however, possess an economic importance to be compared with that of the similar improvements in the cereals and other plants cultivated on the most extensive scale, or in the breeds of some of the most valuable domestic animals. To the breeding of these, great attention has of late been paid—probably more since the beginning of the 19th c. than in all the previous history of the world—and with results the magnitude of which may in some measure be estimated from the statement made on very competent authority, that in the second thirty years of this century the weight of mutton produced was about doubled in proportion to the number of sheep kept. To the improvement of the B. of horses, attention has been paid for a much longer time than to that of oxen and sheep; and to this must, in a great measure, be ascribed the different excellences of some of the well-known breeds employed for very different purposes. The use of the horse in war, and for purposes of pomp and luxury, appears to have been the reason of the higher degree of attention thus paid to it, even from ancient times. The Arabs have long been particularly careful of the B. of their horses, and diligently preserve a record of their pedigree.

What is called *blood* in horses, however, only fits them in a higher degree for certain purposes; and with regard to this as to other animals, the judgment of the breeder must be exercised, as the perpetuation, increase, or combination of particular qualities may be the object which he has in view. Fleetness and strength are important qualities in horses, the extremes of which never coexist in the same animal, but of which a certain combination is for some purposes very desirable; and either of these may be displayed in a great degree without much *bottom*, or power of enduring continued severe exertion—a quality of very high value. The properties most desired in sheep and oxen are very different from those most highly esteemed in the horse—the fleece and the

flesh being chiefly regarded in sheep, the flesh and the milk in oxen. Sometimes a perpetuation of good qualities is the great object of the breeder, and a combination of them in the highest possible degree is aimed at; sometimes, the production of the largest possible quantity of beef or mutton in the shortest time being almost exclusively designed, the breeder neglects considerations which would be of importance if his stock could not be improved by animals obtained from other quarters. Extraordinary differences are certainly found to exist among animals of the same species in the readiness with which they convert food into flesh and fat, and in the age at which they are fit for the hands of the butcher. One effect of the attention bestowed of late upon the breeding of stock, has been to supply the market, to a great extent, with the flesh of younger animals than could previously be sent to it—a change evidently tending not only to the benefit of the farmer, but to the increase of the national wealth; because that land, even without increased produce or grass, sends a greater amount of beef and mutton to market within the same term of years. Those sheep and oxen which exhibit in the highest degree the qualities just referred to, are also characterized by shortness of legs, smallness of bones, smallness of head, and fineness of skin; qualities the very opposite of those which would fit the animal for a wild state and an independent existence.

Some of the most important breeds of domestic animals will be mentioned under their proper heads. It remains for us only to allude here to the rules and physiological principles of breeding; but the latter, in so far as application of them has yet been found practicable, are only the best known principles of physiology (q.v.). In a great measure, however, the rules which guide the breeding of stock have been learned by experience, and are rather to be regarded as contributions to science than as deductions from it. The probable relative influence of the male and female parent upon their progeny, is a point unquestionably of the greatest importance, but concerning which widely different opinions have been maintained; and another much controverted and important point is, the propriety of *breeding in and in*. Practically, the rule is always observed by those who seek the improvement of a *breed*, of selecting the very finest animals possible, both male and female; although a great improvement of the existing stock on a farm is often effected in the most advantageous manner by the mere introduction of males of better quality. The dangers of breeding *in and in* are very generally acknowledged, even whilst it is contended that they may very much be obviated by careful rejection of every faulty animal, and that in this way the utmost advantage may be taken of the very highest improvements; but it is likewise very generally admitted that, if equally improved individuals can be obtained not so nearly related, it is better to seek the perpetuation of the B. by their means. It is a rule also of much practical importance, that an improvement of B. is to be attained not by a *cross* between animals of very different breeds, as between a dray-horse and a race-horse, but only between those which are comparatively similar. The result of the intermixture of very dissimilar breeds is never in any respect satisfactory.

BREE'DÉ, a river in Cape Colony, flowing chiefly through the district of Zwellendam, which contains Cape Agulhas, the most southerly point ef Africa. It rises in the Warm-Bokkeveld, a mountain-basin about lat. 33° 10' S., and long. 19° 30' E., running first to the west, and afterwerds to the south-east; and it enters St. Sebastian's Bay or Port Beaufort, from which, upwards, it is navigable to a distance of 40 miles. Its exports are wool, aloes, skins, feathers, grain, butter, cattle, mules, &c.

BREEZE. See WIND.

BRE'GENZ, a frontier town of Austria, capital of the district of Vorarlberg, is situated at the mouth of the small river Bregenz, which here flows into the Lake of Constance, between the Swiss and Bavarian territories, about 80 miles west-north-west of Innsprück. From the ruins of the castle of Hohenbregenz, on a hill near the town, a very beautiful prospect is obtained of the lake and its surrounding vineyards, &c. B. is one of the oldest towns, and was formerly one of the chief fortified places in the southern part of Germany. The inhabitants (1880) 4736 in number, are engaged in agriculture, horticulture, and cattle-keeping. Cotton-spinning and weaving are also carried on; and articles of wood, gold, and iron, are manufactured. Its position secures B. a large transit-trade in the produce of the district. In the neighborhood lies the mountain-path, the *Bregenzer-Klause*, formerly a strong military position between Swabia and the Tyrol. During the Thirty Years' War, the Swedes, in 1646, stormed and captured the fortress of B., and destroyed the works in the pass.

BRE'HON LAWS (in Irish, *Dlighidh Breitheamhuin*—that is, 'judges' laws'), the name usually given to the system of jurisprudence which prevailed among the native Irish from an early period till towards the middle of the 17th century. The *breitheamhuin* (pronounced *brei-hoo-in*, or *brehon*), from whom the laws had their name, were hereditary judges, who administered justice among the members of their tribe, seated in the open air, upon a few sods, on a hill or rising ground. The poet Spenser, in his *View of the State of Ireland*, written in 1596, describes the B. L. as 'a rule of right unwritten, but delivered by tradition from one to another, in which oftentimes there appeareth great share of equity, in determining the right between party and party, but in many things repugning quite both to God's law and man's: as, for example, in the case of murder, the brehon—that is, their judge—will compound between the murderer and the friends of the party murdered, which prosecute the action, that the malefactor shall give unto them, or to the child or wife of him that is slain, a recompense, which they call an *eric;* by which vile law of theirs many murders amongst them are made up and smothered; and this judge being, as he is called the lord's brehon, adjudgeth for the most part a better share unto his lord, that is, the lord of the soil, or head of the sept, and also, unto himself for his judgment, a greater portion than unto the plaintiffs or parties grieved.'

Spenser was ignorant that pecuniary compensation for manslaughter had obtained in the ancient laws, as well of England as of most European nations. He was mistaken, too, in believing that the B. L. was an unwritten code. Many manuscript collections of the B. L. still exist in public and private libraries in Ireland, England, and Belgium. These manuscripts are regarded as varying in date from the early part of the 14th to the close of the 16th century. For the laws themselves, a much higher antiquity is claimed. On this point, we must be content to quote what has been said on the part of the very few persons who have had an opportunity of making themselves acquainted with the existing collections of the brehon laws. 'So far as we have external evidence to guide us,' say Dr. J. H. Todd and Dr. C. Graves, two eminent Irish antiquarians, 'there is no reason to suspect that the brehon laws have undergone any material change since the time of Cormac Mac Cuilleanain, king and bishop of Cashel, who died 908 A.D. He was a man of great learning and energy, who certainly promoted the execution of considerable literary works, and under whose influence it is not improbable that a systematic compilation of the laws may have been effected. Of this, however, we have no distinct record. On the other hand, we find scattered through all parts of the laws allusions to a general revision of them made in the 5th c., at the instance of St. Patrick, who, in conjunction with certain kings and learned men, is said to have expunged from them all those institutions which savored of paganism, and to have framed the code called the Seanchus Mor. These same documents assert the existence of still more ancient written laws, the greater part of which are ascribed to Cormac Mac Art, monarch of Ireland, in the middle of the 3d century. However slow we may be to acquiesce in statements of this kind, which contradict what we have learned concerning the progress of legislation in the remaining parts of Western Europe, we may readily admit that the subject-matter of many of the laws demonstrates their great antiquity, as it indicates the primitive nature of the society in which they prevailed. In spite of the attempts to efface it, traces of heathenism are still discernible in many parts of them.

'They enumerate various ordeals of a pagan character, which are expressly termed *magical*, and specify the occasions on which a resort to them was prescribed. There are also provisions in the laws of marriage which prove that Christianity could have exercised but a feeble influence at the time when they were enacted. The language in which the brehon laws are written is a convincing proof of their antiquity. They are not composed in a peculiar dialect as many writers have maintained; but if their style differs from that of the vernacular Irish of the present day, as Anglo-Saxon does from modern English, this dissimilarity is to be ascribed mainly to the effects of time, by which the orthography and grammatical forms of the language have been modified, and legal terms and phrases of constant recurrence have become obsolete.' The world of letters will be able, in no long time, to judge for itself on the opinions thus expressed. It is now upwards of twenty years since the publication of the B. L., at the charge of the Irish government, was strongly urged by such men as Guizot, Grimm, and Ranke abroad, and Hallam, Macaulay and Earl Stanhope at home. A commission was accordingly appointed by the Earl of Eglinton in 1852, 'to direct, superintend, and carry into effect the transcription and translation of the ancient laws of Ireland, and the preparation of the same for publication.' The commissioners intrusted the transcription and translation of the B. L. to the two most eminent of Irish scholars—the late Dr. John O'Donovan, professor of Celtic in Queen's College at Belfast; and the late Eugene O'Curry, professor of Irish archæology in the Roman Catholic university of Ireland. These gentlemen have finished their task, the editorship of the work was intrusted to Mr. W. J. Hancock, late professor of political economy in Trinity College, Dublin, and the Rev. Thaddeus O'Mahony, professor of Irish in the university of Dublin. The publication it is reckoned will extend to about eight volumes, of about 550 pages each. Three of these have already appeared—the last in 1873—under title

of *Ancient Laws and Institutes of Ireland*. Along with the Irish text, an English Translation is given, accompanied with preliminary dissertations, glossaries, and indexes, and they give a vivid and characteristic picture of the polity and social life of a Celtic people. A fac-simile reprint of the B. L. has recently been published in 17 volumes by the B. L. Commission.

BREISA'CH, Alt, a very old town of the grand duchy of Baden, situated on an isolated basalt hill on the right side of the Rhine, about 12 miles west of Freiburg. As early as the time of Julius Cæsar, *Mons Brisiacus* was known as a strong military position, and was taken by Ariovistus when he invaded Gaul. Being regarded as the key to the west of Germany, it was a prominent scene of action during the Thirty Years' War, at the conclusion of which it was ceded to the French. During the next century, it frequently changed masters, now belonging to France, and now to Austria. The French destroyed its fortifications in 1744, and during the war of the Revolution in 1793, part of the town was burned by them. In 1806, the French handed it over to the House of Baden. The minster of St. Stephen is a venerable structure in good preservation, and contains several old monuments. Pop. (1880) 3258.

BREI'TENFELD, a village and manor of Saxony, about 5 miles north of Leipsic. It is historically remarkable for three battles, fought on a plain in its neighborhood. The first of these, between the Swedes and the Imperialists, which was fought on the 7th September 1631, was of the highest importance to Europe, as it secured the permanency of Protestantism and the freedom of Germany. Tilly's pride had reached its highest point after the fall of Magdeburg, which took place on the 10th of May 1631; and in the early part of September of the same year, he advanced against the Saxons, with an army of about 40,000 men, for the purpose of forcing the elector, John George I. (who would not submit to the edict of restitution, and was treating with the Swedish king, Gustavus Adolphus), into an alliance with the emperor. No other way remained than for the elector to join the Swedish king, who had just entered Pomerania. Gustavus Adolphus, joined by the Saxons, advanced towards Leipsic, where Tilly lay, who advanced into the plain of Breitenfeld. The imperial forces were completely defeated, and their three most distinguished generals, Tilly, Pappenheim, and Fürstenberg, wounded. The second battle which B. witnessed again resulted in the triumph of Swedish valor: it took place on the 23d of October 1642, between the Swedes, headed by Torstenson, one of the pupils of Gustavus, who had invested Leipsic, and the Archduke Leopold, with General Piccolomini, who were advancing from Dresden to its relief. The Swedes gained a complete victory over the Imperialists, who fled into Bohemia, leaving behind them 46 cannon, 121 flags, 69 standards, and the whole of their baggage. The third battle of which B. was the scene, was fought on the 16th of October 1813, and was part of the great contest known as the battle of Leipsic.

BRE'MEN, one of the three free cities of Germany, is situated on the Weser, about 50 miles from its mouth. Pop. (1880) 112,158, nearly all Protestants. B. is divided into the old and the New Town —the former on the right, the latter on the left side of the river, which is spanned by four bridges. The ramparts and bastions round the old town have been levelled and formed into public promenades, which are laid out with excellent taste. Among the principal buildings, the Cathedral (built about 1160), the Gothic Town-hall (begun about 1405), with its famous wine-cellar, said to contain hock of the vintage of 1624, the Exchange, the Museum, the Post-office, and the Observatory of Dr. Olbers, from which he discovered the planets Pallas and Vesta, are remarkakle. The position of B. makes it the emporium of Brunswick, Hesse, and other countries through which the Weser flows. Besides its excellent water-communication, it is connected by railways with the whole of Western and Central Germany. B. is an exceedingly thriving place, its trade having more than doubled within the last ten years. Large vessels stop at Bremerhaven, where there is a spacious harbor constructed, about 38 miles below B., with which it is connected by electric telegraph. Vessels not drawing more than 7 feet of water can come up to the town itself. B. carries on an extensive commerce with the United States of America, the West Indies, Africa, the East Indies, China and Australia. Its great foreign trade, however, is with the United States, from which alone, in 1880, it imported produce of the estimated value of £9,000,000, exporting in return goods to the value of £4,800,000. With the exception of Hamburg, no continental port ships so many emigrants to the United States as B., through its main port at Bremerhaven. The total number of vessels arriving at B. in 1880 was about 2500, with a tonnage of above 8,000,000 tons; the tonnage cleared was rather smaller. The number of ships belonging to the port in 1880 was 320, with a burden of 261,357 tons. In 1880, the value of the imports amounted to £27,920,000, exports to £25,565,000; whereas in the year 1858, the imports were valued at only £8,237,000, and the exports at about £8,000,000. The chief imports are tobacco, coffee, sugar, cotton, rice, skins, dyewoods, wines, timber, hemp, &c.

The exports consist of woollen goods, linens, glass, rags, wool, hemp, hides, oil-cake, wooden-toys, &c. Large quantities of tobacco are re-exported. B. has manufactures of woollens and cottons, cigars, paper and starch, and extensive ship-building yards, breweries, distilleries, and sugar-refineries. The cigar and sugar manufactures have of late declined, the former on account of the increase of duty. In 1872, it is said that 2500 hands were engaged in making cigars. It has steam-communication with New York, and Hull, Havana, the north coast of South America, &c.

B. first became of historical note in the 8th c., when it was erected into a bishopric by Charlemagne. It soon attained considerable commercial importance, and became one of the principal cities of the Hanseatic League (q. v.). Having frequently suffered at the hands of the French, it was, in 1810, incorporated with that empire; but it recovered its independence in 1813, and by the Congress of Vienna was admitted, in 1815, as one of the Hanse towns, into the Germanic confederation. In 1867, it became a member of the North German confederation, and now it forms part of the German empire. The area of its territory is about 100 square miles; pop., including the town of B. (1880) 156,723. The government is intrusted to a senate of 18 members, two of whom are chosen burgomasters, and to a municipal council of 150 burgesses.

Bremerhaven, a port on the Weser, near 10 miles from its mouth, was founded by Bremen in 1827, on ground acquired from Hanover, and soon became a thriving place. It has extensive docks and quays, and may be regarded as the seaport of Bremen. Pop. in 1875, 12,501.

BREMER, Fredrika, the well-known Swedish novelist, was born near Abo, in Finland, 17th August 1801; but when she was only three years old, her father removed to Sweden. As a child of eight, she had already begun to write verses; and the works of German poets, Schiller more especially, exercised a most powerful influence over her youthful imagination. Her original novels first made their appearance under the general title *Tekningar ur Hvardagslifvet*, at Stockholm, in 1835.

It was not, however, till 1842 that the English public hailed with delight the appearance, in an English dress, of *The Neighbors*, perhaps the most universally popular of all Fredrika B.'s charming pictures of domestic life in Sweden. Encouraged by its enthusiastic reception, Mrs. Howitt subsequently published translations of *The Diary*, *The H. Family*, *The President's Daughters*, *Brothers and Sisters*, *Life in Dalecarlia*, and *The Midnight Sun*. In 1849, Miss B. visited the United States, and there spent two years, passing some time in England on her return. In her *Homes of the New World*, published simultaneously in England, America, and Sweden, in 1853, she not only presents us with exquisite descriptions of scenery, and vivid pictures of social life, but with sound and comprehensive views on political and moral subjects. Returning to her home in Sweden, to find a beloved sister dead, Miss B. devoted her talents and energies to the carrying out of certain philanthropic objects, in which she had throughout life felt deep interest, more especially the education of the poorest classes. As a writer of fiction, she is distinguished for feminine delicacy, shrewd sense, humor, deep knowledge of human nature, and a graphic and forcible style. Her works have been translated into almost all the languages of Europe. She died in 1865. Her Life and unpublished writings were issued by her sister in 1868.

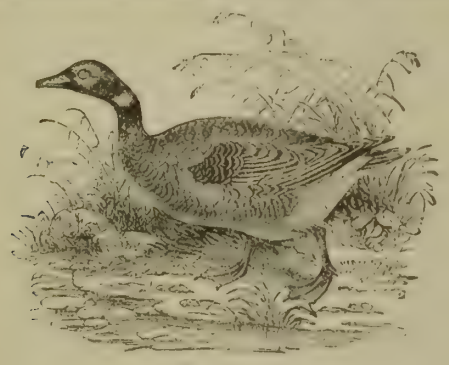
BRE'NNER PASS, a pass in the main chain of the Alps, on the road between Innsbruck (q. v.) on the north and Botzen (q. v.) on the south, connecting the south of Germany with Venice and the north-east of Italy. The B. P. is the lowest which crosses the main chain of the Alps, the summit being only 4775 feet above the level of the sea. Lofty mountains rise above it to the further height of more than 7500 feet, yet the scenery of the pass is less sublime and less interesting than that of any other of the great passes of the Alps. It is open at all seasons of the year. At the summit of the pass is the village of Brenner, a resting-place for travelers, with a pop. of about 400. The climate here is so severe that corn seldom ripens. Here the traveler finds in close contiguity the Eisach, a small stream, which, after growing to be a considerable river, joins the Adige, and the Sill, a tributary of the Inn; the one stream flowing to the Gulf of Venice, and the other into the Black Sea. On 18th August 1867, a railway through the B. P. was opened, and thus a complete line of railway communication was established between Germany and Innsbruck to Botzen, in a direct line is only 52 miles, but by the windings of the road or of the railway, it is much increased.

BRENNUS, the name, or rather the title of several Gallic princes, is probably a Latinized form of the Kymric word *Brenhin*, which signifies a king. The most famous B. was that leader of the Gauls who, in 390 B.C., crossed the Apennines, and hurrying through the country of the Sabines, at the head of 70,000 men, encountered and overthrew on the banks of the Allia (q. v.) the Roman army.

Had the barbarians immediately followed up their advantage, Rome might have been obliterated from the earth; but instead of doing so, they abandoned themselves to drunken delights on the battle-field, and gave the Romans time to fortify the Capitol, whither were removed all the treasures and holy things of the city. When B. entered the gates, he found that all the inhabitants had fled, with the exception of the women, children, and old men, the last of whom, with pathetic heroism, had resolved not to survive the destruction of their homes, and so, the chief among them, clothed in their robes of sacerdotal or consular dignity, and sitting in the curule chairs, waited the approach of their enemies, and received their death in majestic silence. B., having plundered the city, now besieged the Capitol for six months. During the beleaguerment occurred the famous night-attack, which would have been successful had not the cackling of the geese, kept in Juno's temple, awakened the garrison. At length, however, the Romans were compelled to enter into negotiations with the besiegers. They offered 1000 lbs. of gold for their ransom, which was agreed to. According to Polybius, B. and his Gauls returned home in safety with their booty; but the rather mythical Roman traditions affirm that, just as the Gauls were leaving the city, Camillus, who had been recalled from banishment, and appointed dictator, appeared at the head of an army, attacked them, and, in two bloody battles, slew the whole of the barbarians to a man.

Another B., who occupies a conspicuous place in history, was that Gallic chief who invaded Greece, 279 B.C., at the head of 150,000 foot and 61,000 horse. After desolating Macedonia, B. forced his way through Thessaly to Thermopylæ. The Grecian army fled at his approach. B. now rushed on with a division of his great host to Delphi, which he had resolved to plunder; but the Delphians, having taken up a very advantageous position on some rocks, resisted his further progress. Assisted by the terrors of an earthquake and a terrible storm, besides, according to reverential tradition, by the supernatural help of Apollo, they utterly routed the Gauls, who fled in dismay. B. was taken a prisoner, and drank himself to death in despair.

BRENT GOOSE, or BRENT BARNACLE. This bird has been already noticed under BARNACLE (q. v.). We add here a few sentences from Colonel Hawker's *Instructions to Young Sportsmen*, which we borrow from Yarrell's *British Birds*. They refer to wild-fowl shooting on the coasts of Dorsetshire and Hampshire. 'Towards November or December, we have the Brent Geese, which are always wild unless in very hard weather. In calm



Brent Goose.

weather, these geese have the cunning, in general, to leave the mud as soon as the tide flows high enough to bear an enemy; and then they go off to sea, and feed on the drifting weeds. To kill Brent Geese by day, get out of sight in a small punt, at low water, and keep as near as possible to the edge of the sea. You will then hear them coming like a pack of hounds in full cry, and they will repeatedly pass within fair shot, provided you are well concealed, and the weather is windy to make them fly low. Before you fire at them, spring suddenly up, and these awkward birds will be in such a fright as to hover together and present a mark like a barn-door.'—The extensive muddy and sandy flats between Holy Island and the coast of Northumberland are a great winter resort of this species. It is also particularly abundant on muddy and sandy flats in Cromarty Bay. The markets, both of London and Edinburgh, are well supplied with it during winter. The B. G. is known in some parts of England as the Black Goose; it is considered the most delicate for table of all its tribe, and is perhaps as much sought after as any. The B. G. differs in its habits from the common gray lag and several other species, inasmuch as it never feeds on fresh-water herbage, its tastes being exclusively salinous. B. G. may be distinguished, when on the wing, by their black bodies and white tails. Folkhard, in his excellent work *The Wild Fowler*, gives much interesting information regarding this bird.

BRE'NTA (*Medoacus Major*), a river of North Italy, rises from two small lakes in the Tyrol; flows first in a southern, then in an eastern course through the Venetian territory; passes the towns Cismona and Bassano; receives an arm of the Bacchiglione below Padua, where it becomes navigable; and falls into the Gulf of Venice, at the haven of Brondolo. The ancient bed of the B. was, some centuries ago, altered by the Venetians, who feared that their lagoons might be choked with sand by its floods. Afterwards, the old bed of the river was made use of as a canal—the *Naviglio di Brenta Magra*, which forms the chief communication by water between Venice and Padua; while the B. is but little used for navigation.

BRENTA'NO, CLEMENS, known as a novelist and dramatic poet, and as the brother of Goethe's 'Bettina,' was born at Frankfort-on-the-Maine, 1777. He studied at Jena, and afterwards resided successively at Frankfort, Heidelberg, Vienna, and Berlin. In 1818, through a morbid discontent with himself and his fellow-men, he retired to the cloister at Dülmen, in Münster. Latterly, he resided at Regensburg, Munich, and Frankfort-on-the-Maine, where he led the life of a recluse, and gained a considerable reputation on account of his sarcastic wit. He died at Aschaffenburg, on the 28th of June 1842. In his earliest poems the peculiarities of the 'romantic school' of his time are carried to excess. His dramatic productions, such as *The Merry Musicians, a Musical Drama* (Frankfort, 1803), in which there are some gems of lyric poetry, *Ponce de Leon* (Göttingen, 1804), &c., are characterized by great dramatic power, amusing though rather far-fetched wit, and a wonderful flow of humor. Perhaps his most successful piece as a drama is *The Founding of Prague* (Pesth, 1816). B. was most successful in his smaller novels, particularly in the *History of Caspar the Brave and the Fair Anneri* (2d edit. Berlin, 1831), which German critics call a '*chef-d'œuvre* in miniature.' His last work, the legend of *Gokel, Hinkel, and Gakeleia* (Frankfort, 1838), was intended as a satire upon the times in which he lived. He has received the grateful acknowledgment of his countrymen for his renovation of the good old history of George Wickram of Kolmar, which he published under the title of *The Thread of Gold* (*Der Goldfaden*, Heidelb. 1809).

BRE'NTFORD, the county town of Middlesex, on both sides of the Brent, at its confluence with the Thames, 7 miles west-south-west of London, and where the Thames is crossed by a bridge leading to the Kew. It consists chiefly of one long irregular street. Pop. (1881) 11,808. It has large gin-distilleries, a soap-work, and the works of the west London Water Company. There are many market-gardens in the vicinity. Here Ironside defeated the Danes in 1016, after expelling them from London; in 1558, six martyrs were burned at the stake; and in 1642, the Royalists under Rupert defeated the Parliamentarians under Colonel Hollis.

BRE'SCIA, a city of Italy, capital of the province of the same name, in Lombardy, about 60 miles east-north-east of Milan. It is romantically situated on the rivers Mella and Garza, in a wide fertile plain, at the base of several hills. The railway from Milan to Venice passes through Brescia. The city is for the most part regularly built, and, besides two cathedrals, the old and the new, it has numerous ancient churches, adorned with pictures and frescoes, including many by masters of the Venetian school. Several interesting antiquities have been discovered. It has a valuable public library, the *Biblioteca Quiriniana*, founded and nobly endowed about 1750, by Cardinal Quirini, a munificent encourager of literature. It contains upwards of 30,000 volumes, with many rare manuscripts. The population in 1881 was 43,354. B. has manufactures of woollen, silk, leather paper, &c., and its wine is of good quality. The old name of B. was *Brixia*, and its inhabitants were allied with the Romans when Hannibal crossed the Alps. It was captured by the Huns during their migrations, and afterwards passed through the hands of the Longobards, Charlemagne, the Franks, and the Germans. It was taken by the French under Gaston de Foix, in 1512, when it is stated that more than 40,000 of the inhabitants were massacred. The city never fully recovered from the effects of that inhuman sack and pillage. In March, 1849, B., as the only important town opposed to Austrian rule in Lombardy, was besieged by Haynau, and forced to capitulate.

BRE'SLAU, the capital of the province of Silesia, Prussia, is situated at the confluence of the Ohlau and Oder. Next to Berlin, it is the most populous city in Prussia; its pop. was 207,997 in 1870; and in 1880, 272,390, more than the half of whom are Protestants. The Oder divides it into two parts, which are connected by numerous handsome bridges. The fortifications have been converted into beautiful promenades, and the ditch has been transformed into an ornamental sheet of water. The streets of the new portion of B. are spacious and regular, and the houses stately and handsome, affording a pleasant contrast to the sombre, massive structures of the old town. Educational institutions are numerous, including a university founded by the Emperor Leo-

pold I. in 1702, and now accommodating from 900 to 1000 students. The library contains 300,000 volumes. B. has many churches, the most remarkable being the Protestant church dedicated to St. Elizabeth, with a steeple 364 feet in height (the highest in Prussia), and a splendid organ. The position of B., in the center of the manufacturing districts of the province, secures it a large trade, which its railway connection with all the important cities on every side, in addition to the facilities of communication which the Oder affords, enables it to turn to the best account. It has manufactures of linen, woollens, cotton, silks, lace, jewelry, machines, earthenware, soap, allum, starch &c., and upwards of 100 distilleries; and a trade in corn, coal, metals, timber, hemp, and flax. B. is a city of Slavonic origin, and was for many centuries occupied alternately by the Poles and the Bohemians. It afterwards passed to Austria, from which it was taken by Frederick II. of Prussia, in 1741. Six years afterwards, it was captured by the Austrians, after a bloody battle, but retaken by Frederick in about a month. From that time until 1814, when its fortifications were completely demolished, it was frequently besieged.

BRE'SSAY, one of the Shetland Isles, east of the Mainland, and separated from Lerwick by Bressay Sound. It is 6 miles long and two broad, and is composed of Devonian rocks. It supplied Lerwick with peat, until the proprietor, fearing that the peat might be exhausted, stopped exportation; and it continues to supply the Shetland Isles with slates. Pop. (1881) 847, chiefly fishermen. Bressay Sound is one of the finest natural harbors in the world, and is a rendezvous for herring-boats, and for all whalers and other vessels proceeding north. East of B , and separated from it by a narrow and dangerous sound, is a rocky isle, called Noss, 6 miles in circuit, girt on all sides by perpendicular cliffs, and rising abruptly from the sea to the height of nearly 600 feet, with a flattish top. A detached rock, or holm, on the S.E. side of the Noss, used to be communicated with by means of a cradle or wooden chair run on strong ropes, stretched across a yawning gulf, and admitting a man with a sheep to be drawn over at a time.

BREST, a strongly fortified city, in the department of Finistère, France, and one of the chief naval stations of the republic, is situated in lat. 48° 24′ N., and long. 4° 29′ W., on the north side of the Bay or Road of Brest, which forms one of the finest harbors in the world. The only entrance to the bay is by a narrow channel called *Le Goulet*, which is scarcely a mile wide, and is strongly defended by batteries ; the difficulty and danger of access to hostile ships being increased by certain rocks in the center of the channel. A new floating dock, quays, and pier were completed in 1876 at a cost or 22,500,000 francs. The small river Penfel flows through the town, which is, on the whole, irregularly built on an uneven site, and has steep, narrow, dark, and very dirty streets. In some parts, communication between the lower and upper parts of the town can be effected only by stairs. The new quarter, the parade, and the quays, are more cleanly. B. has extensive ship-building yards, rope-walks, store-houses, &c. ; its industry, indeed is confined entirely to the equipment of the navy in its various branches. It has telegraphic communication with America by a submarine cable. The Bagnes (q. v.) or hulks no longer exists, the prisoners having been removed to the penal colony of Cayenne. Pop. (1881), exclusive of garrison, 64,599. B. is a very ancient place, but it was not of much importance until the 17th century. Its splendid position made it an object of contention to French, English, and Spaniards. In 1631, Cardinal Richelieu resolved to make it a naval station, and commenced the fortifications, which were completed by Vauban, but since have been greatly extended. In 1694, the English under Lord Berkeley were repulsed here with great loss. In 1794, the French fleet, under Admiral Villaret-Joyeuse, was defeated off B. by the English fleet under Admiral Howe.

BRETAGNE, or BRI'TTANY (*Britannia Minor*), a peninsula in the north-west of France, formerly a province, and now divided into the departments of Finistère, Côtes-du-Nord, Morbihan, Loire-Inférieure, and Ille-et-Vilaine, is surrounded by the sea on the N., W., and S. W. Though the height of the mountains is nowhere considerable, their structure gives to the peninsula a wild and savage aspect. Clay-slate forms the center of the country, and masses of granite rise in the north and the south.

The climate is often foggy, and subject to violent storms of wind. Large tracts of land lie uncultivated; but in the well-watered valleys, vegetation is luxuriant. In ancient times, B., under the name of Armorica, was the central seat of the confederated Armorican tribes, who were of Celtic and Kymric origin. Traces of them still remain in the old Kymric dialect of the three most westerly departments, and in the numerous so-called Druidical monuments. The name *Armorica* was changed for that of B., in consequence of the numerous immigrations from Great Britain in the 5th and 6th centuries. The peculiar, shut-in situation, and the characteristics of soil and climate in B., seem to have had a powerful effect on the character of its people. The Breton has generally a tinge of melancholy in his disposition; but often conceals, under a dull and indifferent exterior, a lively imagination and strong feelings. 'The tenacity with which the Breton clings to the habits and belief of his forefathers, is apparent by his retention of the Celtic language almost universally in Basse B., and by his quaint costume, which in many districts is that of the 16th century.' The greater number of the people are found to be ignorant and coarse in their manners, and their agriculture is of a very rude character, by no means calculated to develop the natural resources of the country. Until within recent years, B. had escaped the observation of tourists; but it has now been found out, and seems likely to be considerably run upon, as well as to have a pretty extensive literature of its own. It will be some time yet before it is exhausted, and apart from the beauty of its scenery, it possesses great interest, as the only place where men can be seen living and acting much as our forefathers did three centuries ago. Under the Romans, the country, after 58 B.C., was made the *Provincia Lugdunensis Tertia;* but its subjugation was hardly more than nominal, and it was entirely liberated in the 4th c., when it was divided into several allied republican states, which, afterwards, were changed into petty monarchies. B. became subject to the Franks in the reigns of Charlemagne, and was handed over by Charles the Simple to the Northmen in 912. After some fierce struggles, the Bretons appear to have at length acknowledged the suzerainty of the Norman dukes. Geoffroi, Count of Rennes, was the first to assume the title of Duke of Bretagne in 992. The duchy of B. was incorporated with France in 1532, by Francis I., to whom it had come by marriage, and subsequently shared in the general fortunes of the empire, but retained a local parliament until the outbreak of the Revolution. During the Revolution, B., which was intensely loyal, was the arena of sanguinary conflicts and especially of the movements of the Chouans (q. v.), who re appeared as recently as 1832. Daru, *Histoire de B.* (Par. 1826)' Roujoux, *Histoire des Rois et des Ducs de B.* (Par. 1829); Courson *La B. du 5e au 12e Siècle* (1863); Le Saint, *La B. Ancienne et Moderne* (1873); De Kerorguen, *Recherches sur les Etats de B.* (1875).

BRETIGNY, a village of France, in the department of the Eure et-Loir, about six miles south-east of Chartres, on the railway between Paris and Orleans. B. is celebrated as the place where, in 1360, Edward III. concluded a peace with France, by which John II. of France was released from his captivity in England, on agreeing to pay 3 million crowns for his ransom, England renouncing her pretensions to Normandy, Anjou, Maine, and Touraine, and being confirmed in her possession of Gascony, Guienne, and several other parts in France recently acquired by conquest.

BRETON DE LOS HERREROS, Don Manuel, the most popular of modern Spanish poets, was born 19th December 1800, at Quel, in the province of Logroño; received his earliest education in Madrid; and served as a volunteer in the army from 1814 to 1822. Subsequently, he held several situations under government, but always lost them on account of his expression of liberal opinion. As early as his 17th year he wrote a comedy, entitled *A la Vejes Viruelas*, which, in 1824, was brought upon the stage with great success. Henceforward he furnished theatrical managers with more than 150 pieces, partly original, partly adaptations from the older Spanish classics, and partly translations from the Italian and French, most of which have been highly popular. In addition to these, B. published *Poesías Sueltas* (Madrid, 1831, and Paris, 1840); several volumes of satirical verse; a long humorous poem, called *La Desvergüenza, Poema Jócoserio* (Madrid, 1858), &c. All B.'s poems are remarkable for their singularly sweet, yet powerful diction, and for the harmony of the versification. His peculiar sphere is the comic and the satirical, in which the Spanish or national qualities of his genius find their freest expression, and in which also he displays most ease and self-reliance. B. superintended the issue of a collected edition of his poetical works in 1850—1852 (5 vols., Madrid). He died at Madrid in November 1873.

BRETSCHNEIDER, Heinrich Gottfried, a man remarkable for his unsettled life, eccentric habits, and satirical writings, was born at Gera, March 6, 1739. He was first sent for education to the Institute of Herrnhuters at Elbersdorf, and afterwards to the Gymnasium at Gera. He became captain of horse in a Prussian volunteer corps, in which service he was made prisoner, and retained in a French fortification till 1763. In 1775, B. visited England, France, and Holland; and in 1778 was nominated librarian to the university of Ofen, where he was persecuted by the Jesuits, whose hatred he had excited. This circumstance brought him under the notice of Joseph II., who, in 1782, appointed him one of the inspectors of studies. He died 1st November 1810. B. was the author of tales, poems, and satires. The latter are attacks upon every kind of injustice and falsehood. In his 'Almanac of the Saints (*Almanach der Heiligen*) for the year 1788, with Copperplates and Music, printed at Rome, with the permission of the Principals,' the priesthood is severely attacked, and the legends of the monks ridiculed. Like Nicolai, B. was very bitter against the 'Werther' mania which was so prevalent in his time.

BRETSCHNEIDER, KARL GOTTLIEB, a distinguished German theologian, born 11th February 1776, at Gersdorf, in Saxony, studied theology at Leipsic, was appointed pastor at Schneeberg in 1807, general superintendent at Gotha in 1816, and in 1840 obtained the dignity of councillor of the Upper Consistory. He died 22d January 1848. B. has acquired a reputation for sober, reflective, rationalistic thought. The character of his intellect rendered him unable to enter into the profound speculations of men like Schleiermacher and Schelling; but nevertheless by his diligence, clear, incisive understanding, and strength of character, he has secured a permanent place in the history of German theology. His most important work in dogmatics is the *Manual of the Evangelical Lutheran Church* (2 vols., Leip. 1814—1818). In 1824, B. published *Lexicon Manuale Græco-Latinum in Libros Novi Testamenti* (2 vols., Leip. 1824). In 1832, appeared *Der Simonismus und das Christenthum;* in 1835, *Die Theologie und die Revolution*. B. also published many sermons, which have been well received, and in other departments of theology and literature he is considered to have done important service.

BRE'TTEN, a town of Baden, about 13 miles east of Carlsruhe, chiefly noteworthy as the birthplace of Melanchthon. The house in which he was born is pointed out to travelers. Pop. (1880) 4034.

BRETTS AND SCOTS, THE LAWS OF THE (Lat. *Leges inter Brettos et Scotos*, Old Fr. *Lusage de Scotis et de Bretis*), the name given, in the 13th c., to a code of laws in use among the Celtic tribes in Scotland. The 'Scots' were the Celtic people dwelling in the western and more mountainous districts north of the Forth and the Clyde, who, when it became necessary to distinguish them from the Teutonic inhabitants of the low country, received the names of 'the Wild Scots,' 'the Irishry of Scotland,' and, more recently, 'the Scotch Highlanders.' The 'Bretts' were the remains of the British or Welsh people, who were at one time the sole or chief inhabitants of the region now divided into the shires of Dumbarton, Renfrew, Ayr, Lanark, Peebles, Selkirk, Roxburgh, Dumfries, and Cumberland. This province was for some centuries an independent kingdom, known by the name of 'Cambria" 'Cumbria,' 'Strathclyde,' and 'Strathclyde and Reged.' It became, about the middle of the 10th c., a tributary principality held of the king of the English, by the heir of the king of the Scots. It so continued till after the beginning of the 12th c., when Cumberland having been incorporated with England, the gradual absorption of the rest of the territory into the dominions of the king of the Scots seems to have been imperceptibly completed. The last 'Prince of Cumbria' named in record was the brother and heir of King Alexander I. of Scotland, 'the Earl David,' as he was called, who, on his brother's death in 1124, himself became king of the Scots. No more is heard of Cumbria as a principality; but 'the Welsh' continue to be named among its inhabitants, in the charters of King David's grandsons—King Malcolm the Maiden (1153—1165), and King William the Lion (1165—1214). And they seem to have retained more or less of their ancient Celtic laws until after the beginning of the 14th century. It was not until the year 1305 that an ordinance of King Edward I. of England, who appeared then to have reduced all Scotland to his subjection, decreed 'that the usages of the Scots and the Bretts be abolished, and no more used.' It is unknown how far this prohibition took effect.

Of the code which it proscribed, only a fragment has been preserved. It was first printed by Sir John Skene, in his *Regiam Majestatem* (Edin. 1609). But by far the best edition is that of Mr. Thomas Thomson and Mr. Cosmo Innes, in the *Acts of the Parliaments of Scotland*, vol. i., pp. 299—301 (Edin. 1844), where the laws are given in three languages—Latin, French, and English. The French version, which is the oldest, is printed from a manuscript of about 1270, formerly in the public library at Bern, in Switzerland, now in the Register House at Edinburgh. The fragments of the 'laws of the Bretts and Scots' thus published, is of much the same nature as the ancient laws of the Anglo-Saxons, the Welsh, the Irish, and other nations of Western Europe. It fixes the *cro*, or price at which every man was valued, according to his degree, from the king down to the churl, and which, if he were slain, was to be paid to his kindred by the homicide or his kindred. The cro of the king was 1000 cows; of the king's son, or of an earl, 150 cows; of an earl's son or of a thane, 100 cows; of a thane's son, 66⅔ cows; of the nephew of a thane, or of an ogthiern, 44 cows and 21⅓ pence; and of a villain or churl, 16 cows —all persons of lower birth than a thane's nephew, or an ogthiern, being accounted villains or churls. The cro of the married woman was less by a third than the cro of her husband. The cro of the unmarried woman was as much as the cro of her brther. Other chapters fix every man's *kelchyn* or *gelchach*, *gallnes*, and *enauch*—Celtic terms not yet satisfactorily interpreted, but apparently equivalent to the *fyhtwite*, *mund*, and *manbot* of the Anglo-Saxons, as the *cro* of the Bretts and Scots appears to answer to the *wergild* of the English. A chapter 'of blood-drawing'—corresponding with the *blodwite* of the Anglo-Saxons—fixes the fine to be paid for a blow to the effusion of blood, according to the degree of the person wounded and the place of the wound.

BREUGHEL, the name of a famous family of Dutch painters.—PETER B., the head of the family, was born in the village of Breughel, near Breda, in 1510 (or, as others say, 1530), and died at Brussels in 1570 or 1590. He was a scholar of Peter Koeck van Aelst, traveled through Italy and France, and on his return, fixed his residence at Antwerp. He painted chiefly the pleasures of rustic life, for which he himself had a great relish, and which he transferred to his canvas with a clear insight and vivid coloring, though unnecessarily exceeding at times the coarseness of his subject.

He also executed several historical pieces, such as his 'Building of the Tower of Babel,' now preserved in the gallery at Vienna. —His son, PETER B., distinguished by the strange title 'Hellish Breughel'—because he loved to paint scenes in which the leading characters were devils, hags, robbers, &c.—was born about 1569, and died 1625. His paintings of 'Orpheus' and the 'Temptation of St. Antony' are the most remarkable of his pieces.—JAN B., brother of the preceding, and on account of the splendid apparel which he wore when he became rich, usually called Velvet B., was born 1568 or 1575, and died 1625 or 1640. He was an industrious painter, distinguished for his landscapes and for his minute finish of small figures. In concert with Rubens, who supplied the two chief figures, he painted 'Adam and Eve in Paradise,' and 'Vertumnus and Bellona.' These, with the 'Four Elements,' are his chief works.—Other members of the same family were known as painters: AMBROSE B., director of the Academy of Painting, Antwerp, between the years 1635 and 1670; ABRAHAM B., a painter of fruits, flowers, and birds, lived long in Rome and Naples, where he died in 1690; JAN BAPTIST B., born in Rome, died 1700; and finally, CASPAR B., both of whom were flower-painters.

BREVE. See ANT-CATCHER.

BREVE, a note in music, which, in the old notation of Guido d'Arezzo, had the value of two whole bars. The note for a whole bar in modern notation is called semibreve, and has the value of four crotchets. In triple time, the B. contained three semibreves. The B. is now only used in *a la capella* movements, psalm-tunes, and fugues, or at the close of a composition.

BREVE, or BRIEVE, in the practice of the Scotch law, is a writ issuing from Chancery in the name of the crown, to a judge, ordering him to try by jury the points or questions stated in the breve. In ancient times, these writs appear to have been the foundation of almost all civil actions in Sctoland; but they are now only used in the following cases: 1. B. of Inquest, now, however, superseded by a petition of service, according to the 10 and 11 Vict. c. 47. The object of the proceeding is judicially to ascertain the heir of a deceased person. 2. B. of Tutory, the purpose of which is the appointment, as guardian to a pupil, of the nearest agnate or person most nearly related through the father. 3. Breves of Idiotry and Furiosity, by which the mental condition of a party may be determined for the appointment, in case of ascertained insanity, of a guardian or curator.

In the B. of idiotry, the direction is to inquire whether the person is of unsound mind, furious, and naturally an idiot. In the breve of furiosity, it is, whether he be of unsound mind, prodigal, and furious. 4. B. of Terce. The object of this writ is to 'cognosce the widow to her terce'—that is, to enable her to recover her terce or dower. It is issued to the sheriff of the county, and the jury under his presidency are directed to inquire whether the claimant was the lawful wife of the deceased, and whether the husband died infeft in the lands from which the terce is claimed. The verdict of the jury gives the widow her terce, and the judge then 'kens' her to it. See TERCE, and KENNING TO THE TERCE. 5. B. of Division amongst heirs-portioners. By means of this B., an heir-portioner—that is, one of two or more sisters succeeding in equal portions to a landed estate—may have her share of the lands separated or set apart by a judge, who appoints an inquest, or jury of fifteen persons, to measure the land, and make a division; the jury report to the judge; and lots being cast for the different shares, the judge decides accordingly. This form is, however, now seldom used, an arbitration being more generally resorted to. See INHERITANCE, SUCCESSION, HEIRS-PORTIONERS.

BREVE'T (Fr. a writ or warrant), in the British army, is a promotion of officers, now strictly limited in its application, but before 1854 a recognized, though occasional mode of conferring a large measure of general promotion throughout the army. It took place under various circumstances. If no special cause interfered, a general promotion by B. used in former times to be made once in about six years; but in more recent years it was limited to very special occasions, as a coronation, the birth of an heir to the throne, the termination of some great war, &c., and was limited to officers who had some particular claim to promotion. The

officers so promoted obtained an increase of rank, and in some cases pay, even if they had never served in the field.

A B. was determined on by the cabinet, and carried out by the commander-in-chiefs. The officers expected it, as one of the implied conditions on entering the service, and it had formed part of the British military system ever since the time of James II.; but it was unsatisfactory, because the flow of promotion caused by it was arbitrary, uncertain, and much liable to abuse. There were brevets, arising out of the various circumstances above indicated, in 1837, 1838, 1841, 1846, 1851, and 1854. On these occasions, lieutenant-generals, major-generals, colonels, lieutenant-colonels, majors, and captains received a promotion of one grade in rank. On one of these occasions, 200 colonels were at once made major-generals. The higher the rank, the higher the pay, as a general rule; and therefore the cost to the nation is always increased for a time after each brevet. Thus the B. of 1837 occasioned an annual increase of £11,000; that of 1838, £7000; of 1841, £15,000; of 1846, £21,000, &c.; but it must not be forgotten that death and sales had in the intervals cleared off perhaps an equal number of officers at the higher rates of pay. In 1854, the new major-generals alone involved an additional charge of £18,000 a year.

The above description applied before 1854. In that year, general brevets were abolished—a fixed establishment of general officers being substituted. The only brevets now are obtained by service of five years as lieutenant-colonel (making the officer brevet-colonel, without increase of pay); by distinguished service in the field, applicable to lieutenant-colonels, majors, and captains (carrying the substantive pay of the higher rank, except in the case of the lieutenant-colonel); and by succession, when a death occurs among the establishment of general officers. In this last case there is no brevet promotion to the rank of colonel, but the senior major in the whole army and marines becomes a brevet-lieutenant-colonel without increase of pay, and the senior captain a brevet-major with 2*s.* a day extra. Officers become major-generals, in accordance with their seniority as brevet-colonels, and it will be seen, from the above description, that the brevet rank of colonel which is the stepping-stone to major-general, is obtainable *by service only*.

Other matters having reference to this subject will be found treated under the article COMMISSIONS, ARMY.

As brevet-rank was neither purchasable nor saleable, the abolition of the purchase-system made no alteration.

There is no B. promotion in the navy.

BRE'VIARY. By this title we are to understand an *abbreviation*, as well as an amended arrangement of the more ancient offices used at the Seven Canonical Hours, which are Matins, Prime, Tierce, Sext, Nones, Vespers, and Compline. See CANONICAL HOURS. The books in which these offices were contained were formerly distinct—viz., 1. The *Psalter*, which included the Psalms of David according to St. Jerome's Galbian version, the Te Deum, the Athanasian Creed, &c.; 2. The Bible; 3. The *Antiphonarium*, containing the anthems and responsories; 4. The *Hymnarium*; 5. The *Collectarium*, or the collects to be said at the end of the services; 6. The *Homilarium*, *Passionarium*, and *Martyrologium*, containing the comments of the Fathers upon the gospel of the day, and accounts of the martyrdoms of the saints for each distinct festival. Out of all these separate books, the B. was compiled, about the 11th c., by Pope Gregory VII., as is supposed; the lessons, anthems, hymns, and responsories for the different days of the year being all arranged, in their proper places, in the same volume with the psalter, prayers, &c. In later times, the B. was divided into two parts, one for each half of the year, as was the case with those of Salisbury, York, and Hereford, used in England; and afterwards into four parts, so as to be more portable, whence it was also called *Portiforium*. It may perhaps be necessary to inform our Protestant readers, that the B. is an entirely distinct book from the Missal (q. v.), the latter containing the proper offices for the services of the sacrifice of the mass.

The last settlement of the B. was under the pontificate of Pius V., and his bull of 1568 is that by which the present daily office of the Roman Church is authorized. This edition was compiled by the College of Sacred Rites at Rome, in conformity with the decrees of the Council of Trent, because of the variety of *Uses*, as they were called, which at that time existed in different dioceses. The bull of Pius V. abolished the use of all breviaries, except such as could prove a prescription of 200 years. This exception would have extended to the breviaries of Salisbury and York, if the Church of England had not already thrown off Rome's supremacy, and compiled a new Book of Common Prayer for herself. After this, in 1602, Clement VIII. had a standard edition printed at the Vatican, to which all future editions were to conform; and again, in 1631, Urban VIII. caused the metres of the hymns and the Latinity or the whole to be carefully revised.

It is perhaps hardly necessary to state that the B. is in Latin, portions of it being sometimes translated for the use of the unlearned. It is necessarily a very bulky volume, when complete; and although some of the legends of the saints and martyrs may be of doubtful authenticity, yet it is a mine of interesting and devotional reading. Its general contents may be judged of from what has been already stated as to the sources from which they were drawn, every saint in the calender having his proper service for the different canonical hours. The festivals of the Roman Church have their services, according to their importance, duplex, semi-duplex, or simplex—i. e., double, semi-double, or simple: these, again, are further distinguished, so that there are no less than 9 classes of services—the Ferial or ordinary week-day, the simple, the day with an octave, the semi-double, the Dominical, or Sunday, the double, greater double, double of the second class, double of the first class. Indeed, so elaborate and perplexing are the rubrical directions, that it is impossible to form any idea of them without consulting the B. itself, and there are probably but few of the priests who are thoroughly conversant with their own ritual.

The B. contains, besides an office for the dead and other smaller offices, three kinds of office in honor of the blessed Virgin Mary—viz., 1. The full office, said on such festivals as the Purification, Annunciation Immaculate Conception, Assumption, &c., 2. The office of the Virgin Mary on Saturdays; 3. What is called the 'little office,' or the Hours of the Virgin. This last was in use as early as the 7th c., and was enjoined by the Council of Claremont, 1096, to be said by the clergy daily, and by the laity on Saturdays, but the bull of Pius V. removed this obligation except as to clergy in choirs. The Roman Church enjoins under pain of excommunication, all 'religious' persons—i. e., all persons, male or female, who have taken vows in any religious order—to repeat, either in public or private, the services of the canonical hours as contained in the breviary. For the influence of the old breviaries on the English Common Prayer-book (q. v.), consult Palmer's *Antiquities of the English Ritual*, and Maskell's *Monumenta Ritulia*. The matins or morning-prayer of the English Prayer-book is an abridgment, with many omissions and additions, of the matins, lauds, and prime of the B., whilst the office of even-song, or evening-prayer, is in like manner an abridgment of the ancient vespers and compline.

BREVIPE'NNES (Lat. short-winged), in Ornithology, according to the system of Cuvier, that tribe of the order *Grallatores* (q. v.) in which the ostrich, cassowary, rhea or nandou, emu, and apteryx are comprised, and also the extinct dodo.—See these articles. The B. are characterized by a shortness of wing which incapacitates them for flight, but use their wings to aid them in running, which they do with great rapidity. Their *sternum* (breast-bone) has no ridge or keel. They constitute the family *Struthionidæ* of many ornithologists, and are by some placed among Gallinaceous (q. v.) Birds, to which they are allied by the form of their bill and their choice of food. They are, however, very different from all other birds, and whether ranked among Grallatores or Gallinaceous Birds, do not seem to form a natural part of the order. The gigantic *Dinornis* (q. v.) and other fossil birds of great interest exhibit the characters of the *Brevipennes*.

Gigantic birds, of which the footsteps appear imprinted on sandstones in the valley of the Connecticut and elsewhere, seem also to have belonged to this tribe. No remains or traces of such birds are, however, found nearly so ancient as many remains of quadrupeds. But to whatever geological period the commencement of their existence is to be referred, a peculiar interest is attached to them, because its close may be regarded as probably near. There is no tribe of birds that more generally shuns man, or disappears before the increase of population and the progress of colonization. The cassowary and the emu are rapidly becoming rare. The ostrich, the rhea, the apteryx, the notornis, &c., are only found in deserts or other deep solitudes.

BREWING. For the process of B. see BEER. The legal requirements for the B. of beer for sale will be found in many acts of parliament, from the 12 Chas. II. c. 24 to 43, and 44 Vict. c. 20., changes being of late frequent. By this latter act, the tax on malt was repealed and the duty placed on beer. This came into force on 1st October 1880; after which date, malt, and the sugar used in making beer, were exempt from duty. The duties of Excise upon licenses to be taken out annually by brewers brewing beer for sale are: £1 on a license by a brewer of beer for sale; and 6*s.* on a license taken out by any other brewer.

There is a penalty of £100 for brewing beer without a license. In respect of brewers other than brewers for sale, if the annual value of the house occupied by him does not exceed £10, the beer brewed by him is not liable to duty; he must brew only for his own domestic use, or for his farm-laborers in the course of labor, in his own premises or in premises lent gratuitously to him, under a penalty of £10. The duty on beer brewed in the United Kingdom is now calculated according to the specific gravity of the worts thereof; upon every 36 gallons of worts of a specific gravity of 1057°, the fee is 6*s.* 3*d.*, and so on in proportion to

quantity and gravity. There is a drawback of 6*s.* 3*d.* on every 36 gallons of beer of the specific gravity of 1055° which shall be exported or shipped for use as ships stores. The licenses to be taken out by beer dealers are of course distinct. Beer dealers, wholesale, not brewers, pay annually £3, 6*s.* 1½*d.*; retailers of beer to be consumed on the premises, £3, 10*s.*; retailers of beer not to be consumed on the premises, £1, 5*s.* See BEER, BEER ACTS.

Anciently, in Scotland, the privilege of B. was given by a license from the superior or lord, in whose deed or gift of charter to his vassals there was generally a clause *cum brueriis*. But these forms have long been dispensed with. It appears, however, that a person with a right of barony may prevent a feuar, that is, a tenant of property within the barony, or a stranger, from importing and vending ale within the baronial limits without his license.

BREWSTER, SIR DAVID, an eminent natural philosopher and eloquent writer, was born at Jedburgh, December 11, 1781. He was educated for the Church of Scotland at the university of Edinburgh, where he highly distinguished himself. In 1808, he undertook the editorship of the *Edinburgh Enclycopædia*, to which he contributed many important scientific articles. Previous to this, he had entered deeply on the study of optics, with which his name is now enduringly associated. The beautiful phisophical toy, called the kaleidoscope, was invented by him in 1816. In 1819, in conjunction with Professor Jameson, he established the *Edinburgh Philosophical Journal;* and in 1831 he was one of the chief originators of the British Association for the advancement of Science. The honors conferred on this distinguished man make up a long catalogue.

In 1815, he obtained the Copley medal of the Royal Society for one of his optical discoveries, and soon after was elected a Fellow; in 1816, he received half the physical prize bestowed by the French institute for two of the most important scientific discoveries made in Europe during the two preceding years; in 1819, the Royal Society awarded him the Rumford gold and silver medals, for his discoveries on the polarization of light; in 1825, he became corresponding member of the Institute of France; in 1832, he was knighted, and had a pension conferred upon him; in 1838, he was chosen Principal of the united colleges of St. Leonard and St. Salvador, St. Andrews; in 1849, on the death of Berzelius, in the preceding year, he was elected one of the eight Foreign Associates of the French Institute, the highest scientific distinction in Europe. Sir David was also a member of the Imperial and Royal Academies of St. Petersburg, Berlin, Copenhagen, and Stockholm; presided over the British Association, and in 1851, over the Peace Congress held in London. In 1859, on the death of Dr. John Lee, he was chosen Principal of the Edinburgh University. His principal work is his *Life of Newton*, first published in 1828, in the Family Library, and issued in a totally new and greatly enlarged form in 1855. Among his other works are his interesting *Letters on Natural Magic*, addressed to Sir Walter Scott, also published in the Family Library; *More Worlds than One* (1854); his treatises on the Kaleidoscope and on Optics (Cabinet Cyclopædia); his *Martyrs of Science;* and his treatises in the *Encyclopædia Britannica* on Electricity, Magnetism, Optics, the Stereoscope, &c. Among other periodicals to which he contributed largely are the *Edinburgh* and *North British Reviews*. He died Feb. 1868. See *Home Life of B.* by his daughter, Mrs. Gordon (1869).

BREZO'WA, a market-town of Hungary, in the county of Neutra, on a river of the same name, about 19 miles north-west of Leopoldstadt. It has a Roman Catholic church and a Protestant church, tanneries, and distilleries. Pop. (1869) 5886.

BRIAN BOROIMHE (pron. *boru'*), a famous king of Ireland, ascended the throne of both Munsters—answering to the present counties of Tipperary and Clare—in 978. Some time afterwards, he deposed O'Maelachaghlin, and became supreme ruler of Ireland. The surname, Boroimhe, signifying tax, was given him in consequence of the tribute in kind he levied from the various provinces. King Brian supported a rude but princely state at his chief castle at Kincora, a place in the neighborhood of the modern town of Killaloe, and he had also seats at Tara and Cashel. The vigor of his reign brought prosperity to his country. He defeated the Danes in upwards of 20 pitched battles, restricting their influence to the four cities of Dublin, Wexford, Waterford, and Limerick alone. In the battle of Clontarf (1014), in which he was killed, he gained a signal victory over a united army of revolted natives and Danes, the power of the latter receiving a shock from which it never recovered.

BRIANÇON (ancient *Brigantium*), a town of the department of the Hautes-Alpes, France, on the right bank of the Durance, about 35 miles north-east of Gap. It is the highest town in the French empire, being situated at an elevation of nearly 4300 feet above the sea-level. As the principal arsenal and depôt of the French Alps, B. is very strongly fortified, while several forts guard the approaches, and every height in the vicinity is a point of defence. It is considered impregnable. Troops can readily be marched from it on to the passes of the Simplon, St. Bernard, Mont Cenis, and the Col de Tende. Mont Genèvre affords a practicable passage into Italy from the town itself. B. has some manufactures of cotton-goods, hosiery, cutlery, crayons, &c. Pop. (1876) exclusive of garrison, 2321.

BRIA'NSK, a town of Russia, in the government of Orel, 70 miles west of the city of that name. It is situated on the right bank of the Desna, is surrounded with earthen ramparts, and has a considerable trade in grain, hemp, wax, linen, cables, cordage, iron, &c., with Kherson, Odessa, and other ports on the Black Sea. B. has a cannon-foundry and 13 churches. Pop. (1880) 14,650.

BRIARE, a town in the department of Loiret, France, situated on the right bank of the Loire, at the point where the Canal de Briare enters that river, about 43 miles south-east of Orleans. The canal, which unites the Loire and the Seine, is remarkable as the first that was constructed in France, having been begun by Sully, and finished in 1642. B. has a considerable trade in wine, wood, and charcoal. It is supposed to occupy the site of the ancient *Brivodurum*. Pop. (1876) 3970.

BRI'BERY. The corrupt practices known by the term B. might well form the theme of an extended essay. Here we can point only to a few of the more conspicuous features of this grave social disorder, and chiefly as concerns B. at elections.

Election B., a well-known form of corruption, may be called the canker and disgrace of constitutional government. Individuals, with little to recommend them but wealth, and it may be some local distinction, wishing to be elected representatives in the legislature, do not scruple, through various devices, to buy the votes of the meaner order of electors by bribes. B. at elections is perhaps more openly and audaciously practised in various parts of the United States than it is in England; nor are base influences of this kind unknown in connection with the more meagre constitutional forms of some continental states. But in the eye of the world, England had the unenviable notoriety of being the country in which B. was reduced to a regular and continuous, though covert, system. It had been demonstrated by parliamentary inquiry, that masses of the population in certain towns—more particularly the class called freemen—look upon the franchise as a privilege which, for personal benefit, entitles them to enact so much money for their votes. Public considerations had no weight with them whatever. It seemed to them to be alike their duty and their interest to sell their votes to the highest bidder. The Earl of Dundonald mentions in his *Autobiography*, that when, as Lord Cochrane, he offered himself as a candidate for Honiton, he was barefacedly told by one of the electors, 'that he always voted for Mister Most;' and not choosing to bribe, he lost his election. The amount of bribe ordinarily paid at elections in this venal class of boroughs, varied from £1 to £10, according to circumstances; as high a sum as £20, and even £50, had been known to be given in the extremities of a contest. For these corrupting and disgraceful practices, the law threatens certain penalties; but to avoid incurring these, as well as for the sake of decency, the candidates employed a mean class of agents, or were in some obscure way assisted by confederates, of whose proceedings it was difficult to substantiate any guilty knowledge on their part. The agents more immediately concerned did the business of bribing in private, sometimes in darkened apartments, where no one could be seen.

Formerly, the treating of voters in taverns was added to other varieties of corruption, and the demoralization that ensued on occasions of this kind amounted almost to a universal saturnalia. The law having interposed to check this gross form of B., the evil had latterly subsided into a commonplace routine of secret money-dealings. Of course, by this illegal expenditure, along with the necessary outlays which the law allows, the cost of an election was in many cases enormous. Few seats of English borough members cost less than £1800; but double and triple this sum was a common outlay. It is a well-known fact, that for certain boroughs any man—no matter what be his political opinions or private character—might be returned by advancing £4000, and asking no questions as to what was done with it. As the B. was on both sides, it may be safely averred that the money spent at some contested elections amounted to £10,000. As regards elections for counties, the influences brought to bear are ordinarily of a different kind; but though morally wrong, they do not come within the scope of the present article. The Scotch have some reason to boast that their country is comparatively exempt from this social disorder. To avert every form of corrupt influence, the Ballot (q. v.) was long vehemently urged; and an act to secure the use of the ballot in parliamentary and municipal elections throughout Great Britain and Ireland was finally passed in July 1872. So far bribery seems to have been almost unaffected by the Ballot Act. The improved mode of trying election petitions by judges has worked well. A new Corrupt Practices Act was passed in 1879; and a more stringent bill was introduced in 1882. Severe sentences of imprisonment were passed on several persons of good standing, found guilty of bribery in 1880

–31; and several cities were deprived of electoral privileges in 1882 for corruptness. See CORRUPT PRACTICES ACT, and PARLIAMENT.

BRIBERY IN MUNICIPAL ELECTIONS. By the Corrupt Practices (Municipal Elections) Act, 1872, the offence of B. is put on the same footing as in parliamentiary elections. The guilty person is for ever disabled from voting at other municipal elections, and also from holding any office or franchise in the borough. See MUNICIPALITY.

BRIBERY OF CUSTOM-HOUSE AND EXCISE OFFICERS. By the Customs Consolidation Act, the 16 and 17 Vict. c. 107, s. 262, every person who shall give or offer any bribe, or make any collusive agreement with any officer of Customs or Excise, or other person employed for the prevention of smuggling, in order to induce him to neglect his duty, shall forfeit the sum of £200. A former act, passed in 1827, the 7 and 8 Geo. IV. c. 53, s. 12, still in force, specially enacts in the case of the Excise, that persons in such service taking money or reward, or entering into any collusive agreement contrary to their duty, shall for every such offence forfeit the sum of £500, and be incapable of serving the crown in any office or employment; and any person giving or offering money or reward to Excise officers, in order to corrupt and prevail upon them, shall forfeit the like sum of £500, but simply and without any further penalty of disqualification.

BRIBERY OF JUDGES. This offence in the old Scotch law was called BARRATRY (q. v.).

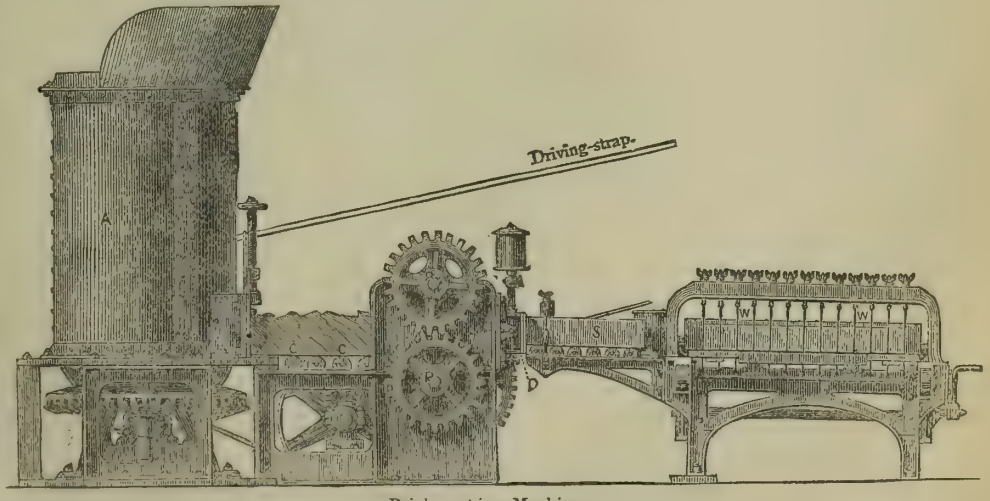
BRICK. The earliest examples of this branch of the ceramic art were doubtless the sun-dried bricks of Egypt, Assyria, and Babylonia. Remarkable to say, many of these, which, in a northern climate, the frosts of a single winter would destroy, have been preserved for some 3000 years by the dry, warm atmosphere of those countries. Sun-baked bricks of ancient date are also found in the mud walls of old towns in India. Kiln-baked bricks must have been the products of a later time; but they are found in all the chief ruins of ancient Babylonia, where they were often used to face or bind together walls of sun-dried bricks, and occasionally they were even ornamented with enamelled colors. Burnt bricks were employed in the foundations of the Tower of Babel (Gen. xi. 3). These ancient bricks, whether baked by the sun or by fire, were all made of clay mixed with grass or straw. The ancient Greeks, probably owing to their possessing plenty of stone, cared little for building with burned clay; but most of the great ruins in Rome are built of brick, and the Romans appear to have introduced the art into England. Interesting historical information has been obtained from the impressions on Roman, and especially on Babylonian bricks. In many instances, the Roman bricks found in England have been removed from their original position, and employed in the construction of buildings of later date. The earliest instance in which bricks of the modern or Flemish make occur in England, is Little Wenham Hall, in Suffolk, 1260.

Manufacture of Bricks.—Clay suitable for the manufacture of common bricks is an abundant substance, but there is a great difference in the nature and quality of the clays found in various localities. The basis of clay consists of hydrated silicate of alumina, with a varying proportion of other mineral matters, chiefly free silica (sand), iron, lime, magnesia, and potash. Great advantage is derived from digging clay in autumn, and exposing it all winter to the disintegrating action of frost. This is not always attended to, but when neglected, the bricks made from it are apt to be unsound and faulty in shape. The next process is that of tempering or mixing the clay into a homogeneous paste, which is sometimes done by the spade, but more commonly in the pug-mill or by crushing between a pair of rollers; often, indeed, both are employed. In making bricks by the old hand process, the shape is given by a mould either entirely of wood, or of wood faced with metal, and without top orbottom. This admits of the clay being pressed into it by a tool called a plane, which is also used to produce an even surface on the upper and lower beds of the brick, by working off the superfluous clay. Sand is used to part the wet clay from the mould and the table on which it rests.

Although hand-made bricks are still very common, yet machinery is now always employed when large quantities are required. Brick-making machines are of two leading kinds; one class of them being constructed to work the clay in a wet plastic state, the other class requiring it to be in a semi-dry condition. Of the two sorts, the wet-clay machines are the simpler, cheaper, and can be worked by less-skilled workmen. On the other hand, the dry-clay machines, which make the bricks by forcing the clay into moulds by strong pressnre, shorten the process, as no time is required for drying them. The bricks so made, too, are not only of a more perfect shape, but they can be moulded into any form, and may even be made highly ornamental at a very slight additional cost.

As might be expected, both the dry and the wet-clay machines of different makers vary considerably in their details. Since we have not room for two figures, we give one, which will convey a good idea of the general plan on which most of the wet-clay machines work. The machine is driven by steam, and the clay is fed by a hopper into the pug-mill A, on the central shaft of which strong pugging blades are placed in a spiral manner. These prepare and force the clay out at the bottom, whence it passes over the carrying rollers, C, to the pressing rollers, PP, which force it through a die at D, in a rectangular stream, S, so exactly shaped to the required size that nothing more is necessary than to cut it into single bricks by the wires, W. These are set in a rocking frame, which can be so adjusted as to cut the bricks on the square or at an angle; the one plan being adopted when the clay is at rest, the other while it is in motion. The figure shows what is called a single-ended machine. When double-ended, the clay is forced out at opposite sides of the pugging cylinder, and there is then, of course, a cutting-table at either side, instead of only one, as shown in our cut. Some of these machines are provided with a pair of powerful crushing rollers, which reduce any hard lumps or stones before the clay enters the pug-mill. One of the best known wet-clay machines is that made by Clayton, Son & Co., London. When of a size which can be worked by a steam-engine of 16-horse power, it produces from 20,000 to 30,000 bricks per day, and its price in 1871 was £330. The one shown in our figure is Murray's patent. Drain tiles are made by the same kind of machinery, with a peculiarly constructed die, so as to make the clay into a hollow tube; so also are hollow bricks, with again an alteration in the shape of the die. Hollow bricks having less body than those which are solid, are more easily, and usually more thoroughly fired. On account of this, as well as by reason of their admitting of a current of air through them, they form, as a rule, dryer walls.

The green bricks, after being carefully dried, either in the sun or by artificial heat, are usually baked in a kiln with a suitable arrangement of fires and flues. Kilns are of many forms, and the time required for firing in them varies from 40 to 60 hours for common red and white bricks, while for some fire-bricks 150 hours are necessary. Where kilns are not used, bricks are burnt in clamps, the clay requiring to be mixed up, in the process of tempering, with a quantity of ground coal sufficient to burn them. A good test of the character of a clay is obtained by the result of firing. The average contraction in the kiln for prepared clays is 7½ per cent. If a brick contracts much more than this, the clay is too fusible; if less, then it is likely to be of an open porous body, which retains its shape well during the firing process.



Brick-making Machine.

All brick clays contain iron, and the color of a burned brick almost entirely depends on the amount of it which is present; thus clays containing less than 1 or 1½ per cent. of iron, change in the kiln to various shades of cream color and buff, whilst those containing more than 2 per cent., range in color from yellowish-fawn to dark red. Blue bricks are made from the same clay as the red

by controlling in a peculiar way the supply of air in firing, and by carrying the heat slightly further. It is asserted by some that the red is changed to the black oxide of iron in the process.

Fire-bricks are made from clay as free as possible from oxide of iron and alkaline substances, so that there may be no tendency to fuse in the kiln, however high the heat. Fire-clays are abundant in the coal-measures, some of fine quality being found about Newcastle and Glasgow, but the most celebrated is that of Stourbridge, which is exported to all parts of the world. See FIRE-CLAY.

Much attention has been paid of late years to the manufacture of fine bricks and terra cotta, which is only another name for ornamental bricks of various shapes, or architectural enrichments of the same material. The effect of some of the public buildings recently erected in London and elsewhere, in which terra cotta has been used, is really beautiful. Although it cannot be said to equal sandstone in appearance, it has yet the advantage of giving a much greater variety of color, and is infinitely better and more enduring than a facing of stucco or cement.

The duties formerly levied on bricks were wholly repealed in 1850.

BRI'CKLAYING, BRI'CKWORK. The material of which a town is built depends mainly on the geology of the surrounding district. In a mountainous country like Scotland, cities of stone, such as Edinburgh, Glasgow, and Abderdeen naturally abound; while London, and most of the great towns of England, situated in alluvial valleys and plains, are built of bricks derived from the alluvial clay beneath and around them. In Holland, where the whole country is but the delta of the Rhine, and no stone is to be found, brick is universal, even to the paving of the streets.

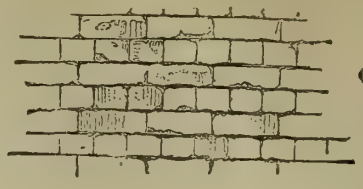
The standard size of English bricks being 9 inches by 4½, the thickness of walls is regulated thereby. They are either half-brick, 1 brick, 1½, 2, 3, or 4 bricks in thickness. In moderate-sized modern English houses, the inside partition-walls are usually half-brick, the outer walls, 1 or 1½. In larger houses of superior construction, a thickness of two or three bricks is sometimes used. This latter thickness is seldom exceeded, except in large public works. Modern brick-houses are, for the most part, far less substantial than those erected by our forefathers. Building leases being usually granted for ninety-nine years, at the expiration of which term, the whole property reverts to the freeholder, the object of the builder is merely to make a house that shall stand for that period, and not to expend any money for the sake of further stability. Garden-walls are commonly built but half-brick in thickness; these, however, are strengthened by 9-inch piers at intervals of 10 or 12 feet. In laying the foundations of walls, the first courses should be thicker than the intended superstructure, and the projections thus formed, usually of quarter brick on each side, are called 'set-offs.' Before laying walls of houses, trenches are dug, and the foundation tried with a crowbar or rammer. If it is found to be loose, and the looseness due to superficial soil, this is removed, and its place supplied with fragments of stone and old broken bricks, which are closely rammed together. In some cases, inverted arches of brick are built for foundation, or a stratum of concrete laid down. See CONCRETE.

Mortar composed of lime and sand is the common cement for brickwork. It should be equally and carefully applied; and the bricks wetted, in order that the mortar may adhere more firmly, by being absorbed into their pores. The force with which good mortar is capable of adhering to bricks is very remarkable. It is found to be the greatest in old structures that have been exposed to the continuous action of water. Such B. is said to be 'water-bound' by workmen, and can scarcely be separated without breaking the bricks.

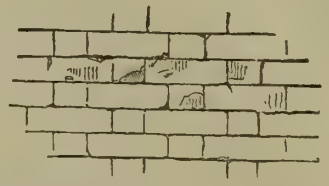
A fundamental principle to be rigidly observed in laying all kinds of brick is, that *no two contiguous perpendicular joints shall fall immediately below each other*, or, to use the bricklayer's phrase, the work must 'break bond.' The mode of arrangement of the bricks to effect this is called the *bond;* a layer or stratum of bricks is called *a course*. Bricks laid with their lengths in the direction of the course, and their sides to the wall face, are called *stretchers;* those laid across the line of the course, with their ends forming the wall-face, *headers;* a layer of headers, a *heading course;* of stretchers, a *stretching course*.

The two kinds of bond almost exclusively used in England are the English and Flemish bond. English bond consists of alternate stretching and heading courses; Flemish bond, of a stretcher and head laid alternately in each course (see figures). English bond, is the strongest; Flemish bond, the more ornamental; and they are used accordingly. There are two other kinks of bond occasionally used—*herring* bond, and *garden-wall* bond. The former is applied to form the core of thick walls, where Flemish bond is used for the facing. A course of bricks is laid obliquely at an angle of 45° to the face of the wall; then above it, another course at the same angle, but inclined in the opposite direction, so that the joints may cross the first.

This is considered to add to the strength of Flemish bond, but is objectionable on account of the triangular interstices necessarily left between the oblique bricks and the bricks of the facing. Garden-wall bond is only used for 9-inch walls, and formed by laying three stretchers and one header, and so on in each course. In order to strengthen Flemish bond, bands of hoop-iron are sometimes laid flatwise between the courses. This 'hoop-iron bond' has superseded the old practice of using bond-timbers, which were inserted the whole length of the wall. The hoop-iron should be slightly rusted, to secure the complete adhesion of the mortar.



Old English Bond.



Flemish Bond.

In constructing arches of brickwork, much care and skill are required. A wooden centring is always used; and when very rude work only is required, common bricks are laid upon the centring, and the gaping interstices at the upper end filled with rough brick wedges. For better work, each brick has to be properly bevelled, according to the curve. When semicircular arches are made, all the bricks require an equal bevel, and therefore bricks moulded uniformly to the required angle may be used; but for other curves and for flat arches, each brick has to be separately shaped by the bricklayer. In order to do this, a drawing of the required arch is made of the full size on a board; the bricks are laid upon this side by side, and shaped to the lines of the drawing; they are then transferred to their corresponding place in the structure. The bricks are first rudely shaped by the *brick-axe*, then finished on the *rubbing-stone*, a piece of rough grained stone about 20 inches in diameter. In all kinds of B., the walls should be built up level throughout, in order that the *settlement* may be equal. An unequal settlement may produce a rupture of the wall.

B. is measured by the rod or by thousand. A rod contains 272 square feet of standard thickness—that is, 1½ brick. This is equal to 306 cubic feet, and will on an average, require 4500 bricks, allowing for waste. The weight of a rod of B. containing 4500 bricks, 27 bushels of lime, and 3 single loads of sand, is about 13 tons. The bricklayer is always attended by a laborer or hodman, who carries his bricks and mortar in a 'hod'—a triangular wooden box, open at the top and one end, and supported on a round leg, by which the hodman holds it on his shoulder. A bricklayer's wages are considerably higher than those of the hodman. The laborers are generally Irishmen.

The surface of brickwork is sometimes ornamented by *pointing*. This is done by raking out the mortar of the joints to a small depth, and filling up again with blue mortar, and marking the courses with the edge of the trowel. This is called *flat-joint* pointing. When the courses are marked by a neatly pared raised line of white plaster of about half an inch in thickness, laid upon the blue mortar, it is called *tuck* or *tuck-joint* pointing. Colored bricks, as a means of external ornament, have been extensively and most effectively used in North Italy and Germany. The works of Mr. Ruskin, Mr. Gally Knight, Webb's *Continental Ecclesiology*, Street's *Brick and Marble of the Middle Ages*, and Ferguson's *Hand-book of Architecture*, may be consulted for illustrated examples of these.

Chromatic brickwork is now becoming very extensively used in England, especially by architects who are endeavoring to revive the style of architecture called by themselves English Gothic, and by some others Venetian Gothic, in which the pointed arch formed of colored bricks, forms one of the prominent features. These architects maintain that, as they are compelled to construct with B., it is more honest to use bricks ornamentally, than by means of stucco to obtain an external imitation of stone; and as B. admits of but little ornamentation in relief, they use variation of color, of which B. is peculiarly susceptible, and thus produce a sort of architectural mosaic. The eloquent and popular advocacy of these views by Mr. Ruskin, and the skill and enthusiasm with which many young and rising architects are carrying them out, seem likely to bring about a great development, almost amounting to a revolution in English domestic and ecclesiastical architecture.

BRICOLLE. See BALLISTA.

BRIDE, BRIDAL. The word Bride (the radical signification of which is thought by some to be 'appropriated,' 'owned') is common to all the Gothic languages, and also to Welsh (Ger. *braut*, Welsh *priod*), and signifies betrothed or newly married. Alone, the word denotes the newly married woman; with the addition of the syllable *groom* (a corruption of *guma* = Lat. *homo*, a man), it denotes the newly married man (Ang. Sax., *brydguma*, Ger. *brautigam*). In Welsh, *priod-fab* (betrothed youth) is bridegroom, and *priod-ferch* (betrothed maid) is bride. Bride is the root of a variety of terms connected with marriage, as Bride-favors, Bride-cake, &c. Bridal is for *Bride-ale* (Ang. Sax. *bryd-eale*) the marriage-feast. Bride-maids, or attendants on brides, appear to have been in use among the Anglo-Saxons, and are mentioned in the early accounts of marriage-ceremonies. A part of their duty consisted in dressing and undressing the bride. Bridemaids, as mere ceremonious attendants at marriages, are still in use in England. The husband has an analogous body of attendants, called bridegroom-men; but they have disappeared in modern usage, and their only representative is one confidential friend in attendance. In Scotland, this personage is called the best man. One of his duties is to pull off the bridegroom's right-hand glove, while one of the bridemaids does the same service for the bride, when the pair are requested to join hands.

BRIDE-FAVORS are small knots of white ribbons, which are pinned to the breasts of all who are in attendance at weddings, nor are even the post-boys and their horses' heads left undecorated with these gay trappings. The origin of the bride-favor is said to be the true-lovers'-knot—something symbolical of the union of hearts and hands on the occasion. In various old plays and poems there are allusions to bride-favors or ribbons, as that in Herrick's *Hesperides:*

> What posies for our wedding-rings,
> What gloves we'll give and ribbonings.

The BRIDE-CAKE is also symbolical in its origin. 'The ceremony used at the solemnization of marriage among the Romans was called *confarreation*, in token of a most firm conjunction between the man and wife, with a cake of wheat or barley.'

This, Blount tells us, is still retained in part with us, by that which is called the bride-cake used at weddings.'—Brand's *Popular Antiquities*. The old English and also Scottish custom of breaking a cake over the head of the bride on entering her new dwelling, perhaps points to a usage of the most remote antiquity —the sprinkling with wheat as a token of plenty. In modern times, the bride-cake is a stately piece of confectionery, consisting of a rich cake as a basis, on which is reared a castellated structure, with various fanciful devices, the whole being covered with a preparation of white sugar. This fabric is cut up and given in pieces to the guests, as part of the wedding jovialty.

BRI'DEWELL, a well between Fleet Street and the Thames, dedicated to St. Bride, which has given its name to a palace, parish, and house of correction. A palace, described as 'a stately and beautiful house,' was built here, in 1522, by Henry VIII., for the reception and accommodation of the Emperor Charles V. and his retinue; and King Henry himself also often lodged here, as, for instance, in 1525, when a parliament was held in Blackfriars; and in 1529, the same regal personage and his queen, Catharine, lived in the B. while the question of their marriage was argued. In 1553, Edward VI. gave it over to the city of London, to be used as a work-house for the poor, and a house of correction 'for the strumpet and idle person, for the rioter that consumeth all, and for the vagabond that will abide in no place.' Queen Mary having confirmed the gift, it was formally taken possession of in 1555 by the lord mayor and corporation. The B. was afterwards used for other persons than the class above named, and at last became a place of punishment, as it now is. As a house of correction, it is not under the sheriff's charge, but is governed by a keeper wholly independent of that officer.

By the 15 and 16 Vict. c. 70, a new House of Correction is established for the city of London. See CORRECTION, HOUSE OF.

BRIDGE (Ang.-Sax. *brycg;* Dutch, *brug*; Ger. *brücke*) is a structure for carrying a road over a stream, river, ravine, low ground, or other impediment to its course. A bridge for carrying a canal or other water-course, is called an Aqueduct (q. v.); one for carrying a railway is sometimes called by the recently coined, though not very correct, word *Viaduct* (q. v.). Bridges are formed of stone, brick, cast-iron, or timber-arches; of timber beams or framework, supported on piles or on masonry; of iron rods or chains, in which case they are called suspension-bridges; of lattice-work; or of cast or wrought-iron girders. Sometimes a combination of beams and suspension-rods is used. Of late years, the plan of tubular or hollow wrought-iron girders has been frequently and successfully employed, the first great emample being the Britannia Bridge (q. v.).

Bridges are either fixed or movable. Of movable bridges there are various kinds. *Flying-bridges* and *floating-bridges* are, in fact, mere ferry-boats (see FERRY) with gangways attached, and other provisions for safe and ready transport, and which are drawn across the stream by ropes. *Draw-bridges* and *swing-bridges* are constructed in two parts, that turn on pivots—in the former, the parts are lifted vertically; in the other, they are moved round horizontally. A *sliding-bridge* runs backward and forward on wheels or rollers. Another kind is much in use in low districts like Norfolk, where the water flows lazily, and almost on the land-level. These are sometimes called pontoon-bridges, from the movable roadway being balanced at a small height above the water-level on a pivot working in a large pontoon or hollow cylinder sunk in the bed of the river—the ends of the roadway of the B., when laid across the river, resting freely on piers on either side. There are several such bridges in use over the Ouse. The pivot is set in the center of the stream, and, when necessary, the B. is turned round on it by machinery, till it lies parallel to the banks, and permits the passage of barges on either side. In a flat district, these bridges are exceedingly appropriate. See also BRIDGE, MILITARY.

Convenience must have led men in a very rude state of society to form bridges, in order to the easier communication between districts separated by rivers. On most streams there occur fords, but often these are not found where they would be most desirable. The most rudimentary form of a B. may be assumed to be a series

Ponte de Rotto.

of stepping-stones, such as are yet almost everywhere to be found on river-courses at some point. Large stones deposted in the streams at the shallows or fords, would first give a chance to a passenger of getting across dry shod; by and by, where one or two stones were wanting to complete the steps in the passage, they would be supplied. Next, it would naturally occur, to give greater security to the passage, by laying planks or trees across the stepping-stones, so as to avoid the risks attending stepping or leaping from one to the other. In the arrangement of planks resting thus on stones, we have the first advance in the art of B.-building, the suggestion at once both of piers and roadways; and beyond this stage, the art would appear not to have advanced for a very long period. From the Greeks, we have accounts of bridges built by Semiramis, Darius, Xerxes, and Pyrrhus; and in Egypt necessity early compelled the formation of bridges in connection with the canals constructed for the purpose of irrigation. But all these would appear to have been rudimentary in form, and to have consisted simply of piers with the intervals between them spanned by beams of timber or large flat stones. Sometimes boats moored in the stream served the purpose of piers, as was the case with the famous B. of Xerxes across the Hellespont. Bridges of boats are in use to this day. The principle of the arch was long known before it was applied to the art of B.-building. See ARCH. That application we owe to the Romans; whose first great work in which the arch was employed, the Cloaca Maxima (q. v.), is referrible to the time of the Tarquins. The Ponte de Rotto, or Senators' B. (127 B.C.), erected by Caius Flavius, appears to have been the first instance of its application to bridges. In the course of the great engineering undertakings of the Roman empire under Augustus Cæsar for the formation of roads and supply of water to Rome, its application became general; and afterwards the empire having extended its bounds, the necessity for ready communication between its provinces, led to the erection of numerous splendid bridges therein, many of which, indeed, surpassed in their greatness those of Rome itself.

But although the Romans have unquestionably the merit of having originated the art of B.-building proper in Europe, it seems doubtful whether the principle of the arch was not applied by eastern nations to B.-building, long before the dawn of the greatness of the Roman empire. The Chinese are said to have been before the West in this as in other arts, though the antiquity of some of the bridges on which this assertion is rested may well be doubted, considering the uncertainty which pervades the chronology of that extraordinary people.

It is impossible here to trace in detail the progress of the art. For a long time after the decay of the Roman empire, it made no progress. It revived in the 11th c., but again languished to the beginning of the 18th, when the formation of the corps of the Ponts et Chaussées in France favored its further growth. Henceforth, many splendid bridges were erected both in Britain and the continent. In 1775, Mr. Pritchard of Shrewsbury, introducing the use of cast iron in the erection of bridges, originated a valuable style of construction. The genius and works of Telford bring us to the present time. Within half a century, the use of steam, the development of the canal system, and the necessity especially for

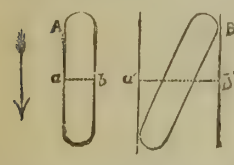
railway-bridges, with the immense amount of capital at the disposal of engineers for purposes of B.-building, have caused a rapid evolution of all the principles and possible modes of the art. Among the new forms called forth within the century by the increasing demand for facilities of communication, are the suspension B., the wrought-iron girder and tubular bridges, and the lattice-bridges. Several of the new bridges over the Thames are models of engineering skill and taste. The Menai and Britannia bridges were regarded, when erected, as perfect marvels. In America, the B. of Trenton, over the Delaware, the great Portage viaduct, and the Niagara suspension B., and the great bridge, opened in 1883, connecting New York and Brooklyn, are equal to any similar works in the world. The highest bridge in the world is one at Gorabit, Cantal, France, which is 1880 feet long and 413 high. The variety of complex structures of wood and of iron that now span streams and hollows is endless.

For some of the more important forms, see FRAME, LATTICE, TUBULAR, and SUSPENSION BRIDGES. What follows here, relates chiefly to arched or masonic bridges, and is confined to the more general and obvious conditions which such bridges must fulfil, avoiding the mecanical theory of their stability as too abstruse for popular exposition.

An arched B. rests between masses of masonry on opposite sides of a river, called its *abutments* (q. v.). The intermediate points of support of the arches are the piers (q. v.), which are rarely built so strong as to be able of themselves to resist the lateral thrust of the arches resting on them, if the thrust of one arch did not counteract that of another. The arch itself is the curved constuction between adjacent piers. The chief terms used in speaking of the arch itself are explained under ARCH. It addition, may be noticed the *spandril*, the name given to the filling in above the extrados to the roadway. The *chord* or *span* is the distance between the piers; while the *rise* of the arch is the perpendicular distance between the level of the springing and the horizontal through the key.

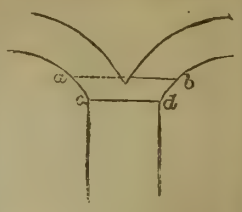
When a B. has to be erected, the question of what form it should be falls to be settled by a variety of considerations. Regard to appearance affects the question, but the material points are its sufficiency for the purposes for which it is intended, and its security and durability. The nature of the embankments and of the soil in the water-bed, together with the nature of the water-shed, or country drained by the stream, may make it necessary that the B. should not be an arched bridge at all, but a suspension or tubular bridge. But if it is to be an arched B., then the most important questions respect the number of its piers and the form of its arches. If vessels must be free to pass under it, the arches must be lofty, and the abutments high; so also must they be if the river is exposed to sudden elevations of its level by floods.

Formerly, a prejudice existed against laying a B. across a stream at any other angle than at right angles to its course. The reason was, that, the theory of the skewed arch (q. v) being unknown, the obliquity of the B. to the water-course involved a corresponding obliquity of its piers to the water, which greatly increased the risk of the B. suffering from floods. That the pressure of the current on piers increases with their obliquity to its course, may be seen at once from the annexed figures, which represent the same section of a pier set first, as in A, dead up and down the stream, and next, as in B, obliquely to it. The mass of water which strikes B is equal in breadth to *a'b'*, the distance between lines through the extremities of B, parallel to the stream; while the mass which strikes A is in breadth only equal to *ab*, the thickness of the pier. But the skewed arch allows a B to be thrown at any angle across a river, with its piers all parallel to the stream; and many an awkward turn in our public roads would have been spared us, had the skewed arch only been earlier known.



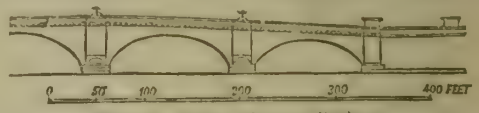
After making allowance for the requirements of position and traffic, the form next must be considered, more particularly in relation to the stream. The stream principally affects the form, through prescribing the number of piers. Each pier takes up so much of the water-course, and thus narrows the effective passage of the water. The immediate consequence of narrowing the channel is to increase the velocity of the stream. As the velocity of the stream increases, it tends more and more to carry off the soil in the neighborhood of the piers, and finally, by deepening its course, to undermine them.

From this consideration, the effect of too many piers will be obvious; but indeed this is not matter of speculation, for many bridges—among others, a B. of Smeaton's at Hexham—have been destroyed from this cause, thus falling from the very overabundance of support! To know how many piers may with safety be used, the volume of water that flows through the channel, both ordinarily and in winter floods, must be ascertained, which can be done very nearly by calculating the mean of many soundings taken at different states of the river, and at a succession of points across its bed. There is another way in which the stream affects the form. If it is liable to floods, care must be taken to make the piers so high as to elevate the spring of the arches above the highest level attainable by the water. The annexed figure sufficiently shows how greatly the pressure of the water on the B. increases whenever it reaches above the pier-head—the breadth above the springing, as at *abcd*, greatly exceeding the breadth of the pier itself. In connection with this part of the subject, it must be remembered, too, that floods are apt to carry down trees and other floating masses, which, if the arches do not afford them passage, become powerful levers for the destruction of the bridge.



The form of the B. being determined on, the remaining questions relate to its stability. This depends on the strength of the abutments and piers, and the balanced equilibrium of the arches. The importance of securing proper foundations for the abutments and piers cannot be overestimated, and very frequently their foundations, owing to the nature of the soil, have to be artificially constructed. See PILES, COFFER-DAM, and CONCRETE. In considering the stability of the B., the first thing is to ascertain the forces which will act to destroy it. This is ascertained by calculating the extreme passing load, and also the weight of the structure above the arches, and of the arches themselves. A scientific and skilled engineer is then able to judge what amount of strain or destructive pressure will be exercised by these weights on the several parts of the structure, and thus to adapt the strength at every point to the strain. As to the passing load, it is usual to calculate on 240 lbs. per foot, superficial, of the whole area in ordinary bridges, and on 960 lbs. in railway bridges. The weight of the superstructure and arches is a question for practical measurement. As to the remaining pressure—viz., that of the stream—it must be ascertained for the highest floods. It is calculated from knowing the mean velocity of the stream, and the amount of surface exposed to it. The surface velocity is readily observed by means of floats; and when this is under 10 feet per second, the mean velocity is found to be about one-fifth less. The stress of the stream on the bridge is diminished by the expedient known as a cut-water, which is an angular projection from the pier, as shown in the annexed figure. The best form for a cut-water has practically been ascertained to be an equilateral prism, presenting an angle of 60° to the water-course. In all bridges, these are to be found on the sides of the piers presented to the stream; and in tidal rivers, they are built on the lower side as well.

After the conditions already mentioned are satisfied, taste has more to do with the form of arches than anything else. The forms in use are the old semicircular, the elliptical—usually got at by putting together several circular arches of different radii—and the segmental arch. The semicircular arch was almost exclusively used in the more ancient bridges. This arch is the most solid and most easily constructed, as all the voussoirs may be worked from the same mould. It requires, however, high banking, as its height is equal half its breadth; and where the water level greatly changes, it is particularly unsuitable, from the great height necessary to be given to the piers, to carry the intrados out of water-reach. The elliptical arch and the segmental of 60° are, besides, far more pleasing in appearance.



Elliptica. Arches.—London Bridge.

In possible extent of span, the masonic bridge is far exceeded by suspension and girder bridges. At Chester there is a stone arch with a span of 200 feet; in the Britannia Tubular Bridge the span is 460 feet; in the suspension-bridge over the Menai Strait, 600 feet; and in the suspension-bridge at Freiburg, Switzerland, 870 feet. The railway bridge, of iron girders, across the Tay near Dundee, was 3450 yards in length, and 90 feet above high-water. Great part of it was thrown down in 1879; but steps were taken to have it rebuilt at a lower elevation. See TUBULAR BRIDGE and SUSPENSION BRIDGES.

The principal objection to the wooden B. is its liability to decay, besides which it is liable to warping. The latter objection applies also to iron bridges; but in their case, the contractions and expansions from heat and cold may be compensated for, as in the compensation-balance of a watch.

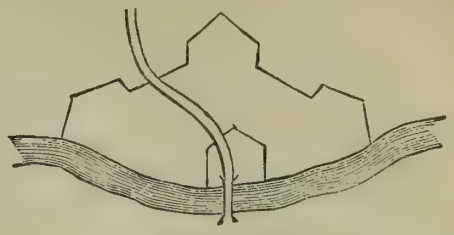
Public bridges are maintainable at the expense of the counties in

which they are situated; but in many cities and boroughs, the inhabitants have acquired by prescription a liability for this expense, and by the 13 and 14 Vict. c. 64, the management and control of such bridges is given to the council of the city or borough. If part of a public bridge be within one county or other place on which the liability rests, and the other part of the bridge be within another, each party or body shall repair that part of the bridge which is within its own boundaries. Besides the bridge itself, the county liable is bound by the 22 Henry VIII. c. 5, to repair 300 feet from the road either way from the bridge. And such is still the state of the law as to all bridges built prior to the passing of the Highway Act, 5 and 6 Will. IV. c. 50. But by that act it is provided that, in the case of all bridges thereafter to be built, the repair of the road itself passing over or adjoining to a bridge, shall be done by the parish, or other parties, bound to the general repair of the highway of which it forms a portion—the county being still subject, however, to its former obligation as regards 'the walls banks, or fences of the raised causeways, and raised approaches to any bridge, or the land arches thereof.' See Stephen's *Com.*, vol. iii. p. 234. The neglect to make such repairs is treated in law-books as a kind of negative offence; but there are positive offences against bridges, which in the statutes are called nuisances, as to which, see the 43 Geo. III. c. 59. An act to amend the law in regard to the maintenance and management of roads and bridges in Scotland was passed in 1878, entitled, 'Roads and Bidges Act.' Private bridges are those erected and maintained under contracts authorized by private acts of parliament. See ROAD; see also BRIDGE in AM. SUPP.

BRIDGE-BUILDING BROTHERHOODS (Fr. *Frères pontifes;* Lat. *Fratres pontifices*) were religious societies that originated in the south of France in the latter half of the 12th century. Their purpose was to establish hospices at the most frequented fords of large rivers, to keep up ferries, and to build bridges. The church during the middle ages regarded the making of streets and bridges as meritorious religious service. Whether or not the herdsman Benezet, subsequently canonized, was the fouder or only a member of this fraternity, is as uncertain as the tradition which attributes to him the completion of the bridge over the Rhone at Avignon in 1180. The fraternity was sanctioned by Pope Clemens III. in 1189; its internal organization was similar to that of the knightly orders, and the members wore as their badge or insignia a pick-hammer on the breast. In France, they labored very actively, but were gradually absorbed into the order of St. John. Similar associations sprang up in other lands, but under different names.

BRIDGE, MILITARY, is a temporary construction, to facilitate the passage of rivers by troops, cannon, and military wagons. The most efficient are described under PONTOON; but there are many other kinds. A *bridge of boats* is formed by small craft, especially cargo-boats, collected from various places up and down the river; trestles are placed in them to bring their tops to one common level; the boats are anchored across the river and baulks of timber, resting on the trestles, form a continuous road from boat to boat across the whole breadth of the river; the boats ought to be of such size that when fully laden, the gunwales or upper edges shall not be less than one foot above the water. *Rope-bridges* are sometimes but not frequently used by military engineers. A *boat-and-rope bridge* consists of cables resting on boats, and supporting a platform or road of stout timber. A *cask-bridge* consists of a series of timber-rafts resting on casks; the casks are grouped together in quadrangular masses; at certain intervals, timbers are laid upon them to form rafts, and several such rafts form a bridge; it is an inferior kind of pontoon bridge. A *trestle-bridge* is sometimes made for crossing a small stream in a hilly country; it consists of trestles hastily made up in any rough materials that may be at hand, with planking or fascines to form a flooring, cables to keep the trestles in a straight line, and heavy stones to prevent them from floating. *Raft-bridges*, consisting of planks lashed together, are easily made of any rough materials that may be found on the spot; but they have little buoyancy, and are not very manageable. A *swing-flying bridge* consists of a bridge of boats, of which one end is moored in the center of the river, and the other end left loose; this loose end is brought to the proper side of the river, the boats are laden, and they make a semicircular sweep across the river by means of rudders and oars, until the loose end of the bridge reaches the other bank. A *trail-flying bridge* is a boat or raft, or a string of boats or rafts, which is drawn across a river by ropes, in a line marked out and limited by other ropes.

BRIDGE-HEAD, or TETE-DU-PONT, in Military Engineering, is a fortified post intended to defend the passage of a river over a bridge. It is a field-work, open at the gorge or in the rear, and having its two flanks on the banks of the river. The most favorable position is at a re-entering sinuosity of the river, where the guns can work better with the supporting batteries opposite. Bridge-heads are usually temporary works, hastily constructed. Their most frequent use is to aid a retiring army to cross the river in good order, and to check an enemy pressing upon it. Openings are left to allow the retiring army, with guns and carriages, to file



Bridge-head Defence Work.

through without confusion; and parapets are so disposed as to flank and defend these openings.

BRIDGE OF ALLAN. See ALLAN.

BRIDGEMAN, LAURA. This famous blind mute was born in Hanover, New Hampshire, United States, on the 21st December 1829. She was a bright, intelligent child, but at two years of age was seized with a violent fever, which utterly destroyed both sight and hearing. For a time this so shattered her system, that there seemed no hope of recovery; but she rallied, and soon learned to find her way about the house and neighborhood, and even learned to sew and to knit a little. A strong passion for imitation began to develop itself, and by assiduously cultivating this power, she was at last enabled to emerge out of her life of unbroken darkness and silence, and take her place among the educated people of the day. In 1839, Dr. Howe of Boston undertook her care and education at the Deaf and Dumb School. The first attempt was to give her a knowledge of arbitrary signs, by which she could interchange thoughts with others.

Then she learned to read embossed letters by the touch; next, embossed words were attached to different articles, and she learned to associate each word with its corresponding object. A pat on the head told her when she was right in her spelling-lesson. Thus far, however, the work was only an exercise of imitation and memory, roused into exertion by the motive of love of approbation, but seemingly without intellectual perceptian of the relation between words and things. It was like teaching a clever dog a variety of tricks. But at last the truth flashed upon her, that by this means she could communicate to others a sign of what was passing in her own mind. Her whole being seemed changed. The next step was to procure a set of metal types, with the letters cast at the ends, and a board with square holes for their insertion, so as to be read by the finger. In six months, she could write down the name of most common objects, and in two years had made great bodily and mental improvement. She grew happier, and enjoyed play like other children, amusing herself with imaginary dialogues, spelling old and new words, and with her left hand slapping the fingers of her right, if they spelled a word wrong; or giving herself a pat of approval, as the teacher did, when correct. Her touch grew in accuracy as its power increased; she learned to know people almost instantly by the touch alone. In a year or two more, she was able to receive lessons in geography, algerbra, and history. She received and answered letters from all parts of the world, and was always employed, and therefore always happy. Her brain seems to have been unduly excited for a blind person; she not only held imaginary dialogues with herself, but dreamed incessantly by night; and during these dreams, while asleep, talked much on her fingers. She learned to write a fair, legible, square hand, and to read with great dexerity, and at last, even to think deeply, and to reason with good sense and discrimination.

Keen, sensitive, and lively, in various occupation, her days now pass rapidly and pleasantly, mainly owing to the unremitting skill and kindness of Dr. Howe. She was saved by him from a life of hopeless, helpless darkness; educated and trained to take her part in the world; and now, as a teacher of the blind and deaf and dumb, is conferring on them the blessings she has herself received. She is probably among the most skilful of Blind teachers.

BRI'DGENORTH, a town of Salop or Shropshire, on both sides of the Severn, 20 miles south-east of Shrewsbury. It consists of an upper and lower town, connected by a bridge over the Severn. The larger part of the town is on the right bank, and is built on a sandstone rock, rising sixty feet above the river. Pop. (1880) of parl. bor. 7216, sending one member to parliament. The navigation of the Severn formerly employed many of the inhabitants, but the traffic has been greatly injured by the introduction of railways. The town, which was at one time called *Bruges* or *Brug*, is said to be of Saxon origin. In the beginning of the 12th c., the Earl of Shrewsbury defended the town unsuccessfully against Henry I. It was besieged in the same century by Henry II.; and during the civil wars it resisted the Parliamentary forces

for three weeks. A great portion of the town was on this occasion destroyed by fire. It has carpet and worsted manufactories. Bishop Percy was born here.

BRI'DGEPORT, a seaport of Connecticut, U. S., at the mouth of the Pequannock, which empties itself into an inlet of Long Island Sound. It is in lat. 41° 11′ N., and long. 73° 12′ W., being 178 miles to the south-west of Boston, and 58 to the north-east of New York. Pop. at the census of 1870, 18,869; in 1880, 29,148. B. is connected by railways both with the interior and with the other places generally on the seaboard. Though the harbor does not admit large ships, having only 13 feet on the bar at high-water, yet B. has a considerable coasting-trade, and a number of vessels engaged in the whale-fishery. Its manufactures are extensive, particularly of carriages, harness, fire-arms, and sewing-machines.

BRIDGET, St. (or, more properly, *Birgit* or *Brigitte*), a famous Roman Catholic saint, was born in Sweden about the year 1302. Her father was a prince of the blood-royal of Sweden. When only sixteen she married Ulf Gudmarson, Prince of Nericia, a stripling of eighteen by whom she had eight children, the youngest of whom, named Catherine, born in 1336, died in 1381, became *par excellence* the female saint of Sweden. Her husband and she now solemnly vowed to spend the remainder of their lives in a state of continence, and, to obtain strength to carry out their severe resolution, made a pilgrimage to the shrine of St. Jago de Compostella in Spain. On their return, Ulf died in 1344, and B. founded about the same time the monastery of Wadstena in East Gothland. Sixty nuns and twenty-five monks were its first inmates. They received the rule of St. Augustine, to which St. B. herself added a few particulars. They constituted a new order, sometimes called the order of St. B., sometimes the order of St. Salvator, or the Holy Saviour, which flourished in Sweden until the Reformation, when it was suppressed, but it still possesses some establishments in Italy, Portugal, and elsewhere. Subsequently St. B. went to Rome, where she founded a hospice for pilgrims and Swedish students, which was reorganized by Leo X. After having made a pilgrimage to Palestine, she died at Rome on her return 23d July 1373. Her bones were carried to Wadstena, and she herself was canonized in 1391 by Pope Boniface IX. Her festival is on the 8th of October. The *Revelationes St. Brigittæ*, written by her confessors, was keenly attacked by the celebrated Gerson, but obtained the approval of the Council of Basel, and has passed through many editions. Besides the *Revelationes*, there have been attributed to this saint a sermon on the Virgin, and five discourses on the passion of Jesus Christ, preceded by an introduction which was condemned by the congregation of the *Index*.

Not to be confounded with this Swedish saint is another St. Bridget, or St. Bride, as she is more commonly called, a native of Ireland, who flourished in the end of the 5th and beginning of the 6th c., and was renowned for her beauty. To escape the temptations to which this dangerous gift exposed her, as well as the offers of marriage with which she was annoyed, she prayed God to make her ugly. Her prayer was granted; and she retired from the world, founded the monastery of Kildare, and devoted herself to the education of young girls. Her day falls on the 1st of February. She was regarded as one of the three great saints of Ireland, the others being St. Patrick and St. Columba. She was held in great reverence in Scotland, and was regarded by the Douglases as their tutelary saint.

BRI'DGETON, a port of entry in New Jersey, U. S., about 40 miles south of Philadelphia. It occupies both banks of the Cohansey Creek, about 20 miles above its entrance into Delaware Bay, its two divisions being connected by a wooden drawbridge. The town contains a public library, two newspaper-offices, an iron foundry, a rolling-mill, a nail-factory, a woollen-factory, and a glass-work. It likewise owns upwards of 15,000 tons of shipping. Pop. (1870) 6820; (1880) 8729.

BRI'DGETOWN, the capital of Barbadoes (q. v.), is situated on the west coast of the island along the north side of Carlisle Bay, which forms its roadstead, in lat. 13° 4′ N., and long. 59° 37′ W. Pop. 21,384. It was founded about the middle of the 17th c., taking the name Indian Bridge, and later its present appellation, from a rude aboriginal structure which spanned a neighboring creek. The present city, however, is only 100 years old, the former having been almost destroyed by fire in May 1766. In 1831, a part of B. was destroyed by a hurricane, and in 1845 it again suffered severely from fire. It is the residence of the bishop of Barbadoes and of the Governor-general of the Windward Islands. Except Broad Street, the thoroughfares are irregular, and the shops or general stores, having no windows in front, look heavy and unattractive. There is a considerable trade.

BRI'DGEWATER, a town and port of Somersetshire, on both sides of the Parret (which is here spanned by an iron bridge), 6 miles in a direct line, and 12 by the river, from the Bristol Channel, and 30 miles south-west of Bristol. It stands on the border of a marshy plain which lies between the Mendip and Quantock Hills, but the country around is well wooded. It is chiefly built of brick. St. Mary's Church has a remarkably slender and lofty spire. The Parret admits vessels of 200 tons up to the town; it rises 36 feet at spring-tides, and is subject to a bore or perpendicular advancing wave, 6 or 8 feet high, often causing much annoyance to shipping. Pop. in 1881, 12,024. B. formerly returned two members to parliament, but was disfranchised in 1870. Bath or scouring bricks, peculiar to B., are made here of a mixture of sand and clay found in the river. Admiral Blake was a native of this town, which suffered severely in the civil wars, when it was besieged by Fairfax, and ultimately forced to surrender, the castle being dismantled by the conqueror. The unfortunate Duke of Monmouth was proclaimed king by the corporation of B., before the battle of Sedgemoor, which occurred in 1685, 5 miles south-east of B., and in which he was defeated by the royal army. In 1880, 143 vessels, of 9099 tons, belonged to the port; and in the same year the number of vessels that cleared the port was 4227, with an aggregate burden of 237,395 tons.

BRIDGEWATER, Francis Egerton, Duke of, styled the 'Father of British Inland Navigation,' youngest son of Scroop, fourth Earl and first Duke of B., was born in 1736, and succeeded his elder brother, second duke, in 1748. In 1758—1760, he obtained acts of parliament for making a navigable canal from Worsley to Salford, Lancashire, and carrying it over the Mersey and Irwell Navigation at Barton by an aqueduct 39 feet above the surface of the water, and 200 yards long, thus forming a communication between his coal-mines at Worsley and Manchester, on one level. In this great undertaking he was aided by the skill of James Brindley (q. v.), the celebrated engineer, and expended large sums of money.

He was also a liberal promoter of the Grand Trunk Navigation; and the impulse he thus gave to the internal navigation of England, led to the extension of the canal-system througout the kingdom. In politics, though he took no active part, B. was a friend to the Pitt administration, and a contributor to the Loyalty Loan of no less than £100,000. He died unmarried, March 8, 1803, and with his death the dukedom became extinct. Before he began to realize profits from his great work, B. lived in privacy, and restricted himself to the simplest fare; and after his death his great wealth was distributed among collateral branches of his family. A monument was erected to his memory in Manchester.

BRIDGEWATER, Francis Henry Egerton, Earl of, son of John Egerton, Bishop of Durham, grandnephew of the first Duke of B., succeeded his brother as eighth earl, October 21, 1823. Educated for the church, he had previously been prebendary of Durham. He died unmarried, in February 1829, and the title became extinct. By his last will, dated February 25, 1825, he left £8000, invested in the public funds, to be paid to the author of the best treatise 'On the Power, Wisdom, and Goodness of God, as manifested in the Creation,' illustrating such work by such arguments as the variety and formation of God's creatures in the animal, vegetable, and mineral kingdoms, the effect of digestion, the construction of the hand of man, and by discoveries, ancient and modern, in arts, sciences, and the whole extent of literature. The then president of the Royal Society of London, Davies Gilbert, to whom the selection of the author was left, with the advice of the Archbishop of Canterbury, the Bishop of London, and a noble friend of the deceased earl, judiciously resolved, that instead of being given to one man for one work, the money should be allotted to eight different persons for eight separate treatises, though all connected with the same primary theme (see next article). B. also left upwards of £12,000 to the British Museum, the interest to be employed in the purchase and care of MSS. for the public use.

BRIDGEWATER TREATISES, eight celebrated works 'On the Power, Wisdom, and Goodness of God, by eight of the most eminent authors in their respective departments, published under a bequest of the last Earl of Bridgewater (q. v.), whereby each received £1000, with the copyright of his own treatise. They are: 1. *The Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, by Thomas Chalmers, D.D. (Lond. 1833, 2 vols. 8vo). 2. *Chemistry, Meteorology, and the Function of Digestion, considered with Reference to Natural Theology*, by William Prout, M.D. (Lond. 1834, 8vo). 3. *On the History, Habits, and Instincts of Animals*, by the Rev. William Kirby (Lond. 1835, 2 vols. 8vo). 4. *On Geology and Mineralogy*, by the Rev. Dr. Buckland (Lond. 1837, 2 vols. 8vo). 5. *The Hand, its Mechanism and Vital Endowments, as evincing Design*, by Sir Charles Bell (Lond. 1837, 8vo). 6. *The Adaptation of External Nature to the Physical Condition of Man*, by John Kidd, M.D. (Lond. 1837, 8vo). 7. *Astronomy and General Physics, considered with Reference to Natural Theology*, by the Rev. William Whewell (Lond. 1839, 8vo). 8. *Animal and Vegetable Physiology, considered with Reference to Natural Theology*, by Peter Mark Roget, M.D. (Lond. 1840, 2 vols. 8vo). All these works have since been republished by Bohn.

BRI'DLINGTON, or BU'RLINGTON, a sea-coast town in the East Riding of Yorkshire (including Bridlington Quay, a port and bathing-place about 1 mile to the south-east), 6 miles west of Flamborough Head, and 40 miles east-north-east of York. B. is situated on a gentle slope in a recess of a beautiful bay. The country is hilly to the north, but subsides to the south into a flat alluvial and fertile tract called Holderness. It has the aspect of an old town with narrow irregular streets. Pop. in 1881, 8363. It has a considerable trade in corn, and also some soap-boiling and bone-grinding works. B. is supposed to have been the site of a Roman station.

The Danes had strongholds in this vicinity for nearly 300 years, and many engagements between them and the Saxons and Normans occurred here. Great numbers of ancient tumuli or barrows still exist. An Augustine priory of immense wealth, and which subsisted for 400 years, was founded here by a grand-nephew of the Conqueror, and obtained many privileges from Henry I., and also from King John. Some parts of it yet remain. In 1643, Henrietta, queen of Charles I., landed here with arms and ammunition from Holland bought with the crown-jewels. Bridlington Quay has a chalybeate mineral spring, as well as an intermitting one of pure water. B. is noted for its chalk-flint fossils. In the lacustrine deposits near B. were found, some years ago, the bones of a large extinct elk, with branching horns, measuring 11 feet from tip to tip.

BRI'DPORT, a town in Dorsetshire, in a vale at the confluence of the Asker and the Birt, or Brit, or Bride, 16 miles west-north-west of Dorchester, and 2 miles from the English Channel. It stands on an eminence surrounded by hills, and consists chiefly of three spacious and airy streets. Pop. (1871) 7670; (1881) 6790. The registered electors numbered (1881) 1070. They return one member to parliament. The chief manufactures are twine, shoe-thread, cordage, fishing-nets, and sail-cloth; and ship-building is carried on to some extent. The vicinity is celebrated for its cheese and butter. B. was a considerable town before the Norman Conquest, and had a mint for coining silver. In 1873 there entered into this port 69 vessels whose tonnage was reckoned 6386; and there cleared it 36 vessels of collectively 3526 tons. On the coast near, are sandy cliffs, 200 feet high, abounding in fossils.

BRIEF, or BREVE, PAPAL (Lat. *brevis*, short), a word which, in the corrupt Latinity of the early ages, was made to signify a short letter written to one or more persons (hence the German *brief*, a letter). It is now used to denote certain pontificial writings, which, however, do not receive their name from the brevity of the composition, but from the smallness of the caligraphy.

The papal B. differs from the papal bull (q. v.) in several points. It gives decisions on matters of inferior importance, such as discipline, dispensations, release from vows, indulgences, &c., which do not necessarily require the deliberations of a conclave of cardinals. Still, it is not to be confounded with the *motus proprii*, or private epistle of the pope as an individual, as its contents are always of an official character. His holiness speaks, as it were, with a kind of familiar parental authority, and the B. is consequently superscribed *papa*, while the person to whom it is addressed is termed *dilecte fili* (beloved son). It is signed not by the pope, but by the *Segretario de' Brevi*, an officer of the papal chancery, with red wax, and only with the pope's private seal, the fisherman's ring; hence it concludes *Datum Romæ sub annulo piscatoris* (Given at Rome under the ring of the fisherman). Like the bull, it is written on parchment, with this difference, that the bull is written on the rough side, and in ancient Gothic characters, while the brief is written on the smooth side, and in modern Roman characters.

BRIEF, in the practice of the English bar, is the name given to the written instructions on which barristers advocate causes in courts of justice. It is called a B. because it is, or ought to be, an abbreviated statement of the pleadings, proofs, and affidavits at law, or of the bill, answer, and other proceedings in equity, with a concise narrative of the facts and merits of the plaintiff's case, or the defendant's defence. But it is also used in forensic business generally, being applied, not only in the courts of law and equity, but also in all other tribunals, whether inferior or superior, original or appellate. In Scotland, the corresponding term is *Memorial*. The skill of the attorney or solicitor is shown in the preparation of this important document, which should be characterized by arrangement and compression, without any material omission.

BRIEG, a town of Silesia, Prussia, about 27 miles south-east of Breslau. It is situated on the left bank of the Oder, and on the railway between Breslau and Vienna, and is surrounded with walls, which have been partly converted into promenades. The streets are wide and regular, and commercially B. is a thriving town, its manufactures including linens, woollens, cottons, hosiery, ribbons, lace, leather, and tobacco. The battle-field of Mollwitz (q. v.) lies a little to the west of Brieg. Pop. (1880) 17,508.

BRIEL, BRIE'LLE, or THE BRILL, a fortified seaport town, on the north side of the island of Voorne, S. Holland. It is situated near the mouth of the Maas, about 14 m. W. of Rotterdam, in lat. 51° 54′ N., and long. 4° 10′ E. B. possesses a good harbor, and is intersected by several canals. It has a population of (1879) 4442, the male portion of which are chiefly engaged as pilots and fishermen. B. may be considered as the nucleus of the Dutch republic, having been taken from the Spaniards by William de la Marck in 1572. This event was the first act of open hostility to Philip II., and paved the way to the complete liberation of the country from a foreign yoke. In 1585, B. was one of the towns made over to England as security for certain advances made to the states of Holland; it was restored to the Dutch in 1616. B. was the first town of Holland which, without extraneous aid, expelled the French in 1813. The celebrated admirals De Witt and Van Tromp were natives of this place.

BRIENNE-LE-CHATEAU, or, as it is now called, BRIENNE-NAPOLEON, a small town in the dep. of Aube, France, on the right bank of the river Aube, and about 14 m. north-west of Bar-sur-Aube. It is celebrated as the place where Napoleon I. received his earliest military education, he having entered the school here in 1779, when he was 10 years old, and remained until 1784. It is also remarkable on account of the battle fought here between the French and the allies in 1814. On the 29th of January, Bonaparte, who had collected his forces in the vicinity of B., with a view to check the advance of the allies on Paris, attacked Blucher, who was stationed in the town, and drove him out with considerable loss. In the struggle, the town, which was chiefly composed of wood, was almost reduced to ashes. On the 30th, the contest was renewed, and Blucher was forced to retreat to Trannes. On the following day, Napoleon deployed his forces in the plain between La Rothière and Trannes, and on February 1, the corps of the Crown-prince of Würtemberg and Count Giulay, and the Russian reserves of grenadiers, having joined Blucher, Prince Schwarzenberg gave orders to renew the combat. After a sanguinary struggle, during which Napoleon, feeling the importance of the contest, exerted all his influence over his troops, led several charges in person, and frequently exposed himself to danger, victory at length declared decisively for the allies at every point. During the night of February 1 and the morning of the following day, the French troops retreated from Brienne-le-Chateau. The loss on both sides was about equal, consisting of nearly 5000 killed and wounded. The allies took 9000 prisoners, and 70 pieces of artillery. This victory at B. opened the way to Paris, and led to the fall of the empire.

BRIENZ, a town of the canton of Bern, Switzerland, beautifully situated at the foot of the Bernese Alps, on the north-east shore of the lake of the same name, and about 30 miles east-south-east of Bern. Its cheese is held in high repute. Pop. (1870) 2605.—The lake of B., which is about 8 miles long and 2 in breadth, is formed by the river Aar, at the foot of the Hasli valley, and by the same river it discharges its surplus waters into Lake Thun. The lake is situated at an elevation of 1850 feet above the sea; its average depth is about 500 feet, but in some places it is said to have a depth of more than 2000 feet. It is surrounded by elevated mountains, the principal of which is the Rothorn, from which splendid views of the whole range of the Bernese Alps are obtained. A small steamer plies daily on the lake between B. and Interlaken, touching at the celebrated Giessbach Fall every trip.

BRI'ERLY HILL, an ecclesiastical district of Staffordshire, England, two miles north-north-east from Stourbridge, on the Oxford, Worcester, and Wolverhampton Railway. It is a place of much activity, the district abounding in coal, iron, and fireclay; and there are here numerous colleries, large iron-works, glass-works, brick-works, and potteries. The manufacture of steam-boilers is extensively carried on. Pop. (1871) 11,046; (1881) 11,546.

BRIEUC, ST., a seaport town, in the department of Côtes-du-Nord, France, situated on the right bank of the Gouet, about 2 miles from its mouth in the Bay of St. B., a part of the English Channel, in lat. 48° 31′ N., and long. 2° 45′ W. The town is said to owe its origin to an Irishman, St. Brieuc, who built a monastery here in the 5th century. St. B. has the ruins of an old tower that formerly defended the entrance to the river, but was partially blown up by order of Henry IV. in 1598, and a cathedral, part of which dates from the 11th century. The ramparts were destroyed in 1788, and their site has been converted into a pleasant promenade, terminating in a terrace that commands a fine view of the Channel. St. B. has manufactures of woollen stuffs, linen, cotton, leather, paper, &c.; it has also ship-building yards, and a trade in agricultural produce. Pop. (1876) 13,683.

BRIG, BRI'GANTINE. A brig is a square-rigged vessel with two masts. A brigantine, or hermaphrodite brig, is a two-masted

vessel, with the mainmast of a schooner and the foremast of a brig. A brig's mainsail is the lowest squaresail on the mainmast,

Brig.

whereas the mainsail of a brigantine is a fore-and-aft sail like that of a schooner.

BRIGA'DE, in the military service, is a group of regiments or battalions, combined into one body. When a British army takes the field, it is customary for three battalions to form a *brigade*, and two brigades a *division*. Thus, at the battle of the Alma, each of the five divisions of British infantry comprised two brigades; and of these ten brigades, nine consisted of three battalions each, the tenth being somewhat stronger. It is nothing more than a temporary grouping, which can be broken up whenever the commanding officer thinks fit. The household troops, comprising the Horse Guards, Life Guards, and Foot Guards, are sometimes called the *Household Brigade*.

BRIGADE MAJOR, is a military officer who exercises duties, in a brigade, analogous to those of the adjutant of a regiment. He attends to matters of discipline, and to the personal movements of the men. When regiments or battalions are brigaded, a brigade-major is appointed, usually from among the captains. He conveys orders, keeps the rollster or roster, inspects guards and pickets, and directs exercises and evolutions; but he nevertheless remains on the books of a particular regiment, and returns to his regimental duties when the B. is broken up.

BRIGADIE'R, or BRIGADIE'R-GENERAL, is an officer of a regiment (usually a colonel or lieutenant-colonel), who, for a limited time and for a special service, is placed upon brigade duties. He is then a general or commander of a brigade, which usually contains his own regiment as one of the number. When the brigade is broken up, he falls back to his colonelcy, unless his services lead to his promotion to the rank of major-general.

BRI'GANDINE, among the articles of armor worn during the middle ages, was an assemblage of small plates of iron, sewed upon quilted linen or leather, and covered with a similar substance to hide the glittering of the metal. It formed a sort of coat or tunic. The B. was named from the *Brigans*, a kind of light-armed irregular corps, employed something like the Cossacks and Bashi-bazouks of recent days, and, like them, addicted to marauding and pilfering; hence the word *Brigand*.

BRIGA'NTES. See BRITANNIA.

BRI'GANTINE. See BRIG.

BRIGGS, HENRY, a distinguished mathematician, was born in 1556, at Warleywood, near Halifax, Yorkshire, and studied at St. John's College, Cambridge. In 1596 he was appointed first reader in geometry at Gresham House (afterwards College), London, and in 1619 first Savilian professor of geometry in Oxford. This office he retained till the time of his death, which took place in Oxford, January 26, 1631. B. made an important contribution to the theory of logarithms, of which he constructed invaluable tables. Napier the inventor had, in 1614, published a table of the so-called natural logarithms, when B. observed that another system, in which the logarithm of 10 should be taken as unity, would afford great facilites of calculation. Napier admitted the improvement on his own system, and intended to assist in carrying the plan into effect; but died in 1618, when the whole work was left to Briggs. In the same year he published his *Chilias Prima Logarithmorum*, containing the first thousand natural numbers calculated to eight decimal places, and in 1624 published his *Arithmetica Logarithmica*, the fruit of many years of unwearied application and giving the logarithms of natural numbers from 1 to 20,000, and from 90,000 to 101,000, with fifteen places. His system of logarithms is that now commonly adopted. Leaving others to carry out his calculations, for which he had provided every facility, he next employed himself on a Table of Logarithms of sines and tangents, carried to the hundredth part of a degree, and to fifteen places, which, with a table of natural sines, tangents, and secants, was posthumously published at Gouda, in Holland, 1633, under the title of *Trigonometria Britannica*.

BRIGHT, JOHN, a popular politician, first brought into notice by the Anti-Corn-Law agitation, son of Jacob Bright, a Quaker cotton-spinner and manufacturer at Rochdale, Lancashire, was born at Greenbank, near that town, November 16, 1811. In 1835, he made a foreign tour, which included a journey to Palestine, and, on his return, delivered before a literary institution at Rochdale, of which he was one of the founders, lectures on the subject of his travels, and on topics connected with commerce and political economy. When the Anti-Corn-Law League was formed in 1839, he was one of its leading members, and, with Mr. Cobden, engaged in an extensive Free-trade agitation throughout the kingdom. In the spring of 1843, he offered himself as a candidate for the representation of Durham, and, though, at first unsuccessful he became, in July of the same year, M.P. for that city. At all times an animated and effective speaker, B. was incessant, both at public meetings and in parliament, in his opposition to the Corn Laws, until they were finally repealed. In 1845 he obtained the appointment of a select committee of the House of Commons on the Game Laws, and also one on the subject of cotton cultivation in India. An abridgement of the evidence taken before the former, published in one volume, contained from his pen an *Address to the Tenant Farmers of Great Britain*, strongly condemning the existing Game Laws. At the general election of 1847, he was elected one of the members for Manchester. He co-operated with Mr. Cobden in the movement in favor of financial reform. On the formation of the first Derby ministry, February 27, 1852, B. aided in the temporary re-organization of the Corn-Law League, in favor of the principles of Free Trade; and at the general election which followed, was re-elected for Manchester. A member of the Peace Society, and strenuously opposed to the war with Russia in 1854, B. was one of the meeting of the Society of Friends, by whom a deputation was sent to the Emperor Nicholas to urge upon him the maintenance of peace; and in 1855 he energetically denounced the Crimean war. A severe illness compelled him to withdraw for a time to the continent, and in his absence he was rejected by Manchester. Elected in 1857 for Birmingham, he seconded the motion against the second reading of the Conspiracy Bill, which led to the overthrow of Lord Palmerston's government. His name then became chiefly associated with the movement for reforming the electoral representation, which resulted in the act of 1867.

In 1868 he accepted office as President of the Board of Trade, but in 1870 was again obliged to retire, in consequence of severe illness. His health having been restored, he took office in 1873 and again in 1881 as Chancellor of the Duchy of Lancaster; he was appointed Lord Rector of Glasgow University in November 1880. A collection of his *Speeches* was published in 1868; a *Life* by Robertson (1877); and *Life and Speeches*, 2 vols., by G. Barnett Smith (1881).

BRIGHTENING, in Calico-printing, is the operation of rendering the colors of printed fabrics more bright or brilliant, by boiling them in solutions of soda and other materials.

BRIGHTON, originally *Brighthelmstone*, a town and watering-place on the coast of Sussex, 50½ miles south of London. It is built on a slope ascending eastward to a range of high chalk-cliffs; to the west, these hills recede from the coast, and have a long stretch of sands. Anciently, Brighthelmstone was a mere fishing village on a level under the cliff. It was fortified by Henry VIII. and more strongly by Elizabeth; but the sea proved more dangerous than the French, and now washes over the site of the village of those days. The inroads of the sea in 1699, 1703, and 1705, undermined many cliffs and destroyed many houses. Its further inroads are prevented by a sea-wall of great strength (60 feet high, 23 feet thick at the base, and 2 miles long), extending along the cliffs, and built at the cost of £100,000. The writings of Dr. Russel, a celebrated physician of George II.'s time, first drew public attention to B. as an eligible watering-place, and the discovery of a chalybeate spring in the vicinity increased its popularity. The visit of the Prince of Wales in 1782, and his subsequent yearly residence there, finally opened the eyes of the fashionable world to its immense attractions and B. thenceforth became the crowded resort of a health-seeking population. Its progress has been very rapid, and the town is still steadily increasing. B. is for the most part extremely well-built, as becomes a favored retreat of wealth and aristocracy. It mostly consists of new and elegant streets, squares, and terraces. The hotels are magnificent. A range of splendid houses fronts the sea for nearly 3 miles, including the famous sea-wall, and the beach is easy accessible by gaps in the chalk-cliffs. Formerly, trees were a great rarity in B.; but within the last thirty years they have been planted both in and around the town, and are now to be seen of considerable size in the North Steyne Enclosures, the Level, and the Queen's Park. Pop. (1801) 7339; (1851) 65,569; (1871) 92,469; (1881) mun. borough, 107,528.

B. returns two members to parliament. The population is greatly increased during the fashionable season by the influx of visitors. Living and house-rent are about a third higher than in London.

Near the center of the town is the Pavilion or Marine Palace, a fantastic Oriental or Chinese structure, with domes, minarets, and pinnacles, and Moorish stables, begun for the Prince of Wales in 1784, and finished in 1827. It is now the property of the corporation of B., and with its fine pleasure-grounds of above seven acres, it is devoted to the recreation of the inhabitants. It stands in the Steyne, an open space between the east and west parts of the town. The Marine Parade, a fine terrace, extends about a mile along the margin of the cliff, between the Steyne and Kemp Town, a handsome district on the east. Westward, there is a similar parade or promenade, extending a great length in front of the more modern part of the town, and here there is daily a large and fashionable concourse. There are two piers—a Chain Pier on the east, opposite the Marine Parade, and a broad wooden Pier on piles on the west; both are used for promenading. A magnificent aquarium, 715 feet in length, was opened in 1872. B. has no maritime trade. It is reputedly a town for recreation and sea-bathing. Its only defect is a want of trees to shade the promenades; the sea-breeze being adverse to the growth of the trees. B. possesses several large public hotels, and is more particularly noted for its excellent private hotels or boarding-houses, locally known as 'Mansions.' B. is connected with London, and also with the towns along the coast, by railways. From its salubrity, the town abounds in boarding-schools.

BRIGHT'S DISEASE (of the kidneys), so called after the English physician, Dr. Bright, who first investigated its character, consists of a degeneration of the tissues of the kidney into fat, and will be better understood after the anatomy of the organ has been studied. Suffice it to say now, that this degenerated condition impairs the excreting powers of the organ, so that the urea is not sufficiently separated from the blood. The flow of the latter, when charged with this urea, is retarded through the minute vessels, congestion ensues, and exudation of albumen and fibrin is the result. When we apply heat to the urine from a kidney so affected, it becomes opaque, showing that it contained *albumen* (q. v.); and on examining a drop of it under the microscope, we observe the exuded lymph mixed with epithelium in the form of casts of the small ducts of the diseased organ.

The patient presents a flabby, bloodless look, is drowsy, and easily fatigued. The disease may succeed any of the eruptive fevers, and is frequently associated with enlargement of the heart.

The *causes* of this terrible malady are any which cause congestion of the kidneys—indulgence in strong drinks, long-continued suppuration, exposure to wet and cold, the exanthematous fevers, and pregnancy. The indications for *treatment* are, to remove any of those causes which may be present, rectify the other secretions, relieve any temporary congestion of the kidneys, at the same time endeavoring to increase the number of red blood globules by the administration of iron and vegetable bitters. And in the advanced stages, when the blood is poisoning the nervous centers, attempts should be made to restore secretion of urine by administering diuretics (q. v.), by giving hydrochloric and vegetable acids, sponging the patient with vinegar, and relieving the congestion of the brain by purgatives and local bleeding.

BRIGNOLES, a town in the department of Var, France, beautifully situated in a fertile valley, surrounded by forest-clad hills, and watered by a stream called the Calami, about 22 miles west-south-west of Draguignan. B., which is a very salubrious place, has manufactures of broadcloth, silk twist, soap, leather, pottery, &c.; and a trade in wines, brandy, olives, and prunes. Pop. (1876) 5164.

BRIHUE'GA, a town of New Castile, Spain, 20 miles east-north-east of Guadalajara, is situated on the Tajuña, and was formerly surrounded by walls, of which traces still exist. The remains of an old Moorish fortress now serve as a cemetery. B. has manufactures of woollens, linen, glass, and leather. Pop. 4140. Here, in 1710, during the War of the Succession, the English general Stanhope, owing to the dilatoriness of his allies in affording him support, was defeated by the Duke de Vendôme, and compelled to surrender, with all his force, amounting to about 5500 men.

BRIL, the name of two Dutch painters.—MATTHÆUS B., born at Antwerp, 1550, went during his youth to Italy, and, under the patronage of Pope Gregory XIII., painted several frescoes in the Vatican. He was also distinguished as a historical and landscape painter. He died in 1584.—His more celebrated younger brother, PAUL B., born 1554 or 1556, received instruction under Matthæus in Rome, and soon excelled his master.

His pieces were at first conceived in the fantastic style which then prevailed; but gradually his style increased in power and beauty, until it exerted a striking influence over landscape painting. The works of his riper age exhibit high poetical qualities, and a fine appreciation of the effects of light in the sky, which have been described as but little inferior to those of his great successor, Claude Lorraine. They have a character of solemn rest and calmness, and at times even an elegiac tone of melancholy, which well accords with representations of the glories of fallen Rome. A collection of excellent landscapes by B. is found in the palace Rospigliosi in Rome, and two beautiful landscapes enrich the gallery of the Pitti Palace, Florence. Besides landscapes, B. painted scenes from biblical history; among them, the 'Tower of Babel,' now in the Berlin Museum. Other pictures by B. are found in the galleries of Munich, Vienna, and the Louvre. He died at Rome in 1626.

BRILL (*Rhombus vulgaris*), a fish of the same genus with the turbot (q. v.), found in considerable abundance on some parts of the British coasts, and common in the markets of the larger towns. It resembles the turbot more than any other British species of this genus, but is at once distinguished by its inferior breadth, which (excluding the fins) is only equal to half its entire length; by the want of tubercles on the upper surface; by a few of the most anterior rays of the dorsal fin being elongated beyond the membrane; and by the coloring, which is reddish sandy-brown on the upper side, varied with darker brown and sprinkled with white pearly spots, the under side being (as in the turbot) white. The B. is taken both in sandy bays and in deep water. Although considered very inferior to the turbot, it is yet much esteemed for the table. It seldom or never attains so great a size as the turbot, rarely exceeding 8 lbs. in weight.

BRI'LLIANT is a popular name given to the diamond when cut in a particular way. See DIAMOND.

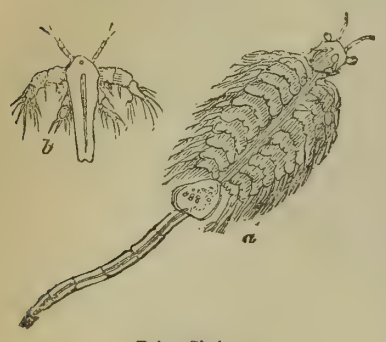
BRI'MSTONE (Saxon, *Brenne-stone*, a stone that burns) is the commercial name for Sulphur (q. v.), in sticks or rolls.

BRI'NDISI (the ancient *Brundisium* or *Brundusium*), a seaport town of Southern Italy, in the province of Lecce, is situated on a small promontory in a bay of the Adriatic Sea, about 45 miles east-north-east of Taranto. B. is a city of very great antiquity. It was taken from the Sallentines by the Romans 267 B.C., who some twenty years later established a colony here. The town, partly owing to the fertility of the country, but chiefly on account of its excellent port—consisting of an inner and outer harbor, the former perfectly landlocked, and capable of containing the largest fleets and of easy defence on account of its narrow entrance, and the latter also very well sheltered—rapidly increased in wealth and importance. It soon became the principal naval station of the Romans in the Adriatic. In 230 B.C., B. was the starting-place of the Roman troops that took part in the first Illyrian War; and from this point the Romans nearly always directed subsequent wars with Macedonia, Greece and Asia. And when the Roman power had been firmly established beyond the Adriatic, B. became a city second to none of South Italy in commercial importance. Horace, who accompanied Antony in a hostile movement on B., in 41 B.C., has made the journey the subject of one of his satires (*Sat.* i. 5). Virgil died here, in 19 B.C., on his return from Greece. The city appears to have retained its importance until the fall of the empire, but it suffered greatly in the wars which followed. When the Normans became possessed of it in the 11th c., the Crusaders made it their chief port for embarkation to the Holy Land; but with the decline of the crusades, B. sank into comparative insignificance as a naval station. The city subsequently suffered greatly from wars and earthquakes. The principal buildings are the cathedral, where the Emperor Frederick II. was married to Yolanda in 1225; and the castle, commenced by Frederick II., and finished by Charles V. The district around B. is still remarkable for its fertility, olive oil being produced in large quantities. Some years ago, B. was constituted an entrepôt for foreign goods. Since the establishment of the overland route to India, B. has greatly increased, being the most convenient point of departure for the east from Northern and Central Europe. The extensive and well-sheltered harbor has undergone great improvement, and a substantial bulwark has been built across the north arm to prevent it from being filled with sand. From 700 to 1000 vessels annually enter the port. Pop. (1871) 13,194.

BRINDLEY, JAMES, an eminent English mechanic and engineer, born in Thornsett, near Chapel-en-le-Firth, Derbyshire, in 1716. Apprenticed at 17 to a millwright, he afterwards became an engineer, and in 1752 showed great ingenuity in contriving a water-engine for draining a coal-mine. A silk-mill on a new plan, and several others of his works, recommended him to the Duke of Bridgewater (q. v.), who employed him to execute the canal between Worsley and Manchester. Thenceforth he devoted his great skill and genius to the construction of navigable canals; commenced the Grand Trunk, and completed the Birmingham, Chesterfield, and others. Once, when under examination before a committee of the House of Commons, being jocularly asked for what purpose he supposed rivers to have been created, he is said to have replied: 'Undoubtedly to feed navigable canals.' He died in 1772.

BRINE is the term applied to water highly impregnated with common salt, and BRINE SPRINGS are those natural waters containing much salt, which in many parts of the world gush out from fissures in the ground. See SALT.

BRINE-SHRIMP (*Artemia salina*), a small crustacean, of the order *Branchiopoda* (q. v.), which, unlike the greater number of animals of that order, is an inhabitant not of fresh but of salt water, and is indeed remarkable, because it is to be found in myriads swimming about in the brine of salt-pans previous to boiling, when, having been concentrated by exposure to sun and air for about a fortnight, it destroys the life of almost all other marine animals. The full-grown B. is about half an inch long. The little animal is almost transparent, and is extremely active and graceful in its movements. The workmen at salt-pans so confidently ascribe to it the rapid clearing of the brine in which it occurs, that when it does not appear in their *salterns*, they transport a few from other salterns. They multiply with extraordinary rapidity.



Brine Shrimp:
a, mature; *b*, young.

BRINJAREE DOG, a rough-haired or long-haired variety of geeyhound (q. v.), used in the Deccan, and said to be the best of the hunting-dogs of India. It is said to be superior in size and strength to the Persian greyhound, but not to be equal to the British greyhound in swiftness. It is generally of a yellowish or tan color.

BRINVILLIERS, MARIE MARGUERITE, MARQUISE DE, notorious as a poisoner in the time of Louis XIV., was the daughter of Dreux d'Aubray, Lieutenant of Paris, and received a careful education. In 1651 she was married, while still young, to the Marquis de Brinvilliers. This nobleman seems to have been a gay and careless spendthrift, who allowed his wife to do very much as she pleased. He even introduced to her a young officer named Jean Baptiste de Gaudin, Seigneur de St. Croix, who was exceedingly handsome, and who inspired her with a violent passion. Her easy husband, however, was wholly indifferent to his wife's conduct; but her father, who seems to have had a stricter sense of duty, caused St. Croix to be arrested and imprisoned in the Bastile. It was here the latter learned the art of preparing poisons, from an Italian, and on his release he imparted his fatal knowledge to his mistress, who, during his incarceration, had affected the greatest piety, spending most of her time in visiting the hospitals and in attending the sick. The marchioness now resolved to destroy her father. St. Croix eagerly abetted her, in the hope of obtaining a portion of the paternal inheritance; but in order to test the efficacy of the poison, she tried its effects upon the invalids of the *Hôtel Dieu*. Having satisfied herself, she commenced operations on her parent, kissing and poisoning him continually for eight months, until her diabolical patience was exhausted, and she was at last induced to administer a very violent dose. He died, and no one suspected the marchioness. With St. Croix's assistance, and that of a domestic servant, Jean Amelin, *alias* Chaussée, she next poisoned, with the same fearful indifference to crime, her two brothers and her sisters; her object being to find means of supporting her extravagant style of living with her paramour. Several times she attempted to poison the marquis, her husband; but he escaped, and, as was said, by means of antidotes given by St. Croix, who dreaded that he should be compelled to marry the widow. St. Croix died suddenly in 1672—his glass mask having fallen off while he was engaged in preparing a poison—leaving documents inculpating the marchioness. She was also accused about the same time by her accomplice Chaussée, who being arrested, confessed all, and was condemned to be broken alive. The marchioness escaped to England; afterwards she traveled into Germany, and next went to Liege, where she took refuge in a convent. From this, however, she was craftily decoyed by an officer of justice disguised as an abbé, and conveyed to Paris. Among her papers was found a general confession of her crimes, including the above-mentioned murders, and many others.

One strange confession stated that, out of pity for a virtuous young lady who had been imprisoned in a convent, the marchioness had poisoned a whole family! It is a singular fact, that this infamous woman was a bigot in her religious tenets, and was quite exemplary in her attendance at church. At her trial in Paris, she at first denied all charges brought against her, and pretended that the 'general confession' had been written during the insanity caused by a fever; but after being put to the torture, she made a full confession, and was beheaded, July 16, 1676. Her career had excited such terror in France, that Louis XIV. instituted a distinct tribunal, the *Chambre Ardente* (q. v.), to investigate cases of poisoning by the 'succession powder' used by the marchioness.

BRIOUDE, a town of France, in the N.W. of the department of Haute-Loire. The church of St. Julien was founded in the 9th c., on the site of a still more ancient edifice erected on the spot where the saint was martyred. Lafayette was born here. Pop. (1876) 4643.

BRISBANE, the capital of Queensland, a seaport, and chief seat of trade in the colony, is about 640 miles N. of Sydney. It stands about 25 miles from the mouth of a river of its own name, which falls into Moreton Bay. North and South B. are connected by the Victoria iron bridge, 1080 feet in length. B. possesses some fine buildings, among the chief of which are the Houses of Legislature, which cost £100,000; the post-office, telegraph office, the viceregal lodge, and the Queensland National Bank. There are upwards of 30 churches, and three daily and four weekly newspapers are published. There are three parks and well laid out botanic gardens. Regular steam communication is kept up with the other Australian ports, as well as with London. The channel of the river is being deepened to admit of large vessels coming up to B. A spacious dry dock was opened at South B. in 1881. B. is the terminus of the Southern and Western Railway; and a trans-continental line from B. to the Gulf of Carpentaria has been surveyed. Pop. (1876) 26,911; (1881) 31,109. B. was settled as a penal station in 1825 by Sir T. Brisbane.

BRISBANE, GENERAL SIR THOMAS MAKDOUGAL, soldier and astronomer, was born at Brisbane, the family seat, near Largs, Ayrshire, July 23, 1773. At the age of 16 he entered the army; and with a company he had raised in Glasgow in 1793, B. took part in all the engagements of the campaign in Flanders; and in the West Indies, to which he was sent in 1796, he greatly distinguished himself under Sir Ralph Abercromby. He afterwards served in the West Indies as colonel of the 69th; and in 1812 obtained command of a brigade under the Duke of Wellington in Spain. For his conspicuous bravery at the battle of the Nive he received the thanks of parliament. When Napoleon abdicated, B. was sent in command of a brigade to North America, from whence he was recalled in 1815, but too late to admit of his being present at Waterloo. In 1821, B., on the recommendation of his friend the Duke, was appointed governor of New South Wales, a position he held for four years, during which time he introduced many wise reforms, especially in penal treatment; secured at his own expense good breeds of horses for the colony; promoted the cultivation of the sugar-cane, vine, tobacco, and cotton; and left at the close of his administration—which was marked by perfect tolerance and protection of all classes of Christians—50,000 acres of cleared land where he had found only 25,000. But high as B. ranks as a soldier and administrator, as a man of science he holds a still higher place. While in Australia, he catalogued no less than 7385 stars, for which great work—known as 'the Brisbane Catalogue of Stars'—he received the Copley medal from the Royal Society. On his return to Scotland, he had an astronomical observatory established at his residence at Makerstoun, and devoted himself entirely to scientific pursuits. He entered warmly into the plans of the British Association for ascertaining the laws of the earth's magnetism, and in 1841 had a splendid magnetic observatory erected at Makerstoun, the observations made there filling three large volumes, published in the *Transactions of the Royal Society of Edinburgh*, of which he was president, having been elected on the death of Sir Walter Scott. He founded two gold medals for scientific merit—one in the award of the Royal Society, the other in that of the Society of Arts. He died January 27, 1860.

BRISSOT, JEAN PIERRE, one of the first movers in the outbreak of the French Revolution, and afterwards numbered among its victims, was born at Chartres in 1754, and educated for the bar. After completing his studies at Paris, he went into the office of a procurator, but quickly abandoned the legal profession for the more congenial one of authorship. From his earliest years he had devoted himself with passionate eagerness to literary studies, especially history, economy, and politics, and, among other lingual accomplishments, acquired a thorough mastery of English. His first work, *Théorie des Lois Criminelles* (1780), gained the approbation of Voltaire and D'Alembert, and was followed by his *Bibliothèque des Lois Criminelles*, which established his reputation as a jurist. Having removed to London, he there started a learned journal, under the title *Lyceum*, for which, however, he found no adequate support. He therefore returned to Paris, and soon afterwards was imprisoned in the Bastile, on a charge of having written against the queen a brochure, which, in fact, was penned by the Marquis de Pelleport. After four months in the Bastile, he was liberated through the intervention of Madame de Genlis and the Duke of Orleans. B. continued to write tracts on finance, &c., but his love of freedom and vehement hatred of despotism again involved him in danger, and, to escape from a *lettre-de-cachet*, he

was once more compelled to retire to England. He afterwards visited North America, as representative of the *Société des Amis des Noirs*. On his return to France, he zealously assisted in the outbreak of the Revolution, and was in consequence elected by the citizens of Paris their representative in the Constituent Assembly, where he exercised a predominant influence over all the early movements of the Revolution. He also established a journal, called *Le Patriote Français*, which became the recognized organ of the earliest republicans; and, through his superior knowledge of politics and the usages of constitutional countries, he gathered round him all the young men of talent and spirit who were opposed to the court-theory of absolute sovereignty. It thus happened that, without his being formally considered the head of a party, all the movements of the early revolutionists were profoundly influenced by him, and he incurred the bitter hatred of the court reactionists, who affixed the nickname of Brissotins to all the advocates of reform. Afterwards, the Brissotins formed the Girondist party. In the Convention, B. was representative of the department of Eure-et-Loir. Here his moderation made him suspected as a friend of royalty, as he opposed the 'men of September' and the trial and condemnation of the king. When Louis XVI. heard his doom pronounced, he exclaimed: 'I believed that Brissot would have saved me!'

But B. was weak enough to imagine that the best way to save the king would be to vote first for his death, and then appeal to the nation. B. and his party, which was perhaps the purest in principle and the weakest in action, ultimately fell before the fierce accusations of the Mountain, or Jacobin party, which believed, or at least pretended to believe, that the virtuous B. had received money from the court to employ against the Revolution. With 20 other Girondists B. suffered death under the guillotine, October 30, 1793.

BRI'STLES, the strong hairs growing on the backo f the hog and wild-boar, and extensively used in the manufacture of brushes, and also by shoemakers and saddlers. They form an important article of British import, between 2 and 3 million pounds being annually imported, chiefly from Russia and Germany; but they are also obtained from France and Belgium, and small quantities of inferior quality have recently been received from China. From Russia, the average annual value of B. imported into Britain is £300,000, Siberia alone supplying about £150,000. Russian B. vary in value from £6 to £60 per cwt. From Germany, about £100,000 worth per annum is received, varying from £6 per cwt. to £35 per cwt. From France and Belgium, about £20,000, varying in value from 2*s.* to about 4*s.* 6*d.* per pound. The quality of B. depends on the length, stiffness, color, and straightness—white being the most valuable. The best bristles are produced by pigs that inhabit cold countries. The Russian hog is a long spare animal, and the thinner the hog, the longer and stiffer the bristles. When the Russian hog is sent to the south and fattened, the B. become soft, and of course depreciated in value. In the summer, the hogs are driven in herds through the forests, to feed on soft roots, &c., when they shed their B. by rubbing themselves against the trees. The B. are then collected, sewed up in horse or ox hides, and sent to fairs, whence they find their way, through agents, to all countries.

BRI'STOL, an important maritime city in the west of England, long. 2° 35′ 28″ W., lat. 51°, 27′ 6″ N. upon the rivers Frome and Avon, and partly in the counties of Gloucester and Somerset, joined with the former for ecclesiastical and military purposes, but otherwise a city and county in itself. It is 108 miles distant from London by road. The ancient portion of B. consists almost entirely of shops, warehouses, offices, manufactories, and other commercial buildings. The streets are, with few exceptions, narrow and irregular; but great improvements have been effected in them recently at a cost of half a million sterling, and there are many handsome shops, and other buildings of a superior character.

Among the latter may be especially mentioned the banking-house of the West of England Company, the Assize Court and Guild Hall, Bank of England, General Hospital, Colston Hall, and Victoria Rooms. A great Central Terminus has been erected for the various railways. The most remarkable modern structure, however, is the suspension bridge over the Avon, at Clifton, which is 702 feet in span, and 245 feet above high-water. Among the ancient buildings are the Church of St. Mary Redcliffe, the Cathedral, and Temple Church, remarkable for its leaning tower. Some remains still exist of the ancient castle and walls, traces of British encampments at Clifton and Leigh, and considerable Druidic vestiges at Stanton Drew. The modern portion of B., including Clifton, Cotham, Redland, &c., consist of handsome residences, in squares, terraces, crescents, and detached villas, and some creditable specimens of architecture in churches, chapels, assembly and club rooms. The population of B. within the municipal boundaries, which coincide with those of the parliamentary borough, was 182,552 in 1871, and in 1881 it had increased to 206,503. In 1880, there were 25,000 electors, who return two members to the House of Commons. The floating harbor and quays extend for more than a mile through the city, and are formed by embanking and locking the old courses of the rivers, which now flow through a new channel cut at a cost of about £600,000. During the year 1880, there were entered inwards with cargoes 9745 vessels, with a tonnage of 1,228,742 tons, engaged in the foreign and coasting trade; and outwards, 9408 vessels, of 1,215,082 tons. The total value of the imports for 1879 was £7,275,275, against £7,057,036 in 1872. The chief trade is with Canada and the United States, West Indies and S. America, Portugal, the Mediterranean, Russia, Mauritius, Turkey, France, and west coast of Africa. The principal exports are iron, tin-plate, copper and brass, coal, salt, and manufactured goods. The manufactures are chiefly cotton goods, glass, refined sugar, earthenware, lead, chemicals, leather, and floor-cloths.

The ship-building yards have the reputation of turning out excellent sea-going vessels. The *Great Western*, the pioneer of steam communication across the Atlantic, the *Great Britain*, and the ill-fated *Demerara*, were built here. The railways terminating at Bristol are—the Great Western from the east, the Midland from the north, with a branch to Bath; the Bristol and Exeter from the west: the North Somerset from the south; the Great Western line communicating with South Wales, and short branches to Avonmouth and Portishead. The municipal government of B. is vested in a mayor, 16 aldermen, and 48 town-councillors, a lord-lieutenant, and lord high steward. The benevolent institutions of B. are numerous and well supported. The most important are the Infirmary, the General Hospital, the Blind Asylum, Orphan Asylum, Asylum for Deaf Mutes, alms-houses, reformatories, &c., and the extraordinary Ashley Hill Asylum, for 2050 orphans, built and maintained without any provision for meeting expenses, except the unsolicited contributions that happen to be sent to it. The public dinners of the Dolphin and Anchor Societies are well known from the occasional political importance of speeches made at them; but they and the Grateful Society were instituted in memory of Colston, the merchant-prince, and they collect alms for lying-in women. Among charitable institutions must also be reckoned the well-endowed Colston, City, and Red Maids Schools, and other free schools. Other educational establishments are Clifton College and the grammar school, and many proprietary and private schools; there are also a medical school, fine arts academy, and trade school. University College has 12 professors and lecturers, and had in 1880 about 500 students, of whom nearly half were women. The Baptists have a theological college here. The first records of the history of B. speak of it under the ancient British name of Caer-oder; it then became a stronghold of the Romans; on their departure was again occupied by the Britons, until, in 584, the Saxons drove them out, and giving it the name of Brightstowe or Bricstowe, made it a thriving place of trade—aboriginal slaves being a principal item in the commerce. It was sacked by the Danes. Henry III. gave it the rights of a corporate town; Edward III., those of a city and county in itself. In 1247, the parishes of Redcliffe, Temple, and St. Thomas were added to Bristol.

During the Civil Wars, it was alternately taken by Royalists and Parliamentarians, and by the latter, the castle and fortifications were razed. It afterwards became the principal port for trade with the West Indies, and carried on a flourishing business in negro slaves. In 1793, the 'Bridge Riots' occurred. In 1804 the Docks were begun, and in 1809 they were opened to shipping. In 1831, the 'Reform Bill Riots' resulted in the destruction of the Bishop's Palace, Custom-house, Excise-office, jail, toll-houses, a number of private residences, and several lives. The bill itself, by the addition of Clifton, &c., gave the city its present municipal boundaries. Among the names of note identified with the history of B. are those of the Fitzhardings family; William of Worcester; Canynge, the great merchant and restorer of Radcliff Church; Colston and Whitson, the merchants and philanthropists; Sebastian Cabot, the navigator, said to have anticipated the discovery of America by Columbus; the poets Southey and Chatterton; Lawrence and Bailey, artists; Sydney Smith, canon of Bristol Cathedral; Robert Hall, Coleridge, and Hannah More; the Misses Porter; Dr. Prichard, Dr. Carpenter, and Miss Mary Carpenter.

BRISTOL BAY, an arm of the Pacific Ocean, in Russian America, lying immediately to the north of the peninsula of Alaska. B. B. receives the waters of two considerable lakes, which, communicating with each other, offer an opening into the interior.

BRISTOL CHANNEL, an inlet of the Atlantic Ocean, in the south-west of England, between South Wales on the north, and Devon and Somerset shires on the south; or it may be regarded as an extension of the estuary of the river Severn. It is about 80 miles long and 5 to 48 miles broad, the greatest breadth being between St. Gowan's Head and Hartland Point, its most western and external points, this line passing through Lundy Isle. It is the largest inlet or estuary in Britain, having a very irregular

coast-line of 220 miles, and receiving a drainage of 11,000 square miles. The chief rivers which flow into it are the Towy, Taff, Usk, Wye, Severn, Avon, Axe, Parrot, Taw, and Torridge. The tides in it rise to an extraordinary height—at Bristol, 35 feet; at King's Road, 40; and at Chepstow, sometimes 70. The rapid flow of the tides meeting the currents of the rivers produces, in the narrow parts of the Channel, and in the mouths of one or two of the rivers which enter it, the phenomenon of the *bore*, the tide advancing like a wall of water sometimes 6 to 9 feet high. The chief Bays and harbors are, on the north, Caermarthen and Swansea bays, Cardiff Roads, the mouths of the Usk and Wye, and the Severn estuary; and on the south, Bideford or Barnstaple, Morte, Ilfracombe, Combe Martin, Minehead, Porlock, and Bridgewater.

BRI'TAIN, GREAT. See GREAT BRITAIN.

BRITAIN, NEW. See NEW BRITAIN.

BRITA'NNIA (perhaps from Celtic *brith* or *brit*, painted, the ancient Britons being in the habit of painting their bodies blue with woad), the ancient name of the island of Great Britain (see BRITANNICÆ INSULÆ). The Romans under Julius Cæsar (who wished to chastise the Britons for aiding the Veneti, a tribe in Gaul, against the Roman power) invaded Britain in 55 and 54 B.C., but they then made no permanent conquest. Nearly a hundred yeards after, in 43 A.D., the real conquest began under Claudius; and in spite of a desperate resistance by the native British princes, especially Caractacus and Boadicea, the south half of Britain was conquered, and made a Roman province. Agricola, sent by Nero in 78 A.D., consolidated these conquests, and extended the influence of Rome to the Firths of Forth and Clyde, between which, in 84 A.D., he erected a chain of forts to repel the inroads of the northern Caledonians, in the line of the stone Wall of Antoninus, afterwards erected, in 140 A.D., by Lollius Urbicus. Agricola was the first Roman to send a fleet round the island, and the first Roman general to come in contact with the Caledonians whom, under their leader Galgacus, he overthrew, in 84 A.D., at a hill called the Mons Grampius, the situation of which has not been satisfactorily determined. The Romans made many ineffectual attempts to subdue the Caledonian barbarians, and penetrated, for this purpose, through the north-east part of Scotland as far as the Moray Firth, as is attested by the remains of Roman camps and stations still existing along their line of march, and the relics of Roman art found in connection with them. Not only did the Caledonians on their own soil resist the Roman sway, but by constant inroads into the Roman territory south of the Wall of Antoninus, they so harassed the Romans themselves, that the latter were forced to abandon their conquests for 80 miles south of that wall, and to secure permanently their remaining conquests in South Britain by a line of defensive works between the mouth of the Tyne and the Solway Firth. Here Agricola had raised a line of forts, and here in 120 A.D. Hadrian built a wall, which was repaired by Severus in 210 A.D.

After this last date the Romans did not attempt to regain their lost provinces. Subject to these incursions of the Caledonians, the opposition of the native British princes, and the invasion of tribes from the opposite shores of the continent, the Romans held sway in Britain down to about the year 410 A.D., soon after which time the Saxons invaded south Britain, and ultimately subdued it. Britain, south of the Solway Firth and the mouth of the Tyne, in the reign of Claudius, formed one Roman province under a consular legatus and a procurator. Ptolemy mentions 17 native tribes as inhabiting this tract. Toward the close of the 4th c., A.D., Roman Britain constituted a diocese in the præfecture of Gaul, and was divided into five provinces, of which the boundaries, though uncertain, are supposed to have been as follows: B. Prima, England south of the Thames and the Bristol Channel; B. Secunda, Wales; Flavia Cæsariensis, the country between the Thames, Severn, Mersey, and Humber; Maxima Cæsariensis, the rest of England to the Scottish border; and Valentia—soon abandoned by the Romans—or Scotland south of the Wall of Antoninus. The population of Roman Britain included Roman and Germanic elements, which had partially blended with the native Britons, who were of Celtic stock, with an earlier Euskarian or Basque admixture. The Romans governed Britain by a vicarius or vicegerent resident at Eboracum (York), under whom were consulars, presidents, and other subordinate officers. To insure the obedience of the natives, at least three Roman legions—chiefly composed of Gauls, Germans, Iberians, and but few pure Romans—were stationed in Britain; viz., at Eboracum, Deva (Chester), and Isca (Caerleon) in S. Wales. Under the Romans, many towns (coloniæ and municipia)—56 are enumerated by Ptolemy—arose in Britain, and diffused Roman law and civilization over the country. The towns of Eboracum (York) and Verulamium (near St. Albans) had the privileges of Roman citizenship. The Romans made many roads or streets (*strata*), of which there are still numerous remains, across the country, all centering in London. They also developed it into a corn-growing country. Druidism was the religion of the Britons at their conquest by the Romans, but the latter introduced Christianity and Roman literature into the country. There are many remains still extant of the presence of the Romans in Britain, such as camps, roads, ruins of houses, baths, flues, altars, mosaic pavements, painted walls, metallic implements and ornaments, weapons, tools, utensils, pottery, coins, sculptures, bronzes, inscriptions, &c.

These remains show that the Romans wished to render their British conquests permanent, and that they had greatly improved the arts of the ancient Britons, as is evident on comparing the remains with the far ruder native antiquities of the British pre-Roman or pre-historic era, such as tumuli, barrows, earthworks, so-called Druidical monoliths and circles, cromlechs, cairns, pottery, weapons, tools, utensils, ornaments, &c. Many of the Roman remains in Britain also show that the Romans had introduced into the country the refinements and luxuries of Rome itself.

Under the term BRITANNIA, Great Britain has been personified in the fine arts as a female seated on a globe or on an insulated rock, and leaning with one arm on a shield, the other hand grasping a spear or a trident. The first example of this personification is on a Roman coin of Antoninus Pius (died 161 A.D.). The figure reappears first on the copper coinage of England in the reign of Charles II. (1665); the celebrated beauty, Miss Stewart, afterwards Duchess of Richmond, is said to have served as model to the engraver, Philip Roetier. The Britannia that appears on the reverse of British copper coins since 1825 was the design of Mr. W. Wyon. See COINAGE.

BRITANNIA METAL is an alloy very largely employed in the construction of the cheaper kinds of tea and coffee pots, teaspoons, &c. The proportions of the metals used in its manufacture are various, but the average composition in 100 parts is: tin, 85½; antimony, 10½; zinc, 3; and copper, 1. B. M. is harder than pewter (q. v.), hence vessels or spoons made of it are not so liable to lose their shape, or to be indented with a slight blow. A variety of B. M., called *Queen's Metal*, is also extensively used for similar purposes, and it ranks intermediate in hardness between pewter and ordinary B. Metal. Queen's Metal is composed of—tin, 9; antimony, 1; bismuth, 1; and lead, 1.

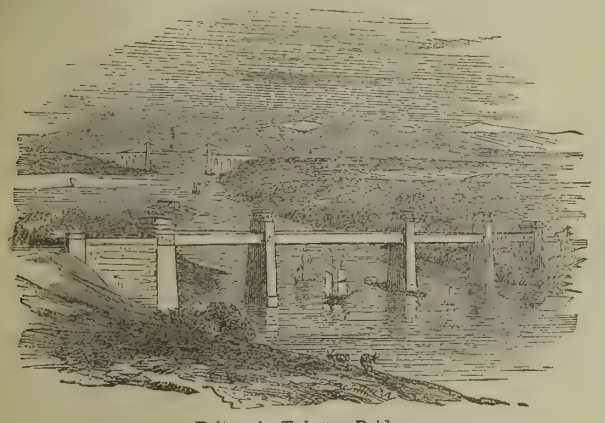
The present composition of Britannia metal at Birmingham is usually 90 tin + 8 antimony + 2 copper, without any zinc or bismuth; although some manufacturers deviate a little from this formula, by adding one or both of the metals last named. The manufacture was begun at Sheffield by Handcock and Jessop, in 1770; it reached Birmingham towards the close of the century, and made gradual progress. At first, the articles were made by stamping with dies, and soldering up into form; this being a slow operation, rendered the articles expensive. Afterwards, the curious process of *metal-spinning* was introduced; and this, with the subsidiary operation of swaging, rendered a great reduction in price possible.

In the spinning process, a thin sheet or piece of Britannia metal is placed upon a wooden model shaped like the article to be made; the model is made to rotate in a lathe; and burnishers and other tools are employed to press the yielding metal into all the curvatures of the model. Ductility is an essential quality to the attainment of this end with the metal; how complete it is, may be seen in such articles as Britannia metal teapots and dish-covers, the principal forms of which are not given by hammering, stamping, or casting, but by spinning. Besides spinning and swaging, the processes include stamping, soldering, casting, and polishing. When electro-plating was introduced, an increased use of Britannia metal arose, as it forms a good ground or basis for the deposited silver. Britannia metal spoons and ladles, made by casting, stamping, and burnishing, have been nearly driven out of the market by German silver; but the former metal is more largely used than ever for hot-water jugs, soup tureens, gravy-dishes, vegetable and side dishes, dram bottles, drinking-cups, sandwich cases, wine-coolers, soap-boxes, liquor-frames, cruets, waiters, trays, &c.; and as a basis for electro-plate. Birmingham is the chief seat of the manufacture.

BRI'XHAM, a market-town and seaport of Devonshire, England, beautifully situated on the south side of Tor Bay, 5 miles south from Torquay, and 22 miles directly south from Exeter. The town occupies the sides of two hills, and is divided into two parts, called Upper and Lower B., the former consisting chiefly of a long straggling street. Some of the more recently erected parts of the town are well built, and contain good houses, but the older parts are mean. The prosperity of B. depends chiefly on its fisheries, it being the head-quarters of the great Devonshire fishery of Torbay, in which many vessels are employed, mostly trawlers, of which there are about 200. These are decked sloops of 40 to 50

tons burden, and generally managed by three men and a boy. Great quantities of fresh fish are sent to London, Bath, and Bristol. Considerable quantities of iron ore are raised in the neighborhood and shipped here. B. has also a number of vessels engaged in the coasting and foreign trade, the foreign trade being chiefly with the Mediterranean. The Admiralty have an establishment here for watering the navy. Near B. is a station of the South Devon branch of the Great Western Railway. It was at B. that the Prince of Orange, afterwards William III., landed, November 4, 1688. Pop. (1871) 4941.

BRITANNIA TUBULAR BRIDGE, a railway bridge over the Menai Strait, remarkable alike for its gigantic dimensions, and as being the first construction of the kind ever undertaken. With a view to facilitate communication with Ireland, *via* Holyhead, the directors of the Chester and Holyhead Railway in 1845 sought the aid of Mr. Robert Stephenson, the great engineer, to bridge the strait with such a structure as should admit of the safe passage of heavily laden trains without in any way interfering with the navigation of the channel. About a mile above the suspension-



Britannia Tubular Bridge.

bridge, and nearer Carnarvon, a rock in the middle of the strait rose ten feet above the water at low tide; and on this site, provided by nature, it was resolved to erect the bridge in the form of a rectangular tube, composed of wrought-iron plates riveted together in a manner to combine the greatest strength with the greatest lightness. See STRENGTH OF MATERIALS and TUBULAR BRIDGES. In the spring of 1846, the undertaking was commenced; by the 22d of June 1849, the Britannia Tower on the rock in the center of the strait was completed (height, 191 feet 6 inches above high-water mark). Other two towers, some 18 feet lower, were erected on each side of the Britannia Tower; thus dividing the space into four spans, of which the two center ones are 460 feet each, the other two being comparatively narrow. The short tubes between the abutments and the shore towers were constructed, by means of strong scaffolding and stages, in the places they were to occupy when finished; the long central itubes were built at the water-edge, from whence they were floated off on pontoons to the base of the towers, which had grooves or recesses made to receive them, and then elevated gradually (supports being built under their ends as they ascended) by powerful hydraulic presses to the requisite height, 102 feet above high-water mark.

On the 13th of October 1849, the first long tube, 472 feet in length (12 feet being allowed for the rest at both ends), and about 1800 tons in weight, was safely fixed at its proper height above the sea. The other center tube was got up by December; and on the 5th of March, 1850, a train swept through, and the bridge was open for traffic. In August the parallel line of tubes was completed, and the up and down trains could now pass over the Menai with as little delay and danger as over any other part of the line. The total length of the bridge is 1841 feet, of the tubes, 1513 feet. The extreme height of the tube at the Britannia Tower is 30 feet, diminishing to 22 feet 9 inches at the abutments, 'the difference being made to give a true parabolic curve to the top while the bottom is straight.' Inside, the width is 13 feet 8 inches throughout, and the height 26 feet at the middle, and 18 feet 9 inches at the ends. To provide for the expansion and contraction of the metal, the bed-plates in the shore towers and in the abutments, on which the tubes rest, are made to move freely on cast-iron rollers and balls. This precaution, for securing free movement to the tubes, was not unnecessary, as it has been found that between the expansion of summer and contraction of winter there is a difference of fully 12 inches. The total weight of iron used was nearly 12,000 tons, of which the tubes contain 9360 tons of malleable iron, 1015 tons of cast iron, and 175 of permanent railway. In their fabrication 186,000 different pieces of iron, fastened together by more than 2,000,000 rivets, were used; and in the towers, abutments, &c., there is 1,492,151 cubic feet of masonry. The total cost was about £602,000. The whole structure was completed in less than five years. See TUBULAR BRIDGE.

BRITA'NNICÆ I'NSULÆ, a term used by ancient classic writers previous to Cæsar for the British Isles, including Albion (England and Scotland), and Hibernia or Ierne (Ireland), with the smaller isles around them. Aristotle, in the beginning of the 3d c. B.C., knew only of Albion and Ierne. Cæsar, about 54 B.C., was the first to apply the name Britannia to Albion. Ptolemy, in the 2d c. A.D., is the first to apply Little Britain to Ierne or Ireland, and Great Britain to Albion or England and Scotland. Herodotus, in the 5th c. B.C., is the first writer to mention Britain with any sort of definiteness; previous Greek writers speak of Britain only in connection with the Phœnician tin trade carried on with the Cassiterides or Tin Isles (the Scilly Isles and Cornwall), which they often confound with the Azores. The Phœnician trade with the British Isles began about 1000 B.C., the Phœnicians giving the native Britons salt, skins, and bronze vessels in exchange for tin and lead. Ptolemy enumerates 52 different Celtic or Gaelic tribes as inhabiting Britain in his time. See CELTIC NATIONS.

BRITISH ARMY. In ARMIES MODERN, a succinct account is given of the relative strength and organization of the chief European armies, with the exception of that of the British empire, reserved for consideration in the present article.

Like other modern armies, the British army originated in the feudal system (q. v.). When regal power, tempered by parliament, superseded that system, the people, according to their rank in life, were expected to provide themselves with certain kinds of weapons and defensive armor. The justices of the peace were empowered to see to these military duties of the people. When the nation was either actually engaged in war, or apprehensive of invasion, the sovereign issued commissions to experienced officers, authorizing them to draw out and array the fittest men for service in each county, and to march them to the sea-coast, or to any part of the country known tobe in most danger. See ARRAYER. It was in the time of Henry VIII. that lord-lieutenants and deputy lieutenants of counties were first appointed as standing-officers for assembling and mustering the military force. During the earlier years of the Tudors, contracts were made by the king with 'captains,' who undertook to provide, clothe, and feed so many fighting-men for a given money-allowance; but the power intrusted to the lord-lieutenants gradually changed this system, in relation at least to home defence. In the reign of Charles I., the important question arose, whether the king of England did or did not possess the right to maintain a military force without the express consent of parliament? and this question was all the more bitterly discussed when the king billeted his soldiers on the people. After the troubles of the civil wars and the Commonwealth, Charles II. found himself compelled to agree, on his Restoration, to the abandonment of all the army except a kind of body-guard or household brigade of 5000 men, sanctioned by the parliament, In the 13th year of his reign, he succeeded in obtaining a statute, declaratory that 'the sole and supreme power, government, command, and disposition of the militia, and of all forces by sea and land, and of all forts and places of strength, is the undoubted right of his majesty; and both or either of the Houses of Parliament cannot nor ought to pretend to the same.' Both Charles II. and James II. found, however, to their mortification, that this statute did not in effect give them so much real military command as they had wished and intended—because the Commons, by holding the purse, virtually held the power.

It was in the time of William and Mary that the real basis for the modern B. A. was laid. The DECLARATION OF RIGHTS (q. v.) settled, in positive terms, 'that the raising and keeping of a standing army in time of peace, without consent of parliament, is contrary to law.' The first MUTINY ACT (q. v.) was passed in 1689, to last for six months only; but it has been annually renewed ever since, except in three particular years; and it constitutes the warrant on which the whole military system of England is exercised by the sovereign, with the consent of parliament. Since then, with only three interruptions, the ministers of the crown have annually applied to parliament for permission to raise a military force, and for money to defray the expenses. The Sovereign can make war, and can bestow military employments and honors; but the Commons, as the representatives of the tax-paying nation, provide a check on the grasping by courtiers of military privileges. The law on army regulation has been revised, and the B. A. made the subject of special legislation in the Army Discipline Bill passed in 1879.

The great distinction between the B. A. and that of almost every other state in Europe, is that the service is *voluntary*. The subjects of the crown engage, by free choice, to serve in the army for a definite number of years. In the rare cases where forced service by ballot is obtained, it is in the militia, not the regular

army. See MILITIA. The British soldier has much hard colonial life to bear, and many long voyages to make; he is, moreover, almost entirely shut out from the chance of being a commissioned officer. As a consequence, the ranks are mostly filled from the more necessitous classes of the community—by those who from want of steady habits, or of education, are the least fitted for industrious pursuits; whereas in France and many other foreign countries, the profession of arms is regarded as an honorable one, of which even the private soldier feels proud. Mr. De Fonblanque, comparing the peace establishments of the chief European armies in 1857, found that of England to be the smallest in ratio to population, but the most costly in relation to its strength. The English ratio was 1 in 128; the French, 1 in 95; the Prussian, 1 in 80; the Russian, 1 in 72; the Austrian, 1 in 68. An English private soldier costs the country £52 per annum; French, £36; Prussian, £31; Austrian, £18, 10*s*.; Russian, £13, 5*s*. The English cost per man is still higher now than it was in 1857, on account of increased attention being paid to the well-being of the soldier.

The B. A., in all its completeness, is supposed to be commanded by the Sovereign, assisted by the Secretary of State for War in some matters, and by the officer commanding in chief in others. The component elements are the household troops; the infantry of the line; the cavalry of the line; the ordinance corps, comprising artillery and engineers; other bodies of native troops, maintained out of the revenues of India; the militia; the yeomanry cavalry; the reserve; the volunteer artillery and rifles; and sometimes during war, foreign legions. The 'peace establishment' of the B. A. varies according to the political aspect of affairs abroad, and to the strength of the economizing principle at home. In 1814, when England was engaged in tremendous contests abroad, the regular army reached 200,000 men, exclusive of fencibles, foreign legions, and militia. In the first few years after the termination of the great war against Napoleon, the reductions in the B. A. involved the compulsory retirement of no less than 10,000 military officers, who thereupon went on half pay; these, by filling vacancies, transfers and deaths, have nearly disappeared. The elasticity which permits the enlargement or contraction of the army arises from varying, not so much the number of regiments, as the number of battalions in a regiment, of companies in a battalion, or of men in a company. If we compare the strength of the regular army at various periods between 1820 and 1879, we shall find that the actual number of regiments has varied but little. But of late the 110 line regiments have been reorganized as 71 (of linked battalions). For this and connected changes, see WAR SERVICES.

The strength of the B. A. declined from 1815 to 1835, since when it has increased. These augmentations have been occasioned partly by our wars, and partly by a sense of insecurity amid the vast armaments of the continent. In compaing the strength of the forces at different periods, much confusion is apt to arise from different modes of interpreting the words 'British army.' This designation may include the whole of the royal troops in India, whether supported out of imperial or of Indian revenues; it may include the militia, the volunteers, the yeomanry cavalry, the foreign legions—or it may exclude any one or more of these. The 'British army,' and the 'military force of the British empire,' are often treated as convertible terms: to the production of much confusion where actual numbers are given. In the following table, relating to the official year 1879—1880, it is shown of what component elements the B. A. now consists. The militia and the volunteer corps are not here included.

BRITISH ARMY VOTED FOR 1879—1880.

	Home and Colonies.	India.		Total British Army.
Horse Artillery	3,131	2,478	=	5,609
Cavalry, including Household Cavalry	12,907	4,312	=	17,219
Artillery	19,225	9,667	=	28,892
Engineers	5,198	428	=	5,626
Infantry, including Foot Guards	76,366	45,768	=	122,134
Service Corps	2,990	..	=	2,990
Colonial Corps	2,485	..	=	2,485
Army Hospital Corps	1,745	..	=	1,745
Additional force in consequence of reinforcements to Natal	3,900	..	=	3,900
	127,947	62,653		190,600

Under the column 'India,' are included only those troops of the royal army which are *lent* to India, and paid for out of Indian revenues; the other military forces in that region are enumerated under EAST INDIA ARMY. Of the total 190,600 forming Her Majesty's forces, 7980 are officers; 16,550 non-commissioned officers, drummers, and trumpeters; and 166,070 rank and file. There are voted for the use of this army, 11,325 horses. The total cost cannot well be estimated per head; because, besides pay and sustenance for the soldiers, there are stores and wages for fortifications and military buildings, military weapons and combustibles, and the various kinds of half-pay and pensions. The total expenditure sanctioned by parliament may, however, conveniently be thrown under four headings, and given in round numbers as follows:

Pay and Allowance of Combatants	£4,944,200
Auxiliary and Reserve Forces	1,258,500
Stores and Works of every kind	6,817,200
Pensions, Militia, Volunteers, &c	2,625,800
	£15,645,700

—being the charge for a *peace* establisment, in which to admit of expansion for actual war, the upper ranks (which cannot be summarily created) are disproportionately large. For the sum taken in aid of the Army Estimates to meet the expenses for raising and training the recruits, and for the non-effective services of the European army serving in India, a separate estimate was presented (1879–80), amounting to £1,100,000.

All the component elements of the army, in *personnel* and *matériel*, and the organization and duties of the troops, will be found noticed under their proper headings. The total military strength of the United Kingdom—including all the various kinds of force, also India and the colonies—comprised the following in 1879:

Regulars (including India and the Colonies)	190,600
Army Reserve, 1st Class	22,000
" 2d "	24,000
Militia (including permanent staff and militia reserve)	137,556
Yeomanry Cavalry	14,614
Volunteers (including staff)	244,263
	633,033

BRI'TISH ASSOCIATION, an Association whose object is, by bringing together men eminent in all the several departments of science, to assist the progress of discovery, and to extend over the whole country the latest results of scientfic research. A prevailing impression that England had fallen behind other countries, both as to the general estimation in which scientific men were held, and the prosecution of science itself, led to its formation. It was thought that an imposing union of men of science with the nobility, gentry, and clergy might tend to revive the philosophic spirit of the country. Such meetings had already taken place in Germany, and probably suggested the idea of this institution. Many leading men of the age took part in its formation, but the honor of being its founder must be ascribed to Sir David Brewster. By his exertions the first meeting of those who were favorable to the design was held at York in the year 1831. The Archbishop of York, the mayor and council of the city, entered warmly into the project. At this meeting the constitution of the society was determined, the several sections had their provinces assigned to them, and subjects were proposed on which reports were to be drawn up and read at the ensuing meeting. This took place at Oxford in 1832. The university had cordially welcomed the new Association, the papers read gave it a high character, and from this date it may be said to have been in complete and successful operation. The jubilee meeting was held at York in 1882. An enumeration of the several sections of the society, each of which has its own committee and president, will show the wide range of topics it embraces: Section A., Mathematical and Physical Science; B., Chemistry; C., Geology; D., Zoology and Botany, including Physiology; E., Geography and Ethnology; F., Economic Science and Statistics; G., Mechanical Science.

At the close of each meeting, it is determined at what town in the United Kingdom the next shall be held, and a president of the whole Association is appointed, who delivers an inaugural address, in which he is expected to present a general survey of the latest advances of science. The rules and by-laws of the society, it is not necessary here to particularize; but it should be mentioned that the subscriptions of a continually increasing membership have placed at its disposal a large fund, which has been expended in the prosecution of science. In many cases, as in long astronomical calculations, or extensive meteorological observations, the labor of subordinates is required, and a certain apparatus, and it is in defraying such expenses that the funds of the B. A. are very wisely employed.

Besides the immediate ends sought to be obtained by such an Association, its utility will be evident if we reflect on the intimate connection that exists between the several branches of science; and the impossibility there is that one mind can be thoroughly conversant with them all. He who now hopes to make discoveries in science must limit himself to a few chosen studies; and yet such is the interlacing of all the several branches of inquiry, that he must often find it indispensable to know the last results of each. The botanist or the physiologist must consult the accomplished chemist; the chemist must call in the aid of those who have specifically studied the action of heat, light, and electricity; the geologist needs them all, and is in turn consulted by them all.

Thus, a certain brotherhood of science is formed, in which each has his specialty, and yet each leans upon his brother.

In ancient times it was otherwise. The facts on which a philosopher speculated were those which lay open to the eyes of all. A Thales could see the rain fall and plants grow, and forthwith pronounce that the vital energy of all things was to be found in water. He could exercise his imagination in perfect independence of the labor of all other men. The philosopher of modern times cannot move a step without a careful consideration of the theories of his predecessors and contemporaries; he has to take notice of the innumerable facts brought to light by various observers, aided by those artificial arrangements which convert observation into experimeut.

Two classes of men, of the most opposite character, are greatly aided by an Association such as this. The humble and plodding workmen are taught where their patient industry will most avail; they are cautioned against re-discoveries; they are told where their love for collecting or experimentalizing may be best applied. And that other class of men, who generalize, who ever seek to embrace all the multifarious facts of science under a few great laws—these are provided with the very last intelligence from every department of inquiry, and may forthwith proceed to weave it into their own comprehensive scheme.

Nor are we to overlook the benefit which the whole community derives from the rapid dissemination of the latest results or speculations of philosophy. Not only do our idle and fashionable, as well as our manufacturing towns and our universities, welcome the meetings of the B. A., but from this *Parliament of Science* the utterance of scientific opinion goes forth over the whole kingdom through the agency of the press. Within three days after one of its meetings, there is not a workshop or a tea-table in the country that has not derived from it a new topic of conversation. This kindling of an interest in science, through the whole population we regard as amongst the greatest advantages of the British Association.

BRITISH EMPIRE. See GREAT BRITAIN and IRELAND.

BRITISH GUM, DEXTRINE, or LEI'OCOME, is a substance extensively employed by calico-printers and others for the thickening of colors, instead of the much more expensive gum arabic. It is prepared from potato-starch (q. v.) or sago-starch by passing the grain through iron cylinders at a temperature about 500° F. It differs from starch in giving no blue color with tincture of iodine, and in being readily soluble in water, and thus yielding a thick liquid resembling in consistence mucilage (strong solution of ordinary gum). B. G. is the material which is produced by baking in the crusts of loaf-bread (q. v.), and which communicates to them their very agreeable taste.

BRI'TISH MUSE'UM. The British Museum, an important national institution in London, originated in a bequest of Sir Hans Sloane, who, during a long lifetime, gathered an extensive and, at the time, unequalled collection of objects of natural history and works of art, besides a considerable library of books and manuscripts. These, in terms of his will, were offered, in 1753, to the government, on conditon that £20,000 should be paid to his family, the first cost of the whole having amounted to more than £50,000. The offer was accepted; the necessary funds were raised by a lottery ! and the collection, along with the Harleian and Cottonian Libraries were arranged in Montague House, which had been purchased for £10,250. The new institution, thenceforth called the BRITISH MUSEUM, was opened in 1759. From time to time, purchases and donations succeeded each other rapidly. Montague House sufficed for the reception of all these acquisitions, till the Egyptian antiquities arrived in 1801. The purchase of the Townley marbles in 1805, necessitated the erection of a gallery for their reception. This, however, did not meet the increasing demand for space. The old house was condemned, and plans were prepared by Sir R. Smirke for new buildings; but none were undertaken till 1823, when the eastern wing of the present building was erected for the reception of the library of George III., which had been presented to the Museum by George IV. The subsequent progress of the work was very slow. The building was completed in 1847. It is a hollow square, whose sides are opposite to the four points of the compass.

Throughout the exterior of the building, the Grecian Ionic is the order of architecture adopted. The principal front is towards the south, facing Great Russel Street, and presents an imposing columnar façade, 370 feet in length. The great entrance-portico, in the center, is composed of a double range of columns, 8 in each range. The columns are 5 feet in diameter at their base, and 45 feet in height. The tympanum of the portico is ornamented with an allegorical sculpture by Westmacott, typical of the progress of civilization. On either side of the Museum, there is a semi-detached house, containing the residences of the chief officers of the establishment. These give an additional length of 200 feet, making the whole length of the structure 570 feet. The interior of the building is admirably adapted to the purposes for which it is devoted. Some of the galleries, from their size and dimensions, have a very imposing appearance, as the King's Library, the Bird Gallery, &c. The grand entrance-hall is a noble and lofty apartment, built in the massive Doric style: it contains a statue of Sir Joseph Banks by Chantrey, and an ideal representation of Shakspeare by Roubilliac.

Scarcely had Smirke's plans been carried out, when demands were made from several of the departments for more accommodation. Additions have accordingly been made, rooms having been provided for the print department, and several new galleries for the recent acquisitions of antiquities; but the most important addition, is the magnificent reading-room which has been erected in the internal quadrangle. In no department of the Museum was additional accommodation more needed than in the library. The number of readers had increased beyond the means of accommodation, and so short of space were they for books, that the estimates for purchases were restricted to only the half of the sum which the trustees considered desirable, for the sole reason that the library would be inadequate for the reception of extensive additions. After considerable delay, and the consideration and rejection of several plans, nothing was done till Mr. Panizzi, at that time keeper of the printed book department, suggested a plan which promised to meet the important requirements of speedy erection and economy in cost. The plan was at length adopted, and the result is a building than which none are better, few perhaps so thoroughly adapted to the purposes for which it is intended. Parliament voted the first grant for it in 1854. It was opened in 1857. The total cost was about £150,000, which includes the fittings and furniture, and the necessary shelves for immediate use. The building was erected in the interior quadrangle, which it completely occupies, with the exception of an interval of about 28 feet all round, necessary for lighting and ventilating the surrounding building.

The reading-room is circular. It is constructed principally of iron, with brick arches between the main ribs. The dome is 106 feet, in height, and its diameter 140 feet, being second only to the Pantheon of Rome, and that but by two feet. The use of iron has economized the space to an extraordinary degree, for while the piers which support the Pantheon fill 7477 feet, those on which the reading-room rests occupy only 200 feet. Equally remarkable has been the saving of space in the fitting up of the library. The shelves are formed of galvanized iron plates, edged with wainscot, and covered with leather, and are supported on malleable iron standards. In all the cases except against the external walls, the bookcases are double, a lattice of iron-work being fixed for the longitudinal separation of the books. Thus, throughout the whole interior of the new building, walls are dispensed with, the divisions being in all cases formed of the double ranges of books. The building contains three miles lineal of bookcases eight feet high. Assuming them all to be spaced for the average octavo book size, the entire ranges form 25 miles of bookshelves, and would accommodate 1,000,000 such volumes. In addition to this, the dome-room, which is the reading-room, has accommodation for 60,000 volumes. This magnificent room contains ample accommodation for 300 readers. Each person has a space of 4 feet 3 inches long. He is screened from the opposite occupant by a longitudinal division, which is fitted with a hinged desk, graduated on sloping racks, and a folding-shelf for spare books. In a recess between the two are placed inkstand and penholders, thus leaving the table unencumbered. By an ingenious contrivance, one part of the iron framework is made to distribute fresh air in the summer and heated air in the winter. The vitiated air is conveyed through apertures in the soffits of the window, into one of two separate spherical and concentric chambers which extend over the whole surface of the roof, and escapes through outlets around the lantern.

The other chamber, between the external covering of copper and the brick vaulting, has for its object the equalization of temperature, during extremes of heat and cold out of doors. Every modern improvement, in short, has been applied when it could be serviceable for the comfort or convenience of the readers. Much praise is due to the architect and builder, but a larger share is owing to the late Sir A. Panizzi, who not only supplied the original design, but daily, almost hourly, superintended the progress of the work, continually suggesting little improvements, and in the end, producing a room which is admired by all who use it. It is now lighted at night by the electric light.

This building, while supplying amply the demands of the printed book department, did nothing to meet the requirements of the other departments. Various schemes have been suggested; the best, and perhaps in the end the cheapest, of securing the ground immediately arouud the Museum, has been given up, and the trustees resolved to erect a building, to be devoted entirely to Natural History—that is to say, to the departments of Botany, Zoology, Geology, and Mineralogy—on the site occupied by the International Exhibition of 1862. Parliament voted in the year 1873, £80,000 for this purpose, and a beginning was made by the

contractor. The whole cost of the new building very nearly reached the sum of £400,000. This elegant new terra-cotta building, situated in the Cromwell Road, near South Kensington Museum, was designed by Mr. Alfred Waterhouse.

Contents.—At first, the contents of the Museum were arranged under three departments—Printed Books, Manuscripts, and Objects of Natural History. Under the last head were included the antiquities, works of art, &c., comprised in the Sloane collection, their number being too scanty to entitle them to constitute a separate department. The progress of the Museum has caused a more precise division of its contents. From time to time, the number of the departments has been increased, so that, instead of three, there are now twelve—viz., Printed Books, Maps, Manuscripts, Prints and Drawings, Oriental Antiquities, Greek and Roman Antiquities, Coins and Medals, and British and Mediæval Antiquities and Ethnography, Zoology, Botany, Geology, and Mineralogy. In noticing the contents of the Museum, we shall refer to them in this order. We can but allude here to the most important portions of the collection, and must refer for more particular information to works specially devoted to this subject; such as the various handbooks and catalogues prepared by the officers of the Museum.

Printed Books.—This is the largest department in the Museum. It occupies the whole of the ground floor on the north and east sides, the new building erected in the quadrangle, and a considerable portion of the basement of the Museum. The keeper of the department has the help of four assistant-keepers and about 50 assistants. There are in addition upwards of 50 attendants.

The original bequest of Sir Hans Sloane consisted of 50,000 volumes. When these were placed in Montague House, a small collection of 2000 volumes, bequeathed to the nation by Major Edwards in 1738, was added to them. In 1757, George II. presented the library of printed books which had been collected by the kings of England since Henry VII., and which included the libraries of Cranmer and Casaubon. He also annexed the important privilege, which the Royal Library acquired in the reign of Queen Anne, of being supplied with a copy of every publication entered at Stationers' Hall. By this means, the library has been supplied with the current British literature without expense or trouble, and the trustees have been able to devote the funds of the Museum to the purchase of the earlier literature of the country and foreign publications. Among subsequent additions to the library, may be mentioned the voluminous collection of pamphlets, &c., relating to the civil wars of England between 1640 and 1660, presented by George III.; the musical libraries of Sir J. Hawkins and Dr. C. Burney; Garrick's collection of old English plays; Dr. Bentley's collection of the classics, annotated by his own hand; the law library of F. Hargrave; Sir J. Banks's valuable and extensive collection on natural history; and a large mass of tracts and pamphlets relating to the French Revolution, purchased from J. Wilson Croker, and of very great value. The most important addition was made in 1823, when George IV. presented the splendid library that had been collected by his father during his long reign, at an expense of little less than £200,000. This library, which, from the terms of the gift, cannot be mixed with the general collection, occupies a large and handsome hall, extending along the whole of the ground-floor of the eastern side of the Museum. It is undoubtedly the finest and most complete library ever formed by a single individual. 'It contains,' says Sir H. Ellis, 'selections of the rarest kind, more especially works of the first ages of printing; it is rich in the early editions of the classics; in books from the press of Caxton; in the history of the states of Europe, in the languages of the respective countries; in the transactions of academies; and in a grand geographical collection.' The magnificent library of the Right Honorable Thomas Grenville, in importance second only to the King's Library, was bequeathed to the Museum in 1846. It consists of 20,240 volumes, which cost upwards of £54,000.

In the same year was obtained also the extensive collection of Chinese works, amounting to 11,509 volumes, which belonged to Robert Morrison. By purchases, bequests, and donations, the library has become one of the first in the world, containing now over 1,300,000 printed volumes. See LIBRARIES. But even this figure large though it is, does not represent the immense collection of separate and distinct articles in tracts, pamphlets, and manuscripts. The British Museum Library is (with the exception, perhaps, of the National Library of Paris) the largest collection of printed literature in the world. Since the opening of the new reading-room, and the consequent acquisition of the book-accommodation, the want of which long hindered the proper increase of the library, the rate of increase has been enormous. During the year 1880, there were added 27,543 volumes, including music and volumes of newspapers, of which 2379 were presented, 15,361 purchased, 8857 acquired by home copyright, and 941 by international copyright. The number of parts of volumes was 39,873. In addition, the library had accumulated numerous miscellaneous articles. The pieces of music added were 5911 complete works. The total number of articles received during the year amounted to 76,774. About 2000 sets of newspapers were added.

A catalogue of the printed books in seven octavo volumes, was published in 1813—1819. So great have been the additions to the collection since the publication of that catalogue, that the interleaved copy of it, in which the new entries were made, had expanded in 1846 into 82 folio volumes. This is now superseded by one general MS. catalogue, contained in upwards of 2000 folio volumes. The plan of printing the title slips was adopted in 1880; and a printed catalogue is in progress. There are separate catalogues of the Grenville Library, in 6 volumes; of music, in 126 volumes; of newspapers in 4 volumes; of the pamphlets in the King's Library, in 9 volumes; and of the pamphlets published during the Civil War and Commonwealth, called the 'Thomason Collection,' in 12 volumes, all folio. These various catalogues are placed in the central circular stands in the reading-room, for consultation by readers. Here also are copies of the catalogue of the books of reference, arranged around the wall of the room, to which the readers have free access without the intervention of an official. These books, forming a library of 20,000 volumes, have been carefully selected to represent all the different branches of knowledge. The facility of consultation has been increased by the employment of different colors in the binding, corresponding to the colors of a hand-catalogue scattered throughout the room. Thus theological works are bound in blue, historical in red, philosophical in green, and so on.

The right of access to the library is easily obtained. Any person desiring it, is 'to apply in writing, addressed "To the Principal Librarian of the British Museum," and not otherwise, specifying his description and place of abode, and accompanying his letter with a written recommendation satisfactory to an officer of the Museum.' Formerly, the right of admission was granted only for six months at a time, and had then to be renewed. Under the new regulations, the ticket, once granted, does not require renewel; it can of course be withdrawn, and is not granted to persons under 21 years of age. When the reader has become well known to the officials, he is not even asked to show his ticket.

Maps.—The maps, charts, plans, and topographical drawings were separated from the library, to form a distinct department in 1867. There are over 50,000 published and 20,000 manuscript maps in the Museum. Many of the latter have thrown much light on the history of early geographical discovery.

Manuscripts.—The manuscripts are contained in several rooms in the south-east angle of the building. The work of the department is carried on by a keeper, assistant-keeper, a keeper of oriental manuscripts, and nine assistants. The manuscripts are for the most part bound in volumes, and placed in cases around the rooms. The collection consists of: 1. The Sloanean manuscripts, relating chiefly to medical and natural history subjects. 2. The Cottonian manuscripts, rich in documents referring to the history of Britain, including two of the originals of *Magna Charta*, in registers of English monasteries, and in original letters of royal and illustrious personages. This collection contains the *Durham Book*—a copy of the Latin Gospels, with an interlineary Saxon gloss, finished in the year 720. 3. The Harleian manuscripts, a collection rich in illuminated MSS., in ancient, civil, and ecclesiastical records, in manuscripts of the classics, among which is one of the earliest known copies of the *Odyssey*, and in early English poetry. 4. The manuscripts of the Ancient Royal Library. These were collected by our kings from Richard II. to George II.; many of them were obtained from the monasteries, on their destruction. Amongst the most valuable treasures here are the *Codex Alexandrinus*, a manuscript of the Bible written in uncial Greek, before the close of the 5th c.; and the *Basilicon Doron* of James I., in his own handwriting.

5. The Lansdowne manuscripts. This collection comprises the Burghley and Cæsar papers, the manuscripts of Bishop Kennett, and numerous valuable historical documents and state papers. 6. The Hargrave manuscripts, almost exclusively connected with law. 7. The Burney manuscripts, containing a large collection of the Greek and Latin classics. Among them is a copy of the *Iliad*, answering that of the *Odyssey* in the Harleian collection. 8. The Howard-Arundel manuscripts, obtained from the Royal Society. This collection is singularly rich in materials for the history of our own country and language. 9. The Oriental manuscripts, a collection composed of several purchases and bequests. It includes the manuscripts acquired by Mr. Rich while consul at Bagdad, and consists of numerous Syriac, Arabic, Ethiopic, and other oriental codices. A large series of Ethiopic manuscripts was obtained at Magdala, on the occasion of the Abyssinian war. 10. Additional manuscripts. This collection consists of innumerable bequests, donations and purchases, which from the establishment of the Museum have been and are still being acquired. Among recent additions may be specified a charter of William the Conqueror; the original mortgage-deed of a house in Blackfriars, dated 11th March 1612, and signed by William Shakspeare; the holograph manuscript of Scott's *Kenilworth*, and of many of Burns's poems, including the *Cottar's Saturday Night*, and the songs published in

Johnson's *Scots Musical Museum;* an extensive series of papal bulls; several *Books of Hours*, including the famous *Bedford Missal;* and a large collection of original letters and papers relating to the affairs of Scotland during the 16th and 17th centuries. Catalogues of the complete collections have at different times been published. The additions to the ever-increasing Oriental and Additional collections are at intervals published in supplements to each of the original catalogues. Copies of all these, with manuscript lists of the annual additions, are placed in the reading-room for consultation.

Supplementary catalogues were printed up till 1853; since then the additions have been kept up in manuscript catalogues. A general class catalogue, embracing all the collections, has been commenced, and the printing of it has begun. The first part is a catalogue of ancient and illuminated manuscripts, illustrated with photographic *fac-similes*, of which several volumes are published.

The right of using the reading-room includes the privilege of consulting the manuscripts. During 1880, the number of deliveries of manuscripts to readers in the reading-room amounted to 29,239; besides, the number consulted in the rooms of the department was about 6000. These numbers do not include the volumes exhibited to visitors on private days.

Prints and Drawings.—The collections of this department, managed by a keeper and two assistants, are kept in rooms in the north-west angle of the building. They consist of prints and drawings bequeathed to the Museum, in 1799, by the Rev. C. M. Cracherode; of those bequeathed in 1824 by Mr. Payne Knight; and of numerous smaller bequests and donations. No purchases were made for this department until about 1840, when a sum was first included in the estimates for this purpose. Since that time, the prints and drawings have been increasing at a rate equal to any of the other departments of the Museum. The collection is arranged in *schools*. 1. The Italian school, containing original drawings by Leonardo da Vinci, Raphael, Correggio, Tintoretto, Paul Veronese, Michael Angelo, Guido Reni, Salvator Rosa, and others. 2. The German school, containing drawings by Albert Dürer, Hans Holbein, Dietrich, Hollar, and others; and engravings by Lucas Cranach, Martin Sehon, Gauer, and others. 3. The Dutch school, containing several superb originals of Rubens, an extensive and nearly complete set of the works of Rembrandt, with many drawings by A. Cuyp, Teniers, Van Dyck, &c.; and engravings and etchings by Berghem, Lucas van Leyden, Rembrandt, Ostade, &c. 4. The French school, with drawings by Watteau, Claude Lorraine, &c., and etchings and engravings by Bourdon, Boisseaux, Le Prince, &c. 5. The Spanish school, represented by some drawings of Murillo, and others of less note. And, 6. The English school, containing drawings by R. Wilson, Wilkie, Stothard, Callcott, Gibson, &c.; a splendid collection of Hogarth's prints, and specimens of the works of Barlow, Gaywood, Raimbach, Finden, Worlidge, Geikie, &c.

This department contains also an extensive and very valuable collection of works in Niello; a beautiful silver cup, designed and carved by Benvenuto Cellini, and a wonderful stone-carving in alto-rilievo by Albert Dürer, representing the birth of St. John.

Oriental Antiquities.—Within the last ten years the objects in the Museum, included under the name Antiquities, have been divided into four departments. The first of them includes the Egyptian and Assyrian antiquities. The Egyptian monuments date from a period as remote as 2000 years before the Christian era, and come down to the Mohammedan invasion of Egypt, 640 A.D. The collection has been obtained chiefly from these sources: the antiquities which fell into the hands of the British army at the capitulation of Alexandria, presented by George III.; presents from General Vyse, the Duke of Northumberland, the Marquis of Northampton, Sir Gardner Wilkinson, and others; and acquisitions from the Earl of Belmore, Mr. Salt, and M. Anastasie. The sculptures are formed of granite and basalt; they represent human and allegorical figures, sometimes of colossal size. There are several beautifully sculptured sarcophagi. Most of the monuments are inscribed with hieroglyphics (q. v.). The key to this dead and forgotten language was furnished by the celebrated Rosetta Stone (q. v.), which is placed in the center of the gallery. The smaller Egyptian remains are exhibited in a gallery on the upper floor; they consist of objects relating to religion, as representations of divinities and sacred animals, in wood, metal, stone, and porcelain; of objects relating to civil and domestic life, as dress, personal ornaments, household furniture, artistic and writing implements, armor, and weapons of war, &c.; and of objects relating to death and burial, as mummies and coffins, with the scarabæi, amulets, and other ornaments found with them. A collection of papyri is exhibited on the north-west staircase, containing extracts from the ritual of the dead.

The Assyrian antiquities are contained in a suite of rooms recently erected on the outside of the Egyptian Gallery, and in a spacious room on the basement. The collection consists of sculptures excavated at Nimrud, Khorsabad, and Koyunjik by Layard in 1847—1850, and more recently by Rassam and Loftus, under the direction of Sir H. C. Rawlinson. The Nimrud sculptures are the oldest, belonging to a period ranging from 930 B.C. to 747 B.C. Those obtained from Khorsabad seem to have been executed under a monarch who reigned about 747—721 B.C., while the collection from Koyunjik belong to the time of Sardanapalus, apparently 721 B.C. and 625 B.C. The monuments consist chiefly of slabs of gypsum, alabaster, and limestone sculptured in low relief, the subjects being the exploits of the king whose palace walls they ornamented.

Many of the sculptures are covered with Cuneiform (q. v.) writing, which, by the labors of Rawlinson, Hincks, and Smith, has been deciphered, giving us a history of this remarkable people, and corroborating the narrative of the sacred Scriptures whenever they refer to the same event. See ASSYRIA. Besides the series of sculptures, the Assyrian collection includes a variety of smaller but highly curious and instructive objects, discovered at Nimrud and Koyunjik.

Greek and Roman Antiquities.—This collection occupies four apartments, which run parallel to the Egyptian Gallery. The Lycian Gallery contains a series of architectural and sculptural remains from ancient cities in Lycia, obtained by Sir C. Fellows in 1842–1846. In the next gallery are the remains of the famous Mausoleum (q. v.) at Halicarnassus, erected in honor of Mausolus by his widow Artemisia. These remains were discovered by C. T. Newton, Esq., in 1857—1859. In the same room are some remains of the Temple of Athene Polias at Priene, including the stone on which its dedication by Alexander the Great is inscribed. The Elgin Gallery contains the sculptures from Athens and Attica, the greater portion of which were obtained by the Earl of Elgin, and purchased from him by parliament in 1816 for £35,000. The most important series in the gallery is the decorations of the Parthenon (q. v.), which, notwithstanding their dilapidated condition, form the most valuable monument of Greek art which has descended to modern times. The gallery contains also sculptures and casts from the Temple of Wingless Victory, the Temple of Theseus, and the Erechtheum, at Athens. In an extension recently made to this gallery, are a colossal lion from Cnidus, and a drum of a sculptured column, and other remains, from the Temple of Diana at Ephesus. The Hellenic Gallery contains a number of antiquities brought from Greece and its colonies at different times. The most important are 23 slabs of a frieze sculptured in mezzo-rilievo, which, from the locality where they were found, are called the 'Phigalian Marbles.'

The gallery on the south side of the building is occupied with the Roman and Græco-Roman sculptures. The bulk of the collection was formed by Charles Townley, Esq., and purchased in 1805 for £20,000. Subsequent additions have been made by the bequest of the collection of R. P. Knight, Esq., in 1824, and by various purchases and donations.

The collection contains an interesting series of Roman portrait sculptures, and a very extensive mythological series, amongst which are some of universal fame—the Venus, Clytie, the Discobolus, and many others. A room on the basement is appropriated to mosaics and miscellaneous monuments, such as representations of animals, architectural and decorative fragments, and sacred and domestic implements. A fine collection from Southern Italy, exhibiting specimens of the arts of the Etruscans, Greeks, and Romans, was bequeathed to the Museum by Sir William Temple in 1856.

The collections of smaller remains are placed in a suite of rooms on the upper floor. They consist of—1. An extensive series of vases, commonly, though not correctly known as Etruscan, formed from the collections of Sir W. Hamilton and Mr. Burgon, from purchases at the sales of the Prince of Canino, M. Durand, and others; and from excavations in Sicily, Rhodes, and on the sites of Greek colonies in Cyrene and elsewhere. 2. A miscellaneous collection of terra-cottas, mural paintings, and other objects. 3. Bronzes of Greek, Etruscan, and Roman workmanship, consisting of sculptures, and various domestic and other articles, as candelabra, lamps, vases, horse-trappings, armor, &c. 4. The collection of engraved gems and gold ornaments now, since the addition of the Blacas and Castellani collections, perhaps the richest in the world.

Coins and Medals.—The very large collection of these objects is arranged in chronological order under five great divisions, viz.: Greek, Roman, Mediæval and Modern, English, and Oriental. The department is under the care of a keeper, assistant-keeper, and four assistants.

British and Mediæval Antiquities and Ethnography.—The British collection is arranged in chronological order. The oldest series contains the antiquities of the Stone and Bronze Periods, consisting of celts, daggers, swords, shields, and early pottery. The British-Roman antiquities comprise specimens of earthenware, lamps, and miscellaneous articles. A small collection of sepulchral urns, weapons, and personal ornaments represent the Anglo-Saxon period. The antiquities found in London, and be-

longing to Mr. C. Roach Smith, were some years ago transferred to this collection. The Ethnographical collection contains antiquities as well as objects of modern use.

In 1855 the extensive collections of antiquities and ethnography, belonging to Henry Christy, became the property of the Museum, having been bequeathed by their proprietor. Felix Slade bequeathed his valuable collection of glass to the Museum, and it is arranged so as to show the history of glass in all its branches.

Natural History Museum at South Kensington.—In 1856 the trustees united the Natural History departments under Professor Owen, who was then appointed superintendent of Natural History. In the spring of 1881 the new building erected at South Kensington, for the reception of the zoological, mineralogical, geological, and botanical departments, was opened to the public. The following departments, therefore, though nominally belonging to the B. M., now form the Natural History Museum at Cromwell Road, South Kensington.

[*Zoological Department.*—To give an idea of the contents of this and the other natural history departments, would be to write an epitome of the various sciences they illustrate. This department contains a collection of animals arranged in systematic order in the galleries, comprising stuffed mammals, birds, reptiles, and fishes, and the hard portions of radiate, molluscan, and articulate animals. A room is specially devoted to the fauna of Britain. In rooms on the ground and basement floors are arranged the collections of insects, of osteology, and of specimens preserved in spirits. An idea of the extent of the collection may be formed from the fact, that 142 separate publications, illustrative of the contents of the department, in the shape of catalogues, lists, &c., have been issued under the superintendence of the indefatigable past and present keepers. During the year 1880, there were added to this collection 24,283 specimens of animals, of which 4718 were vertebrata, 4206 mollusca and radiata, and 15,359 annulosa. In 1873, the unique and extensive collection of birds formed in the Eastern Archipelago by Wallace, was acquired by purchase.

Botanical Department.—The herbarium of Sir H. Sloane, the nucleus of this collection, consisted of about 8000 species, bound in 262 volumes. In 1820, the magnificent herbarium of Sir Joseph Banks was bequeathed to the Museum, and under the superintendence of the late Robert Brown, was transferred to two rooms prepared for it in the south-east angle of the building. The collection has since been rapidly increasing: during the year 1880, about 9000 species of plants were added; and in the year 1873, the late William Wilson's herbarium of British and foreign mosses was acquired by purchase. The collection contains an extraordinary number of typical specimens—the identical plants from which the original descriptions were taken by Linnæus, Aublet, Jacquin, Brown, Bentham, Bennett, and others. The exhibition rooms contain a series of specimens illustrating the most striking characteristics of the great divisions of the vegetable kingdom, arranged in order; and a series of fossil plants, the value of which is increased by the transparent sections showing their structure, which are placed beside them.

Geological Department.—This collection occupies the wall-cases of the principal gallery on the north side of the Museum. It contains an extensive series of the fossil remains of plants and animals from the various fossiliferous strata; it is especially rich in the fossils of the secondary formations. Amongst its more valuable contents may be mentioned the collections of Dr. Mantell, the Tertiary fossils collected by Dr. Falconer in India, and the remarkable fossil birds from New Zealand.

Mineralogical Department.—The minerals are contained in the table-cases in the Geological Gallery. They are arranged according to a chemical classification. Many valuable and unique specimens exist in the collection, which is rapidly increasing. In the year 1880, the number of specimens added was 324.

The expenses of the Museum are paid by grants of public money. According to the estimates, £136,432 were required in 1881—1882.

Admission to the Museum was at first obtained by printed tickets, which were delivered by the porter to persons making a written application. There could be no more than 45 visitors, at the utmost, per day, under the regulations then in force. Now, all who present themselves are freely admitted; and every week-day the Museum is visited by large numbers: as many as 43,000 holiday-folk have passed through the building in one day.

BRI'TISH NA'VY. Under NAVIES, MODERN, will be found a brief description of the chief navies belonging to the continent of Europe, and to the United States of America. The B. N. is separately treated in this place.

While the Romans occupied Britain, they were obliged to maintain a fleet of war-vessels on the coasts to protect it from the ravages of the Saxons, who were the pirates and bucaneers of those times. When the Romans had departed, and the Saxons became dominant, the coasts were infested by another naval power—the Scandinavian Vikings. It was Alfred the Great who first established what may be called a navy in this island, consisting of efficient vessels well manned, for protection, and not aggression. Ethelred made the building of a ship a condition for holding a certain acreage of land. William the Conqueror strengthened the navy by the institution of the CINQUE PORTS (q. v.). During the first three centuries after the Conquest, we read of British fleets of 240, 400, and even 730 sail—a proof that the vessels must have been very small even if there were no exaggeration of numbers. Until 1485, the fleets were collected just as wanted; but in this year, Henry VII. conceived the idea of a *permanent* navy to be ready at all times. He built the largest ship of the age, the *Great Harry*. Henry VIII. pursued the course established by his father, and still further strengthened the navy by instituting the Admiralty, the Navy Office, the Trinity House, and the dockyards at Woolwich, Portsmouth, and Deptford. The *Henri Grace de Dieu*, the largest ship built by him, was of 1000 tons burden; but most of the vessels were high, unwieldy, and narrow, with the guns nearly down to the water's edge. The ships of the navy presented an aggregate tonnage of 12,000 tons at the period of Henry's death. Elizabeth made a large increase in the navy; but they were not all royal ships which were sent to struggle against the Spanish Armada. James I. made many improvements in ship-building, by encouraging a distinguished naval architect, Phineas Pett. Charles I., who built the *Sovereign of the Seas*, of 100 guns, was the first to group the royal ships into rates and classes. Cromwell brought up the navy to the strength of 154 sail, including a large number of two-deckers.

Charles II. allowed it to fall into decay for a time; but his brother, the Duke of York, who afterwards became James II., not only restored it, but brought it to a higher state of efficiency and strength than ever. When William of Orange became king of England, he found a navy carrying 7000 guns and 42,000 seamen; he built many additional ships, some with as many as 80 guns, and established Plymouth dockyard. Queen Anne succeeded to the possession of a fine navy; which at her death had increased to 198 ships, mounting 10,600 guns, with a tonnage of 157,000 tons. George I. attended to the navy chiefly in repairing the ships after a period of war, and in supplying a new armament. George II. greatly added to the number of ships, established a naval uniform, and increased the renown of the B. N. during the war against Spain.

The long and eventful reign of George III. was especially distinguished by the achievements of the navy. When he came to the crown in 1760, he found himself in possession of 127 ships of above 50 guns, and 198 of 50 guns and under, manned by 70,000 seamen. These numbers, by building and by capture, were increased to 174 and 203 respectively, by the end of the American war. Throughout the European struggle, from 1793 to 1815, the B. N. exhibited a spectacle, for vastness and achievements, which had never before been equalled in any country. In the first nine years of this period, between 1793 and 1802, England lost by war 5 ships of the line and 46 smaller vessels; but she captured from the French, Dutch, Spaniards, and Danes, in various battles, 74 ships of the line and 519 smaller vessels; or rather, four-fifths of this number were captured, and one-fifth destroyed. Besides these more than 800 privateers were taken and destroyed by the English. Of the total number of captures, 144 ships of war were at once converted into British ships, and added to our navy. When war recommenced in 1803, England had 189 ships of the line, and 781 smaller ships of war; during the next seven years, the seamen varied from 100,000 to 120,000, and in 1810 the number was raised to 140,000. At all times, many of the ships of the royal navy are unemployed or out of commission; but it frequently happened during that great war, that England had 450 liners, frigates, and sloops, besides smaller armed vessels, employed simultaneously. The conquered vessels added to the navy between 1803 and 1815 were upwards of 100 in number.

After the termination of the great European struggle, a large number of ships of war were put 'in ordinary,' or out of commission, and their officers placed on half-pay. In 1820, the vessels in commission, in ordinary, and building, comprised 127 ships of the line, 311 frigates and sloops, and 27 smaller vessels; but in this total of 465, there were only 113 in commission. In the nineteen years that next followed, almost wholly years of peace, the total number of ships of the line, frigates, and sloops, decreased; the gun-brigs, shooners, and cutters increased in number; while the first germs of a new element, a *steam navy*, made their appearance.

The year 1839 must be viewed as a turning point in the history of the British navy. Twenty-four years of peace had thrown the memory of warlike achievements into the background; and the House of Commons had insisted on the lessening of these estimates which provide for armies and navies. It was now found, however, that both Russia and France had accumulated formidable navies. From that year to the present, the B. N., in common with the navies of other powers, has been undergoing a series of 'reconstructions.' First, ships of larger size, and carrying heavier

guns, were built. These ships were of immense power in the days of wooden broadsides, but are now useless for purposes of war. The next stage, from about 1853 to 1859, was the conversion of our force from a sailing to a steam navy. This became the era of great steam frigates of about 5000 tons, and of heavy armaments in a few great guns, of which the *Mersey*, 36 guns, may be taken as a leading specimen. With the introduction of rifled guns, of force hitherto undreamt of, came the necessity for armor-plated sides. The fighting part of the navy (i. e., the line of battle) changed once more after 1860 to low-sided vessels, clad in thousands of tons of iron plates. The *Warrior* was the first ship so built in England, and she was followed by a whole squadron similarly protected. Guns, however, went on increasing in offensive power; and whereas 5-inch plates were at first thought sufficient, now, 10-inch, 12-inch, 14-inch, and even 22-inch plates are necessary to exclude shot. Such a vast weight of armor all over a ship would sink any vessel of moderate dimensions. The principle of turret-ships is therefore becoming predominant, in which the greater part of the veesel, clad in comparatively light armor, is under water, or only just visible above the surface. The earliest formidable turret-ship was the ill-fated *Captain*, which, in 1870, capsized in the Bay of Biscay, and entombed 600 brave seamen, with the inventor Captain Coles. Ships of analogous construction with lower freeboard have been since built; and now the *Inflexible*, of 11,165 tons, carries 4 guns of 81 tons. Several of the Italian ironclads are yet more powerful. See TURRET-SHIPS, ARMOR-PLATES.

The expenditure on the B. N. greatly increased between 1839 and 1875, on account of the changes just adverted to. In 1839, the number of men and boys voted was little over 25,000; in 1881, it was about 58,800. Even as late as 1852, the expenditure was only £6,500,000, against £11,155,900, in 1882–83.

The B. N. is composed of some 75 ironclads, about 360 steam-vessels, and 120 sailing-vessels. In 1882 there were in commission 253 vessels. The unarmored ships comprise cruisers, despatch vessels, gun-boats, several large old-fashioned two-deckers, troop-ships for India, tugs, old-wooden vessels for harbor-service.

All matters about ships, seamen, &c., will be found under their proper headings. See TURRET-SHIP; also ARMOR-PLATES and WAR-SERVICES.

BRITTANY. See BRETAGNE.

BRITTON, JOHN, an eminent English topographical and antiquarian writer, the son of a small farmer and village shop-keeper, was born July 7, 1771, at Kingston-St.-Michael, near Chippenham, Wiltshire, and, losing his parents young, received but a scanty education. Some short notices which he had contributed to the *Sporting Magazine* brought him into acquaintance with its publisher, Mr. Wheble, who employed him to compile the *Beauties of Wiltshire*, which he did in conjunction with a young literary friend named E. W. Brayley. They also prepared the *Beauties of Bedfordshire* in the same manner. B. afterwards issued a more elaborate work, entitled the *Architectural Antiquities of England*. One of the most important of his subsequent publications was *The Cathedral Antiquities of England*, 14 vols. fol. and 4to, 1814—1835, with upwards of 300 highly finished plates. Altogether, his illustrated works of architectural and topographical description and antiquities number 87, besides others of a similar kind which he edited.

BRIVE, a town of France, in the department of Corrèze, pleasantly situated in the midst of vineyards, and shut in by a fine circular avenue of elms, about 15 miles south-west of Tulle. It has manufactures of woollen, cotton-yarns, &c. Pop. (1872) 8016.

BRIZA. See QUAKING GRASS.

BRIZURE, BRIZÉ or BRISÉ, terms used in heraldry to indicate that a charge is bruised or broken. See ROMPU.

BROACH, or BROCHE, an old English term for a spire springing directly from a tower without any intermediate parapet. Such spires are common in England, and in some places in Scotland, particularly in Fife.

Broach.

BROAD ARROW, a government mark, thus stamped, cut, or otherwise fixed on all solid materials used in Her Majesty's ships or dock-yards, and on government stores generally, in order to prevent embezzlement. The origin of the mark is obscure. Previous to the year 1698, the naval authorities prosecuted a dealer in marine-stores, for having in his possession certain stores bearing the B. A. of his majesty. The defendant allowed the evidence against him to go on, and when asked what he had to say, replied, that it was *very curious* that the king and he, as a dealer, should both have the same private mark on their property! The receiver of stolen goods was acquitted, and this led to the passing of the act 9 and 10 Will. III. c. 41 (1698), which enacts that persons in possession of naval stores, or goods of any kind marked with the B. A., or other marks therein mentioned, and usually employed in marking naval stores for the navy, shall forfeit all such goods and £200, and also pay costs. The mark is for iron, wood, &c., what the color-thread is for sailcloth and ropes, which enables the government to identify the smallest piece of such articles.

BROAD-BILL. See SHOVELLER.

BROAD-BOTTOM ADMINISTRATION, a name derisively applied to the ministry formed by Henry Pelham in 1744, because it professed to include all parties of weight and influence in the state in a grand coalition, and comprised no less than nine dukes. Thus for a time the Whig party were reunited, and even Tory support secured. The ministry was dissolved in 1754, by the death of Pelham, though several of its original members had seceded long before.

BROA'DSIDE, the simultaneous discharge of all the guns on one side of a ship of war. The fighting power of a ship used to be estimated by the weight of all the shot and shell that could be fired off at once from one side or half of the ship. Thus, the broadside of the old-fashioned *Duke of Wellington*, 131-gun war-steamer, amounted to 2400 lbs. With iron-clad turret-ships the term is inapplicable.

BROADSTAIRS, a quiet watering place in Kent, 2 miles E.N.E. of Ramsgate. The church dates from the 12th c. Near B. is a noble orphanage.

BROADSWORD is a sword with a broad blade, usually for cutting only, not for stabbing. See CLAYMORE.

BROCA, PAUL, the most eminent of modern anthropologists, was born in the Gironde in 1824. He studied medicine and became Professor of Pathology at Paris, and famous as a sugeon. He was founder and secretary of the Anthropological Society of Paris, founder and professor of the Anthropological Institute or School, and founder and editor of the *Anthropological Review*. He wrote several monographs, as on Strangulation and Hernia, on Aneurisms, on Anæsthesia, on Abscesses, on Hybrids, and on various anthropological subjects. He was leader of the evolutionist school in France. In the last years of his life, he was made a life member of the senate. B. died 9th July 1880.

BROCADE. This term is used to describe a silken fabric on which a figure of any kind is formed by the threads of the warp or weft being raised by the heddles, or, more, generally, by the Jacquard-loom, in such order as to produce the pattern required. The word has much the same application to silk textures that damask has to linen textures or to worsted textures for upholstery uses. See WEAVING, and JACQUARD-LOOM.

BROCAGE BONDS, or bonds securing a reward for the promotion of a marriage by influence to be used, are void by the law of England and of Scotland.

BRO'CCOLI, a well-known and much esteemed garden vegetable, one of the many varieties which cultivation has produced of the *Brassica oleracea*, the common kale or cabbage. B. is said to have been originally brought to Italy from Cyprus about the middle of the 16th century. Its name is Italian. It differs little from Cauliflower (q. v.), of which it may be considered a mere variety, having colored instead of white heads, and a deeper tinge of color in the leaves, being also more hardy, the character from which its chief importance is derived, as it can be readily obtained at seasons when there is no cauliflower in the open garden. It is perhaps inferior to cauliflower, however, in delicacy of flavor.

There are many subvarieties, the number of which is, of course, continually increasing; and some of these are preferred for early spring sowing, with a view to an autumn crop; others for later sowing, with a view to a crop in the following spring. The subvarieties differ in size, in their more cut or entire leaves, in the greater or less degree of color—generally purple—with which the leaves are tinged, in the more or less compact form of the whole plant, in the more or less green, yellow, or purple color of the head, &c. Some of the kinds of B. preferred for late sowing and spring use are known by the general name of Cape B., the first of them being said—but on doubtful authority—to have been introduced into Britain from the Cape of Good Hope. The mode of cultivation of B. pretty much resembles that of cauliflower, except as to the times of sowing and transplanting, and that it is generally—even in Scotland—sown in the open ground, and not in a hotbed. A similar richness of soil is required. Various modes of protection in winter are adopted. In mild winters, protection is scarcely or not at all needed, but precautions are generally employed against severe weather. It is found very advantageous to plant in trenches of 6 inches deep, and to earth up the plants, as they are thus not only in some measure preserved from frosts, but also from the winds of winter, which are apt to shake and loosen plants, so as to cause their destruction. It is a common practice

to take up some of the most advanced plants in the beginning of winter, and to lay them in a sloping position with their heads towards the north. The heads produced in this way are not in general so large as they might be, but they are sometimes procured when otherwise they probably would not.

BROCHURE, a French word (from *brocher*, to stitch), equivalent to the English word Pamphlet (q. v.)

BRO'CKEN (*Mons Bructerus*, *Melibocus* of the ancient Romans), popularly known as the *Blocksberg*, is the highest summit of the Harz Mountains. It is situated in the province of Saxony, Prussia, about 20 miles west-south-west of Halberstadt, and has an elevation of 3740 feet above the sea. The mountain is very frequently veiled in mist and cloud-strata, and is celebrated for the phenomenon known as the *Brockengespenst* ('Spectre of the Brocken'), which is nothing more than the shadow of men, houses, or other objects thrown upon the misty eastern horizon by the light of sunset. (See Milner's *Gallery of Nature;* Leibrock, *Der Brocken*, 1864.) In clear weather, a fine view is obtained from the summit of the Brocken.

BROCKHAUS, FRIEDRICH ARNOLD, the founder of the well-known firm of Brockhaus in Leipsic, and publisher of the *Conversations-Lexicon*, was born at Dortmund, May 4, 1772. In 1802, circumstances led him to Holland, where, however, his business schemes did not prosper. He returned to Germany in 1810, and in the following year commenced business in Altenburg. Before this, however (in 1808), B. had purchased the copyright of the *Conversations-Lexicon*, which had been commenced in 1796, and he completed the first edition, with the addition of two supplementary volumes in 1809—1810. In 1812, a second improved edition of the work was commenced under the supervision of B. as editor. The peace of 1815 enabled B. to pursue prosperously his peaceful and civilizing career. In 1817, his business had so increased that he found it necessary to leave Altenburg for Leipsic, where, in the following year, he commenced book-printing in addition to book-publishing. In the course of a few years, the *Lexicon* passed through six editions; it has now arrived at the eleventh edition. Through all the enterprises of B. as a publisher, a zealous devotion to the cause of liberty and general enlightenment may be traced. He died August 20, 1823. B. was not only an able and assiduous man of business, but distinguished for his literary culture, his knowledge of the world, and his numerous social accomplishments. He was also eminently patriotic, and furthered many literary undertakings, simply through a pure love of 'fatherland.'

The business was afterwards carried on by HEINRICH BROCKHAUS, second son of the former (b. 1804, d. 1874), and now by Heinrich's sons, Rudolf and Edward. Among the numerous publications issued by the house, may be mentioned the later editions of the *Conversations-Lexicon*, with an *Atlas;* the *Universal Encyclopædia*, by Ersch and Gruber; and the German *Penny Magazine*, founded in 1833.

BROCKHAUS, HERMANN, third son of F. A. Brockhaus, was born at Amsterdam, January 28, 1806; studied at Leipsic, Göttingen, and Bonn, and lived successively in Copenhagen, Paris, London, and Oxford. From 1848 till his death in 1877, he held at Leipzig the chair of ordinary professor of the Sanscrit language and literature. Among his several works on Oriental literature may be mentioned, the *First Five Books of the Large Collection of Fables, Kathá Sarit Ságara, in Sanscrit and German* (1839); an edition of the drama *Prabodha Candrodaya*, by Krishna Misra, with Hindu scholia (1845); Nachschebi's Persian version of the *Seven Wise Masters* (1845); and (in 1854) the Persian text of the *Songs of Hafiz*. After 1856, he was editor of the *Universal Encyclopædia*. B.'s method of printing Sanscrit in Roman types is now generally adopted in Germany.

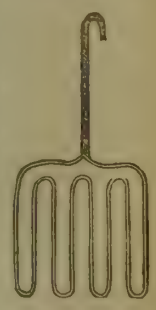
BRO'CKVILLE, a town of Upper Canada, or Ontario, taking its name from General Brock, who, during the last American war, died in the arms of victory on Queenston Heights, between the town and falls of Niagara. It stands on the left bank of the St. Lawrence Proper, about 40 miles below Kingston, and about 160 above Montreal. Originally, its communications downward were interrupted by powerful and rugged rapids, which, however, are now, one and all, either avoided by canals or overcome by steam. B. is a thriving place, with (1881) 7609 inhabitants.

BRODIE, SIR BENJAMIN COLLINS, BART., a distinguished surgeon, third son of the Rev. Peter Bellinger Brodie, rector of Winterslow, Wiltshire, was born there in 1783. He studied under Sir Everard Home at St. George's Hospital, to which he was, in 1808, elected assistant-surgeon, and afterwards surgeon. He had previously lectured both on anatomy and on surgery. In 1810, he was elected a Fellow of the Royal Society, and in 1811 received their Copley medal for his physiological papers contributed to the *Philosophical Transactions*. In 1834 he was created a baronet, and he held the appointment of serjeant-surgeon to Queen Victoria, as well as that of first surgeon in ordinary to the Prince Consort. He was made D.C.L. of Oxford in 1850; was president of the Royal Society, a corresponding member of the Institute of France, and a foreign member of other learned societies and academies in Europe and America. Author of *Lectures on Local Nervous Affections* (1837, 8vo.); *Hunterian Oration*, 1837; *Lectures Illustrative of Subjects in Pathology and Surgery* (1840, 8vo.); *Introductory Discourse on the Duties and Conduct of Medical Students* (1843. 8vo.); *Psychological Inquiries as to Mental Faculties* (3d ed., 1856); an edition of his works with *Autobiography* appeared in 1865. He also contributed papers to several scientific journals. He died in 1862.—B.'s son, Sir B. C. BRODIE, F.R.S., was in 1855 elected Aldrichian Professor of Chemistry at Oxford, a chair suppressed in 1866. He died 24th November 1880.

BRO'DY, a town of Galicia, Austria, is situated on a swampy plain, surrounded by forests, about 58 miles east-north-east of Lemberg. B., which was made a free commercial town in 1779, has a large trade in the agricultural produce of the country with Russia, Poland, and Turkey. Its chief manufactures are leather and linen; jewelry, manufactured goods, and colonial produce are imported by way of Odessa. The trade is almost entirely in the hands of the Jews, who form so large a proportion of the inhabitants, that B. has been called 'The German Jerusalem.' Pop. (1880) 20,071.

BROG, or BROGUE, a rudely formed species of shoe, formerly in use by the aboriginal Irish and the Scottish Highlanders, and of which there were different varieties. See SHOES, SHOE-TRADE. The name has been applied to a modern kind of shoes, with some fanciful peculiarities.—The term Brogue is also used to signify the peculiar pronunciation of English that distinguishes natives of Ireland.

BROILING is a convenient and expeditious mode of cooking small pieces of meat, by laying them on a gridiron over a bright fire, or even on the coals themselves. This is perhaps the most primitive mode of preparing meat for eating, as may be supposed from the great ease and simplicity with which the operation is managed. B. is, in fact, a quicker sort of roasting. The albumen of the outside being sealed up at once, the meat is rendered extremely nutritious, and therefore this process is much to be recommended. But to broil meat so as to preserve its odor, juice, and fat, requires care. The meat should be prepared for the gridiron by being beaten slightly with the rolling-pin, trimmed of superfluous fat and skin, and cut so as to look well on the dish. The fire should be perfectly clear, and of a red-hot surface to answer to the size of the gridiron, that all parts of the meat may be equally cooked. Just before setting the gridiron over, some salt should be sprinkled on the fire to prevent the flare. The gridiron should be perfectly clean and smooth, being always rubbed when it is put away; and, before using, it should be warmed, greased with suet, and rubbed again with paper. When it is placed on the fire, the back should be higher than the front. The meat should never be touched with a fork, but turned rapidly with the broiling tongs; and when sufficiently done, should be served immediately on a very hot dish, being seasoned according to taste.



Gridiron.

In large ranges there should be a broiling stove, and an apparatus for B. suited to it; by this the heat of the fire can be easily regulated. But for all ordinary purposes, a fire of charcoal, or of common coal, and a grooved gridiron, to preserve the gravy, is all that is necessary. Sometimes a gridiron is used to hang before the fire, when a dinner is being dressed, and the top of the fire is occupied; this is convenient, but it is an inferior way of cooking, the meat being roasted rather than broiled. There is a gridiron sold in the streets which is very well adapted to small low fires, as it is easily put in between the bars (see fig.).

BROKEN KNEES. The part commonly termed the knee of the horse is the carpus or wrist of man, and from the peculiar conformation of a quadruped, is much exposed, and liable to serious injury. By *broken knee* is meant the abrasion or more serious injury of the joint by a fall; and even when the wounds are healed, the scar usually remains to indicate that the horse has once fallen, and is 'broken-kneed'—an animal is then regarded as unsafe, and seriously deteriorated in value.

Causes.—The fall is necessarily the immediate cause of the broken knee; as to the cause of the fall, it is usually to be looked for elsewhere than in the horse himself. As a rule, the safety of a horse's action is very great, particularly about the age of from four to seven or eight years. Rarely does a horse at any age fall on his knees unless his feet have suffered from improper shoeing; the animal then moves cautiously, and is very apt to 'stumble.' Undoubtedly, some horses of defective conformation and sluggish disposition are more likely to stumble and fall than a well made, high-actioned steed; nevertheless, the most perfect animal may gradually be rendered unsafe by improper shoeing. See SHOEING OF HORSES.

Symptoms.—It is important, so soon as the injury is done, to determine the extent and depth of the wound. If it be merely a superficial wound, the case is a simple one; and unless the skin is much bruised, the hair will grow, and the animal not be permanently blemished. The sheath, however, through which the tendon over the joint passes, may be opened, and the tendon itself injured. The wound is then gaping, heals rather slowly, and sloughs have to be thrown off. Lastly, the joint itself may be opened, and this is indicated by a free discharge of the joint-oil or synovia, and by the bones being seen or felt on probing. The worst form of accident is that when the bones of the joint are fractured. The system suffers when the wounds are serious, and severe fever sets in.

Treatment.—Whatever may be the form of injury, the first injunction is to wash the wound thoroughly with cold water applied constantly for hours. The joint will swell, become hot and painful, and in some cases irritative fever occurs. Then the animal should be kept on low diet, and be purged with four, five, or six drachms of aloes, according to its size, &c. Should the wound be deep, much dirt remaining in the tissues, a large linseed-meal poultice should be applied over the joint for a day or two, until free suppuration sets in. If this is retarded, and in all cases when the poultice does not appear necessary, cold fomentations may be continued, using either some infusion of chamomile, or one part of tincture of arnica to twelve of water, or one part of Goulard's Extract to a similar quantity of water. The severe symptoms speedily subside, unless the bones are fractured or the joint otherwise seriously injured.

Usually, the wound heals rapidly, the joint-oil ceases to flow; and in order to insure a contraction of the wound, mild astringent or caustic applications should be used, such as tincture of myrrh, sulphate of zinc lotion, or sulphate of copper in crystal rubbed over it. When the wound is thoroughly healed, the hair may not grow rapidly, even in parts where it should form; in this case its production may be accelerated by the use of a very mild cantharidine ointment, which should act as a mild irritant, but not as a blister. In some cases of severe broken knee, it is advisable to fix the limb so that the animal may not move the joint much. In veterinary jurisprudence, a broken knee is regarded as a *blemish*, not as an unsoundness.

BROKEN WIND, a disease or unsoundness of the respiratory organs of the horse, which, from the French *pousse*, was termed, by some of the old English writers on farriery, *pursiness*. The Germans term it *Dämpfigkeit*, or asthma, though in many of their works it receives also the name of *Herzschlägigkeit*, from a belief that it consists in palpitation of the heart. The nature of the malady is not well understood, though it appears in the form of difficulty in the act of expiration, the horse making an extraordinary or spasmodic effort to expel from the lungs the air which has readily entered them in inspiration.

Symptoms.—A broken-winded horse is usually an animal that does not thrive, is lean, and has a dependent belly, the muscles of which are unusually active as expiratory muscles. The characteristic symptoms are best observed when the horse is exercised, the breathing becoming very labored, the nostrils dilated, the eyes bloodshot, and even blue, showing imperfect purification of the blood in the lungs. On watching the chest and flank, the ribs are observed very actively moved, and after collapsing, when the air is expelled from the lungs, are further depressed by a spasmodic jerk brought about by the abdominal muscles. A broken-winded horse has a bad cough, of the kind referred to by veterinarians as characteristic of unsoundness, and termed a *hollow cough*. When the animal is oppressed by fast work, or dragging a load up a hill, the pulse is excessively rapid, and the heart beats energetically. From this circumstance, it is regarded by some as a disease of the heart. Others have believed the diaphragm affected, but in reality it is the lungs, or the apparatus for expelling the air from these organs, that is at fault. The diaphragm being a muscle of inspiration, it is probably in no way implicated. No doubt, when the heart is diseased, the function of breathing is sometimes much affected, but these are not the symptoms of true B. W., any more than when the lungs are in part rendered impervious to air, and the act of inspiration is rendered short. This condition constitutes *thick wind*, and is often one of the remote results of inflammatory disease of the lungs.

Causes.—Low-bred horses are liable to B. W., especially if improperly fed on innutritious and bulky food, and at the same time kept at hard and fast work. Whatever may be the way in which the condition of the alimentary canal operates in producing B. W., of this we are certain, that the function of digestion is much impaired. Indeed, the term B. W. is believed to have had reference originally to the constant escape of flatus. B. W. is far more rare now a days than of old, and it is at present most common in those countries where horses are worst managed, and fed almost exclusively on coarse, indigestible, or innutritious kinds of hay and beans.

Treatment.—The treatment of B. W. is very unsatisfactory; and we can only hope for palliation of the symptoms by keeping the alimentary canal in proper order, administering occasional purgatives, and feeding on a proper quantity of the best oats, which should always be bruised; also allowing the horse the best hay in spare quantities—viz., from 10 to 12 lbs. daily. Some veterinarians have vaunted their powers in curing this disease, and recommended large doses of camphor, digitalis, and opium; but these potent narcotics only operate for a very short time, and as their effects pass off, the symptoms return, and often with increased severity. We may say that B. W. is incurable; and horses very frequently drop down exhausted when at hard work, and die either from congestion of the lungs, hæmorrhage, or simple suffocation.

B. W. is so bad a form of unsoundness, that horse-dealers sometimes attempt, and even successfully, to hide the defect for the time they may be engaged in the sale of a horse, and this they do by causing the animal to swallow *shot* or *grease*. A certain portion of lead weighing in the stomach has a wonderful effect in diminishing the symptoms, which become again obvious enough a few hours after the ruse has been practised on some unwary purchaser.

BRO'KER (so called, from a Teut. and Slav. root, *brak* or *wrak*, signifying refuse, blemish; as if the function had originally been to select good articles of merchandise and reject blemished ones: the German term is mäkler, from *makel*, blemish), an agent employed to make bargains and contracts between other persons, in matters of trade, commerce, and navigation, for a compensation commonly called brokerage. Where he is employed to buy or sell goods, he is not intrusted with the custody or possession of them, and is not authorized to buy or sell them in his own name.

In this respect, he differs from a factor, and he differs from an auctioneer in two particulars: a B. may buy as well as sell, but an auctioneer can only sell; a B. cannot sell personally at public auction, for that is the appropriate function of an auctioneer, but he may sell at private sales, which an auctioneer (as such) does not. A B. is strictly a middle-man, or intermediate negotiator between the parties, and for some purposes, he is treated as the agent of both parties, but primarily he is deemed merely the agent of the party by whom he is originally employed. There are several sorts of brokers, such as STOCK BROKERS, SHARE-BROKERS, SHIP-BROKERS, INSURANCE-BROKERS, and BILL-BROKERS (q. v.). Persons who appraise goods, sell or distrain furniture for rent, are also called brokers, although differing entirely in their occupations from the preceding commercial agents. The business of a Pawnbroker (q. v.) is also of a different nature.

Brokers, in London, must be admitted by the lord mayor and aldermen, paying £5 on admission, and a like sum annually, under a penalty of £100; but they are no otherwise subject to the control of the Court of Aldermen. A list is kept by the city of brokers admitted, and of those who have been convicted of fraud or disqualified (33 and 34 Vict. c. 60).

By the Larceny Consolidation Act, 24 and 25 Vict. c 96, s. 76, it is enacted that any person, who, being a banker, merchant, B., attorney, or agent, and being intrusted for safe custody with the property of any other persons, shall in any manner convert or appropriate it to his own use, shall be guilty of a misdemeanor, and be liable to be kept in penal servitude from five to seven years, or to suffer some other punishment, by imprisonment for not more than two years, with hard labor or confinement. See FACTOR. See also BROKER in AM. SUPP.

BRO'KERAGE is the remuneration or compensation allowed to a broker (q. v.).

BRO'MBERG, a town of Prussia, in the province of Posen, 69 miles north-east from the city of that name, is situated on the Brahe, about 6 miles from its junction with the Vistula. B. has manufactures of woollens, linen, chicory, tobacco, and Prussian blue; a large sugar-refinery, distilleries, breweries, potteries, and corn-mills. The *Bromberg Canal*, by uniting the rivers Netz and Brahe, connects the Oder and Elbe with the Vistula. Pop. (1880) 34,044.

BROME-GRASS (*Bromus;* Gr. *bromos*, a kind of oat), a genus of Grasses, very nearly allied to FESCUE (q. v.), with flowers in lax panicles, glumes many-flowered, the outer palea bifid at the extremity, and awned beneath, and the very short stigma growing from the face of the germen, beneath its apex. The species are numerous, and some of them are very common British grasses—none more so than the SOFT B. (*B. mollis*), an annual or biennial, which has very soft downy leaves, grows well on poor soil, and is readily eaten by cattle, but is not much esteemed by farmers, either for the quantity or quality of fodder which it yields. Its seeds have also the reputation of possessing deleterious or poisonous properties: and those of two other species of this genus, *B. purgans* and *B. catharticus*, the former a native of North America, and the latter of Chili, are said to be emetic and purgative. The

whole subject of the existence of poisonous properties in the seeds of these grasses, requires further investigation. Soft B., although now disliked by farmers, was formerly sown as a fodder-grass, and its large seeds were even regarded as making hay more nutritious; so that there are some who view its present proscription as a thing which ought to be reconsidered, and who deem it not improbable that its weighty produce, both in foliage and seeds, and its adaptation to poor soils, may yet recommend it to the favor of agriculturists. Very similar to it are SMOOTH B. (*B. racemosus*), FIELD B. or MEADOW B. (*B. commutatus* or *B. pratensis*, and *B. arvensis*), all of which seem very much to resemble it in their properties.—The TALL B. (*B. giganteus*, also known as *Festuca gigantea* and *Bucetum giganteum*), a native of Britain, which reaches the height of four or even five feet, affords a great bulk of foliage, but is not much relished by cattle. Naturally growing in shady places, it succeeds even in dense woods, and is sometimes sown to form covert for game.—

Rye Brome-grass (*Bromus secalinus*).

RYE B. (*B. secalinus*) is generally regarded as a troublesome weed, especially in fields of rye. It is very abundant in some parts of Europe. In a young state it has a great resemblance to rye. Its seeds, which are large, retain their power of germination for years, and do not lose it by passing through the intestines of animals. Deleterious effects have been erroneously ascribed to bread made from rye, along with which these seeds have been ground; but poultry are very fond of them, as of those of other species of this genus.

BROMELIA'CEÆ, a natural order of monocoty ledonous plants, allied to *Amaryllideæ* and *Irideæ* stemless, or with short stems, and rigid, channelled, often spiny and scaly leaves. The flowers are in racemes or panicles; the calyx 3-parted or tubular, persistent, more or less cohering with the ovary; the petals three, withering or deciduous, equal or unequal, imbricated in bud. The stamens are six, inserted into the tube of the calyx and corolla, the anthers opening inwards. The ovary is 3-celled, the style single, the fruit capsular or succulent, many-seeded; the seeds with a minute embryo lying in the base of mealy albumen.—The order contains about 170 known species, all natives of the warmer parts of America, although some of them are now naturalized both in Asia and Africa. The best known plant of the order, and the only one much valued for its fruit, is the Pine-apple (q. v.). B., with their strong spiny leaves, cover the ground in many places, so as to form impenetrable thickets. Many of them are epiphytic, or grow upon trees, without being parasites, particularly the species of *Tillandsia*, one of which is the New Orleans Moss, Long Beard, or Old Man's Beard of the West Indies and of the southern parts of the United States, hanging from the trees like the lichens of colder climates. The leaves of some are so formed and placed as to retain near their base a quantity of water, often affording a delicious refreshment to the traveler in a hot climate. The water is, perhaps, of use to the plant itself in droughts. Not a few of the B. are capable of vegetating long without contact with earth, and of sustaining long drought without inconvenience, for which reason, and because of their beautiful and fragrant flowers, some of them are very frequently suspended from the balconies in South America as air-plants. But the plants of this order are more generally valuable for their fibres than upon any other account. *Tillandsia usneoides*, the New Orleans Moss already mentioned, yields a fibre, easily obtained, and in great abundance, which is used instead of hair for stuffing mattresses. The fibres of the leaves of the pine-apple, and of some other species of this order, have been made into fabrics resembling the finest white muslin, whilst they are found also to possess sufficient strength for cordage. It is supposed that the produce of different species of *Bromelia* is often included along with that of the American Aloe or *Agave* (q. v.), under the name of *Pita* fibre or Pita flax, the appearance and properties of the fibres being very similar, as well as those also of the fibres of the species of *Yucca*.

The fibre of the pine-apple is, in some countries, very frequently twisted into fishing-lines, and made into nets and into ropes intended for immersion in water, being very little liable to injury from this cause. Abundant as the plant is in its native regions, and now so perfectly naturalized as to form thickets in many parts of the old world, there seems no limit to the quantity of this fibre which might be procured.—The Pine-apple cloth of the Philippines is called *Pina muslin* and *Batiste d'ananas*. It is also sometimes erroneously called *Grass*-cloth. 'With a magnifier, the fibres may be seen to be very numerous and fine, but not twisted at all, as in grass-cloth or the finest muslins and cambrics.' The Philippine pine-apple fibre is obtained from a species called by the Spaniards *pigna* or *pina* (a cone), and which has by botanists been named *Bromelia Pigna*, although some regard it as a mere variety of the pine-apple, with small and rather dry fruit. It grows in great abundance in the Philippine Islands, and is cultivated by the Chinese near Singapore, and the fibre exported to China. This firbre is prepared also in Malacca, Java, Celebes, &c. When bleached, the pine-apple fibre can be spun like flax. A patent for this has been taken out in Britain by Mr. Zincke.

The WILD ANANAS (*Bromelia Penguin*) of the West Indies, the *Bromelia Karatas*, common in South America, the *B. Sagenaria*, common in some parts of Brazil, and the *Billbergia variegata*, which grows in wild luxuriance in Mexico, where it is called *Caroa*, often covering miles of country—all yield fibres which are used for cloth, cordage, nets, &c. The fibre of *Bromelia Sagenaria* is known as *Curratow* fibre. Very strong ropes are made of it.

The genus *Bromelia* has a 3-parted calyx shorter than the corolla, and the fruit is succulent. The species are pretty numerous, the leaves of all of them are more or less characterized by spiny serratures. The fruit of *B. Pinguin*, already mentioned, affords a cooling juice, which is used in the West Indies mixed with water, to make a drink for patients in fever and dysentery. It is said to be diuretic. A vinous liquor is sometimes made from it.

BROMIC ACID is the only known compound of bromine and oxygen. It is prepared by acting upon bromine (Br) by caustic potash (KO), when much bromide of potassium (KBr) is formed, accompanied by bromate of potash ($KOBrO_5$), a compound of potash and B. acid. It likewise combines with silver, lead, and mercury, yielding salts, all of which are styled Bromates.

BRO'MINE (Greek, *bromos*, disagreeable smell: symb. Br.; equiv. 80; spec. grav. 2·96), one of the chemical elements, occurs in combination in sea-water to the extent of about 1 grain to the gallon. It is found more abundantly in certain saline springs, especially those at Kreuznach and Kissengen in Germany. It is also present in water and land-plants and animals. In the extraction of B. from concentrated sea-water, from which common salt has been separated in quantity, and which is then called *bittern*, or from salt springs, the liquor—which contains the B., as bromide of magnesium (MgBr)—has a stream of chlorine gas (Cl) passed through it, which forms chloride of magnesium (MgCl), and liberates the bromine. The liquid thus becomes of a more or less yellow tint, and if it be then agitated with ether, and allowed to settle, the latter floats up the bromine. The ethereal solution is then treated with potash, which principally forms bromide of potassium (KBr), and fixes the B., so that the ether may be distilled off. The residue is then treated with oxide of manganese and sulphuric acid in a retort with heat, which results in the liberation and distillation of pure bromine. It exists as a deep red liquid of density 2·966 (nearly 3), which readily evolves red fumes of a very irritating and suffocating nature. It is very poisonous, actually destroying the animal tissues. It is sparingly soluble in water, more so in alcohol and ether, and its water solution possesses great bleaching properties. When raised to the temperature of 145°·4 F., it boils, and reduced to 9°·5 F., it becomes a red crystalline solid. B. combines with great rapidity with metals, occasionally with ignition, as with antimony, and forms a class of salts. Treated with hydrosulphuric acid, B. yields hydrobromic acid (HBr), which is the analogue of hydrochloric acid, as B. is of chlorine.

BRO'MSEBRO, a village of Sweden, in the län, and 27 m. S. of the town, of Calmar. It is celebrated as the place where treaties were entered into between Sweden and Denmark in 1541, 1641, and 1645.

BRO'MSGROVE, a market-town of Worcestershire, England, near the small river Salwarp, 12 miles south-south-west from Birmingham. It is 1¼ mile east from a station on the Birmingham and Bristol Railway. The Birmingham and Worcester Canal also passes near it. It is situated in a highly cultivated and richly wooded valley. The principal street is about a mile in length. There is a very flourishing grammar-school, founded by Edward VI. in 1553. The linen manufacture was formerly carried on at B.; button-making and nail-making are at present the principal branches of industry. B. returned two members to the House of Commons in the reign of Edward I., but was afterwards disfranchised on petition of the inhabitants themselves, because the trade of the town had declined. Pop. (1871) 6966; (1881) 7959.

BRO'NCHI are the subdivisions of the trachea or windpipe. Opposite the third dorsal vertebra, the latter divides into two branches or B., of similar structure to itself—namely, round and

cartilaginous in front; and flat, with muscular and fibrous tissue behind, lined with mucuos membrane. Of these B., one goes to each lung, the right being little more than an inch; the left about two inches in length. On entering the substance of a lung, the B. divide into smaller branches, which again subdivide, until they are no larger in diameter than one-fiftieth to one-thirtieth of an inch, which give origin to, or terminate in, small polyhedral cells, which seem to cluster round their extremities, and open into them. These are the air-cells; they consist of elastic tissue, with a lining of mucous membrane, and beneath the latter, a layer of minute blood-vessels of the lung. See RESPIRATION, ORGANS AND PROCESS OF.

BRONCHI'TIS, or inflammation of the lining membrane of the bronchial tubes, is a disease of very common occurrence in Great Britain, and one of the greatest importance, for, if neglected, it not only destroys life, but if carelessly treated, may lead to premature and miserable old age. The first symptoms are generally those which distinguish a common cold—viz., shivering, headache, and sense of weariness, with occasional cough; but the cough continues, and recurs in paroxysms; there is a feeling of oppression on the chest, and the person *wheezes* when he breathes. He also breathes more rapidly, six or ten respirations in the minute more than he did when in health, and his pulse is quicker; and the ear applied to his chest, after these symptoms have continued for two or three days, will hear a rattling, as if air was bubbling through thickish fluid, which is the case; he is breathing through an extraordinary amount of mucus secreted by the inflamed lining membrane of the tube. During his paroxysms of cough. This mucus is spit up. If the inflammation extend no further, it is termed *tubular* B., and is seldom a fatal disease in the first attack; but, as may be expected, it will often extend, or, in some cases, begin in the small tubes—*vesicular* B.—when the symptoms just described will be present, but in a greater degree, the breathing being so embarrassed that the patient can no longer lie down, but requires to sit or stand up, and use all his muscles of respiration. Though he coughs, he spits very little, till about the third day, when he expectorates large quantities of yellow fluid. At last, prostration becomes so complete that he ceases to spit, and dies suffocated by the accumulated mucus, from the fifth to the seventh day.

In less severe cases, or those which yield to treatment, the delicate tubes may be permanently injured by the inflammation. They may be thickened, which narrows their calibre; this will prevent the proper passage of the air, and gives rise to wheezing on any exertion, and cough, especially in winter. Moreover, after repeated attacks, one of the tubes may be blocked up entirely, so that the portion of lung to which it ought to conduct air, is no longer filled, and consequently collapses and wastes. This compels the adjacent tubes and air-cells to dilate to receive more air at the expense of their elasticity (emphysema (q. v.); the air-cells may even burst, and so by degrees the apparatus for aërating the blood becomes less and less perfect. The treatment of B. must vary with the patient's constitution; but in most cases, counter-irritation, applied through the medium of mustard or hot turpentine fomentations, will be found very useful. These remedies act more rapidly than a blister, and may be frequently repeated. It should be remembered that patients suffering from B. are very easily depressed. Such medicines as ammonia should be given, to promote expectoration, combined with the liquor ammoniæ acetatis, to produce perspiration. In very acute cases, after a brisk purge, salines, with ipecacuanha or squills, may be given, and an emetic will remove accumulations of mucus.

In the B. of old persons, chloric ether will be found very useful, and may be combined with sedatives, as henbane; but opium must be given with great caution, or not at all, as it tends to increase the congestion of the inflamed tubes. The paregoric elixir (compound tincture of camphor) is an old and popular remedy in B., but enough has been said to impress on the reader the danger of tampering with bronchitis. In every case where it is possible, a skilled medical man should be employed, to determine, by the stethoscope, not only the disease but its exact situation; and as it is but too likely to recur at some future period, or symptoms caused by it to appear, a skilled opinion has a permanent value to the patient. See CATARRH.

BRONDSTED, PETER OLUF, a learned antiquary, born near Horsens in Jütland, November 17, 1780. On completing his course of studies at the University of Copenhagen, he, in 1806, went to Paris, where he remained two years. He afterwards visited Italy and Greece, where he made excavations which furnished valuable materials for the study of classical antiquity. He died rector of the Copenhagen University in 1842. B.'s principal work is *Travels and Researches in Greece* (2 vols., Paris, 1826.) In addition to several smaller archæological papers, amongst which was one in English, entitled *An Account of some Greek Vases found near Vulci* (Lond. 1832), and another on the bronzes of Siris, which appeared at Copenhagen, 1837, B. also wrote some valuable contributions to Danish history from Mediæval Norman Manuscripts (2 vols., Copenh. 1817—1818) and *Memoirs of Greece during the Years* 1827 *and* 1828 (Paris, 1835).

BRONGNIART, ALEXANDRE, an eminent French chemist and naturalist, born at Paris in 1770, is said to have delivered a lecture on chemistry before he was 15. In 1790, he visited England for a scientific examination of the Derbyshire mines and pottery works, and on his return to France, published a *Mémoire sur l'Art de l'Emailleur*. Appointed in 1800 director of the porcelain manufactory at Sèvres, he held that office for the remainder of his life, and revived an almost lost art of painting on glass. In his *Essai d'une Classification des Reptiles*, 1805, he established the four divisions of reptiles, and first gave them the names of *Saurians, Batrachians, Chelonians*, and *Ophidians*. His *Traité Elémentaire de Minéralogie*, published in 1807, at the instance of the Imperial University, became a text-book for lecturers. In 1814 appeared his *Mémoire sur les Corps Organisés Fossiles nommés Trilobites*, a name which, as well as a basis of classification for those singular *crustacea*, naturalists owe to Brongniart. In 1815 he was elected a member of the Academy of Sciences of the French Institute; he was also a member of the Royal and Geological Societies of London, and of other learned bodies. In 1845, appeared his *Traité des Arts Ceramiques*. He died 14th October 1847.

BRONGNIART, ADOLPHE THEODORE, son of the preceding, author of several botanical works held in high esteem, was born in 1801, in 1833 became professor of botany at the Jardin des Plantes, Paris, and in 1834 member of the Academy of Sciences. In 1852 he was elected a foreign member of the Royal Society of London. He died in 1876.

BRO'NI, a town of Northern Italy, in the province of Pavia, about 11 miles S.E. of the town of Pavia, in a beautiful situation at the foot of the Appennines. It has a singular old church, some portions of which date from the 10th century. In its vicinity is the castle of Broni, celebrated in history as the place where Prince Eugene obtained a victory over the French in 1703. Pop. about 7000.

BRONN, HEINRICH GEORG, a German naturalist, was born at Ziegelhausen, March 3, 1800, and educated at Heidelberg University, where he devoted himself to the science of forests and natural history. In 1828, he commenced at Heidelberg a course of lectures on the physical and industrial sciences, and in 1833 was nominated ordinary professor of the same. After Leuckhardt's departure from Freiberg, B. was appointed to the zoological lectureship. B. wrote several important scientific treatises. His first was *A System of Antediluvian Conchylia* (Heidelberg, 1824), which was followed by *A System of Antediluvian Zoophytes*. In 1824, he visited the southern countries of Europe; and in 1827, made a second journey to Italy. On his return, he published the Results of his Journey (2 vols., Heidelberg, 1825—1830). In 1834 appeared his most important geological work—*Lethæa Geognostica;* in 1841—1849, his *History of Nature;* and in 1850, his *Universal Zoology*, which was the first attempt to develop zoology in its entirety with reference to extinct organisms. B. died in 1862.

BRO'NTÉ, a town in the province of Catania, Italy, situated at the western base of Mount Etna, about 22 miles north-north-west of the city of Catania. B. has manufactures of woollen and paper, and the district produces oil, almonds, wine, &c. But the town is celebrated chiefly for its connection with Admiral Lord Nelson, who was created Duke of B. by the Neapolitan government in 1779, with an annual income of 6000 *oncie* (about £3750). Pop. (1872) 14,589.

BBONTÉ, CHARLOTTE, one of the most distinguished of modern novelists, was born at Thornton, in the West Riding of Yorkshire, on the 21st of April, 1816. Her father, a clergyman of Irish descent, removed, with six young children and an invalid wife, from Thornton to Haworth, in the same county, in 1821. Soon after their arrival, Mrs. Bronte died, so that Charlotte, trying hard in after-life, could but dimly recall the remembrance of her mother. Her father, eccentric and solitary in his habits, and full of extravagant theories for making his children hardy and stoical, was illfitted to replace a mother's love.

When Charlotte was eight years old, she was sent with three of her sisters to Cowan's Bridge School, which, whether deservedly or not, had an unfortunate notoriety conferred upon it twenty-five years later in the pages of *Jane Eyre*. Her two eldest sisters falling dangerously ill, and dying a few days after their removal thence, and the low situation evidently disagreeing with Charlotte's health, she was sent home when little more than nine, and remained there, 'the motherly friend and guardian of her younger sisters,' till, in 1831, she was sent to Miss Wooler's school at Roe Head, where her remarkable talents were duly appreciated by her kind instructress, and friendships formed with some of her fellow-pupils that lasted throughout life. A few years later, she returned to Miss Wooler's school as teacher there, and also had some sor-

rowful experiences as governess in one or two families. It was with a view of better qualifying themselves for the task of teaching that Charlotte and her sister Emily went to Brussels in 1842, and took up their abode in a *pensionnat*. When Charlotte returned home in 1844, a new shadow darkened the gloomy Yorkshire parsonage. Her father's sight was declining fast, and her only brother was a source of continual anxiety. It now seemed plain that school-keeping could never be a resource, and the sisters turned their thoughts to literature. Their volume of poems was published in 1846; their names being veiled under those of Currer, Ellis, and Acton Bell, but it met with little or no attention. Charlotte's next venture was a prose tale, *The Professor*, and while it was passing slowly and heavily from publisher to publisher, *Jane Eyre* was making progress. In the August of 1847, it was submitted to Messrs. Smith and Elder, and published by them two months later. It took the public by storm. It was felt that a fresh hand, making new harmonies, was thrown over the old instrument. Henceforward, Charlotte B. had a 'twofold life, as author and woman.' Over the latter, the clouds closed thicker and thicker. Mr. Bronte had indeed recovered his sight; but the sister Charlotte so intensely loved, and whose genius she ever delighted to exhalt above her own, Emily—the Ellis Bell of *Wuthering Heights*—died in 1848. Her only brother also died in the same year; and Anne, the youngest of the family, following in 1849, Charlotte was left alone with her aged father in that dreary deserted home among the graves. Nevertheless, her energy never flagged. *Shirley*, begun soon after the appearance of *Jane Eyre*, was published in the autumn of 1849; and *Villette*, written under the frequent pressure of bad health and low spirits, came out in 1852.

In the spring of 1854, Charlotte B. was married to her father's curate, the Rev. A. Nicholls, who had long known and loved her. It is a relief to find that a little bright sunshine was permitted to the close of a hitherto clouded life. It was, however, but brief; for serious illness set in, and on the 31st of March 1855 she died. A fragment of an unfinished novel appeared in the *Cornhill Magazine* for April 1860. See Mrs. Gaskell's *Life of C. B.* (1857).

BRONZE is a reddish-yellow, fine-grained alloy of copper and tin, in variable proportions. It was early known, and what is usually spoken of as *brass* in regard to the ancient nations, was in reality bronze. The brass or B. referred to in the Bible was probably composed of copper and tin, though some translators consider it likely to have been copper alone. The examination of the most ancient coins and metallic ornaments and implements leaves no doubt as to the acquaintance of the ancients with B.; so much so, that in the antiquarian history of European nations, there is a distinct period styled the *Bronze Period* (see next art.). At the present time, B. is largely used for house and church bells, Chinese gongs, ordnance or cannon metal, and speculum or telescope metal. In the preparation of the various kinds of B., great care must be taken to keep the tin from being burned away or wasted. To obviate this, it is customary to use much old B., as worn-out cannon, &c., and when that is fused in the furnace, to add the new copper and tin. The best Cornish and Banca tin are employed for the better kinds of castings, especially where strength of alloy is required. For inferior work, old scrap tin, which often contains lead, is used; and where strength of material is not an object, a little zinc and lead are added. In either case, during the fusion of the mixed metals in the furnace, at a high temperature, as little air as possible must be admitted to the furnace, otherwise the metals are oxidized, and the alloy is deteriorated. B., when well made, is, excepting gold, platinum, and some of the rare metals, the most durable metallic material with which we are acquainted; and this, coupled with its extreme hardness, rendering it difficult for time and ordinary wear and tear to efface inscriptions or medallions stamped on it, has led the mint in France, some years ago, to issue a bronze coinage in place of copper; and for the last twelve or fifteen years bronze coinage has taken the place of a copper coinage in Great Britain.

The principal varieties of B. have the following average composition:

		Copper.	Tin.
	Brass ordnance or bronze cannon	9	1
	Bronze for toothed wheels	10	1
	" for mathematical instruments	12	1
	" for bearings of machinery	8	1
	Chinese gongs and cymbals	5	1
	Musical bells	6	1
	House bells	4	1
	Large bells	3	1
	Telescope or speculum metal	2	1
Ancient.	Mirrors	2	1
Ancient.	Hard bronze	7	1
Ancient.	Medium bronze	8	1
Ancient.	Soft bronze	9	1
Ancient.	Flexible bronze nails	20	1

Recently, B. has been deposited on small statues and other articles, in greater or less thickness, by the electrotype process (see GALVANISM), forming very pleasing ornaments at a cheaper rate than ordinary B. ornaments can be purchased for. The same process has been suggested for coating those parts of machinery which are liable to rust.

The novel word *steel-bronze* first began to be common about 1875, when Uchatius devised a new method of hardening the old bronze or the Austrian guns. This steel-bronze, with which Austria is mainly armed, has accordingly no steel in it; but is almost as hard as cast-steel, and was for Austria about 75 per cent. cheaper than steel. *Silico-bronze* and *phosphorus-bronze* are copper alloyed with silicon and phosphorus respectively, and are used for conducting electricity. *Manganese-bronze* is a valuable material for making screw-propellers.

BRONZE, AGE OF. Aluminium also (q. v.) forms several valuable alloys with copper, a term used by many modern archæologists to distinguish the second of the three successive periods into which, as they hold, the primitive or prehistoric antiquities of a country may be divided. They take for granted that among a rude or savage people, stone would come into use before any kind of metal; and that of metals, copper being oftener found ready for the hammer, would come into use before iron. These assumptions—which, in so far, are only in accordance with what has actually been observed among uncivilized races—have obtained from a very early date. Lucretius, writing in the century before the Christian era, has recorded them with his usual vigorous precision (*De Rer. Nat.*, v. 1282).

More than one antiquary of the last century appears to have suggested the distribution of archæological objects into eras of stone, of copper or bronze, and of iron. But the proposed classification received scarcely attention until about forty years ago, when it was adopted and developed by Mr. C. J. Thomsen, superintendent of the Ethnographical and Archæological Museum of Copenhagen, in his *Ledetraad tit Nordisk Oldkyndighed* (Kjöbenhavn, 1836), and by Mr. Nilsson, professor of zoology in the university of Lund, in Sweden, in his *Skandinaviska Nordens Urinvonare* (Lund, 1838—1843). According to the theory of these writers—which is held by almost all archæologists in Denmark, Sweden, and Norway, by many in Northern Germany and in Switzerland, and by a few in other parts of Europe—the first three stages in the progress of a nation from barbarism to civilization are as clearly identified and defined by their relics of stone, of bronze, and of iron, as the comparative antiquity of geological strata, or periods of the world's creation, is determined by the fossils which they are found to contain.

The name of the 'age of stone' is given to the period when weapons and implements were made of stone, amber, wood, bone, horn, or some such easily wrought material, and during which very little or nothing was known of metals. During this era, the people, few in number, and savage in their habits, clothed themselves chiefly with skins of animals. They buried their dead in large sepulchral chambers, covered by what have been called *cromlechs*, or girdled round by the unhewn stone pillars called 'Druidical circles.' The bodies have most frequently been found unburned, and often with rude urns beside them.

During the 'age of bronze,' weapons and implements were made of copper or of bronze, and iron and silver were little or not at all known. The dead were burned, and their ashes kept in urns, or deposited in stone-chests, which were covered by conical mounds of earth or heaps of loose stones. In the urns, articles of gold and amber are found, but never of silver. Most articles of metal appear to have been cast; where marks of the hammer appear, it is contended that the forging or beating must have been by a stone hammer upon a stone anvil.

The 'age of iron' is the name applied to the third and last of the three supposed periods. During this era, it is conceived that iron displaced bronze in the manufacture of weapons and implements, and that silver and glass came into use. The dead were still occasionally burned; but they were frequently buried without burning, often seated on chairs, and, at times, with a horse in full war-harness laid beside the body of his master.

The Scandinavian and German antiquaries admit that their three periods run, more or less, one into another; that stone weapons continued to be used throughout the age of B.; that B. and gold were not unknown in the age of stone; and that weapons of stone and B. continued to be used in the age of iron. This admission obviously detracts very much from the practical value of the classification for chronological or other scientific purposes. But the late Mr. J. M. Kemble, and other British antiquaries, have taken objection to the classification altogether, as irreconcilable with generally admitted facts, when carried out to its strict and necessary consequences. They point to the everyday discovery of objects of stone, B., and iron, in the same ancient urns, graves, and dwellings. They instance the case of the Huns, who had swords of iron, while they pointed their arrows with bones; the case of

the Anglo-Saxons, who fought with stone mauls at Hastings; and the case of the Germans, who used stone-hammers in the Thirty Years' War. They show stone weapons, in some of which the traces of metal are still fresh, while others attest for themselves that they could not have been cut but by a thin sharp metal point.* They prove from Greek and Roman writers that the nations of the north and west of Europe used iron weapons during what must have been their B. age. And they repudiate the proposed appropriation of different modes of burial to the different ages—a point on which the supporters of the theory appear to be hopelessly divided among themselves—on the ground, that graves assigned to the B. period have been found to contain more iron than B., and that other supposed characteristics of sepulchres of the B. age are quite as common in sepulchres of the iron age. But although the threefold classification of the Scandinavian and German archæologists cannot be relied upon for historical uses, it may be accepted as a very convenient mode of arranging archæological objects. It has been adopted, with some modifications, in the Gallery of British Antiquities in the British Museum at London, in the National Museum of the Antiquaries of Scotland at Edinburgh, in the Museum of the Royal Irish Academy at Dublin, and in other collections, where the articles are classed, for the most part, according to the materials of which they are made.

BRONZE-WING, BRONZE-WINGED PIGEON, and BRONZE PIGEON, names given in the Australian colonies to certain species of pigeon (see PIGEON and COLUMBIDÆ), chiefly of the genus *Peristera* of Swainson, on acconnt of the lustrous bronze color with which their wings are variously marked. They are otherwise also birds of beautiful plumage.—The COMMON B. or Bronze-winged Ground Dove (*Columba* or *Peristera chalcoptera*) is distributed over all the Australian colonies. It is often seen in flocks, feeds on the ground, and builds its nest chiefly on low branches of trees growing on meadow-lands or near water. It is a plump bird, often weighing fully a pound, and is acceptable at every table,—The BRUSH B. or Little Bronze Pigeon (*C.* or *P. elegans*) is not so plentiful nor so widely distributed, chiefly inhabiting Tasmania and the southern parts of Australiar It inhabits low swampy ground, never perches on trees, resembles a partridge in its habits, and makes a loud burring noise like a partridge when it takes wing on being alarmed.—The HARLEQUIN B. (*C.* or *P. histrionica*) is found in the north-western parts of New South Wales in great flocks, feeding on seeds.—Some of the species of *Geophaps*, another of the genera or sub-genera of the *Columbidæ*, are also sometimes called Bronze-wing. Their partridge-like appearance and habits have gained for them the name of Partridge Pigeon (q. v.).

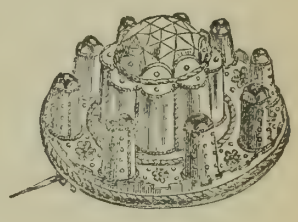
BRONZING is the process of covering plaster or clay figures, and articles in ivory, metal, and wood, so as to communicate to them the appearance of the ordinary bronze. Several of the materials employed are of little value, whilst others are expensive. Thus, *gold powder* is used for the finer work, and is prepared by grinding gold-leaf with honey on a stone slab till a very fine state of division is attained, then washing out the honey, and drying the gold powder. Inferior gold-leaf, or that which contains much silver and copper, yields the *German gold powder* employed in bronzing. *Copper powder* is prepared by introducing an iron bar or plate into a solution of copper, when the latter metal is precipitated as a finely divided red powder. *Mosaic gold*, or *musivum*, is made by fusing 1 lb. of tin, introducing ½ lb. mercury, allowing the alloy or amalgam to cool, then pulverizing and grinding up with ½ lb. sal-ammoniac, and 7 oz. sublimed sulphur. Ultimately, the whole is subjected to the process of sublimation, when the tin, as a brilliant yellow powder, resembling gold, is left in the subliming vessel. The color of mosaic gold may be deepened by the addition of red oxide of lead, and it then assumes a copper tint. *Gold size* is prepared by heating 1 lb. of linseed oil, and gradually adding 4 oz. of gum animi in very fine powder. When boiled sufficiently it assumes the consistence of tar, and may then be strained through cloth. When employed in bronzing, some vermilion is added to make it opaque, and turpentine, to make it thin and limpid enough to be easily laid on the plaster cast or other article with a brush, and the object may ultimately be rubbed over with soft chamois leather, which is occasionally dipped into the gold size. The other B. powers are best laid on with a solution of gum-arabic or isinglass, either of which acts as a cement.

Gun-barrels are bronzed by acting upon them with the chloride or butter of antimony (*bronzing* salt), or with hydrochloric or nitric acids, when the surface of the iron gets partially eaten into, and covered with a thin film of oxide; after which the gun-barrel is thoroughly cleaned, oiled, and burnished. A brownish shade is thus communicated to the barrel, which protects it from rust, and at the same time renders it less conspicuous to an enemy or to game. In the bronzing operation known as the Damascus, the barrel is treated with dilute nitric acid and vinegar, to which sulphate of copper has been added. The result is, that metallic copper is deposited irregularly over the iron surface; and when the latter is washed, oiled, and well rubbed with a hard brush, a very pretty appearance is communicated to the barrel. Articles in wood that require to be bronzed, are first coated with a mixture of size and lampblack, and dried, and then a bronze-powder, consisting of very finely divided patent yellow, raw umber, pipe-clay, lampblack, and Prussian blue, is put on with a brush. After being dried again, the article is burnished with cloth or leather, covered with a layer of Castile soap, and, lastly, cleaned up with a woollen cloth. Copper vessels, coins, &c., are bronzed by heating them in a copper boiler containing vinegar, with 2 parts of verdigris, 1 of sal-ammoniac dissolved in it, when, after sufficient boiling, a pleasant reddish-brown hue is imparted. Bronze and copper articles may have an antique appearance communicated by applying a solution of sal-ammoniac 1 part, cream of tartar 3, common salt 6, hot water 12, and more or less nitrate of copper, when an ancient greenish hue is obtained.

BROOCH (from a root signifying to pierce; comp. Eng. *to broach*; Fr. *brocher*, to spit, or to stitch; Wel. *proc*, to stab), an ornamental pin or instrument for fastening the dress, consisting for the most part either of a ring or disc, or of a semicircle, there being a pin in either case passing across it, fastened at one end with a joint, and at the other with a hook. Brooches were much used in antiquity, and varied in form as much as in modern times.

They were worn both by men and women, and with a view both to ornament and use, from the time of Homer to the fall of the Western Empire. Nay, in the early portion of the middle ages, and even amongst semi-barbarous tribes, the art of making *fibulæ*

Hunterston Runic Brooch,



Brooch of Lorn.

seems not only to have flourished, but to have attained marvelous perfection. Many of those found, both in Ireland and in Scotland, are wonderfully beautiful in workmanship, and still more so in design; and it is doubtful whether antiquity has left us anything in the way of personal ornament more perfect than the so-called Hunterston B., of which a wood-cut is subjoined. It was found in 1830, on the estate of Hunterston, in the parish of West Kilbride, Ayrshire, near to the scene of a conflict which preceded the battle of Largs in 1262. It is of silver, richly wrought with gold filigree, and elaborately chased with lacertine and ribbon patterns. It is set with ornaments of amber; diameter, $4\frac{3}{10}$ inches. On the reverse are runes, which have been variously read. Dr. Wilson says, 'what is decipherable reads in good Scottish Celtic into what he explains to mean—Malbritha, his friend, in recompense to Maolfridi.'—*Prehistoric Annals*. One of the most famous articles of the kind existing in Scotland is the *Brooch of Lorn*, in the possession of Macdougal of Dunolly, near Oban. It is believed to be identical with one torn from the breast of Robert Bruce by Alexander of Lorn, the ancestor of Macdougal, in a personal contest with the king. This interesting article is of silver, about 4 inches in diameter, with a circle of jeweled obelisks.

BROOKE, HENRY, dramatist and novelist, was born in 1708, in the house of Rantavan, county Caven, Ireland. His father was a wealthy clergyman. Young B. was first sent to school to one Felix Somerford, where he so distinguished himself that his tutor, in the fullness of his heart, prophesied that he would play a great part in life. His talent for rhyming first made itself evident here, and it received further development while he resided at Dr. Sheridan's school in Dublin. In 1724, he went to study law in London, and became the chosen friend of Pope and Lyttleton. From the heart of this brilliant literary society he was recalled to Ireland by a dying aunt, who left him guardian of her child, a girl of twelve. B. put the child to a Dublin boarding-school, and married her secretly two years thereafter. Four or five years subsequently, when his wife had borne him three children, he removed to London, and once more became a bright particular star in the galaxy

* M. Frederic Troyon of Lausanne, one of the Swiss antiquaries who accept the three periods of their Scandinavian brethren, instances certain stone axes (now in the collection of Baron Renberg, at Prague), which were found, along with their cores, at the site of a primitive manufactory of these weapons in Bohemia. 'These cores,' he says, 'when replaced in the holes from which they had been taken (easily verified by the corresponding veins of the stone), left so little play-room, that it was evident they could only have been detached by a metal point, and not by a hollow cylinder, which could not have given to the hole its conical form, now quite apparent. Instead of the soft iron which is employed nowadays in such operations, the ancients used copper or bronze; and, of course, water and silicious sand were likewise employed in the process.'

of metrepolitan genius. In London, he published a poem, entitled *Universal Beauty*, which Pope admired, and of which he perhaps turned a couplet here and there. Shortly after, B. returned to Ireland; but in 1736 he was again in London, and was introduced to the Prince of Wales, who cultivated his friendship, and made him presents of books and china. About this time, he published his play, entitled *Gustavus Vasa*, full of the noblest sentiments, and the most inconceivable characters. In 1740, B. was taken ill, and returned to his native country, where he published several books, and a tragedy, *The Earl of Westmoreland*, which was performed in Dublin. In his later years he removed to Dublin, and died there in 1783. The sonorous eloquence of his plays has not saved them from oblivion; and his novel, entitled *The Fool of Quality*, is the only work of his which is likely to meet the eyes of modern readers. It was originally published in five volumes, and was greatly admired by John Wesley. A new edition was published in 1859, with a preface by the Rev. C. Kingsley.

BROOKE, Sir James, Rajah of Sarawak, and Governor of Labuan—a man strongly imbued with the spirit of the old adventurers of the Elizabethan time—was born at Coombe Grove, near Bath, 29th April 1803. He early entered the East India army, was seriously wounded in the Burmese war, and returning home on furlough, spent some time in travel on the continent. Shipwrecked on the voyage out to join his regiment, he was unable to reach India before his furlough had expired; his appointments consequently lapsed, and he quitted the service. He now conceived the idea of putting down piracy in the Eastern Archipelago, and of carrying civilization to the savages inhabiting these islands. He purchased a yacht, which he manned with about twenty sailors, and after a three years' cruise in the Mediterranean, to test the sea-worthiness of his vessel and the seamanship of his crew, sailed from London for Sarawak, a province on the north-west coast of Borneo, October 1838.

When he arrived there, Muda Hassim, the uncle of the sultan of Borneo, was engaged in a war with some rebel tribes. B. lent his assistance, and in return had the title of Rajah and Governor of Sarawak conferred upon him, the native governor being forced to resign. B. immediately set about reforming the government, instituted free trade, and framed a new code of laws. The murderous custom of head-hunting, prevalent among the Dyaks, he declared to be a crime punishable with death, and vigorously set about the extirpation of piracy. This was done so draconically as to occasion great dissatisfaction in this country; and the result was, that parliament abolished the 'head-money' that had been previously paid for the slaughter of pirates. Certain charges, however, brought against B. in the House of Commons, in connection with this matter, were declared by a Royal Commission to be unsubstantiated. The head-money was received, not by B. and his associates, but by the British ships-of-war that had co operated with him. On his return to England, B. received a warm welcome, was created a Knight Commander of the Bath in the year following; and the island of Labuan, near Sarawak, having been purchased by the British government, he was appointed governor and commander-in-chief, with a salary of £2000 a year. In 1857, B., who had been superseded in the governorship of Labuan, but who still acted as Rajah of Sarawak for the sultan of Borneo, was attacked at night in his house by a large body of Chinese, who were irritated at his efforts to prevent opium-smuggling, and only escaped with his life by swimming across a creek. The Chinese committed great havoc on his property, but their triumph was short-lived. B. collected some natives, attacked the Chinese, defeated them in several successive fights, and ultimately forced them into the jungle, where they must have perished of starvation. Upwards of 2000 Chinese were killed, and all their flourishing settlements destroyed. Returning to England soon after this, B. lectured in several of the chief towns on the advantages likely to result to this country from a possession of Sarawak, and urged the desirableness of the British government taking it under its protection, as otherwise it was likely to fall into the hands of the Dutch. To enforce this view, an influential deputation waited upon the Earl of Derby (then head of the government) in November 1858, but he declined to entertain it. He returned to Borneo in 1861, but visited England again twice before his death, on the second occasion having the satisfaction of seeing the independence of Sarawak recognized by the English government. The town prospered greatly under his régime; he found it a place of some 1000 inhabitants, he left it a town of 25,000; and the exports to Singapore, which, in 1840, amounted to £25,000, were in 1858, £300,000. B. died in 1868: a biography appeared in 1877.

BROO'KLIME (*Veronica Beccabunga*), a species of Speedwell (q. v.) abundant in ditches, water-courses, and wet places near springs in Britain, common also in most parts of the continent of Europe. It is a perennial plant, with procumbent stems, rooting at the base; the leaves on short stalks, elliptical, obtuse, and slightly serrate, both stems and leaves smooth and very succulent; the small blue flowers, in form resembling those of the other Speedwells, in racemes, the stalks of which arise from the axils of the opposite leaves. The leaves and young shoots have a bland or slightly bitter taste, and are a tolerable ingredient in spring salads. They are sometimes sold along with water-cresses. —See Cress, Water.—In Scotland, the plant is called *Water Purpie*.

BROO'KLYN, a city on the west end of Long Island, in the United States, belonging to New York state, in lat. 40° 42′ N., 73° 59′ W. It stands at the south-west extremity of Long Island Sound, which is here appropriately known as East River, partly in allusion to the narrowness of its channel and the rapidity of its tide, and partly in contradistinction to North River as a second name of the Hudson. Between B. and New York there are numerous ferries of about three-quarters of a mile in width, on which ply ferryboats every few minutes by day, and every half-hour by night. B. is connected with New York by a suspension bridge nearly half a mile long and 125 feet above the water. In 1850, the population was 96,838; in 1870, 396,099; and in 1880, 566,689. B. was founded by the Dutch in 1625, and in 1776 its neighborhood was one of the principal seats of the revolutionary war. Occupying comparatively elevated ground, B. commands a complete view of the adjacent waters and their shores, while, notwithstanding its inequalities of surface, it consists chiefly of straight streets, crossing each other at right angles. It is divided into wards, and governed by a mayor and a board of aldermen. B. has a very large number of churches (whence it is often called the 'city of churches'), several flourishing banks, various literary institutions, and numerous seminaries of education—and ample share, in short, of all that characterizes a wealthy, populous, and intelligent community. It has an immense trade in grain, the warehouses being capable of holding about 12,000,000 bushels. It possesses also a national navy-yard, which embraces 45 acres of land, and magnificent docks, including a wet-dock for the largest vessels, the most extensive in the Union. See Brookln in Am. Supp.

BROOKS, Charles Shirley, novelist and journalist, was the son of Mr. William Brooks, an architect, and was born at Brill, in Oxfordshire, about the year 1820. B. was educated chiefly by the late Rev. T. J. Bennett, canon of St. Paul's; and upon leaving school, was articled to an attorney. Upon serving out his time, he passed with distinction the examination in the Law Society's Hall. Literature, however, had more charms for him than the law, and he had not long been settled in London, before he tried the experiment of living by it as a profession. He wrote dramas—*Our New Governess, Honors and Tricks, The Creole, The Daughter of the Stars;* and he contributed at the same time to some of the leading periodicals and journals. An introduction to the editor of the *Morning Chronicle* procured him a steady engagement as writer of the Parlimentary Summary for that journal. He was also sent by the proprietors of the *Chronicle* on a mission into Russia, Syria, and Egypt, to report on the condition of labor and the poor in those countries; and the results of his observations appeared in a series of letters in that journal. B. was also a contributor to *Punch* from the commencement of that periodical. The 'Essence of Parliament' in *Punch* is said to have been regularly contributed by him. He also wrote for it 'Miss Violet and her Offers,' 'The Naggletons,' &c. B. also contributed political and other articles to the columns of the *Illustrated London News*. As a novelist, B. is a graceful and pleasing writer, and therefore deservedly popular. He is author of *Aspen Court, The Gordian Knot, The Silver Cord* (originally published in *Once a Week*), and *Sooner or Later*. B. is likewise the author of *The Russians of the South*. He acquired a reputation as a lecturer. On the death of Mr. Mark Lemon, in 1870, B. became the editor of *Punch*. He died in 1874. A volume of his *Wit and Humor* appeared in 1875.

BROOM-CORN, a grass cultivated in North America for the manufacture of brooms and whisks, which are made of the tops of the culms and the branches of the panicle. It is regarded as a mere variety of the same species (*Sorghum saccharatum*), of which the shaloo, or sugar-grass (see Sugar-cane and Durra), is another variety. It has been much longer cultivated in North America, however, than the sugar-yielding variety. Its introduction is ascribed to Dr. Franklin, who, seeing an imported whisk in the possession of a lady of Philadelphia, found a single seed on it, and planted it. It is said to have been brought from the East Indies. It is now extensively cultivated in all parts of the United States, and especially by some branches of the religious society called Shakers. The manufacture of brooms is annually becoming of greater importance, much capital being invested in it. The crop of B. has a beautiful appearance when near maturity. It often attains a height of 12—15 feet. The stalks are long and hard, and mostly used for manure, although cattle will feed on them before they are touched by frost, and cattle are very fond of the leaves. The seed is used like Indian corn, for feeding poultry, and sometimes for feeding cattle and horses. The usual practice in harvesting B. is to bend the stalks 2½—3 feet from the ground

and leave them a few days to dry, then to cut them over 6—8 inches below the panicle, laying the tops in heaps, to be conveyed to the scraper, which is often wrought by horse-power, and which removes the seed from them. Improved machinery has recently begun to be employed in the manufacture of brooms and whisks from B., and they are therefore produced with much greater rapidity than before. It is supposed that, in 1860, about 10,000 acres of B. were cultivated in the state of New York, 9000 in Illinois, 6000 in Ohio, and about an equal amount in all the other states of the Union, or 30,000 acres in all; the value of the produce about 1,590,000 dollars. Great numbers of brooms and whisks of this material are exported to Britain.

BROOM, a name given to a number of species of shrubs of the closely allied genera *Cytisus*, *Genista*, and *Spartium*, of the natural order *Leguminosæ*, sub-order *Papilionaceæ*—all of them having long slender branches, along which are produced axillary flowers. The genera differ in the form of the standard (see PAPILIONACEÆ), which is roundish in *Spartium*, broadly ovate in *Cytisus*, and oblongo-ovate in *Genista*, whilst *Spartium* has also an acuminate keel, and that of *Cytisus* is very obtuse, that of *Genista* being oblong, and not wholly including the stamens and pistil.

The legume is many-seeded in all, the calyx 2-lipped, and the filaments united in a tube.—COMMON B. (*Cytisus scoparius*, the trivial name being from the Lat. *scopæ*, long twigs, or a besom)—which has by different botanists been ranked in each of the genera just named, although it possesses the characters above assigned to *Cytisus*, but has recently been made the type of a new genus, under the name of *Sarothamnus scoparius*, or *communis*—is a well-known native of Britain and of the continent of Europe, growing in dry soils, and ornamenting hedge-banks, hills, and bushy places, in May and June, with its large yellow flowers, which are on short stalks, drooping, solitary, but produced in considerable number along the straight slender branchlets. The whole aspect of the plant is graceful. The lower leaves have three oblong leaflets, the upper ones, or bracts, are simple; the branches are angular and of a very dark green, very tough, and much in use for making besoms. They have also been used for tanning and dyeing; and their fibre has been woven into a coarse strong cloth, and even made into paper. The whole plant is very bitter, with a peculiar nauseous taste and smell when bruised. The young tops and seeds are used in medicine, being powerfully diuretic, and very beneficial in some kinds of dropsy. They are also mildly laxative, and in large doses emetic.

Common Broom:
a, flowering branchlet; *b*, end of branchlet, not flowering, showing leaves with three leaflets; *c*, a pod; *d*, the tube of stamens cut open.

They are commonly administered in the form of a decoction. B. inhabits colder climates than furze, reaching to a greater elevation on mountains, and being found beyond the northern limit of furze. It varies in size from a very humble shrub to one of 20 or even 30 feet in height, and when it reaches this size, the wood is of great value for the finer purposes of cabinet-makers and turners.—IRISH B. (*Cytisus* or *Sarothamnus patens*), not unfrequent as an ornamental plant in British shrubberies, is not at all a native of Ireland, but of Spain and Portugal.—PORTUGAL B., or WHITE B. (*Cytisus albus*), a native of the countries bordering on the Mediterranean, is very often planted in Britain as an ornamental shrub, and is much admired for the beauty of its fascicled white flowers, which are produced upon long filiform branches. Its leaves have three leaflets. It sometimes attains a height of 15 or 20 feet.—SPANISH B. (*Spartium junceum*) is a native of the south of Europe, generally growing in dry soils and rocky situations, and attaining a height of 8 feet or upwards. Its branches are upright, round, and rush-like, a characteristic of this genus. They are smooth, and bear only a few small simple leaves, which soon drop off. The fibre of the branchlets is much used in some parts of Italy, France, and Spain, for making cloth, ropes, &c. In the south of France, the plant is cultivated on dry unproductive soils. The branchlets are made into bundles, dried, beaten, steeped, and washed, in order to the separation of the fibre. It possesses medical properties similar to those of the common broom.—A white-flowered species (*S. monospermum*), occasionally to be seen in British shrubberies, grows abundantly on the loose sands of the coasts of Spain, and produces a similar fibre. It is mentioned by Barth as growing in great abundance in Africa to the south of the Great Desert. Many species somewhat resembling these are occasionally to be seen in Britain among ornamental plants, some of them often in greenhouses. The Canary Isles produce some remarkable for the fragrance of their flowers. The name B. is not given to those species of *Cytisus* (q. v.) and *Genista* (q. v.) which do not display in a marked degree the character of having long slender twigs.—BUTCHER'S B. (q. v.) is a plant of an entirely different family.

BROO'MRAPE. See OROBANCHEÆ.

BRO'RA BEDS are a series of strata occurring at Brora, a village in Sutherlandshire, of the same age as the inferior oolite of Yorkshire. They are chiefly remarkable for the occurrence in them of a seam of coal of good quality 3½ feet thick, being the thickest stratum of true coal hitherto discovered in any secondary strata in Britain.

BROSSES, CHARLES DE, a learned French historian, was born at Dijon, February 8, 1709. His first work was *Lettres sur l'Etat de la Ville d'Herculaneum*, the result of a tour through Italy in 1739. At the suggestion of his friend Buffon the naturalist, he wrote the *Histoire des Navigations aux Terres Australes* (1756), in which he described the supposed great southern continent under the several names Magellania, Australia, and Polynesia. The last two of these names, now commonly used, were first employed by Brosses. His next work was *Du Culte des Dieux Fétiches*, &c. (1760). It was followed by a *Traité de la Formation Mécanique des Langues* (1765), which, in spite of many errors, contains not a few novel and ingenious observations and conjectures. During the greater part of his life, B. was occupied in endeavoring to supply the *lacunes* in the works of Sallust; and having collected about 700 fragments by this historian, he published, with such interpolations as he deemed necessary, the *Histoire de la République Romaine dans le cours du Septième Siècle, par Salluste* (1777). B. died as president of the parliament of Burgundy, May 7, 1777. His letters from Italy, under the title *Italie il y a cent Ans*, were edited and republished by his son René, Count de Brosses, in 1834.

BROTH is an infusion or decoction of vegetable and animal substances in water. It is customary to use more or less meat, generally ox-flesh, with bone, and certain vegetables, as cabbage, greens, turnips, carrots, pease, beans, onions, &c. The whole are mixed together in cold water, heat slowly applied, and the materials allowed to simmer for some hours. The meat yields up certain ingredients, whilst others are retained in the residual flesh. The following table will illustrate this.

Ox-flesh heated with water

Yields to the Water.	Leaves in the Boiled Meat.
Albuminous matter.	Fibrin.
Gelatine.	Coagulated albumen.
Kreatine.	Gelatinous tissue.
Extractive matters or Osmazome.	Fat.
Lactic acid.	Nervous matter.
Salts.	
Fat.	
Saccharine matter.	

The vegetables yield albuminous constituents, coloring and mucilaginous matter, and volatile oils and salts.

The real nutritive material present in broth is less than is generally thought, though it aids in satisfying the cravings of the appetite. To invalids, however, the form of broth known as Beef-tea (q. v.) is of great importance, as it affords the weak and sickly stomach a light palatable article of diet at a time when stronger food would do the weakened system much harm. See NUTRITION.

BRO'THERHOODS, RELIGIOUS. These were societies instituted for pious and benevolent purposes, and were numerous in the middle ages. Their origin is probably to be traced to the desire which then prevailed to imitate the spiritual orders. They were usually founded at first without ecclesiastical authorization, on account of which, several of the confraternities that either did not seek or did not obtain the recognition of the church, assumed the character of sects, and were suspected of heresy. To this class, among others, belonged the Beghards and Beguines (q. v), the Brothers and Sisters of the Free Spirit (see below), the Apostolic Brethren (q. v.), the Flagellants (q. v.), who, tolerated by the church for a while, at last incurred its displeasure, and were severly persecuted. We may also reckon among religious B. the old building corporation, from which sprang the order of Freemasons, the religious character of whose secret societies indicated, in the opinion of the church, a peculiarly dangerous gnosis and symbolism. Others coming into existence under ecclesiastical

oversight, or at least being confirmed by the church, had no *arcana*, but were simply dedicated to the promotion of religion, either by the imposition of new penances, the acceptance of new and severer devotions, or the assisting of strangers, travelers, the unprotected, the oppressed, the destitute, and the sick.

Nor can we refuse our admiration and approbation to such self-denying fraternities, when we remember how defective were the early communities in charitable institutions. They were most numerous in Italy, Rome alone boasting more than a hundred.

BROTHERS AND SISTERS OF THE FREE SPIRIT, a sect which sprang up in the Rhine country during the 13th c., and afterwards spread into France and Italy. It grounded its peculiarities on the biblical doctrine, that the Holy Spirit is a spirit of 'freedom.' Misunderstanding the true nature of spiritual freedom, the members of this sect conceived themselves released not only from the thraldom of the church, but also from the obligations of morality. They set aside the marriage-tie, and indulged in licentiousness. A few even maintained that the deeds of the body could not possibly affect the soul. Intellectually, they are said to have been given to Pantheism. The synods of Cologne in 1306, and of Treves in 1310, decreed their suppression, and in the persecutions which ensued, they appear to have been completely dispersed.

THE BRETHREN OF SOCIAL LIFE, BRETHREN OF THE COMMON LOT, or BRETHREN OF GOOD WILL (also called HIERONYMITES and GREGORIANS, from Hieronymus and Gregory the Great, whom they claimed as patrons), a fraternity founded about 1376 by Geert Groote (b. at Deventer, 1340—d. 1384), and Florentius Radewin (b. 1350, at Leerdam, in South Holland—d. 1400). This society—which professed to be a copy of the earliest Christian communities, and was in several respects a forerunner of the subsequently formed societies of United Brethren, now sometimes styled Moravians—was composed of persons who sought after pious and spiritual exercises without any conventional distinctions of order, &c. Community of goods, ascetic habits, industry, care of the education of young persons, and the use of the vernacular language in divine service, were some of the chief points insisted on by the brethren, who were not fettered by manastic or any other vows. Perfect community of goods was a rule of their societies.

Despite the persecutions which they suffered from the mendicant friars, they were recognized and sanctioned by several popes and by the Council of Constance. They became most numerous in the Netherlands and North Germany, but also spread themselves in Italy, Sicily, and Portugal, so that, in 1430, they reckoned more than 130 societies. The last was founded at Cambray in 1505. Several brotherhoods or Gregorians assisted in the Reformation. In other cases, their institutions fell into the hands of the Jesuits. Though the original founders of these societies were opposed to all learning and science which was not purely moral and practical, their followers rendered most important services to popular education, having free schools in connection with many of their houses, supporting students at other schools, and distributing useful books. They have, indeed, been not incorrectly described as pioneers of the Reformation. After the revival of learning in Italy, the Brethren of Social Life entered into the spiritual activity of the time. The most important and distinguished members of the society were Gerhard Zerbold of Zütphen, Thomas-à-Kempis, and the learned Cardinal Nicholas Cusa.—Female societies, of a similar character, sprung up at the same time with those of the Brethren of Social Life. At the head of each was a superior or directress, who was styled the *Martha*.

BRO'THERS, a name given to a group of six or eight rocky islets immediately outside the Strait of Bab-el-Mandeb, varying in height from 250 to 350 feet. They lie off the African coast about 9 miles south of the island Perim, now occupied by England. Of the loftiest point, the lat. and long. respectively are, 12° 28′ N., and 43° 22′ E.—Brothers is also the name given to three isolated mountains near the coast of New South Wales, between Harrington Inlet to the south, and Port Macquarie to the north, or between lat. 32° and 31½° S. They are valuable as landmarks.

BROTHERS, LAW OF DESCENT AMONG. In the law of England, this was immediate, without reference to the parent as the *commune vinculum*; but by the 3 and 4 Will. IV. c. 106, s. 5, it is enacted that no brother or sister shall be considered to inherit immediately from his or her brother or sister, but every such descent shall be traced through the parent. See INHERITANCE.

BROTHERS, LAY, an inferior class of monks, not in holy orders, but bound by monastic rules, and employed as servants in monasteries (q. v.).

BROTHERS AND SISTERS OF CHARITY. Under these names there exist in the Roman Catholic Church two widely ramified beneficient societies, for the nursing of the poor and sick in hospitals, without distinction of faith, rank, or nation. The order of the Brothers of Charity, or Compassionate Brothers, was established in 1540, at Seville, in Spain, by the Portuguese John di Dio (died 1550), who had served in Africa under Charles V. The funds for the purpose were obtained by begging. The primitive object of the society was the care of the sick, and the reformation of women of immoral character: it was composed of lay-members, under no rule. In the year 1572, the order received the papal recognition, and was subjected to the rule of St. Augustine. All the privileges of the mendicant orders were conceded to it in the year 1624, and it was then divided into a Spanish congregation, with a major-general in Granada, and an Italian or extra-Spanish congregation, with a major-general in Rome. To the latter belong also the Brothers of Charity in Switzerland, Germany (where Austria is their chief seat), Poland, the Netherlands, France, and other countries. The European members of the order clothe themselves in black; the extra-European, who are under a separate general of their order in America, wear brown. Their services to distressed humanity continue to be held in high estimation. The Sisters of Charity, formerly also, on account of their dress, called *Gray Sisters*—independent associations of unmarried Christian females, for the alleviation of human suffering, especially for the tending of the sick and the poor—were first called into existence in France, in 1634, by Vincent de Paul (born 1576), greatly assisted by the noble-hearted and self-devoted widow, Le Gras, by birth De Marilac. The society was recognized in 1655 by Clement IX., and in 1685 already numbered 224 convents. The French Revolution sorely interrupted the abundant and benevolent labors of the Sisters of Charity by the suppression and proscription of their convents in France; but Napoleon restored the order in 1807 by the convocation of a General Chapter of the scattered sisters, under the presidency of the Empress Mother, and by the grant of the necessary funds; and there exist at present more than 300 associations in France, where, in the villages, elementary education is in great part conducted by them. They attend the sick in all the great hospitals.

There exists in Germany a Roman Catholic association of unmarried females, not bound by conventual rules, and possessing the right of withdrawing from the association at pleasure, but placed under a strict supervision, and occupied in the same duties as the Sisters of Charity. The Institute of Deaconesses (q. v.) in the Protestant churches of the continent of Europe is of a very similar character.

BROTHERS, RICHARD, a fanatic, whose prophecies and writings excited an unusual sensation in his day, was at one time a lieutenant in the British navy, which he quitted in 1789. Refusing, from conscientious scruples, to take the requisite oath to enable him to receive his half-pay, he was reduced to great distress, and ultimately placed in the workhouse. Dating his first call from 1790, he announced himself, in 1793, the apostle of a new religion, 'the Nephew of the Almighty, and Prince of the Hebrews, appointed to lead them to the land of Canaan.' In 1794, he published a book, in two parts, entitled *A Revealed Knowledge of the Prophecies and Times*, &c.; and in 1795, an *Exposition of the Trinity*. He was the author of several other publications, marked by a strange mixture of reason and insanity. In consequence of prophesying the death of the king, and the destruction of the monarchy, he was committed to Newgate, but soon liberated. Some of his political predictions, especially in reference to the state of the continent, were either altogether or partially fulfilled; and many persons were induced to sell their goods, and prepare to accompany him to his New Jerusalem, which was to be built on both sides of the river Jordan, where he was to arrive in the year 1795. His disciples were not confined to the poor and ignorant, but even men of ability and education were deluded into believing in him, two of the most eminent being Nathaniel Brassey Halhed, Esq., M.P., the orientalist, and Sharp, the celebrated engraver. As a dangerous lunatic, he was at length, by order of government, committed to Bedlam, but released April 14, 1806, and died January 25, 1824.

BROUGHAM, HENRY, LORD BROUGHAM AND VAUX, was born in Edinburgh, 19th September 1778. His father, Mr. Henry Brougham, was the descendant of an ancient family in Westmoreland, and his mother, Eleonora Syme, who was a woman of much talent, was a niece of Robertson the historian. B. received his education at the High School, and afterwards at the university, of Edinburgh.

He gave early promise of future ability, some mathematical papers written by him at the age of eighteen having been considered worthy of publication in the Transactions of the Royal Society. He spent some time traveling on the continent, and in 1800 was admitted to the Scotch bar. In company with Jeffrey, Horner, and Sydney Smith, B.'s first public efforts were given to the service of the *Edinburgh Review*, and he contributed to it some of its most powerful articles. His liberal political views excluded him from the hope of promotion in Scotland, and a character which he had acquired for eccentricity and indiscretion, excluded him from all legal practice, except the unremunerative practice of the criminal courts. After seven years of vain attendance in the courts of Edinburgh, he betook himself to a field

more worthy of his ambition, and in 1808 passed at the English bar.

In London, B. first attracted public notice by the admirable appearance he made at the bar of the House of Commons, when he was employed on behalf of certain Liverpool merchants to ask the repeal of the Orders in Council. Soon after this, in 1810, he entered parliament, and within a few months of the time of taking his seat, brought in and carried his first public measure—an act making participation in the slave-trade felony. He was welcomed by the opposition leaders, to whose party he had attached himself, as a most powerful assistant in their attacks upon the government. B. succeeded in carrying the repeal of the obnoxious Orders in Council shortly before the general election of 1812, and then ventured to contest along with another Whig, the membership for Liverpool against Canning and another Tory. He was defeated, and remained without a seat in parliament till 1816, when he was returned for Winchelsea, and again became an active member of the opposition. By this time he also established some reputation in the courts of law. He never, indeed, acquired a very large practice, but he repeatedly distinguished himself by speeches of great vigor and ability in the defence of persons prosecuted for libel by the crown. His most famous appearance as an advocate, however, was in defence of Queen Caroline, when, along with Denman, he defended the injured queen with unequalled courage and disinterestedness, at the cost, as both well knew, of exclusion, for years to come, from all professional advancement. But his eloquence and boldness, though they forfeited for him the favor of the crown, gained him that of the people, and for the ten years between 1820 and 1830, B. was the popular idol. He made no bad use of his power.

In 1822, he used it, though in vain, in support of a scheme of national education; and to his activity is owing, in great measure, the establishment of the London University of the first Mechanic's Institute, and of the Society for the Diffusion of Useful Knowledge. In 1830, B. delivered a most powerful speech against slavery, and in consequence of it—as he himself believes—was invited to stand, and returned, as member for the great popular constituency of the county of York. The aristocratically disposed Whigs would—had they dared—have excluded B. from the Reform ministry; but, in addition to having enormous popularity, he was virtually their leader in debate in the Commons, and was thus, in spite of his unmanageableness, indispensable. After various intrigues, B. was offered, and was persuaded, against both his interests and his inclinations, to accept a peerage and the chancellorship. He took his seat in the Lords in November, 1830, and assisted very materially in carrying through that House the great measures then proposed by the liberal ministers. He shared in the general unpopularity which afterwards attached to them, and when they were dismissed by William IV. in 1834, B. left office, never to return to it. After that time, he held in the Upper House a position as nearly analogous as may be to that formerly held by him in the Commons, criticising freely the conduct of successive administrations, and steadily forwarding every measure for social progress.

It will be as a law-reformer that B. will be best remembered. He took up Romilly's uncompleted task, of carrying into practice the ameliorations suggested by Bentham. His efforts in this direction began as early as 1816, when he introduced into parliament a bill to remove various defects in the law of libel. In 1827, in a memorable speech which occupied six hours in delivery, B. enumerated the defects in nearly every branch of English law, and made proposals for dealing with law-reform on a proper scale. These, as might have been expected, met with little encouragement. It has been the fortune of many of his measures to be carried afterwards, in a mutilated form, by other hands. After he left office, B. also succeeded in carrying various reforms in the law, among which may be noted some very extensive changes in the law of evidence.

Among the measures proposed by B., but left for future law-reformers to carry, were bills for the codification of the criminal law, for the establishment in England of a system of public prosecutors, and for the giving of compensation to parties acquitted. Lord B.'s acts and bills, as well those regarding the slave-trade, education, and other public questions, as those touching on law-reform, have been collected and published by Sir J. E. Eardley Wilmot (Lond., Longman, 1857). The large well-filled volume which they form is the most fitting monument that could be preserved of the activity, perseverance, and public spirit of the man.

As an orator, more especially as a debater in parliament, B. was, among the men of his time, inferior only to Canning. He was wont, however, to indulge in his speeches in too large an admixture of exciting elements: argument was mingled with fiery declamation; ridicule, sarcasm, invective, were freely used; and these he dealt out with a vehemence and energy that at times carried him far beyond bounds. The power of ready, rapid, and forcible diction was eminently his. In many other fields besides oratory, B. has won a high reputation. He cultivated mathematical and physical science with success, and ventured upon the domain of metaphysics, and even of theology. His miscellaneous writings are of great extent, and upon an almost incredible variety of subjects. They were, however, intended more to serve purposes of the moment, than as permanent additions to our literature; and though they display great powers of rapid comprehension and nervous clear exposition, it cannot be said that we are indebted to their author for any new truths in politics or morals, or any original discoveries in science. The honors due to men of letters B. did not fail to acquire, having successively been made Lord Rector of Glasgow University, President of University College, London, Member of the Institute of France, Chancellor of the University of Edinburgh, and lastly, D.C.L. of Oxford.

Lord B. took a warm interest in legal and social reform. While not engaged in parliament, he resided chiefly at Cannes, in the south of France, where he died, May 7, 1868. His lordship married, in 1819, Mary Anne Eden, the granddaughter of a baronet in the county of Durham. The issue of this marriage was two daughters, who both died before reaching womanhood. The patent of the title to the peerage was extended to make it descend to the family of his brother. B. left a Memoir of his Life and Times, which was published in 3 vols. (1871).

BROU'GHTY-FERRY, a town of Forfarshire, on the Firth of Tay, 4 miles east of Dundee. Pop. (1871) 5817. It is connected with Ferry-Port-on-Craig, in Fifeshire, by a railway ferry over the firth, here a mile broad, which, before the opening of the Tay Bridge, formed the chief connection between Edinburgh and Fife with Dundee. It has cod and other white fisheries. Many Dundee merchants occupy fine villas at B.-F. On the shore stands an ancient castle, lately repaired as a defence for the Tay.

BROU'SSA, or BOU'RSA, the ancient *Prusa*, where the kings of Bithynia usually resided, situated in lat. 27° N., long. 40° E., at the foot of Mount Olympus, in Asia Minor. Prusa is said to have been built by Prusias, king of Bithynia, who waged war with Crœsus or Cyrus. Seifeddulat, of the race of Hamadan, took it in 336 of the Hegira, but it was retaken by the Greek emperor in 947 A.D. In 1356, Orcan, son of Othman, the second emperor of Turkey, captured it, and made it the capital of his empire, and it continued so until the taking of Constantinople by Mohammed II. in 1453.

B. is most pleasantly situated, facing a beautiful and luxuriant plain, covered for many miles with plantations of mulberry-trees. The city and suburbs are about six miles in circumference. The town is divided from the eastern suburb by a deep channel or vale, over which there are several bridges, one of them—with shops on each side—being 90 paces long and 16 broad. The streets are remarkably clean, and the bazaars very good, being supplied with European goods from Constantinople. The population of B. amounts to 73,000 souls, of whom about 11,000 are Armenians. It contains a great number of mosques, some of which are very fine buildings. The silks of B. are much esteemed in the European markets, and great quantities are exported every year to France, Constantinople, and Smyrna. The inhabitants manufacture a kind of silk, like satin, mostly striped, which is used for the under-garment of the oriental dress; also a material from silk and flax used chiefly for shirts; and a sort of gauze, called 'brunjuke,' which is much worn by the Turkish ladies for under-garments. A great quantity of British manufactured goods, such as Manchester 'twists,' 'gray calicoes,' 'prints,' 'zebras,' &c., are imported into B., the goods being landed at Constantinople, and thence conveyed overland to Broussa. It is the official residence of a Turkish Pasha, and the seat of a Turkish tribunal. B. is subject to frequent earthquakes. In ancient times, it was famous for its thermal baths, or 'royal waters,' as they were called, which still exist.

BROUSSAIS, François Joseph Victor, the founder of the school of medicine, was born at St. Malo, December 17, 1772, and in early life, after studying at Dinon, served for a time first in the navy, and then in the army. In 1820, he was appointed first professor at the military hospital of Val-de-Grace. In 1832, he became Professor of General Pathology and Therapeutics in the Faculty of Medicine in Paris, and afterwards was made a member of the Institute. He died at his country residence at Vitry, November 17, 1838. In 1841, a statue was erected to his memory in the court of Val-de-Grace. B.'s peculiar views are ably explained in his chief works—the *Histoire des Phlegmasies ou Inflammations Chroniques* (1808), and *Examen de la Doctrine Médicale généralement adoptée* (1816), which assert the following principles: that life is sustained only by excitation; that this excitation may be either too strong (*surexcitation*) or too weak (*adynamie*), the latter case, however, being far less frequent than the former. These abnormal conditions of surexcitation and adynamie at first manifest themselves in a specific organ of the body; but afterwards, by sympathy, are extended to other organs; that is, all diseases are originally *local*, and become *general* only by sympathy of the several organs. The organs most subject to disease are the

stomach and bowels, and therefore *gastro-enteritis* (inflammation of the stomach and intestines) is the basis of pathology; consequently, B. resorted to local phlebotomy—especially the application of numerous leeches to the region of the abdomen—as a remedy in fevers and various diseases. His theory and practice gained many adherents in France, who took the name of the 'Physiological School.' But a more exact knowledge of physiology has demonstrated that the views of B. were one-sided and exaggerated. Yet they have not been without use in pathology, as they have led to a more careful study of pathological anatomy and physiological sympathies, and to a more exact observation of the so-called specific morbid processes of which the existence was denied by B. and his followers. Montègre, *Notice Historique sur la Vie, les Travaux, et les Opinions de Broussais.*—His son, CASIMIR B., born 1803, professor at Val-de-Grace (1833), was a zealous adherent of the Broussais system, and is the writer of a work, *Hygiène-Morale,* based on phrenology.

BROUSSONE'TIA. See MULBERRY.

BROWN, CHARLES BROCKDEN, a celebrated American novelist, was born at Philadelphia, January 17, 1771. His early education was carried on under the care of Mr. Robert Proud, author of the *History of Pennsylvania.* Afterwards he studied for the law, but the license which he had already given to his imagination induced an unconquerable aversion to legal pursuits, and he consequently betook himself to literature. The French Revolution exercised on him, as on many other ardent spirits, a considerable influence; several of his writings at this period being penetrated with the new thoughts and sentiments which sprung out of that great convulsion. In 1798, he published *Wieland,* the first of his remarkable fictions; and in 1799, *Ormond, or the Secret Witness.* His next production was *Arthur Mervyn, or Memoirs of the Year* 1793—the fatal year of yellow-fever in Philadelphia. In 1801 appeared *Edgar Huntly, or the Adventures of a Sleep-walker,* 'a romance presenting a greater variety of wild and picturesque adventure, with more copious delineations of natural scenery, than is to be found in his other works.'—*Prescott.* This was followed in the same year by *Clara Howard,* and in 1804 by *Jane Talbot,* first printed in England. He died of consumption in 1810.

Besides the writings which have been enumerated, B. composed a number of political pamphlets, contributed to various literary magazines, and founded three or four periodicals himself. The author who exercised the greatest influence on the development of his genius was Godwin, whom he occasionally imitated, while Godwin himself, on the other hand, acknowledged his obligations to B., and warmly admired him. The most striking quality of his mind is its ingenuity, both imaginative and psychological. He invents incidents and analyzes feelings with remarkable subtlety, but his success is somewhat marred by his extravagant departure from the realities of everyday-life.

BROWN, JOHN, of Haddington, once the most popular, and still among the most revered, theological writers in Scotland, was born in 1722 at Carpow, near Abernethy, in Perthshire. Deprived of both his parents when only 11 years of age, he became assistant to a venerable and pious shepherd, named John Ogilvie, who tended his flock among the neighboring hills, and nursed the religious ardor of the boy's heart. B., however, aspired to be wise as well as good. His thirst for learning was insatiable, and the most romantic yet well-accredited stories illustrative of this are related by his biographers.

While still a friendless 'herd laddie,' he had made great progress in a self-acquired knowledge of Greek and Latin. The extent of his acquisitions, even at this early time, may be estimated from the fact, that the country-people round about believed he was in league with the devil, and that he had pledged his soul for unhallowed lore. At a later period of his life, 'he knew nine or ten languages, classical, oriental, and modern, and had amassed vast stores of Puritan, Scottish, and Dutch divinity.' After a brief career as a pedlar—an employment which English readers will understand from Wordsworth's *Excursion* was neither mean nor degrading—B. became a volunteer in a regiment of militia raised in Fifeshire during the rebellion of 1745, and in 1747, schoolmaster in the neighborhood of Kinross. During the vacations of his school, he studied philosophy and divinity under the inspection of the Associate Synod, and the superintendence of the Rev. Ebenezer Erskine and James Fisher. In 1750, he was ordained pastor of the Secession Church at Haddington. Perhaps a more faithful, industrious, and holy minister never labored in Scotland. David Hume was once prevailed upon to go and hear him, and the criticism of the great sceptic was: 'That old man preaches as if Christ were at his elbow.' Although self-educated, he had little of the narrowness which culture so obtained generally brings along with it; he corresponded on friendly terms with Episcopalians, and often expressed a warm affection for all true Christians. Although himself a sound Presbyterian, and a tolerably strict Calvinist, 'the love of the Lord' was his real and ultimate test of a man's orthodoxy. In 1758, B. published *Help for the Ignorant;* and in 1765, his famous *Christian Journal.* In 1768, he was appointed professor of divinity under the Associate Synod, and in the same year issued his valuable *Dictionary of the Holy Bible.* In 1771 appeared his *History of the Church from the Birth of the Saviour*—a work good enough for cottage reading; and in 1778, *The Self-interpreting Bible.* This last, B.'s *magnum opus,* has been amazingly popular in Scotland, and has been commended by high dignitaries of the Anglican Church. B. also issued a great variety of sermons, tracts, &c. He died on 19th June 1787.

BROWN, JOHN, D.D., son of the Rev. John Brown of Whitburn, who was the son of the preceding, was born 12th July 1784. He studied at Edinburgh University, and at the theological hall of the Secession Church. In 1806 he was ordained to the pastorate of a church in Biggar, a small town in Lanarkshire. In 1822 he was transferred to Rose Street Church, Edinburgh, and in 1829 to Broughton Place Church, in the same city. In 1834 he was appointed professor of pastoral and exegetical theology in connection with the Associate Synod. He died 13th October 1858. Dr. B. was a powerful and popular preacher, and a profound expositor of Scripture. Among his works are—*The Law of Christ respecting Civil Obedience; The Resurrection of Life;* and his scholarly *Expository Discourses on the Epistles of Peter, on the Epistle to the Galatians, and on the Epistle to the Romans.* See Dr. Cairns's Memoir (1860).

BROWN, JOHN, M.D., LL.D., author of *Rab and his Friends,* was the son of the foregoing, and was born at Biggar, 22d Sept. 1810. He studied medicine at Edinburgh University, and in 1832 established himself at Edinburgh as a physician. He was highly esteemed as a professional man, but it was as an essayist of rare insight, quaint fancy, humor, and tenderness, that he became well known to his fellow-citizens and to all English-speaking people. He contributed to various magazines, and in 1858 issued a first volume of collected essays, to which he gave the name of *Horæ Subsecivæ.* In 1882 the *Horæ* were extended and rearranged in three volumes, of which the first comprises *Locke, Sydenham,* and other papers. *Rab and his Friends,* a powerful but eminently simple tale of a Scottish carrier and his dog Rab, gives name to the second volume. This story, delightfully combining smiles and tears, pathos and humor, soon attained world-wide popularity, and has been frequently reprinted and translated. The third series of the *Horæ* is *John Leech and other Papers.* B., catholic, kindly, loving and beloved, died 11th May 1882. He was a Fellow of the Royal Society of Edinburgh, and had a civil list pension of £100 allotted to him in 1876.

BROWN, SAMUEL, M.D., son of Samuel Brown (the founder of itinerating libraries, and grandson of the Rev. John Brown of Haddington), was born on the 23d February 1817, and entered the university of Edinburgh in 1832. He took his degree as M.D. in 1839, and immediately surrendered himself to the magical fascination of chemistry. One idea possessed him to the close of his life—the possibility of reconstructing the whole science of atomics. He never, in spite of crushing failures in experiment, abandoned his early conviction that chemical elements, usually considered simple, might be transmuted into each other. In 1843, he delivered in Edinburgh four critical lectures on the atomic theory. During the same year, he became a candidate for the chair of chemistry in the university of that city; but having perilled his claims on the experimental success of his fatal theory, and being again doomed to disappointment, he withdrew his application, and devoted himself with a kind of mournful austerity, and with more than the earnestness of a medieval alchemist, to the solitary work of his laboratory. In 1850 appeared his *Tragedy of Galileo,* a volume which indicates, but does not embody, the finely imaginative and philosophical genius of its author. B. died of consumption 20th September 1856. His fugitive essays were collected and published after his death; and though for the most part too comprehensive in their intent, they enable the public to understand why he was held in admiration by men like Hamilton, Ferrier, De Quincy, Wilson, Carlyle, Hare, Jeffrey, and Chalmers.

BROWN, SIR GEORGE, a distinguished British general, born at Linkwood, near Elgin, Scotland, in August 1790, entered the army in 1806, became lieutenant in 1807, and was present in the latter year at the capture of Copenhagen. He served in the Peninsular War. At the battle of Talavera he was severely wounded, and at the storming of Badajoz was one of the forlorn-hope. He was appointed major, May 26, and lieutenant-colonel, September 29, 1814, in which year he embarked in Major-general Ross's expedition against the United States of America, and was wounded at the battle of Bladensburg. From February 6, 1824 to 1842, he commanded a battalion of the Rifle Brigade. He was made adjutant-general of the forces, April 1850, and lieutenant-general, 1851. In the Crimean war, 1854—1855, B. commanded the Light Division.

At the battle of Inkermann, November 5, 1854, he was severely wounded, and obliged to retire for a short time to Malta. In 1855 he was created a Knight Commander of the Bath. In the expedition

to the Sea of Azof, he commanded the British troops; and in the first unsuccessful attack on the Redan of Sebastopol, he had the chief command of the storming-party. He was gazetted April 3, 1856, 'General in the army for distinguished service in the field.' He was a Knight of Hanover, received the Turkish Order of the Medjidie of first-class in 1855; and the Grand Cross of the Legion of Honor, 1856. In 1860 he became commander-in-chief in Ireland, and in 1862 a privy-councillor. He died in 1865.

BROWN, THOMAS, a Scottish metaphysician, son of the Rev. Samuel Brown, was born in 1778 at the manse of Kirkmabreck, Kirkcudbrightshire. After being some time at school in England, he went to Edinburgh in 1792, and for several years attended the lectures of Playfair, Black, Robison, and Dugald Stewart. He began the study of law, but shortly abandoned it for medicine; and having taken his diploma of M.D. in 1803, he became (1806) the partner of Dr. Gregory in his large practice. But his strong bent was for literature and philosophical speculation. At the age of 18, he had published a refutation of Darwin's *Zoonomia;* was a member of an Academy of Physics, or society for 'the investigation of the laws of nature,' formed in 1797, and embracing the names of Erskine, Brougham, Leyden, Jeffrey, Smith and others; and contributed at the outset to the *Edinburgh Review*. In 1804 appeared his essay on *Cause and Effect*, in which he holds that there is nothing in a cause but the fact of immediate and invariabe antecedence to the change called its effect. Dugald Stewart, professor of moral philosophy in the university, being obliged, from bad health, to retire in 1810, got Dr. B. appointed assistant and successor, which office he continued to discharge till his death in 1820. He was popular as a professor; and his *Lectures*, published after his death, have gone through a great many editions, though of late they have somewhat fallen out of notice. He also wrote a good deal of poetry, which is now forgotten. Dr. B. attempted to overturn the psychological system of his predecessors Reid and Stewart, and to substitute a new and simplified scheme of mental phenomena. The greater part of this new philosophy was the production of his first session as professor, the writing of each lecture being begun on the evening previous to its delivery. A philosophic system thus improvised could not but be crude and inconsistent, however acute and imaginative its author might be. B.'s chief contribution to psychology is the establishment of a sixth or *muscular sense*.

BROWN, JOHN, M.D., founder of the Brunonian system of medicine, the son of a day-laborer, and himself first intended for a weaver, born in 1735, in Bunkle parish, Berwickshire, was educated at the grammer-school of Dunse, in which he was subsequently an usher. After studying medicine at the Edinburgh University, he become tutor to the children of the celebrated Dr. Cullen, and assistant in his university lectures. Conceiving himself slighted by Cullen, he commenced giving lectures himself upon a new system of medicine, according to which all diseases are divided into the sthenic, or those depending on an excess of excitement, and the asthenic, those resulting from a deficiency of it; the former to be removed by debilitating medicines, as opium, and the latter by stimulants, such as wine and brandy. His system gave rise to much opposition, but his partisans were numerous; for a time his opinions had some influence. In 1779, B. took the degree of M.D. at the university of St. Andrews, and in 1780 published his *Elementa Medicinæ*. He was also author of *Observations on the Old System of Physic*. In 1786, being overwhelmed with debt, he removed to London, where he died of apoplexy in 1788. His works, with a memoir by his son, Dr. William Cullen Brown, appeared in 1804 (3 vols. 8vo).

BROWN, ROBERT, an English clergyman, founder of the sect of Brownists, born in 1549, the son of Anthony Brown, Esq., of Folthorp, Rutlandshire, was educated at Cambridge, and was at first a preacher at Bennet Church, then a schoolmaster in Southwark, and a lecturer at Islington. In 1580 he began to attack the order and discipline of the Established Church, and soon after formed a distinct church on democratic principles at Norwich. Committed by Dr. Freake, bishop of that see, to the custody of the sheriff, he was released from prison through the influence of the lord-treasurer, Cecil, to whom he was nearly related. Having, in 1582, published a controversial work, entitled *The Life and Manners of True Christians*, with, prefixed, *A Treatise of Reformation without Tarrying for Any*, he was again arrested, but, through the lord-treasurer's intercession, again liberated. He afterwards formed several Congregationalist churches; but, with many of his followers, was obliged to take refuge in Holland. In 1589, he returned to England, reconciled himself to the Established Church, and became rector of a church near Oundle, Northamptonshire.

Of a very violent temper, he was, when 80 years old, sent to Northampton jail, for an assault on a constable, and died in prison in 1630. The Brownists continued, notwithstanding the defection of their leader, to subsist as a separate sect for some time, both in Holland (among the English there) and in England. In the former country, they were at last absorbed in, or reconciled to, the Presbyterian Church in 1701; in the latter, they may be said to have given birth to the Independents (q. v.), who rose into great importance in the 17th century.

BROWN, CAPTAIN JOHN, the leader of the Harper's Ferry (U. S.) insurrection (1859), designed to incite the slaves of the southern states of America to rebellion, was descended from a Puritan carpenter, one of the *Mayflower* emigrants, and was born at Torrington, Connecticut, in the year 1800. He intended to enter the ministry, but had to abandon his studies on account of weak sight, and subsequently became a wool-dealer. In 1854, having imbided an intense hatred of slavery, he went to Kansas, in order to vote, and, if need were, fight against the establishment of slavery in that territory. In many of the conflicts which ensued between the pro-slavery party from Missouri and the free settlers, B. played a prominent part, and in one of these he had a son killed, a circumstance which deepened his hostility against the Southern party. After the agitation in Kansas was settled by a general vote, B. traveled through the northern and eastern states, declaiming against slavery, and endeavoring to organize an armed attack upon it. In October 1859, at the head of 17 white men and 5 blacks, he commenced active hostilities by a descent upon Harper's Ferry, a town of some 5000 inhabitants, at the confluence of the Potomac and Shenandoah, and possessed of an arsenal containing from 100,000 to 200,000 stand of arms. The arsenal was easily captured, and 40 or 50 of the principal inhabitants were made prisoners; but instead of retreating at once to the mountains with arms and hostages, as his original design had been—meaning to exchange the hostages for slaves—B. lingered on in the town until the evening, by which time 1500 militiamen had arrived. Next day, an attack was made on his position, which, after some loss of life, was carried. B. was captured, and shortly after was tried for treason, and executed. He is described as a singularly brave and honest man.

BROWN, ROBERT, an eminent botanist, the son of an Episcopal clergyman, was born at Montrose, Scotland, December 21, 1773, and educated at Marischal College, Aberdeen. Having studied medicine at the university of Edinburgh, he became, in 1795, ensign and assistant-surgeon in a Scottish Fencible regiment, with which he went to Ireland. Devoting himself to the study of botany, he resigned his commission in 1800, and the following year was, on the recommendation of Sir Joseph Banks, engaged as naturalist in the expedition sent out under Captain Flinders for the survey of the Australian coast. On his return in 1805, he brought home nearly 4000 species of Australian plants, a large proportion of which were new to science. Soon after, he was appointed librarian to the Linnæan Society. To the *Transactions* of the Edinburgh Wernerian Society, and those of the Linnæan Society, he contributed memoirs on *Asclepiadeæ and Proteaceæ*, and published *Prodromus Floræ Novæ Hollandiæ et Insulæ Van Diemen's*, vol. i. 1810; a supplement to this work appeared in 1830, relating to the *Proteaceæ* only. He also wrote the *General Remarks, Geographical and Systematical on the Botany of Terra Australis*, attached to the narrative of Captain Flinders's expedition, 1814. His adoption of the natural system of Jussieu, the French botanist, led to its general substitution in place of the Linnæan method. B.'s numerous memoirs in Transactions of societies, and other contributions to botanical science, secured for universal approval the title conferred on him by Alexander von Humboldt of *Botanicorum facile Princeps*. In 1810, B. received the charge of the library and splendid collections of Sir Joseph Banks, which in 1827 were transferred to the British Museum, when he was appointed keeper of the botanical department in that establishment. In 1811, he was elected F.R.S.; in 1832, D.C.L. of Oxford; and in 1833 was elected one of the 18 foreign associates of the Academy of Sciences of the Institute of France. In 1839, the Royal Society awarded him their Copley medal for his *Discoveries during a Series of Years on the Subject of Vegetable Impregnation*. He was president of the Linnæan Society from 1849 to 1853. He died in London, June 10, 1858. A collected edition of B.'s works, in 5 vols. 8vo, has been published in Germany.

BROWN, WILLIAM, founder of the Free Public Library at Liverpool, born at Ballymena, Ireland, in 1784; was educated at Catterick, near Richmond, Yorkshire; and in his 16th year accompanied his parents to the United States. Employed in the counting-house of his father, who was engaged in the linen trade in Baltimore, in a few years he was admitted a partner. Returning to England in 1809, he established a branch of the business at Liverpool, and laid the foundation of one of the largest mercantile firms in the world. Embarking in the American trade, he became an extensive importer of cotton, and by his rare energy, quick business habits, and sterling integrity, soon became distinguished for the magnitude of his dealings. A liberal reformer, he took a prominent part in local and public affairs, and unceasingly promoted the education of the people. In 1844, he contested South Lancashire upon the Anti-Corn-Law League interest without success,

but was returned to parliament for that division of the county in 1846, and was subsequently three times re-elected. A series of letters in defence of free trade, which, in 1850, he contributed to the *Pennsylvanian* (Boston newspaper), attracted much attention. He was also an able advocate for the adoption of a decimal coinage. In 1857, he munificently subscribed £30,000 for the establishment of a Free Public Library at Liverpool, and the noble building erected for the purpose owes its existence entirely to his generosity. He died in 1864.

BROWN COAL, a mineral substance of vegetable origin, like common coal, but differing from it in its more distinctly fibrous or woody formation, which is sometimes so perfect that the original structure of the wood can be discerned by the microscope, whilst its external form is also not unfrequently preserved. In this state, it is ofted called *Wood Coal;* and it sometimes occurs so little mineralized, that it may be used for the purposes of wood, as at Vitry, on the banks of the Seine, where the wood-work of a house has been made of it.

From this to the most perfectly mineralized state, it occurs in all different stages. It is often brown or brownish black, more rarely gray. It burns without swelling or running, with a weaker flame than coal; emits in burning a smell like that of peat, and leaves an ash more resembling that of wood than of coal. Whereever it occurs in sufficient abundance, it is used for fuel, although very inferior to common coal. *Bovey Coal*, so called from Bovey Tracey, in Devonshire, where extensive beds of it occur, and where it has been long wrought, is B. C., and often exhibits the woody structure very beautifully. B. C. occurs in a number of other places in Britain, and more abundantly near Paris and in Liguria and Hanover, where it forms thick beds in alluvial deposits.—The *Surturbrand* (q. v.) of Iceland is regarded as a variety of it. *Jet* (q. v.) is also sometimes regarded as a variety of brown coal. Although bearing the name of coal, B. C. is rather a kind of *lignite* (q. v.) than of coal.

BROWN PIGMENTS, a term in art applied to those substances in which the three primary colors unite in unequal proportions, red being in excess. B. P. are chiefly mineral, and are used sometimes in a raw but usually in a burned state. The most important are bistre, asphaltum, umber, terra di sienna, Mars brown, Cassel earth, and brown madder.

BROWN SPAR, a name often given by mineralogists to certain varieties of Dolomite (q. v.), or magnesian limestone, of not unfrequent occurrence, distinguished by a brownish or reddish color, and a pearly lustre, upon account of which they are also sometimes called *pearl spar*.

BROWNE, Charles Farrar, an American humorist, better known as 'Artemus Ward,' was born in Waterford, Maine, in 1836,and graduated from the free village school into a printing-office —the American boy's college. As a printer's boy, he worked in all the principal towns in New England, until settled at Boston, where he began to write comic stories and essays. A roving disposition carried him to the West, and he was engaged as local editor in Toledo, and later in Cleveland, Ohio, where his letters from 'Artemus Ward, showman,' a pretended exhibiter of wax figures and wild beasts, first attracted general attention. In 1860, he became a contributor to *Vanity Fair*, a New York comic weekly paper; and being invited to lecture, soon became very popular and attractive. As a lecturer, in 1863, he visited California, making the overland trip, visiting Salt Lake City, the Mormon capital, and drawing crowds in every town he visited.

In 1864, he opened his illustrated lectures on California and Utah in New York with immense success; and in 1866, was induced to visit England, where he became a contributor to *Punch*, and gave his lectures on the Mormons in the metropolis, at the Egyptian Hall, Piccadilly. But while convulsing crowded audiences with laughter, he was wasting with pulmonary disease. Early in 1867, he went to Guernsey for a milder air, but with no benefit; and was about to embark for America, when he died at Southampton, March 6, 1867. He was tall, slender, with striking features, and a most amiable character, which attracted and attached to him many friends. By his will, after providing for his mother, leaving legacies to his friends, and his library to the best boy in the school of his native village, he left the bulk of his property in trust to Horace Greeley to provide an asylum for printers. His collected writings, which have had a wide circulation in America and England, are *Artemus Ward His Book*; *Artemus Ward among the Mormons; Artemus Ward among the Fenians*; and a posthumous collection and biography entitled *Artemus Ward in England*.

BROWNE, Thomas, antiquary and physician, was born in London, 1605. His father, a merchant, left him an ample fortune, and he was educated at Winchester and Oxford. He began the study of medicine, then traveled over France and Italy, and after taking the degree of M.D. at Leyden, returned and settled (1636) at Norwich, where he continued to practise as a physician. He was knighted in 1671 by Charles II., and died 1682. His chief works are: *Religio Medici* (1642), *Inquiries into Vulgar and Common Errors* (1646), and a *Discourse on Sepulchral Urns* (1648). He wrote also *The Garden of Cyrus, or the Quincunxial Lozenge;* besides a variety of tracts, published after his death. His writings are highly prized by many for their genial fancy, pleasing quaintness of style, and varied erudition.

BROW'NIE, a domestic spirit of the fairy order in the old popular superstitions of Scotland. The common tradition respecting the B. is, that he was a good-humored drudging goblin, who attached himself to farmhouses and other dwellings in the country, and occupied himself during night, when the family were in bed, in performing any humble kind of work that required to be attended to, such as churning, thrashing corn, &c.—a spirit not seen or spoken to, and only known by the obliging performance of his voluntarily undertaken labors—a most valuable adjunct to the domestic establishment, and unfortunately no longer obtainable by good housewives. In Cornwall, a goblin known as *Browny* is evoked to assist at the swarming of bees (Borlace's *Antiquities of Cornwall*). The resemblance of the Scotch B. to the *Robin Goodfellow* (q. v.) of the English, and the *Kobold* of the Germans, is also so conspicuous that we must necessarily refer the different fragmentary legends on the subject to one of the old superstitions generally prevalent in Europe.

BROWNING, Elizabeth Barrett, England's greatest poetess, was born near Ledbury, Herefordshire, in 1809. Her maiden name was *Barrett*. The culture which she received in her youth was of a kind far transcending the ordinary education even of 'ladies intellectual.' Classics, philosophy, and science were studied with enthusiasm and success. At a comparatively early period, she became a contributor to periodicals, and a series of articles on the Greek Christian poets indicated that she possessed both recondite learning and keen poetic insight. Her first important essay in authorship was a translation of the *Prometheus* of Eschylus in 1833. In 1838, appeared the *Seraphim, and Other Poems*, the external peculiarity of which was its endeavor to embody the ideas and sentiments of a Christian mystery in the artistic *form* of a Greek tragedy. Delicate health, arising from the rupture of a blood-vessel in the lungs, and the death by drowning of a favorite brother in the following year, compelled her to live in seclusion for a long time. At length her health was restored, and in 1846 she married Robert Browning (q. v.). himself a great poet. After their marriage, they resided chiefly in Italy, in whose welfare they were passionately interested. In 1850, Mrs. B. published her collected works, together with several new poems, among which was *Lady Geraldine's Courtship*. In 1851, appeared the *Casa Guida Windows*, a poem whose theme was the struggle made by the Tuscans for freedom in 1849. *Aurora Leigh*, her longest production, was published in 1856. *Poems before Congress* appeared in 1860. Her poetry is distinguished by its depth of feeling, by its true pathos, by its noble and generous sentiments. Apparently she poured forth her verse with dangerous facility; and there are few of her poems which would not be improved by the simple process of curtailment. But there is not a thought or a sentiment of the many she has so beautifully expressed which any one would wish expunged. No writer ever exerted a better, gentler, happier influence. She died in 1861.

BROWNING, Robert, a distinguished contemporary poet, born in the neighborhood of London in the year 1812, and educated at the London University. The drama of *Paracelsus*, which first brought him into notice, was published in 1836. In the following year appeared his tragedy of *Strafford*, which was brought out upon the stage, but proved unsuccessful, though Macready himself personated the hero. *Sordello* and *The Blot in the Scutcheon* also failed, through lack of vivid and impressive incident. *Pippa Passes* secured a greater measure of popular approbation. In 1855 B. published *Men and Women*, one of his greatest works, containing poems which for depth and subtlety of conception, profound analysis of the human mind in its most delicate and impassioned conditions, and abstract speculative insight, are unsurpassed in the English language. If, as some think, in vigor and brilliancy of thought he is above Tennyson, he is as far beneath him in melody of versification and artistic beauty of style. Often he shows a morbid love of obscurity, but he frequently exhibits a Shaksperian clearness of idea and emphasis of expression. Some of his *Dramatic Lyrics* are faultless. Among his other poems are *The Ring and the Book; Balaustion's Adventure* (1871); *Prince Hohenstiel-Schwangau* (1871); *Red Cotton Night-cap Country* (1873); *Aristophanes' Apology* (1875); *The Inn Album* (1875); *Pacchiarotto, with other Poems* (1876); *La Saisiaz: The Two Poets of Croisic* (1878); *Dramatic Idyls* (First and Second Series, 1879—1880.—The *Browning Society*, for the study of B.'s poetry, has branches at Oxford, Cambridge, and elsewhere.

BROWNS on porcelain are generally imparted by a mixture containing sulphate of iron. See Pottery.

BROWNS on cloth are communicated by arnotto (q. v.) and copperas, assisted by fustic sumach, peachwood, logwood, and alum. See DYEING.

BRSHESI'NY, an insignificant town of Poland, in the government of Piotrkov, 62 miles south-west of Warsaw, near the railway that connects Warsaw with Vienna and other places. Pop. 2060

BRUCE, the surname of a family illustrious in Scottish history, descended from Robert de Bruis, a Norman knight, who accompanied William the Conqueror to England in 1066, and died soon after. His younger son, Adam, who acquired large possessions in Yorkshire, left a son, Robert de Brus of Cleveland, a companion in arms of Prince David of Scotland, afterwards David I., from whom he received a grant of the lordship of Annandale, held by the tenure of military service. At the commencement of the war in England between Stephen and Matilda, niece of the king of Scots, Robert de B. adhered to the former, and renounced his allegiance to David, resigning his lands in Annandale to his son Robert. In 1138 he was sent by the barons of the north of England to negotiate with David, who had advanced in support of his niece's claims as far as Northallerton, Yorkshire.

In the battle of the Standard which followed, he took prisoner his son Robert, then fourteen years of age, who, as lord of Annandale, fought on the Scottish side. He died in 1141. His English estates were inherited by his eldest son, Adam, whose male line terminated in Peter de B. of Skelton, Constable of Scarborough Castle in 1271. Robert de B., 2d lord of Annandale, had two sons: Robert—who married a natural daughter of William the Lion, and died, without issue, before 1191—and William, whose son, Robert, 4th lord of Annandale, married Isobel, 2d daughter of David, Earl of Huntingdon and Chester, brother of William the Lion, and thus laid the foundation of the royal House of Bruce. He died in 1245.

BRUCE, ROBERT DE, fifth lord of Annandale, son of the fourth lord above mentioned, and the competitor with John Baliol for the crown of Scotland, was born in 1210. On the death of his mother, the Princess Isobel, in 1252, he did homage to Henry III. for her lands in England, and in 1255 was made Sheriff of Cumberland, and Constable of the castle of Carlisle. About the same time he was appointed one of the fifteen regents of Scotland, in the minority of Alexander III. In 1264, he led, with Comyn and Baliol, the Scottish auxiliaries to the assistance of the English monarch at the battle of Lewes, where he was taken prisoner, but released after the battle of Evesham, the following year. On the Scottish throne becoming vacant at the death, in 1290, of Margaret, the 'Maiden of Norway,' granddaughter of Alexander III., Baliol and Bruce claimed the succession, the former as great-grandson of David, Earl of Huntingdon, by his eldest daughter, Margaret; the latter as grandson, by his second daughter, Isobel. Edward I. of England, to whom the dispute was referred, decided in favor of Baliol, 19th November 1292. To avoid swearing fealty to his successful rival, B. resigned Annandale to his eldest son, Robert de B., Earl of Carrick. He died at his castle of Lochmaben, Dumfriesshire, in 1295, leaving three sons and a daughter.

BRUCE, ROBERT DE, Earl of Carrick, eldest son of the preceding, accompanied King Edward I. of England to Palestine in 1269, and was ever after greatly esteemed by that monarch. On his return to Scotland, he married, in 1271, Martha Margaret, Countess of Carrick, and in her right became Earl of Carrick. Following the example of his father, to avoid doing homage to Baliol, he resigned the lordship of Annandale to his eldest son, Robert, the future king of Scotland, then a minor. Retiring to England, he was, on the death of his father, in 1295, appointed Constable of the castle of Carlisle; and in the following year, when Baliol renounced the authority of Edward, and assisted by the Comyns, had recourse to arms, B. fought on the side of the English. After the battle of Dunbar, in which the Scots were defeated, and Baliol compelled to relinquish the sovereignty, he made application to Edward for the vacant crown, but was refused it. He died in 1304.

BRUCE, ROBERT, the most heroic of the Scottish kings, eldest son of the preceding, was born March 21, 1274. In his youth he favored the English interests, in the expectation, doubtless, of his father being preferred to the Scottish throne. In 1296, as Earl of Carrick, he swore fealty to Edward I. at Berwick, and the following year he renewed his oath of homage at Carlisle. Shortly after, he abandoned the cause of Edward, and with his Carrick vassals, joined the Scottish leaders in arms for the independence of their country. On the defeat of the Scots, a few months afterwards, at Irvine, B. made his peace with the English monarch. After Wallace's defeat at Falkirk, B. burned the castle of Ayr to the ground, to prevent its falling into the hands of the English, and retired into the recesses of Carrick. In 1299, the year after Wallace had resigned the regency, B., then in his 25th year, was admitted one of the four regents, who ruled the kingdom in the name of Baliol. In the three campaigns which subsequently took place, previous to the final subjugation of Scotland, B. continued faithful to Edward, and in 1305 was consulted in the settlement of the government. With John Comyn, called the Red Comyn, the nephew of Baliol, he appears to have entered into some agreement as to their rival claims to the throne. In an interview between them, in the church of the Minorite Friars, Dumfsies, February 4, 1305–6, a quarrel took place, and B. in a paroxysm of passion, stabbed Comyn with his dagger. Rushing out to his attendants, he exclaimed: 'I doubt I have slain the Red Comyn.' 'You doubt!' cried one of them; 'I mak sikker!' (i. e., sure), and running into the church with some others, slew Comyn and his brother, who attempted to defend him. B. hastened to Lochmaben Castle, assembled his vassals, and asserted his right to the throne. Two months after (March 27), he was crowned king at Scone. An English army, under the Earl of Pembroke, nominated by Edward governor of Scotland, took possession of Perth, and on the night of the 18th June, attacked B. in the Wood of Methven, compelling him to retreat into the wilds of Athole. At Dalry, near the head of Loch Tay, B. was attacked by Alexander, Lord of Lorn, chief of the Macdougals, husband of the aunt of the Red Comyn, and compelled to retire. Sending his queen and her ladies to Kildrummie Castle, Aberdeenshire, under the charge of Nigel Bruce and the Earl of Athole, he, with 200 followers, crossed Loch Lomond, and had recourse for subsistence to the chase. B. next took refuge in the little island of Rathlin, on the north coast of Ireland, where he remained all winter, and was supposed to be dead. In his absence, the English took the castle of Kildrummie, hanged Nigel Bruce and other chiefs who had defended it, and tore the queen and Princess Marjory from the sanctuary of St. Duthac, Ross-shire. All B.'s estates were confiscated, and himself and adherents excommunicated by the pope's legate at Carlisle. In the spring of 1307, with about 300 men, B. landed in Carrick, and at midnight surprised the English garrison in his own castle of Turnberry; but before a superior force he retired into the mountainous districts of Ayrshire. At Loudon Hill, May 10, 1307, he defeated the English under the Earl of Pembroke, and, three days after, overthrew another party under the Earl of Gloucester. In less than two years he wrested from the English nearly the whole of Scotland.

His authority being now established, in 1309 B. advanced to Durham, laying waste the country. The same year, Edward II. of England invaded Scotland, but was compelled to retreat from Edinburgh to Berwick-upon-Tweed. In the harvest of 1312, the Scots again invaded England, but unsuccessfully. B. now reduced the Isle of Man also. On his return, in the autumn of 1313, he found his brother, Edward Bruce, engaged in the siege of Stirling Castle, held by Sir Philip Mowbray for the English. A treaty was entered into, by which Mowbray bound himself to surrender it, if not relieved before 24th June following. This led to the memorable battle of Bannockburn, 24th June 1314, at which B. commanded in person. The English, under Edward II., amounting, it is said, to about 100,000 men, were totally routed, leaving 30,000 dead upon the field; while the Scots, numbering only 30,000, and 15,000 camp-followers, lost about 5000. In 1317, B. passed over to Ireland, to assist his brother, Edward, elected king of that country, and defeated the Anglo-Irish under the Baron of Clare; and in the spring of 1318 the Scots army invaded England by Northumberland. Another invasion of Scotland by the English king, who was compelled to retreat, was followed by B. again marching into England. After besieging Norham Castle, he defeated Edward once more at Biland Abbey, Yorkshire. A truce was, in consequence, ratified between the two kingdoms at Berwick, June 7, 1323, to last for 13 years. On the accession of Edward III., in 1327, hostilities recommenced; and the Scots being again victorious, a final treaty was ratified in a parliament at Northampton, March 4, 1328, recognizing the independence of Scotland, and B.'s right to the throne. His warfare was now accomplished, and suffering under the disease of leprosy, he spent the last two years of his life at Cardross Castle, on the northern shore of the Firth of Clyde. He died June 7, 1329, in his 55th year, and the 23d of his reign. His heart, extracted and embalmed, was delivered to Sir James Douglas, to be carried to Palestine and buried in Jerusalem. Douglas was killed fighting against the Moors in Spain, and the sacred relic of B., with the body of its devoted champion, was brought to Scotland, and buried in the monastery of Melrose. B.'s body was interred in the Abbey Church of Dunfermline; and, in clearing the foundations for a third church on the same spot in 1818, his bones were discovered. He was twice married: (1) to Isabella, daughter of Donald, tenth Earl of Mar—issue, a daughter, Marjory, wife of Walter the High Steward, whose son ascended the throne as Robert II.; and (2) to Elizabeth, daughter of Aymer de Burgh, Earl of Ulster—issue, one son, who succeeded him as David II., and two daughters.

BRUCE, EDWARD, king of Ireland, brother to the above, a chivalrous but rash and impetuous prince, was actively engaged in the struggle for Scotland's independence; and in 1308, after de-

feating the English twice, made himself master of Galloway. In 1315, the chieftains of Ulster tendered to him the crown of Ireland, on condition of his assisting them to expel the English from the island. With a small army of 6000 men, he embarked at Ayr, and reached Carrickfergus, May 25th of that year, accompanied by Sir Thomas Randolph, Earl of Moray, Sir John of Soulis, Sir John the Stewart, Sir Fergus of Ardrossan, and other Scottish knights of renown. His rapid victories soon made him master of the province of Ulster, and he was crowned king of Ireland, May 2, 1316, but was slain at the battle of Dundalk, October 5, 1317.

BRUCE, DAVID, son of King Robert Bruce, succeeded his father, in 1329, as David II., when only five years old. In terms of the treaty of Northampton, he had married, when four years old, Joanna, daughter of Edward II. of England, and on 14th November 1331 he was crowned with her at Scone. In 1333, the success of Edward Baliol and the English party obliged David's guardians to send him and his consort to France; but on the dispersion of Baliol's adherents, David returned to Scotland in 1341. He made three unsuccessful inroads into England, and on a fourth invasion, in 1346, was taken prisoner at the battle of Neville's Cross, near Durham, and conveyed to the Tower of London. Thence he was removed to Odiham, in Hampshire, and not released till 1357, when his ransom was fixed at 100,000 marks. His queen dying in 1362, he married Margaret Logie, a Scottish gentlewoman of singular beauty, whom he divorced in 1370. He had no issue; and in his latter years, he was engaged in several intrigues with England, with the view of excluding his nephew, Robert, the Stewart of Scotland, the next heir, from the throne. He died at Edinburgh Castle, February 22, 1371.

BRUCE, JAMES, a celebrated traveler, born at Kinnaird House, Stirlingshire, December 14, 1730, was the eldest son of David Bruce, Esq., of Kinnaird, and Marion Graham, of Airth. Educated at Harrow, he was sent, in the winter of 1747, to the university of Edinburgh, with the intention of studying law; but changing his views, he went to London, and having, in February 1754, married the daughter of a wine-merchant's widow, became a partner in the business. His wife dying within a year, he made a tour on the continent, and on his father's death in 1758, he succeeded to the estate of Kinnaird. In 1761 he retired from the wine-trade, and in 1763 was appointed consul-general at Algiers. He remained there about two years, studying the oriental languages, and acquiring the rudiments of surgery. He then went to Aleppo, where he took further instructions in the medical art, being resolved to travel in the character of a physician. In June 1768, he proceeded to Alexandria, and from Cairo set out on his famous journey to Abyssinia, which forms an epoch in the annals of discovery. Sailing up the Nile to Syene, he crossed the desert to Cosseir, and arrived at Jeddah in April 1769. After various detentions, he reached Gondar, the capital of Abyssinia, in February 1770; and on November 14 of that year, succeeded in reaching the sources of the Abawi, then considered the main stream of the Nile. This accomplishment of the chief object of his journey filled him with the greatest exultation. He remained about two years in Abyssinia, and returning by way of Sennaar and the desert of Assouan, after great hardship reached Alexandria, whence he embarked, March 1773, for Marseilles. In France he spent a considerable time, visiting the celebrated Count de Buffon, and other distinguished men, and in 1774 he returned to Scotland. In 1776, he married Mary, daughter of Thomas Dundas, Esq., of Fingask, by whom he had two sons and one daughter. His long-expected *Travels to Discover the Sources of the Nile, in the Years* 1768—1773, were published in 1790, in 5 large 4to vols., with plates and charts. The work contained such curious accounts of the manners and habits of the people of Abyssinia, that it startled the belief of many, and some of them were set down as fabrications. Among other doubters were De Tott in France, and Dr. Johnson in England. Modern travelers, including Salt, Pearce, Burckhardt, Belzoni, and others, have, however, fully confirmed his statements. B. died April 27,1794, at Kinnaird, of a fall down stairs.

BRUCE, MICHAEL, a minor Scottish poet, the son of a weaver, born at Kinnesswood, Kinross-shire, Scotland, March 27, 1746, was in his younger years, employed as a herd-boy. In 1762 he was sent to Edinburgh University to study for the ministry, and when not at college, was engaged as a village schoolmaster. He had all his life to struggle with poverty, and his frame being weak, melancholy took possession of his mind, and his constitution began visibly to decline. He died of consumption, July 6, 1767, aged 21. His poems, few in number, and of a tender and pathetic description, were published by the Rev. John Logan, his fellow-student and associate at college, at Edinburgh in 1770. His last composition was a touching elegy on his own approaching death.

BRU'CEA, a genus of shrubs somewhat doubtfully referred to one or other of the allied natural orders *Rutaceæ* (q. v.), *Simarubaceæ* (q. v.), and *Xanthoxylaceæ* (q. v.).—*B. antidysenterica*, or *ferruginea*, is an Abyssinian species, the leaves of which are said to be tonic, astringent, and useful in dysentery. Those of *B. Sumatrana*, a native of the Indian Archipelago, China, &c., possess the same medicinal properties. They are intensely bitter.—The Abyssinian species acquired a factitious importance in the beginning of the 19th c., from a mistaken belief that it produced the dangerous False Angostura Bark (see ANGOSTURA BARK), and in this belief the name *Brucine* (q. v.) was given to an alkaloid really produced by the Nux Vomica (q. v.) and other species of *Strychnos* (q. v.).

BRU'CHSAL, a town of the grand duchy of Baden, situated on the Salzbach, and on the railway between Heidelberg and Carlsruhe, 12 miles north-east of the latter place. B., which is a place of considerable antiquity, has three suburbs. The old castle of the prince-bishops of Speier, who took up their residence here early in the 11th c., is still standing, and in the church of St. Peter are some ancient tombs. B. has two prisons organized on a modified form of the Pennsylvanian system. Pop. (1875) 10,810, who were chiefly engaged in the wine trade.

BRU'CINE is one of the Alkaloids (q. v.) present in *Strychnos Nux Vomica* along with strychnine, &c. It is not so abundant as the strychnine, nor is it so poisonous. It is mainly characterized by giving a blood-red color with concentrated commercial nitric acid, and, indeed, the red color always yielded by nux vomica, and occasionally by strychnine, when treated with nitric acid, is due to the presence of brucine.

BRUCKENAU, a village of Bavaria, on the Sinn, 36 miles north-east of Würzburg. It is famous in connection with the baths of B., which are picturesquely situated in a beautiful part of the valley of the Sinn, about two miles west from the village. The grounds are tastefully laid out in gardens, and charming walks traverse the surrounding woods. The place is a favorite summer resort of the Bavarian court. B. has paper-mills. Pop. (1871) 1669.

BRUGES (Ger. *Brügge*), a city of Belgium, capital of the province of West Flanders, is situated in a fertile plain about 8 miles from the sea, with which it is connected by the three canals from Ghent, L'Ecluse, and Ostend, the latter admitting the largest sea-going ships. Lat. 51° 12′ N., long. 3° 14′ E. B. derives its name from its many bridges, all opening in the middle to admit of the passage of vessels. The ramparts surrounding the city are an agreeable promenade. The streets have a venerable and picturesque appearance, but they are greatly deserted, the population of the city being now scarcely a quarter of what it was during the middle ages. Among the most interesting buildings are the town-hall, with a lofty tower and a celebrated set of 48 bells; a Gothic senate-house, built about the close of the 14th c.; a court of justice, containing a famous carved chimney-piece of the date 1559; the church of Notre Dame, with its spire 450 feet high, its many valuable paintings, and a statue of the Virgin (said to be by Michael Angelo), for which Horace Walpole offered 30,000 florins, and its splendid monuments of Charles the Bold and his daughter Mary, wife of the Emperor Maximilian; the cathedral of St. Sauveur, not remarkable for its exterior, but containing paintings by eminent masters; St. John's Hospital, with celebrated pictures by Memling, &c. The Academy of Painting contains several fine pictures by J. van Eyck. B. has manufactures of woollen, linen, cotton, lace, leather, cordage, and tobacco; and distilleries, sugar and salt refineries, and ship-building yards. Railways connect B. with Ostend, Ghent, and other cities of Belgium and the continent. Pop. (1876) 45,097, of whom nearly a third are paupers. B. is a very ancient city. Here, it is said, St. Chrysolus preached the gospel as early as the 3d century. In the 7th c., B. was the capital of the surrounding district called Flanders, and before the conquest of England by the Normans, its commercial importance was established. In the beginning of the 13th c., it was the central mart of the Hanseatic League; and in the following century it may be said to have become the metropolis of the world's commerce. Commercial agents from 17 different kingdoms resided here, and no less than 20 ministers from foreign courts had mansions within its walls. Its population at this time amounted to upwards of 200,000. In 1488, the citizens rose in insurrection against the Archduke Maximilian, and with the harsh measures of repression which ensued, commenced the commercial decline of Brüges. Many of the traders and manufacturers, driven forth from their own country, settled in England, and from this time may be dated the beginning of English manufacturing superiority. In the 16th c., however, the tapestry of B. was still celebrated throughout Europe, and the famous Gobelin tapestry of Paris is said to owe its origin to a manufacturer of Brüges. The city was taken by the French in 1794, and soon after incorporated with the French empire; but in 1815 it became a part of the kingdom of the United Netherlands, and in 1830 of the Belgian monarchy.

BRUGG, or BRUCK, a village of Switzerland, in the canton of Aargau, on the right bank of the Aar, and near the mouth of the Reuss, about 9 miles north-east of Aarau. It is interesting as

occupying a part of the site of the ancient *Vindonissa*, the strongest fortress, as well as the most important settlement of the Romans in Helvetia; and also as the cradle of the House of Hapsburg, to whom, in early times, it belonged. The remains of the castle of Hapsburg, founded by Count Radbod of Altenburg in 1020, are still to be seen on a wooded height, about 2 miles from the village. Nearer, is the Abbey of Königsfelden, founded in 1310 by the wife and daughter of the Emperor Albert, who, two years before, was murdered on the spot by his nephew and others, for which a terrible revenge was taken on the relatives of the murderers. In the vaults beneath the abbey are interred many of the members of the Austrian royal family. High conical roofed towers guard the exit and entrance to B., which has a population of (1870) 1338. Zimmerman was a native of this place.

BRUHL, a town of Rhenish Prussia, about 9 miles south-southwest of Cologne, on the railway to Bonn. It is surrounded by old walls, and has a splendid château, erected in the early part of the 18th c. by the Elector Clement Augustus of Bavaria. There is also an ancient Franciscan convent, now converted into a seminary for Roman Catholic schoolmasters. After his banishment from France in 1651, Cardinal Mazarin took up his residence in Brühl. Pop. (1875) 3499.

BRUHL, Heinrich, Count von Bruhl, prime-minister of Augustus III., king of Poland, and Elector of Saxony, deserves a place in history as a signal example of an unworthy minister and venal statesman. He was born in 1700, at Weissenfels, and in early life entered, as a page, into the service of the Duchess of Sachsen-Weissenfels. His winning address and tact gained for him rapid promotion through several offices of state, until, in 1747, he became prime-minister to that idle and unpatriotic ruler, Augustus III. Never was a ruler more slavishly obeyed by a statesman. B. would follow the prince, as he strolled about smoking, without speaking a word for a whole day; or, when his majesty lazily inquired: 'Brühl, have you any money for me?' 'Yes, sire,' would be the constant reply; but in order to be able to give this answer as frequently as it was demanded, B. drained the coffers of the state, and burdened the country with debt. He, however, contrived to enrich himself, and to accumulate honors and titles. By Elizabeth of Russia, he was invested with the order of St. Andrew, and by Charles VI. of Austria, he was made a count of the empire.

He kept 200 servants, paid his body-guard better than Augustus did his, furnished the costliest table, possessed the finest wardrobe, and in short, maintained the most splendid establishment in the kingdom. 'Of all statesmen,' said Frederick II., 'Brühl has collected the greatest quantity of fine clothes, watches, lace, boots, shoes, and slippers!' The effect of B.'s reckless robbery of the national finances to gratify the dissolute Augustus and himself, made itself felt at the outbreak of the Seven Years' War, when the country could only furnish 17,000 men to oppose Frederick of Prussia, who surprised and captured the whole Saxon army in its camp at Pirna. Augustus and B. fled to Warsaw. When peace was concluded, they returned to Dresden, where Augustus died on the 5th Oct. 1763, and was followed by his worthless parasite, 28th Oct. B.'s palace is still one of the principal buildings in Dresden, and his library of 62,000 vols. forms a chief part of the Royal Library, Dresden.

BRUISE, or CONTUSION, signifies an injury inflicted by a blow or sudden pressure, in which the skin is not wounded, and no bone is broken or dislocated. Both terms, and especially the latter, are employed in surgery to include all such injuries in their widest range, from a black eye to a thoroughly crushed mass of muscle. In the slighter forms of this injury, as in ordinary simple bruises, there is no tearing, but only a concussion of the textures, the utmost damage done being the rupture of a few small blood-vessels, which occasions the discoloration that is always observed in these cases. In more severe contusions, the subjacent structures—muscles, connective tissues, vessels, &c.—are more or less ruptured, and in extreme cases, are thoroughly crushed, and usually become gangrenous. The quantity of blood that is extravasated mainly depends upon the size and number of the ruptured blood-vessels, but partly also on the nature of the textures of the injured part. Thus, a lax tissue, as that of the eyelids, favors the escape of blood into the surrounding parts. Moreover, the constitution of the patient has some influence, and many persons, especially (according to Mr. Paget, in his article on 'Contusions' in Holmes's *System of Surgery*, vol. i.) pallid, fatty, soft-skinned women, though suffering from no apparent disease, are subject to extravasations, and consequently to discolorations, very disproportionate to the injuries that cause them.

The most characteristic signs of a recent contusion are more or less Shock (q. v.), pain, swelling, and discoloration of the surface from effused blood (commonly known as *Ecchymosis*, q. v.). There is nothing special in the character of the shock, but it is worthy of notice that it is most severely felt in injuries of special parts—as the testes, the breasts, and the larger joints, which are often followed by remarkable general depression, faintness, loss of muscular power, and nausea. The immediate pain following the blow is succeeded by a feeling of numbness, which, after a varying time, unless the part is killed, gives place to a heavy, aching pain. Although some depression may usually be observed immediately after the infliction of the blow, swelling of the parts rapidly follows, as may be well seen in the case of a child receiving a blow on the head, or of the wale that rises after the lash of a whip. In lax parts, such as the eyelids, the swelling is often considerable, and may remain for a week or more; but in other parts, it usually subsides in two or three days. The discoloration of the skin consequent on blows is of a more or less purple tint, varying from black to crimson or pink. 'Blackness,' says Mr. Paget (*op. cit.*), 'usually indicating intense injury, is probably due to the extravasation of a large proportion of entire blood; crimson or pink tints, to the prevalence of a blood-stained fluid; blue, to the degrees in which blackness is veiled by the cuticle and skin, as the color of blood in veins is; and perhaps some of the shades of pink to the partial aëration of the blood by the penetration of air through the epidermis. After a variable time, proportionate to the severity of the injury, these colors fade out, passing most commonly through gradually lightening shades of brownish olive, green, and yellow.' The cause of these changes of color are not clearly known; as, however, the changes are not observed in bruises of parts removed from air and light, they are probably due to oxidation and actinic agency. When a severe bruise tends to a natural cure, and there is no inflammation or sloughing, the effused blood is generally absorbed, the liquid portion rapidly disappearing, while the blood-cells are more slowly removed. In some cases, it is probable that the effused blood becomes organized into vascular connective tissue, which takes part in the repair of the injured tissue. We need not follow the course of a bruise in which active inflammation with suppuration ensues, or in which sloughing takes place, as these complications must be treated according to the ordinary rules for those affections. There are, however, one or two ill consequences following partial recovery, which require notice.

Thus, in some organs, as the breast, abscess may ensue long after a blow; or a sensitive indurated lump may remain; or (more commonly) there may be long-continued pain, without change of texture; or, lastly, cancer may ensue. Blows on superficial bones, as those of the skull, are not unfrequently followed by very painful thickening of the periosteum; and a muscle violently struck may be paralyzed, and rapidly waste away; and constitutional diseases, such as gout and rheumatism, are well known to localize themselves with special severity in parts that have once been seriously bruised.

With regard to treatment, simple and not very severe bruises require little treatment but the rest necessary for the avoidance of pain; but the removal of the swelling and discoloration may be hastened by the application of various local stimulants, which seem to act by accelerating the circulation through the bruised part, and promoting the absorption of the effused fluid. Friar's balsam, compound soap liniment, or poultices made with the roots of black bryony beaten to a pulp, are popular remedies of this class. Mr. Paget regards the tincture of arnica as the best application. Where the skin is thick, it may be gently rubbed over the bruised part in an undiluted state; where the skin is thinner, it should be mixed with an equal bulk of water; or, which is probably better, it may be constantly applied as a lotion if diluted with five or six parts of water. Pugilists, who are probably better acquainted with ordinary bruises than any other class of men, are in the habit of removing the swelling of the eyelids that often naturally occurs during a prize-fight, to such an extent as to close the eyes, by at once puncturing the eyelids at several points with a lancet; and their favorite remedy for a black-eye or other bruise on the face is a fresh beef-steak applied locally, as a poultice. Bruises of a more severe nature, as when there is much breaking or crushing of the tissues, must, of course, at once be placed in the hands of a surgeon.—For further details on this subject, the reader is referred to Mr. Paget's excellent article, from which we have freely quoted.

BRUMAIRE (Lat. *bruma*, winter), a division of the year in the republican calendar of France. It includes the time from October 22 to November 20. The celebrated 18th B., which witnessed the overthrow of the Directory and the establishment of the sway of Napoleon, corresponds with November 9, 1799, of the Gregorian calendar.

BRUNCK, Richard François Philippe, one of the most ingenious critics and philologists of modern times, was born at Strasburg, December 30, 1729. He was educated under the Jesuits in Paris; but abandoned his studies, and for some time was engaged as a military commissary during the Seven Years' War. A professor in Giessen, with whom B. happened to lodge while the army was in winter-quarters, revived in him the love of classical studies. Returning to Strasburg, he devoted all his spare time to Greek, and soon distinguished himself as an able but adventurous

critic and emendator. His belief that all inaccuracies in ancient Greek writings were introduced by copyists, often led B. astray; but, since the revival of learning, few critics have done more for the progress of Greek literature. His first work, *Analecta Veterum Poëtarum Græcorum* (1772—1776), was followed by several editions of Anacreon (1778—1786), and editions of Apollonius Rhodius (1780) and Aristophanes (1781—1783), *Poëtæ Gnomici* (1784), Virgil (1785), and Sophocles (1786—1789). The last of these established a new era in the criticism of the tragic writers. The outbreak of the French Revolution interrupted B.'s studies. He ardently attached himself to the popular side. During the Reign of Terror, he was imprisoned, but was liberated after the downfall of Robespierre. His means, however, had been so much reduced, that he was compelled to sell his valuable library. From this time, 1801, he turned his attention from Greek to Latin literature, and published editions of Plautus and Terrence. He died June 12, 1803.

BRUNE, Guillaume Marie Anne, a French marshal of the first empire, was born at Brives-la-Gaillarde, 13th March 1763. His education brought him at an early period into connection with the men of the revolution. Along with Danton, he helped to establish the Cordeliers' Club. After the conquest of Belgium, he was sent as civil commissary to that country, but his warlike aspirations soon induced him to enter the military service. In 1797, he became brigadier under Napoleon in the army of Italy, and distinguished himself at Arcola and Rivoli, where he was made general of division and leader of the advance-guard.

Sent by the Directory to Switzerland in 1798, he executed his orders with brilliant success. In 1799, he was appointed to the command of the army of Holland, where he achieved the reputation of being one of the best generals of his age. He vanquished the Anglo-Russians at Bergen on the 19th of September 1799, and on the 19th of October, forced the Duke of York, commander-in-chief of the combined armies, to capitulate at Alkmaar, under humiliating circumstances. In 1803, he was named ambassador to the Ottoman Porte, and was received by Selim III. with great distinction. In 1804, he obtained the dignity of marshal, and in 1805 returned to France. Two years afterwards, B. became governor-general of the Hanseatic towns, and was charged with the conquest of Pomerania; but circumstances having occurred which unnecessarily excited the distrust of Napoleon, he was recalled, and his future services dispensed with. After the fall of the emperor, he declared for the Bourbons, but his offers were rejected, and, in consequence, he joined Napoleon after his return from Elbe. He was now made a peer, but the battle of Waterloo completely destroyed his prospects. He again made his submission, but was barbarously assassinated at Avignon, 2d August 1815, by the populace, who were infuriated against him on account of certain crimes laid to his charge, of which, however, he seems to have been entirely guiltless.

BRUNE ISLAND lies off the south part of the east coast of Tasmania, from which it is separated by D'Entrecasteaux Bay. It has a length of 32 miles, with a breadth varying from 1 to 6 miles; and its east or outside coast is indented by a bay, which takes it name from the *Adventure*, one of Cook's two vessels during his second voyage.

BRUNEL, Sir Mark Isambard, the celebrated engineer of the Thames Tunnel, son of an agriculturist, was born at Hacqueville, near Rouen, in France, April 25, 1769. He early showed an inclination for mechanics, and at school preferred the study of the exact sciences to the classics. In 1786, he became a sailor in the French navy. In the revolutionary period of 1793, having compromised himself by his political opinions, he escaped from Paris to the United States. His career as an engineer began in 1794, when he was appointed to survey for the canal which now connects Lake Champlain with the river Hudson at Albany. He afterwards acted as an architect in New York. On his return to Europe in 1799, he married the daughter of William Kingdom, Esq., Plymouth, and settled in England. A plan submitted by him to government for making block-pulleys for ships by machinery was adopted, and he was for many years employed in carrying it into execution in Portsmouth dockyard. He was also successful in the construction of other public works—in Woolwich arsenal and Chatham dockyard, &c. His most remarkable undertaking was the Thames Tunnel, formed beneath the bed of the river, and which, commenced in March 1825, was open to the public in March 1843. Assisted by his son, the subject of the next article, he for ten years pursued a course of experiments for employing carbonic acid gas as a motive power, but the cost of the machinery prevented its introduction as a substitute for steam. Among the less important of B.'s inventions, were machines for making wooden boxes; for ruling paper; for shuffling a pack of cards without using the hands; for the manufacture of nails; and for making seamless shoes for the army—the latter, tried for two years, was abandoned from economical motives. Elected a Fellow of the Royal Society in 1814, he was appointed Vice-president in 1832. He was knighted in 1841; and died, December 1849, in his 81st year.

BRUNEL, Isambard Kingdom, an eminent engineer, son of the preceding, born at Portsmouth, England, in 1806, was educated at the college of Henri Quatre, Caen, in France. He commenced practical engineering in 1826, under his father at the Thames Tunnel, and in the progress of that great work was often exposed to danger from the water breaking in and flooding the excavations, having more than once to save his life by swimming. He assisted in his father's experiments for making carbonic acid gas a motive power, and was designer and civil engineer of the *Great Western*, the first steamship built to cross the Atlantic; and of the *Great Britain*, the first ocean screw-steamer. The *Great Eastern*, the largest vessel ever built in the world, was erected under his sole direction. In 1833, B. was appointed chief-engineer to the Great Western Railway, and designed and constructed the whole of the tunnels, bridges, viaducts, and arches on this line, and extension branches. Among other docks at English seaports, in the improvement and construction of which he was engaged, may be mentioned the Bute docks at Cardiff, and the old North Dock at Sunderland. In 1842, he was employed by government to construct the Hungerford Suspension-bridge across the Thames at Charing Cross, London. In 1850—1853, he constructed the works of the Tuscan portion of the Sardinian railway. Made a Fellow of the Royal Society in 1830, he was chosen on the Council in 1844. He was also Vice-president of the Institution of Civil Engineers, and of the Society of Arts; a Fellow of the Astronomical, Geological, and Geographical Societies, and Chevalier of the Legion of Honor. He died suddenly, September 1859.

BRUNELLESCHI, Filippo, one of the greatest Italian architects, was born at Florence in 1377. He first learned the art of a goldsmith; next that of a sculptor; and finally dovoted himself to that of architecture. He also studied zealously both mechanical and mathematical science, and is reckoned the first who established, on a sound basis, the theory of perspective. When still a young man, B. went to Rome, where he acquired a profound knowledge of ancient architecture, the result of which was, that two ideas completely possessed his mind; the one was, to revive the ancient style of architecture; the other was, to make himself master of the mechanical knowledge of the ancient architects. In 1407 he returned to Florence. In 1420, it was proposed to complete the structure of the cathedral of Santa Maria del Fiore, founded in 1296, and now only wanting a dome. A great assembly of architects from all quarters was convened to determine how it might be practicable to cover the vast octangular area. While the debate was going on, B. was earnestly elaborating his own designs; but when he first came forward and proposed his plan, it was so ill-received, on account of its supposed absurdity, that B. was 'lifted off his legs, and carried out of the room.' He, however, obstinately persisted in explaining his scheme, and at last succeeded in convincing every one of its feasibility, The work was intrusted to him, and finished, with the exception of the lantern, with which he intended to crown the whole, but was prevented by his death in 1444. B's dome, measured diametrically, is the largest in the world, and served as a model to Michael Angelo for that of St. Peter's. Besides this *chef-d'œuvre*, B. executed several other great works, such as the churches of San Spirito and San Lorenzo, as well as the designs far the Pitti Palace, which originated the beautiful style of Tuscan palace-architecture in the 15th century.

BRUNI, Leonardo, a native of Arezzo, and hence called *Aretino*, was born in 1369. He merits notice as one of the most learned men who flourished during the epoch of the revival of Greek learning in Italy. He first studied law at Florence and Ravenna, but afterwards turned his attention to classical literature. He then went to Rome, where he filled several offices at the papal court. In 1414, he attended John XXII. to the council of Constance. On the deposition of that pope, he returned to Florence, where he was of service to the republic in several important matters. His *Historia Florentina* procured for him the rights of citizenship, and, at a later period, through the favor of a Medicean family, he was appointed state-secretary. He died 9th March 1444. Florence and Arezzo vied with each other in the splendor with which they celebrated his obsequies.

B. aided in advancing the study of Greek literature mainly by his literal translations into Latin of Aristotle, Demosthenes, Plutarch and others. Of his original works, which are very numerous, many have never been printed, and most are nearly forgotten. We may mention *Commentarius Rerum suo Tempore Gestarum* (Ven. 1476), *De Origine Urbis Mantuæ*, *De Romæ Origine*, *Epistolæ Familiares*, and *Vite di Dante e del Petrarca*.

BRUNN, a fortified city of the Austrian empire, capital of the government of Moravia, is beautifully situated, partly on the slope of a hill, and partly in a pleasant valley, at the confluence of the Schwarzawa and the Zwittawa, in lat. 49° 12′ N., and long. 16° 37′ E. Behind the city, on an eminence, is situated the castle of

Spielberg, formerly the citadel, but now used as a state-prison, and noteworthy as the place in which Silvio Pellico was confined from 1822 to 1830. Among the most interesting buildings of B. are the cathedral of St. Peter; St. James's Church, a Gothic edifice, with a tower 276 feet in height, and a valuable collection of ancient printed books; the Church of the Minorites; and the Augustine convent. There are also several fine palatial residences belonging to the old nobility. B. is one of the most important manufacturing towns in the Austrian dominions. Its woollens are specially celebrated, and it has also manufactures of cotton, silk, ribbons, yarns, glass, leather, soap, tobacco, and dye-stuffs. Pop. (Dec. 31, 1869) 73,771. Napoleon made B. his headquarters before the battle of Austerlitz.

BRU'NNEN, a village of Switzerland, in the canton of Schwyz, of which it forms the port, near the mouth of the Muotta, in the Lake of Lucerne. It is beautifully situated at the south-eastern bend of the lake, and is celebrated in history as the place where, in December 1315, the deputies of the Forest Cantons, who, eight years before, had formed a plan for the liberation of their country from the Austrian yoke, laid the basis of the Helvetic Republic.

BRUNNOW (Count), Ernest Phil. von, a Russian diplomatist, was born at Dresden, 1797, and studied at the university of Leipsic. At the time of the Congress of Aix-la-Chapelle, he entered the Russian service, and the ministers Nesselrode and Capo d'Istrias recognized at once his fitness for a diplomatic career. Among other posts, he attended the congresses of Troppau and Laybach, acted one year as secretary to the embassy in London, went to the congress of Verona, and then occupied for a time a high office in St. Petersburg. He was present, in a civil capacity, in the campaigns of 1828 and 1829 against the Turks. In the autumn of 1839, he was sent on a special mission to London, to take advantage of the unpleasant feeling between Great Britain and France for drawing the cabinets of St. Petersburg and London closer together, and in the following spring was accredited as permanent ambassador. In this capacity he soon acquired distinction as a diplomatist. After retiring from London on the outbreak of the war in 1854, he represented Russia in Frankfort, and along with Count Orloff, was sent to the conference of Paris, February 1856. Immediately after the treaty of peace had been concluded, he was sent on a special mission to London, to re-establish friendly relations between the courts of St. Petersburg and St. James's. He was afterwards appointed to the court of Prussia; but in 1858 he returned to his old place in London, where he was a great favorite. He represented Russia at the conferences in London in 1864 and 1871. In recognition of his services, he was raised by the emperor of Russia to the rank of count in April 1871. In 1874, he retired to Darmstadt, where he died in the following year.

BRUNO, Giordano, the precursor of the school of modern Pantheistic philosophers, was born at Nola, in the kingdom of Naples, about the middle of the 16th century. He entered, at an early age, the order of the Dominicans, but soon began to express his doubts in regard to the doctrines of Transubstantiation and of the Immaculate Conception, in consequence of which he was obliged to flee from his convent. Henceforth, his life was unsettled. In 1580, he went to Geneva, where he spent two years, but having excited the suspicion and dislike of the strict Calvinists of that city by his general scepticism, he judged it prudent to betake himself to Paris, where he delivered prelections on the 'Great Art' (Logic) of Raymond Lully. His disputes with the bigoted Aristotelians of the university of Paris compelled him, however, to leave France. He passed over into England, where he resided for two years in comparative quiet, enjoying the friendship of Sir Philip Sidney and the protection of the French ambassador, Michel de Châteauneuf de la Mauvissière. Here he composed his most important works, but at last, having incurred the displeasure of the clergy by his vehement denunciation of the Aristotelian philosophy, and other grave heresies, he returned to Paris in 1585. In 1586, he proceeded to the university of Marburg, where he matriculated; and to Wittenberg, where he became professor; but being asked to join the Lutheran communion, he refused. On his departure from the city, he pronounced an impassioned panegyric on Luther. After spending some time in Prague, Brunswick, Helmstadt, and Frankfort-on-the-Maine, he resolved to go back to Italy. He fixed his residence at Padua; but after a stay of two years, he went to Venice, where he was arrested by the officers of the Inquisition, and conveyed to Rome in 1598. He was now subjected for two years to persecution, in the vain hope that he would recant; but when all the endeavors of his enemies proved ineffectual, he was brought to the stake on the 17th February 1600, and burned as an obstinate heretic.

B.'s writings, of which the most valuable are composed in Italian, display throughout a strong, courageous, excitable soul, susceptible of deep enthusiasm, but vainly laboring to attain perspicacity. The *Cena delle Ceneri*, or Evening Conversations on Ash-Wednesday, is an apology for the Copernican astronomy; the *Spaccio della Bestia Trionfante*, or Expulsion of the Triumphant Beast (Par. 1584), is a satirical but somewhat heavy allegory in the style of the times. His greatest works are metaphysical, such as the *Della Causa Principio ed Uno* (On the One Sole Cause of Things), and the *Del Infinito Universo e Mondi* (On the Infinity of the Universe and of Worlds). The doctrine enunciated in these is Pantheistic. B. held that the infinite soul of God did not merely inhabit or pervade the universe, but that the universe was simply a manifestation of Him, and therefore itself divine. God was therefore, in the most literal and physical sense, all *in* all. B.'s philosophy, in later times, was quite unappreciated, and even neglected, until Jacobi drew public attention to it in his *Letters on the Doctrine of Spinoza*. Both Spinoza and Descartes were much indebted to Bruno. His influence is also discernible in the Pantheistic speculation of modern Germany. Original editions of B.'s works are very rare. Those in Italian were published by Wagner in 1830: some Latin ones by Gfrörer in 1836. See Bartholomès's *Bruno* (1846); Berti's *Vita di B.* (1868).

BRUNO, The Great, Archbishop of Cologne, and Duke of Lorraine, one of the most eminent men of his time, was born about 928 A.D. He was the third son of Henry the Fowler, and the brother of Otto I., Emperor of Germany. Baldrich, Bishop of Utrecht, and afterwards Israel Scotigena, and others, were his tutors. His surprising knowledge, sagacity, and eloquence secured for him an immense influence over the bishops and clergy, while, on the other hand, his liberality, meekness, and great earnestness of heart, won the affections and reverence of the laity. Summoned by Otto to the imperial palace, he quickly assumed an influential position among the chroniclers, poets, and philosophers of the court. At a later period, he was appointed Archbishop of Cologne, and Lord High Chancellor of the empire. He accompanied Otto to Italy in 951, and honorably distinguished himself by his fidelity to his brother, when Otto's own son, Conrad, and others of his kindred rebelled against him. As a reward, the emperor appointed him Duke of Lorraine. B. died at Rheims, 11th October 965. He wrote a commentary on the Pentateuch, and several lives of saints.

BRUNO, Saint, the founder of the Carthusian order of monks, was born at Cologne 1051, and received his earliest education in the school attached to the Collegiate Church of St. Cunibert. Subsequently, he studied at Rheims, where he distinguished himself so greatly, that Bishop Gervasius appointed him director of all the schools in his diocese. B., however, soon began to be troubled by the wickedness of his time, and, anxious to escape from what seemed to him the general pollution, he took refuge, along with six pious friends, in a desert place near Chartreuse, in the diocese of Grenoble. Here, in 1086, he founded one of the most austere of all the monkish orders, which received its name from the locality whence it had sprung. See Carthusians. B. and his companions had each a separate cell, in which they practised the severities of the rule of St. Benedict, keeping silence during six days of the week, and only seeing one another on Sundays, Pope Urban II., who was one of B.'s most eminent scholars, in 1089 summoned the saint to Rome. B. obeyed the call reluctantly, and steadily refused all offers of preferment. In 1094, he established a second Carthusian monastery, called La Torre, in a solitary district of Calabria, where he died in 1101. He was not canonized until 1628. B. left no written regulations for his followers. These first made their appearance in a complete form in 1581, and were enjoined on all Carthusians by Innocent IX.

BRU'NSWICK, Duchy of (Ger. *Braunschweig*), a state of Northern Germany, consisting of three larger and five smaller distinct parts, and lying mostly within lat. 51° 38′—52° 28′ N., and long. 9° 23′—11° 30′ E. Its entire area amounts to about 1425 square miles. Pop. in 1875, 327,493. For administrative purposes, B. is divided into six circles—viz., Brunswick, Wolfenbüttel, Helmstedt, Gandersheim, Holzminden, and Blankenburg. Of the three larger parts, the principal one, forming the circle of Wolfenbüttel, and including the capital, lies between Prussia and Hanover; the second, extending east and west from Prussia to the Weser, divides Hanover into two parts; and the third, forming the circle of Blankenburg, lies to the south-east between Hanover, Anhalt, and Prussia. The smaller parts are the isolated bailiwicks of Calvörde in the east, Thedinghausen in the west (not far from Bremen), and some very small demesnes in the Hanoverian boundaries. B. belongs mostly to the basin of the Weser, which serves as a boundary on the west. The surface is mostly mountainous, particularly in the southern portions of the country, but B. has nevertheless level tracts of considerable extent. The rivers, with the exception of the Weser, are comparatively unimportant, though advantage is taken of one or two for the transport of timber. The climate in the low lands resembles the general climate of Northern Germany; but in the Harz district it is so much colder, that harvest is generally a month later than in the plains.

The mines and quarries of B. produce marble, alabaster, limestone, gypsum, alum, iron, copper, lead, sulphur, and salt in large quantities, with some portions of gold and silver. Agriculture, which is carried on with intelligence and energy, constitutes the chief wealth of the duchy. The products include, beside the ordinary cereals, large quantities of leguminous plants, potatoes, tobacco, and hops. The pasture-land is extensive, and great attention is paid to the rearing of cattle, and especially to the breeding of sheep, wool being an important article of commerce. A large number of persons are employed in the cutting and preparation of timber. The chief manufactures of B. are of linen, stockings, woollen cloth, metals, porcelain, paper, sugar, glass, beer, &c.

The inhabitants are mostly Saxons, and, with the exceptions of about 3000 Reformed, 7000 Roman Catholics, and 1100 Jews, all adhere to the Lutheran Church. The people in the rural districts speak a very broad Low-German dialect; but good High-German is spoken by the educated classes. Education is well looked after by the government, which is a limited monarchy, the duke being head of the state, and his power restricted by the legislature, which is partly hereditary and partly elective. As a state of the German empire, B. has two votes in the Bundesrath (confederate council), and sends three deputies to the Reichstag or parliament.

The annual revenue of Brunswick in 1880 was given at 8,760,441 marks (£438,022), and just balanced the expenditure. In 1879 the public debt amounted in all to 86,736,972 marks (£4,336,848), of which a large portion was borrowed for the construction of railways. The civil list of the duke is not comprised in the budget, being paid out of a special fund consisting of the revenues of the state domains, which amount to 729,166 marks, and other receipts amounting to about 70,000 marks.

B. was included, as a part of Saxony, under the empire of Charlemagne. In 1235, B., with Lüneburg, was made a duchy under Otto, who died in 1252, and was succeeded, in 1267, by his son, Albrecht, founder of the older line of Wolfenbüttel. John, another son of Otto, was the founder of the older Lüneburg line, which became extinct with William of Lüneburg in 1369. In 1569, Henry, who styled himself Duke of Brunswick-Lüneburg-Dannenberg, founded the new House of Brunswick-Wolfenbüttel; and his brother William founded the new line of Brunswick-Lüneburg, which, in 1815, became the kingdom of Hanover. See HANOVER.

BRUNSWICK, the capital of the duchy of Brunswick, is situated on the Oker, in a level and fertile district, in lat. 52° 46′ N., and long. 10° 4′ E. B., which is a very old place, is supposed to have been first walled about the 9th c., by Bruno, Duke of Ostfalen. But Henry the Lion, in the 12th c., so greatly beautified and extended the city that he may be almost said to be its founder. In the 13th c., B. became a member of the Hanse League, and soon attained considerable commercial prosperity, but its importance declined with the decay of the League. The town is most irregularly built, with narrow and crooked streets, but possesses the advantages of good causeways and an abundant supply of water. The cathedral—in which are preserved some interesting relics brought by Henry the Lion from the Holy Land—with the churches of St. Martin, St. Catharine, and St. Andrew, with its steeple 316 feet high, are among the principal buildings. In the museum, are some interesting antiquities and works of art by Jan Steens, Albert Dürer, Holbein, Rembrandt, Raphael, Guido, Ruysdael, Michael Angelo, and Benvenuto Cellini. The industry of B. consists chiefly in manufactures of woollen and linen, chicory, beet-sugar, tobacco, *papier-mâché*, lackered wares, &c. Its great annual fair, founded in 1498, is important. The old fortifications of B. have been demolished, and their site converted into pleasant promenades. A fine avenue of linden-trees leads to the duke's palace, an imposing edifice, built in 1869. Pop. (1875) 65,938.

BRUNSWICK, NEW. See NEW BRUNSWICK.

BRUNSWICK BAY, on the north-west coast of Australia, in long. 125° E., and about lat. 15° S. It receives Prince Regent River.

BRUNSWICK BLACK is a varnish employed for coating over coarsely finished iron grates, fenders, &c. It is mainly composed of lamp-black and turpentine, and when applied with a brush, quickly dries, and leaves a shining jet-black surface.

BRUNSWICK GREEN is a pigment used in the arts, and consisting of the hydrated chloride and oxide of copper ($CuCl,3CuO,4HO$). It may be prepared (1) by acting upon metallic copper with common salt and diluted sulphuric acid, (2) by acting upon metallic copper with moistened sal-ammoniac, or (3) by mixing sulphate of copper and common salt into a paste with water. It is found native at Atacama, in Peru, in the form of a green sand, hence the name Atacamite (q.v.).

BRUSH TURKEY. See MOUND BIRD in AM. SUPP.

BRU'SSELS (Fr. *Bruxelles*), the capital of Belgium, is situated on the small river Senne, a tributary of the Dyle, in lat. 50° 51′ N., and long. 4° 21′ E. It communicates with Antwerp and the Baltic Sea, by means of the Scheldt canal, and railways connect it with Germany, France, and Holland, as well as with all the principal towns of Belgium. The city is built partly on the side of a hill, and partly on a fertile plain; and though some of the streets are so steep that they can be ascended only by means of stairs, B. on the whole, may be pronounced one of the finest cities in Europe. The Upper Town, situated on the side of the hill, is the newest and most fashionable, and is the residence chiefly of the great and wealthy. The king's palace, public offices, chief hotels, and mansions of foreign ministers are here. It is also much more healthy than the Lower Town, which, stretching along the canal and the Senne, is greatly subject to fogs. But the latter, with its numerous handsome old buildings, formerly belonging to the Brabant nobility, but now occupied by merchants and traders, has a fine picturesque appearance, while some of its public edifices are unrivalled as specimens of Gothic architecture. This part has also several noble churches, but it is now wholly given over to trade. French is spoken in the upper part of B.; but in the lower, Flemish is prevalent, and in one quarter the Walloon dialect is spoken. The English language, owing to the large number of English who reside in B. for economy, is also very common. The walls which formerly surrounded B. have been removed, and their place is now occupied by pleasant Boulevards, shaded by alleys of trees, extending several miles.

The *Allée Verte*—a double avenue along the Scheldt canal—forms a splendid promenade, and leads toward the palace of *Laeken*, the suburban residence of the royal family, three miles north of the city. Besides the fine park in the Upper Town, covering an area of some seventeen acres, ornamented with fountains and statues, and surrounded by the king's palace, the 'Palace of the Prince of Orange,' the Chamber of Representatives, and other buildings, B. has several other squares or places, among which the most noteworthy are—the *Place Royale*, with its colossal monument of Godfrey of Bouillon; the *Grand Place*, in which is situated the Hôtel de Ville, a splendid Gothic structure, erected in the beginning of the 15th c. with a pyramidal tower 364 feet high, surmounted by a statue of St. Michael, the patron saint of B., and where, in 1568, the patriot counts, Egmont and Horn were beheaded by order of the Duke of Alba; and the *Place des Martyrs*, where a memoral has been erected to those who fell here in the revolution of 1830. Among the churches of B., the largest and finest is the cathedral of St. Gudule, which dates from the 12th c., and is built in the pointed Gothic style, with two towers of more modern date, rising on each side to a height of 264 feet, many richly painted windows, a pulpit considered the master-piece of Verbruggen, and monuments of the Dukes of Brabant and other distinguished persons. In the *Palais des Beaux Arts* is the picture-gallery, containing the finest specimens of the Flemish school of painting; the public library with its 234,000 volumes, and its 20,000 MSS., collected by the Dukes of Burgundy—MSS. interesting and valuable not only for their contents, but for the beautiful miniature paintings with which the scholars of Van Eyck adorned them. The Observatory is well equipped. The new *Palais de Justice* is one of the most magnificent buildings in Europe. The University, founded in 1834, has four faculties in law, medicine, mathematical and physical science, and belles-lettres, and a special school of pharmacy attached. It has also numerous charitable and benevolent institutions; and is the seat of the provincial government of South Brabant, as well as of the general government of the kingdom. This is one of the chief centers of the industry of the country. Its lace is particularly famous. Of the esteemed carpets which pass under the name of B. carpets, only a few are manufactured here, most of those of Belgic make being produced at Tournai. It has also manufactures of damask, linen, ribbons, paper, jewelry, hats, soap, porcelain, mathematical and musical instruments, &c. Carriage-building is also an important branch of industry. Printing and lithographic establishments are numerous; and about a dozen newspapers, of which the *Indépendance Belge* has a European reputation, are published daily. Pop. in 1876, 161,816, with suburbs, 348,180.

As early as the 8th c., we find B. (*Bruchsella*), then probably a villa of the Frank kings, mentioned in old chronicles, and that a church existed here in 966 is proved by a deed of the Emperor Otho I. Under Charles V., B. was made the court-residence in the Netherlands, and became afterwards, under Philip II., the chief arena of the revolution, and of the atrocities committed by the Duke of Alba and the Inquisition. B. suffered greatly in the war of Spain against Louis XIV.—in whose reign it was bombarded by Marshal Villeroi and upwards of 4000 buildings destroyed—and in that of Austria against Louis XV.; but still more from the continual prevalence of party animosities caused by the policy of Austria. Under the mild rule of Maria Theresa, B. flourished greatly, and in this time, many of its best institutions and public buildings were founded. In 1789 occurred the Brabant revolution under Joseph II.; and scarcely had Austrian rule been re-estab-

lished, after a brief time of independence, when B. fell into the hands of the French, 1792. After other changes of fortune, B., with the other parts of Belgium, was incorporated with the kingdom of the Netherlands in 1815, and so remained until the revolution of 1830, by which it became the capital of the independent kingdom of Belgium.

BRUSSELS CARPETS. See CARPETS.

BRUSSELS SPROUTS, one of the many cultivated varieties of *Brassica oleracea* (see BRASSICA and CABBAGE), distinguished by producing, in the axils of the leaves, little clusters of leaves which close together and form miniature cabbages. These are used, like other greens of this species, for the table, and are very delicate. The plant is cultivated much in the same way as cabbage or kale, requiring, however, less space than most of the varieties. It may be planted in shady situations, or between the rows of crops, such as peas, beans, scarlet-runners, &c., which are to be removed from the ground in autumn. The sprouts are fit for use chiefly in winter and spring. The stem sometimes attains a height of four feet, and the head resembles a small imperfectly bolled savoy; but there is a subvariety with shorter stems, preferable for many situations. In some places, it is customary to remove the head early in winter, in order to promote the development of the lateral shoots in spring; but if the head is allowed to remain, the plant becomes taller, and new shoots are formed as the lower ones are removed. The seed is sown in February or March. Seed is very generally imported from Belgium, as this vegetable is said to degenerate in Britain. Its use has of late rapidly extended, and none of the many varieties of the species to which it belongs is better deserving of cultivation.

BRUTUS, LUCIUS JUNIUS, figures in the legendary history of early Rome, as the hero who overturned the monarchical, and established the republican form of government. The legend runs that he was the son of a rich Roman. On his father's death, Tarquin the Proud took possession of the property, and put an elder brother to death, and B. himself only escaped the same fate by feigning idiocy (hence the name *Brutus*, stupid). The oracle of Delphi foretold that he should govern in Rome. Remembering his own wrongs, and gifted with the strength and wisdom of one who was fulfilling the decrees of fate, B., when the foul rape committed by one of the royal family upon Lucretia had shocked the people, convoked them, placed himself at their head, and drove the kings from Rome. He is said to have been then elected one of the two first consuls (509 B.C.). That his character as a stern old Roman hero might be complete, the legend adds that he sacrificed to the new republic his own sons, detected in a conspiracy to restore the monarchy; and that at last he fell in mortal combat repelling an attack led on by one of the sons of Tarquin. Little more, however, can be said to be established upon sufficient historical evidence with regard to B., than that there existed a person of that name who held high office in Rome at a very early period.

BRUTUS, MARCUS JUNIUS, born 85 B.C., appears to have spent the early years of manhood in exclusive devotion to literary pursuits, and not to have taken part in the political dissensions agitating Rome till he had attained a mature age. When the civil war broke out between Pompey and Cæsar, he sided with the former; but after the battle of Pharsalia, made his submission to the latter, and, in the following year, was appointed governor of Cisalpine Gaul. On returning to Rome, he divorced his wife, in order to marry Portia, the daughter of Cato, of whose principles in politics he professed to be a disciple. The influence of Cassius prevailed upon him to join the conspiracy which ended in the murder of Cæsar. The efforts of B. to retain popular favor afterwards being unavailing to counteract the effects of the eloquence of Antony, he was forced to leave first Rome and then Italy. The remainder of his life was spent partly in Athens, partly in Asia Minor, and partly as the leader of a marauding force which maintained itself by plundering the inhabitants of the eastern shores of the Adriatic. Defeated by Antony and Octavianus (Augustus) at Philippi (42 B.C.), he terminated his life by falling upon his sword.

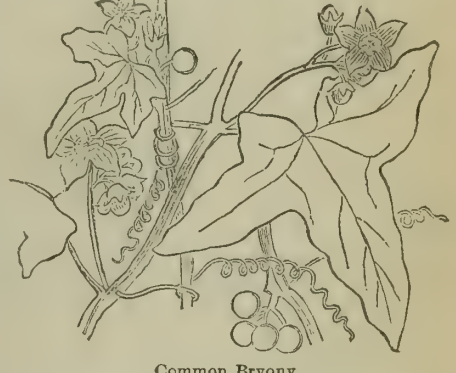
BRUX, a town of Bohemia, situated on the Bila, about 14 miles north of Saatz. In his vicinity are extensive coal mines, and the famous mineral springs of Püllna and Seidlitz, from which the inhabitants of B. prepare a considerable quantity of salts. Pop. (Dec. 31, 1869) 6102.

BRUYÈRE, JEAN LA. See LABRUYERE.

BRYANT, JACOB, an eminent English scholar, was born at Plymouth in 1715. He was educated at Eton and King's College, Cambridge, where he took his degree of M.A. in 1744. In 1756 he became private secretary to the Duke of Marlborough, and accompanied his Grace to the continent. Substantial proofs of the duke's esteem raised him above the region of pecuniary cares, and enabled him to devote his whole life to letters. He died 14th November, 1804. Among his numerous publications, may be mentioned: *Observations and Inquiries relating to various Parts of Ancient History* (Cambridge, 1767); *A New System or Analysis of Ancient Mythology* (1774—1776); *Vindiciæ Flavianæ* (a defence of Josephus's testimony in regard to Christ), (1780); *Treatise on the Authenticity of the Scriptures and the Truth of the Christian Religion* (1792); *A Dissertation concerning the War of Troy, &c.* (1796); *The Sentiments of Philo-Judæus concerning the Logos* (1797); and a variety of Dissertations on the Difficult Passages of Scripture (1803). B. was a man of great and varied learning, but his intellect, although acute, was neither philosophical nor comprehensive enough to enable him to handle in a satisfactory manner the important questions on which he wrote.

BRYANT, WILLIAM CULLEN, a distinguished American poet and journalist, was born in Hampshire, Mass., November 3, 1794. At the early age of 10, he published translations from some of the Latin poets; at 13, he wrote a terse and vigorous political poem, entitled *The Embargo;* and at 18, he composed his *Thanatopsis*, a poem full of beauty. In 1815 he was admitted to the bar, and for ten years practised with diligence and success. In 1825 he removed to a more congenial sphere, and in association with a friend, established *The New York Review*, to which he contributed many of his best poems. In 1826 he became principal editor of *The Evening Post*, the leading democratic paper of New York, which he conducted with a manliness and purity of tone that might be imitated by his professional brethren with great advantage to the character of the press. The first collected edition of his poems appeared in 1832. They were soon after republished in Britain, and were regarded as the highest efforts, up to that time, of the American Muse. In 1842 he published *The Fountain, and other Poems.* B. visited Europe in 1834, and several times afterwards, and records his observations in *Letters of a Traveler in Europe and America.* In 1858 appeared a new edition of his poetical works, and in 1869, a metrical translation of the *Iliad* followed in 1871 by that of the *Odyssey.* He afterwards engaged in writing a *History of the United States.* Although the popularity of B.'s writings has been eclipsed by those of Longfellow and Poe, they have yet a large circle of readers and admirers. B. died 12th June, 1878.

BRY'ONY (*Bryonia*), a genus of plants of the natural order *Cucurbitaceæ*, distinguished by triadelphous stamens, with distinct anthers, a trifid style, and a few-seeded fruit destitute of hard rind. The stems climb by means of lateral tendrils, the leaves are angular or 3–5-lobed, and the flowers campanulate, 5-partite, unisexual, and generally yellow. The COMMON BRYONY (*B. dioica*), the only British species, is frequent in hedgerows in England, but is not indigenous to Scotland. It has cordate palmate leaves, axillary bunches of flowers, and red berries about the size of a pea. It abounds in a fetid and acrid juice. The root is perennial, very large, white and branched, has a repulsive smell, and is acrid, purgative, and emetic. *B. alba*, common in the middle parts of Europe, possesses similar properties. The root of both is applied topically to bruises, and was formerly very much in use as a purgative. It is now again much employed in homœopathic practice. A decoction made of 1 lb. of the fresh root is said by Withering to be 'the best purge for horned cattle.' It contains a bitter extractive, called *Bryonine*, to which it seems to owe its properties. The young shoots of both species are, however, so free from acrid and dangerous qualities, that they may be used as pot-herbs.—The roots of other species of the genus are also acrid and purgative; but it is said that the root of *B. Abyssinica*, when cooked, is eaten without danger.—BLACK BRYONY (*Tamus communis*) is a plant of a different natural order (*Dioscoreaceæ*, q. v.). The genus is distinguished by an inferior ovary and succulent fruit. Black B. has long twining stems, cordate undivided leaves, greenish flowers, and red berries. Its roots are very large and fleshy, black externally. The berries are unwholesome, and the whole plant is acrid, the roots so much so as to have been formerly employed for stimulating plasters. But the young suckers, in which the acrid principle is not much developed, are eaten in Greece as asparagus, after careful boiling with change of water, as are also those of *T. Cretica*. The plant is common in most parts of Europe, and is found in England, in hedges and thickets.



Common Bryony.

BRYOPHY'LLUM (Gr. *bryon*, moss, and *phyllon*, a leaf), a genus of plants of the natural order *Crassulaceæ* (q. v.). *B. caly-*

cinum, a succulent shrubby plant, a native of the Moluccas, with quinate or almost pinnate leaves, oblong deeply crenulated leaflets, and panicles of large pendulous greenish-yellow flowers, is not unfrequent in British hot-houses, being regarded as an object of interest, upon account of its producing buds on the edges of the leaves more frequently than almost any other plant. These buds are capable of forming independent plants. The curious mode of propagation is found also in the Bog Orchis (*Malaxis paludosa*), a plant of a very different natural order. See BUD and LEAF.

BRYOZO'A. See ZOOPHYTES.

BRY'UM (Gr. *bryon*, moss), a genus of Mosses (q. v.) distinguished by a terminal fruit-stalk, a double *peristome* (see MOSSES)—the outer one of 16 teeth, the inner a membrane cut into 16 equal segments—and a dimidiate *calyptra*. The species are very numerous, and many of them are natives of Britain. They are all small, their stems short, and their leaves forming little rosettes, from the center of which the fruit-stalk springs. They very generally grow in dense patches, on wet rocks, wet earth, the bark of trees, &c., beautifully clothing them with bright green.

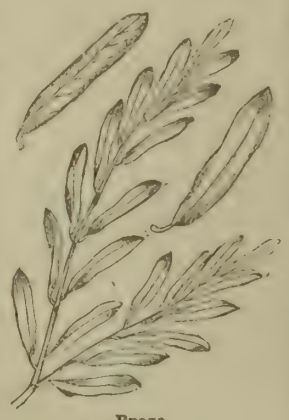
Bryum Longicollum:
a, Sterile shoots with leaves; *b*, fertile plant, showing the *spore-case* and its stalk; *c*, the spore-case or capsule, magnified; *d*, the *calyptra*, magnified; *e*, the top of the spore-case or capsule, showing the double *peristome*, magnified.

BRZESC LITE'WSKI, a walled town of Russia, in the government of Grodno, about 108 miles south from the city of the same name. Being advantageously situated on the right bank of the Bug, it has an extensive trade. It was the scene of a battle between the Russians and Poles in 1794. Pop. (1878) 22,132.

BRZE'ZAN, a town of Galicia, situated on the Zlota-Lipa, about 54 miles S.E. of Lemberg. It has an old castle and a gymnasium, and manufactures of linen, sail-cloth, and leather. Pop. (1869) 9290.

BUA'CHE, or GARDEN ISLAND, an island of Western Australia, near the mouth of Swan River, in lat. 32° 10′ S., and long. 115° 40′ E. Though measuring only 6 miles by 1, it is yet important as sheltering from the open ocean the deep and spacious anchorage of Cockburn Sound, which flows between it and the mainland of the colony.

BU'AZE, a South African plant, of which the botanical characters and relations are not yet known, but which is likely to prove of importance on account of its fibre. Dr. Livingstone found it growing in large quantities in the Maravi country, north of the Zambesi; but he could not procure any specimen in flower or fruit, and Dr. Hooker did not recognize the specimens of branches and leaves. It is not cultivated, and the only use to which it is put by the natives is to afford threads for stringing beads on; but Dr. Livingstone thinks its fibre stronger and finer than flax, and says that a firm thread of it feels like catgut in the hand, and would rather cut the fingers than break.



Buaze.

BU'BALUS, BU'BALIS, or BU'BALÉ (*Antilope Bubalus*), supposed to be the *Bubalus* of the ancients—although that name is now generally appropriated to the buffalo (q. v.)—a species of antelope, of that section of the genus which is characterized as *bovi*-form or ox-like. The Arabic name is Bekker-el-Wash, which signifies wild ox. It is an animal about the size of a large stag, with very ox-like head and muzzle—the head, however, remarkably long; the horns about as long as the head, surrounded by a succession of thickened rings, curved so as to resemble somewhat the sides of a lyre, the points directed backward. The general color is yellowish brown, but the tail is terminated by a black tuft. The B. is an animal of rather coarse appearance, very destitute of the gracefulness of the typical antelopes. It inhabits Barbary, and occasional wanderers make their way to the banks of the Nile. It is figured on the monuments of ancient Egypt. It is gregarious in its habits. It is said to be easily domesticated. The most nearly related species to this, of other antelopes known, is the KAAMA (q. v.) of South Africa.

Bubalis.

BUBA'STIS, a goddess of the Egyptians, was, in their mythology, the child of Isis and Osiris, and the sister of Horus. She was identified by the Greeks with Artemis (Diana), though upon what grounds is unknown, as the best information with regard to her is, that she was the goddess who presided over pregnancy and childbirth. The chief temple erected to B. was at Bubastis (q. v.). B. is represented on monuments as having the head of a cat, an animal which was sacred to her.

BUBA'STIS (the *Pi-beseth* of Scripture, and modern *Tel Basta*), a ruined city of Egypt, about 14 miles north of Belbeys, in lat. 30° 36′ N., and long. 31° 33′ E. B. derived its name from the Egyptian goddess Bubastis, in whose honor a temple was erected here, which, if not so large and magnificent as some Egyptian temples, was, according to Herodotus, one of the most beautiful, and vast numbers of persons were wont to make annual pilgrimages to it. Nothing but some stones of the temple, which are of the finest red granite, now remain. There are some other ruins, and mounds of great extent, consisting chiefly of the remains of brick-houses and heaps of broken pottery.

BUBBLE, as a term, is defined by Blackstone as an unwarrantable undertaking by unlawful subscriptions, subjecting the parties who originate and put them in operation to the penalties of *præmunire* (q. v.). The *South-sea Company* (q. v.) was a terrible example of such a bubble.—The BUBBLE ACT is the name given to the 6 Geo. I. c. 18, 'enacted,' says Blackstone, 'in the year after the infamous South-sea project had beggared half the nation,' and which public fraud the act was intended to punish. But it was repealed by the 6 Geo. IV. c. 91, which at the same time left such companies to be dealt with by the common law.

BU'BBLE SHELL. See BULLA.

BU'BO, an inflammatory tumour, seated in the groin or the armpit.

BU'BO. See OWL.

BUCCANEE'RS, a celebrated association of piratical adventurers, who, from the commencement of the second quarter of the 16th c., to the end of the 17th, maintained themselves in the Caribbean seas, at first by systematic reprisals on the Spaniards, latterly, by less justifiable and indiscriminate piracy. The name is derived from the Caribbee *boucan*, a term for preserved meat, smoke-dried in a peculiar manner. From this the French adventurers formed the verb *boucaner* and the noun *boucanier*, which was adoped by the English; while singularly enough, the French used in preference, the word *flibustier* (see FILLIBUSTERS), a corruption of our 'freebooter.' The B. were also sometimes called 'Brethern of the Coast.' The arrogant assumption by the Spaniards of a divine right—sanctioned by the pope's bull—to the whole New World, was not, of course, to be tolerated by the enterprising mariners of England and France; and the enormous cruelties practised by them upon all foreign interlopers, of which the history of that time is full, naturally led to an association for mutual defence among the adventurers of all other nations, but particularly among the English and French. The fundamental principles of their policy—for they, in course, of time, formed distinct communities—were close mutual alliance, and mortal war with all that was Spanish. Their simple code of laws bound them to a common participation in the necessaries of life; locks and bars were proscribed as an insult to the general honor; and every man had his comrade, who stood by him when alive, and succeeded to his property after his death. The principal center of their wild and predatory life was for some time the island of Tortuga, near St. Domingo. When they were not hunting Spaniards, or being hunted themselves, the chief occupation and means of subsistence was the chase. From the flesh of wild cattle they made their

'boucan;' their skins and tallow they sold or bartered to Dutch and other traders. The history of these men embraces, as may be supposed, narratives of cruelty and bloodshed unsurpassed in the annals of crime. It has, however, not a few stories of high and romantic adventure, of chivalrous valor, and brilliant generalship.

Among the 'great captains' whose names figure most prominently in the records of bucaneering, were the Frenchmen Montbars, surnamed by the terrible title of 'The Exterminator;' his countrymen, Peter of Dieppe, surnamed 'The Great'—as truly, perhaps, as others so distinguished—and L'Olonnais, Michael de Busco, and Bartolomeo de Portuguez, Mansvelt, and Van Horn. Pre-eminent, however, among them all was the Welshman, Henry Morgan, who organized fleets and armies, took strong fortresses and rich cities, and displayed throughout the bold genius of a born commander. He it was that led the way for the B. to the Southern Ocean, by his daring march in 1670 across the Isthmus of Panama to the city of that name, which he took and plundered after a desperate battle. This brilliant but most unscrupulous personage was knighted by Charles II., and became deputy-governor of Jamaica. A higher subordination of the love of gold to the passion for dominion in him, might probably have made him Emperor of the West Indies, some dream of which seems at one time to have occupied his mind. In 1680 and 1689, extensive bucaneering expeditions were made to the Pacific, even as far as the coasts of China, of which the best record is preserved in the lively pages of William Dampier, himself an important partner in these bold adventures. The war between France and Britain, after the accession of Willaim III., dissolved the ancient alliance of the French and English bucaneers. After the peace of Ryswick, and the accession of the Bourbon Philip V. to the Spanish crown (1701), they finally disappeared, to make way for a race of mere cut-throats and vulgar desperadoes, not yet utterly extinct. The last great event in their history was the capture of Carthagena in 1697, where the booty was enormous.—See the *Histories* of Burney and Thornberry, Dampier's *Voyages* and the *Narratives* of Wafer, Ringrove, and Sharp.

BUCCA'RI, or BAKAR, a free port of Austrian Croatia, on an inlet of the Gulf of Quarnero, 5 miles east-south-east from Fiume. It is beautifully situated on the slope of a hill, and has a small but very good and safe harbor. The linen manufacture is carried on here, and ship building is actively prosecuted; but the inhabitants are principally sailors and fishermen. The tunny fishery is the chief fishery of this part of the Adriatic. The vine is extensively cultivated in the neighborhood of B., and good wine is made. Pop. (1869) 2116.

BUCCINA'TOR (from Lat. *buccinare*, to sound a trumpet), the name of a muscle, situated in the substance of the cheeks; it is so called, because, when the cheeks are distended with air, the contraction of the B. muscles forces it out.

BUCCI'NO, a town of South Italy, in the province of Salerno, pleasantly situated on the Botta, which at this point is crossed by an old Roman bridge, about 14 miles east from Campagna. In its vicinity are quarries yielding fine marble. Pop. (1872) 6049.

BU'CCINUM. See WHELK.

BUCCLEU'CH. The Scotts, Dukes of B., are one of the oldest and most distinguished families in Scotland. The family traces its descent from Sir Richard le Scott, in the reign of Alexander III. (1249—1285); but the ancestor who first becomes historically conspicuous is Sir Walter Scott of Branxholm and B., a brave and powerful chieftain on the border. B., which from this early period was destined to be associated with the family title, is a lonely estate in the vale of Rankleburn, at the head of Ettrick, Selkirkshire. The Sir Walter alluded to flourished in the reign of James V., and on some incidents in his life, his great namesake founded the *Lay of the Last Minstrel*. Sir Walter fought bravely at the battle of Pinkie, 1547, and was slain in an encounter with Sir Walter Kerr of Cessford in the streets of Edinburgh, 1552. He was succeeded by his grandson, Sir Walter Scott of B., a knight 'wise, true, and modest,' who was succeeded by his only son, who bore the same name. This Sir Walter is celebrated for his military exploits on the border, not the least daring of his enterprises being the rescue of one of his attendants, Kinmont Willie, from the castle of Carlisle. (See *Minstrelsy of the Scottish Border*.) For his services to the state, in which is to be reckoned his carrying away of large numbers of the border marauders to foreign wars, he was raised to the peerage, 1606, as Lord Scott of Buccleuch. Dying in 1611, he was succeeded by his only son, Walter, who, in 1619, received an elevation in the peerage, as Lord Whitchester and Eskdale, and Earl of Buccleuch. Through his son Francis, the second earl, the family, by a grant, acquired the extensive domain of Liddlesdale, formerly belonging to the House of Bothwell; also, by purchase, large territories in Eskdale; and in 1642, the barony of Dalkeith from the Morton family.

Francis left only two daughters, the eldest of whom dying without issue, the titles and estates went to her sister, Anne, who, in 1663, was married to James, Duke of Monmouth, an illegitimate son of Charles II. In 1673, this pair were created Duke and Duchess of B., Earl and Countess of Dalkeith, &c. After a marriage of twenty-two years, the unhappy duke, on a charge of rebellion, was tried and beheaded, 1685; the duchess, however, retaining her honors, title, and estates, as in her own right. The Duke left a family of four sons and two daughters. The duchess afterwards married Lord Cornwallis, by whom she had a son and two daughters, and died in 1732, at Dalkeith House, where she had occasionally resided in princely splendor. James, her eldest surviving son, predeceased his mother, and his son, Francis, by the death of his grandmother, succeeded to the title of Duke of Buccleuch. Notwithstanding the connection with the son of Charles II., the family still preserved the surname of Scott. Duke Francis, in 1743, obtained a restoration of his grandfather Monmouth's Earldom of Doncaster and Barony of Tynedale, and was hence a British peer. In 1720, he married a daughter of James, second Duke of Queensberry, and by this fortunate connection, a portion of the Queensberry estates, along with the dukedom, merged in the family of B. in 1810. Henry, third Duke of B., born 1746, was the greatest and most estimable of his family. He had for his tutor and friend Dr. Adam Smith, and his beneficent talents were directed towards the improvement of his extensive estates in the south of Scotland. The amelioration of the soil, the planting of trees, the making of roads, the improving of the breed of sheep, and the social elevation of his numerous tenantry, uniformly engaged his attention. He died in 1812, and was succeeded by his eldest son, Charles, fourth duke, who dying in 1819, was succeeded by his son, Walter Francis, born 1806, who bears the title of Duke of B. and Queensberry, Marquis of Dumfriesshire, Earl of Drumlanrig, B. Sanquhar, Dalkeith, &c., in the peerage of Scotland; and Earl of Doncaster, &c., in the peerage of England. His eldest son, William Henry, takes the courtesy title of Earl of Dalkeith. The duke, like his grandfather, is noted for the improvement of his estates, which in Scotland are situated in Mid-Lothian, Dumfriesshire, Roxburghshire, Selkirkshire, Peeblesshire, Lanarkshire, and stewartry of Kirkcudbright; his farms everywhere being noted for their good steadings and thriving tenantry.

As an heritor, the number of churches and school-houses which the duke has been concerned in building is very considerable. He has one small possession in Fife—the island of Inchkeith (q. v.). The greatest public improvement ever executed in Scotland by an individual at his own private cost, was carried out by the Duke of B., at vast expense. We allude to the creation of the deep-water harbor and port of Granton, on the Firth of Forth, two miles from Edinburgh. The Duke of B. was one of the chief patrons of church livings in Scotland, but waived all claim to compensation when patronage was abolished in 1874. The duke is lord-lieutenant of Midlothian and Roxburghshire, and captain of the Queen's body-guard in Scotland.

BUCE'NTAUR, the name of a ship which acquired much celebrity in Venice at the time when that state was a flourishing republic. A bucentaur was known as early as the end of the 12th c.; and a vessel of the same name was burnt when the French took Venice more than six centuries afterwards; but it is not certain whether this was the same vessel, maintained by being repeatedly patched up with new ribs and planking. The B. is described as having been a galley, about 100 feet long by 21 in extreme breadth; on a lower deck were 32 banks or rows of oars, manned by 168 rowers; and on an upper deck was accommodation for the illustrious visitors who occasionally came on board. The whole of the fittings were of the most gorgeous character. Although propelled mainly by oars, there were 40 mariners employed in other ways to manage the galley. The B. was employed only once a year, when the Doge 'married the Adriatic.' A splendid water procession was formed, with the Doge and the chief notables in the B. and other distinguished persons in gondolas and feluccas; and when the vessels arrived at the mouth of one of the channels opening into the Adriatic, the Doge dropped a ring into the water, using the words: 'We wed thee with this ring, in token of our true and perpetual sovereignty.' This singular ceremony, which took place on Ascension Day, arose out of an honor or privilege conferred by the pope on the Doge in 1177, consequent on a splendid victory gained by the Venetians over the Emperor Frederick Barbarossa.

BUCE'PHALUS (Greek, meaning 'ox-head'), the name of the favorite charger of Alexander the Great, was probably also the name of a peculiar breed of horses in Thessaly. According to tradition, Alexander in his boyhood was the first to break in the steed B., and thus fulfilled the condition stated by an oracle as necessary for gaining the crown of Macedon.—The town BUCEPHALIA, on the river Hydaspes, in India, was founded near the grave of Bucephalus, which died during Alexander's Indian expedition.

BUCER, MARTIN, one of the church reformers of the 16th c., was born, 1491, at Schlettstadt, in Alsace. His real name was *Kuhhorn*

(cow-horn), but in accordance with the fashion of his time among scholars, he changed it into its Greek equivalent; Bucer being derived from *bous*, an ox, and *keras*, a horn. At the age of 14, he entered the order of Dominicans. At the suggestion of his superior, he went to Heidelberg to study theology, devoting his attention, however, at the same time to the Greek and Hebrew languages. While young, he was appointed chaplain to the Elector of the Palatinate. An acquaintance with the works of Erasmus had already inclined B. toward Protestantism, and his views were confirmed by the influence of Luther at the Heidelberg disputations in 1518. Following the example given by Luther at the Diet of Worms (1521), B. became one of the boldest and most decided of the German reformers. In 1523, he went to Strasburg, where he introduced the doctrines of the Reformation. In the disputes between Luther and Zwingli, he adopted a middle course, and endeavored to make reconciliation between them; but his view of the sacraments, which approached that of Zwingli, exposed him to Luther's harsh reprobation. At the Diet of Augsburg, where he conducted himself with great circumspection and moderation, he generally accorded with the Lutheran views; but, along with other Strasburg theologians, declined to subscribe to the proposed confession of faith, and afterwards drew up the *Confessio Tetrapolitana*. An agreement, however, was subsequently entered into between B. and the Lutherans, and as a disciple of Luther, he appeared at the religious conference of the Reformers held at Leipsic. In consequence of his refusal to sign the *Interim*—a temporary creed drawn up by order of the Emperor Charles V.—B. found his situation irksome in Germany, and therefore accepted the invitation of Archbishop Cranmer (1549), and came to England to teach theology at Cambridge, and assist Paul Fagius and others in forwarding the Reformation. His modesty, blameless life, and great learning gained many friends in England; but his labors were soon interrupted by death, February 27, 1551. His remains were interred in a church at Cambridge with great solemnity; but during the reign of Mary, his bones, with those of Fagius, were taken from their graves, and burned in the market-place.

His constant attempts to express himself in language agreeable both to Luther and Zwingli, induced in him at times an obscure, ambiguous, and elusive kind of thought, to which, perhaps, Bossuet refers when he stigmatizes B. as 'the great architect of subtleties.' B. was, of course, exposed to many censures and scandals by the assiduous malice of the Roman Catholic theologians, whose fertile imaginations during the Reformation period were exclusively devoted to the manufacture of indecent calumnies; but by Protestant writers he has been highly commended, and by some has been ranked above even Luther and Melanchthon. His best work is a translation and exposition of the Psalms, which he published under the pseudonym Aretinus Felinus (Strasburg, 1529). Hubert intended to edit the whole of B.'s writings in ten volumes, but only one volume appeared (Basel, 1577).

BU'CEROS. See HORNBILL.

BUCH, LEOPOLD VON, one of the most celebrated of German geologists, was born at Stolpe, in Prussia, in 1774 or 1777, and received instructions under Werner at the Mining Academy, Freiberg. He afterwards traveled in pursuit of his favorite science, through all the states of Germany, through Scandinavia as far as the North Cape, and through several parts of Great Britain, France, and Italy, visiting the Canary Islands in 1815. His chief writings are—*Geological Observations during Travels in Germany and Italy* (1802—1809), a *Physical Description of the Canary Islands* (1825), *Travels in Norway and Lapland* (1810), and essays *On the Jura in Germany* (1839), and *On the Mountain Systems of Russia* (1840), with several monographs on Ammonites (1832), and other fossils. He was also the author of an excellent geological chart of Germany and its neighboring states, published in 42 plates (2d ed., Berlin, 1832). He died in Berlin, March 4, 1853. B. has been described by an eminent scientific man as 'the only geologist who has attained an equal fame in the physical, the descriptive, and the natural history departments of his science. In all these, he has been an originator and a discover.'

BU'CHAN, the north-east district of Aberdeenshire, consisting of about a fourth of the county, lying between the Ythan and the Doveran. Its surface is undulating, the highest points being Mormond Hill in the north, 742 feet, and Dudwick Hill in the south, 562 feet. Portions of the coast are bold and precipitous, especially for a few miles east of the Doveran mouth, where Troup Head is 600 feet high, and south of Peterhead, where the coasts rise from 70 to 100 feet. Among the rocks five miles south of this town are the famous Bullers of B., a huge vertical well in the granite margin of the sea, 50 feet diameter, and 100 feet deep, into the bottom of which the sea rushes by a natural archway, and, in storms, dashes up the sides with great violence.

The eastern parts of B. consist chiefly of granite and gneiss, and the western of clay-slate and old red sandstone. The chief seats of population are Peterhead, Fraserburgh, Macduff, and Turriff. B. contains several so-called Druid circles, as well as the remains of the Abbey of Deer, and of several castles belonging to the Comyns, who held the earldom of B., but forfeited their title and property in 1309.

BUCHAN-NE'SS, the easternmost promontory of Scotland, in the north-east of Aberdeenshire, three miles south of Peterhead, in lat. 57° 28′ N., and long. 1° 46′ W. A light-house, 130 feet high, with a revolving light, has been erected here. It may be stated that the low rocks at Peterhead stretch a little further east than the Buchan-ness. In the sea off the B. lie the Buchan Deeps, a great trough 50 to 90 fathoms deep, and 25 miles broad, and stretching south nearly as far as the Bell-rock. Outside lie the Long Forties, a bank at the depth of 35—45 fathoms, and 10—20 miles broad.

BUCHANAN, GEORGE, one of the most learned men of the 16th c., and a distinguished poet and historian, was born of poor parents at Killearn, in the county of Stirling, in February 1506. He was sent to the university of Paris by his uncle, who died two years afterwards, leaving B. without the means of prosecuting his studies. He returned home, served in one campaign against the English, and entered St. Andrews University in 1524, where, in the following year, he took his degree of B.A. In 1526 he went to Paris, and became a student in the Scots College there. He subsequently obtained a professorship in the college of St. Barbe, but returned to Scotland about 1537. During his residence on the continent, B. adopted the tenets of the reformed faith. A satire entitled *Somnium*, exposing the Franciscans, brought down upon him the wrath of the priests; and he had resolved upon seeking safety in his old college at Paris, when King James V. took him under his protection, and intrusted him with the education of one of his illegitimate sons. At the request of the king B. wrote another and more pungent satire against the monks, entitled *Franciscanus*, increasing their anger, and rousing especially the bitter hatred of the powerful Cardinal Beaton, who, after a time, procured B.'s arrest, and even went so far as to offer the king money for his life. Though to James was entirely due the publication of the offensive satire, he did not interfere to protect the poet, who, however, contrived to effect his escape to Paris. After spending some years at Bordeaux and Paris in tuition, he accompanied the learned Portuguese, Govea, to the university of Coimbra, in Portugal, as one of his associates.

After the death of Govea, B. was arrested as a heretic, and was for some time detained in a monastery, where he began his splendid Latin metrical version of the Psalms. In 1551, being restored to liberty, he went to England; but soon afterwards went to Paris. About 1560, he returned to Scotland, where he made an open confession of Protestantism. His reputation as a scholar gained for him a good reception at the court of the young queen, Mary, whose classical tutor he became. But his religious and political principles attached him to the party of the Regent Moray, by whose influence he was appointed Principal of St. Leonard's College, in St. Andrew's University, in 1566. In the following year, he was chosen Moderator of the General Assembly—a very high honor for a layman. The doings of Mary, which scandalized the Scottish public, disgusted her tutor also, and he accompanied the Regent Moray to England, in order to give evidence against her before the commissioners appointed by Elizabeth to inquire into her guilt. His *Detectio Mariæ Reginæ*, laid before these functionaries, was industriously circulated by the English court. In 1570, B. was appointed tutor to the young king, James VI. (afterwards James I.), who owed to him all the erudition of which in later life he was so vain. No considerations of the future position of his pupil were allowed to interfere with B.'s treatment of him, which was strict, if not even stern; and in dedicating his *De Jure Regni apud Scotos* to the young monarch in 1579, he warned him against favorites with a freedom remarkable not only in a subservient but in any age. In 1570, B. was appointed director of Chancery, which he soon resigned, and in the same year was made keeper of the Privy Seal, an office which he retained until within a short time of his death. The latter years of his life were devoted to the composition of his *History of Scotland* (published 1582). He died thirty days after its publication, on the 28th September 1582, and was buried in Greyfriars Churchyard, Edinburgh. As a scholar, B. was unrivalled in his age; and he wrote Latin poetry 'with the purity and elegance of an ancient Roman.' He was alike humorous, sarcastic and profound. His *History*, written in Latin, is remarkable for the richness, force, and perspicuity of its style, though it has been found fault with for the partiality of its narration of contemporary events; and two years after the author's death, it, as well as *De Jure Regni*, &c., was condemned by the Scottish parliament, and every person possessed of copies was ordered to surrender them within 40 days, in order that they might be purged of 'the offensive and extraordinary matters' they contained. Two collected editions of B.'s works have been published—one by Ruddiman in 1715, 2 vols. folio; and another by Burman, Leyden, in 2 vols. quarto, in 1725. The translations that have yet appeared are far from doing justice to the original.

BUCHANAN, JAMES, a distinguished American statesman, was born in Franklin county, Pennsylvania, April 13, 1791. He was educated at Dickenson College, adopted the profession of the law, and, in 1814, was elected a member of the Pennsylvania House of Representatives. In 1820, he was chosen a member of Congress, and remained so till March 4, 1831. In May of that year, he was nominated ambassador to Russia. He returned to the United States in 1834, and soon after was elected a member of the Senate; he was re-elected in December 1836, and 1843. Appointed by President Polk, in March 1845, secretary of state, he held that office till the close of Polk's presidency. Ambassador to England in 1854, B. resigned that post the following year, and in 1856 was elected President of the United States. His administration was, on the whole, popular. He was in favor of the maintenance of slavery, but when the civil war broke out he warmly embraced Lincoln's policy. He died June 1, 1868.

BU'CHANITES, an extraordinary sect of fanatics, which sprang up in the west of Scotland in 1783, but has now become extinct. The founder of the sect was Mrs. or Lucky Buchan, born in Banffshire in 1738, of humble parentage. Her maiden name was Elspeth Simpson. She early fell into habits of vice, but with her licentiousness were combined a sort of religious fervor and extreme Antinomian opinions. In 1782, being resident in Glasgow with her husband, a potter, who ultimately divorced her, she became acquainted with the Rev. Hugh White, minister of the Relief congregation in Irvine, a weak vain man and coarse declamatory preacher, who adopted her opinions, for which he was deposed by his presbytery, and began along with her to found a new sect in Irvine. Popular tumults arose, which led to her expulsion from the town in May 1784. Mr. White and his wife, with other devoted adherents, male and female, accompanied her, regarding her as a divinely commissioned person, and expecting her to lead them to the place where Christ was speedily to appear again on earth. She was addressed as 'Friend Mother in the Lord,' and among other more blasphemous pretensions, gave herself out to be the woman mentioned in Rev. xii., White being represented as the 'man-child' whom she had brought forth.

She and her followers traveled towards Nithsdale, and found a resting-place in a barn at New Cample, near Thornhill, where they afterwards built for themselves a house of one apartment with a loft, in which they all dwelt, supported chiefly by the money of the more wealthy of their number. A few additional persons joined them. They lived in expectation of being translated to heaven without death; and on one occasion, after a fast of extraordinary duration, by which many of them were reduced to a very spectral condition, were led out by their prophetess to a hill-top to be immediately taken up, but returned disappointed. After this, dissensions began to arise among them; and some, recovering from their infatuation, left the society. Their expected heaven was one of mere sensual delights; and it is now sufficiently ascertained that they lived in unrestrained sexual intercourse—for they condemned marriage as unworthy of Christians—and that they systematically practised infanticide. Yet they were protected from the outbreakings of popular indignation, and no investigation was made by the authorities. On the failure of their means of subsistence, they took a farm in a moorish part of the stewartry of Kirkcudbright; and those who remained of them accumulated by their industry the means of purchasing a small property, on which was built the first house of the village of Crocketford, where they finally became extinct, the last of them surviving till 1846, full even in his old age of the strange delusions of his youth, and preserving in his house the bones of Lucky Buchan, which were buried with him in his grave.—See *The Buchanites from First to Last*, by Joseph Train. (Edin. 1846).

BUCHARE'ST, BUKHARE'ST, or BUKHORE'ST, the chief city of Walachia, and capital of Rumania, in a rich and extensive plain on the Dumbovitza, a tributary of the Argish, in lat. 44° 26′ N., and long. 26° 5′ E. The town is for the most part meanly built, and the streets are very irregular and generally unpaved. There are, however, some handsome hotels; and the churches are numerous and many-spired, giving to the place a picturesque appearance. The prince's palace, a large structure in the center of the town, has no claim to architectural beauty. The number of cafés and gambling tables is excessive; and altogether B. has the unenviable reputation of being the most dissolute capital in Europe. The *corso*, or public promenade, is a miniature Hyde Park. B. is the entrepôt for the trade between Turkey and Austria, the chief articles of commerce being grain, wool, salt, honey, wax, building-timber, and cattle.

It has some small manufactures of woollen cloths and carpets. B. has at various times suffered considerably at the hands of the Russians, and is remarkable as the place where in 1812 a treaty was concluded between Turkey and Russia, by which the former ceded to the latter the province of Bessarabia and a portion of Moldavia; Russia waiving her claim to all other territories she had conquered. This treaty also defined the Pruth as the boundary-line between the two empires. During the Crimean campaign, B. was successively occupied by Russians, Turks, and Austrians. Pop. (1866) 141,754; (1875) estimated at 250,000.

BUCHEZ, PHILIPPE BENJAMIN JOSEPH, a French physician, writer, and President of the National Assembly in 1848, was born in 1796 at Matagne la Petite, in the department of Ardennes, and studied medicine in Paris, 1815. He became involved in several plots against the Bourbons, was active in the conspiracy of the French Carbonari (q. v.), and supported the doctrines of St. Simon (q. v.); but, after editing for some time the communist journal *Le Producteur*, he separated from his colleagues. Curiously enough, during all his active career of underhand politics, he was prosecuting his learned studies, and in 1825, published a *Précis Elémentaire d'Hygiène*, besides editing the *Journal des Progrès des Sciences et Institutions Médicales*. After the revolution, 1830, B. established and conducted the journal *L'Européen*, the organ of Neo-Catholicism; and in concert with M. Roux Lavergne, began a republican history of the French Revolution. All his writings are marked by original views and arguments in favor of the belief in human progress. After the February revolution, 1848, B. was made President of the National Assembly; but by his want of energy during the disturbance of May 15, he incurred the censure of all parties. On the inauguration of the Empire, B. returned to his studies. He died in 1866.

BUCK, a name sometimes distinctively appropriated to the male of the FALLOW DEER (q. v.), the female of which is a *Doe*. But the term B. is often applied to the male of other species of deer, as of the ROEBUCK (q. v.), although never to that of the Red Deer (see DEER), which when mature, is a STAG or a HART.

BU'CKBEAN, or MARSH TRE'FOIL (*Menyanthes trifoliata*), a plant of the natural order *Gentianeæ* (q. v.), the only known species of its genus, widely distributed in all the colder parts of the northern hemisphere, and common in Britain. It has been described as 'perhaps the most beautiful' of all British plants. It grows in marshy places, its creeping root-stocks (or rhizomes) and densely matted roots often rendering boggy ground firm. The leaves are alternate, like those of the trefoils or clovers, and are supported on pretty long stalks.

The flower-stalk bears a compound raceme of 10—20 white flowers, externally tipped with red. The calyx is 5-parted; the corolla funnel-shaped with a spreading 5-lobed limb, shaggy on the inner surface, with thick fleshy hairs. The fruit is a one-celled, two-valved capsule. The leaves are destitute of smell, but very bitter. From them is prepared a valuable bitter extract, which has long been used in cases of dyspepsia and disorders of the bowels, and which was also formerly employed in intermittent fevers. An infusion is also sometimes used, and sometimes the dried and powdered leaves. The whole plant seems to possess the same bitter and tonic properties. It is sometimes used in Germany as a substitute for hops. The root-stock, however, which is black and jointed, contains a considerable quantity of a kind of starch, which is separated form the bitter substance, and used as food in some of the northern parts of Europe.

Buckbean.

BU'CKEYE. See HORSE CHESTNUT.

BU'CK-HOUND, a hunting-dog once common in Britain when buck-hunting was a most fashionable amusement, but of which few packs now exist. The B. resembles a dwarf STAG-HOUND (q. v.), and possesses great strength and perseverance. Bucks are, however, often hunted by other kinds of hounds.

BUCKINGHAM, DUKE OF, GEORGE VILLIERS, the favorite of James I. and Charles I. of England, third son of Sir George Villiers, was born at his father's seat of Brookesley, Leicestershire, August 20, 1592. Knighted in April 1616, and sworn a gentleman of the bedchamber on January 1, 1617, he became Master of the Horse and a Knight of the Garter. Created the same year Baron of Whaddon and Viscount Villiers, and in January following Earl of B., and sworn of the privy-council, he was next made a Marquis, and appointed Lord-admiral of England, Chief-justice in Eyre of parks and forests south of the Trent, Master of the King's Bench Office, High Steward of Westminster, and Constable of Windsor Castle. In 1620, he married the daughter of the Earl of Rutland,

the richest heiress in the kingdom. In 1623, while negotiations were in progress with the Spanish court for a marriage between the Infanta and the Prince of Wales, afterwards Charles I., B. persuaded the latter to go himself to Madrid and prosecute his suit in person.

The ultimate failure of the negotiations has been ascribed to B.'s arrogance. In his absence he was created a Duke, and on his return nominated Lord-Warden of the Cinque Ports, and Steward of the Manor of Hampton Court. By his advice, James declared war against Spain. On the accession of Charles I., in 1625, B maintained his ascendency at court, but after the ill-fated expedition against Cadiz, he became odious to the nation, and was saved from impeachment only by the king's dissolving parliament. The treaty for the marriage of Charles with the Princess Henrietta of France was concluded by him, but he was not allowed to return to Paris, in consequence of his audacity in lifting his eyes to the French queen. In 1627, with an armament of 100 sail and 7000 soldiers, he appeared before Rochelle, then in possession of the Huguenots, who refused him admission within the harbor. His troops then made an ill-conducted descent on the neighboring Isle of Rhé, and returned to England beaten and disgraced. He soon after undertook a second expedition to Rochelle, and proceeded to Portsmouth for embarkation, when he was assassinated by a discontented subaltern-officer, named Felton, August 23, 1628, in his 36th year.

BUCKINGHAM, 2d Duke of (George Villiers), a brilliant but profligate nobleman, son of the preceding, was born at Wallingford House, Westminster, January 30, 1627, and studied at Cambridge. On the outbreak of the civil wars, he served in the royal army; his estates were confiscated by the parliament, and he took refuge on the continent. He attended Charles II. into Scotland, and after the battle of Worcester, in 1651, went again into exile. Returning secretly into England, he married, in 1657, the daughter of Lord Fairfax, the parliamentary general, to whom his forfeited estates had been assigned. Arrested by Cromwell, and committed to the Tower, he was afterwards removed to Windsor Castle, but released on the abdication of Richard Cromwell. At the Restoration, he recovered his estates, and was made Master of the Horse, and sworn of the privy-council. He was mainly instrumental in the fall of the chancellor, Clarendon, whom he made an object of ridicule to the king, and was one of Charles's confidential ministers, who from the initial letters of their titles, were called 'the Cabal.' Engaging in 1666 in some treasonable practices for effecting a change in the government, he was deprived of all his offices at court, but on his submission, soon recovered them.

In 1670, he was sent ambassador to France, and was employed on some other embassies. He was elected chancellor of the university of Cambridge in 1671. Supporting the nonconformists in 1674, he opposed the Test Act, and was deeply engaged in the Popish Plot. After Charles's death, in 1685, B. retired to his manor of Helmsley, in Yorkshire, and amused himself with the chase. He died at Kirkby-Moorside, April 16, 1688, and was interred in Westminster Abbey. The manufacture of glass and crystal is said to have been introduced into England from Venice by him. B. was the author of several stage-plays, of which the best is *The Rehearsal*, a comedy; *A Satire against Mankind;* and some poems.

BUCKINGHAM, James Silk, a modern traveler and popular lecturer, the son of a farmer, born in 1786, at Flushing, near Falmouth, Cornwall; when a boy, went to sea, and made several voyages to Lisbon. After years of unsettled and wandering life, he, in 1816, established a journal at Calcutta,, but the boldness of his censures on the Indian government led to his expulsion from the presidency of Bengal. His lectures, on his return to England, against the East India Company monopoly, and in support of opening the trade to China, tended greatly to direct public attention to the subject. In London, he established *The Oriental Herald*, and *The Athenæum*, now the leading weekly literary journal. Subsequently, he traveled through the United States, and from 1832 to 1837 was M. P. for Sheffield. He was projector and secretary of the British and Foreign Institute, literary club, 1843—1846; and president of the London Temperance League, 1851. B. was the author of numerous works of travel on the continent, in the east, and in America. He was engaged on his autobiography, two volumes of which were published before his death, which took place June 30, 1855.

BUCK'INGHAM, the old county town of Buckinghamshire, in the north part of the shire, is situated on the Ouse—which flows round the town, and has three bridges. B. is 61 miles north-west of London by rail. It returns one member to parliament. Pop. (1881) 6859. Bobbin lace is the chief manufacture, but it is on the decline. B. is a place of considerable antiquity. Edward the Elder fortified it in 978, and the Danes captured it in 1010. The Earls of Buckingham built a castle here soon after the Norman conquest. Edward III. made it a staple for wool. Here Catharine of Aragon received the news of the battle of Flodden, and Charles I. had his head-quarters in B. for a few days in 1644.

BU'CKINGHAMSHIRE, a south-midland county of England, its greatest length being about 54 miles, its average breadth 18, and total area 738 square miles. The plastic clay tertiary strata occupy the southern parts of the county, which is finely diversified with hill and dale, wood and water. To the north is a broad chalk-band, including the Chiltern range of chalk-hills, which enter from Oxfordshire, and stretch across the county in a north-east direction into Bedfordshire, partly covered with heath and wood, and near Ivinghoe and Wendover, above 900 feet high. Sloping north from these hills, and crossed by narrower bands of greensand and oolite, is the extensive and very fertile vale of Aylesbury, watered by the Thame. The chief rivers are the Thames, bordering the county on the south-west, the Ouse, Ousel, Colne, and Thame, the latter two falling into the Thames. The Grand Junction Canal, and the Great Western and North-Western Railways, intersect the county on the east and south. The climate of Bucks is mild and healthy; the soil is mostly good, chalk and clay predominating. About half the county is under tillage, the rest in meadows and pasture. The agriculture is not equal to the capabilities of the land, which is often overcropped and exhausted. The farms are generally small, averaging 200 acres. The cottages are generally good. Wheat and beans are the principal crops. The chief diary product is butter, of which four to five millions of pounds are annually sold, chiefly in London. In the vale of Aylesbury, fattening of cattle is extensively carried on; the sheep are noted for their fine and heavy fleeces; and large numbers of ducks are reared for metropolitan consumption. Of the total area of 467,132 acres, 405,899 were cultivated in 1880, 50,391 being under wheat crops. Beech and oak are the chief timber-trees, but box and juniper are also grown. The chief manufactures are paper, straw-plait, and thread-lace. B. returns 8 members to parliament—3 for the county, and 5 for the boroughs. The chief towns are Aylesbury, Buckingham, Marlow, and Wycombe. B. contains some Roman and British remains, as traces of Watling, Ickneld, and Akeman Streets or Ways. The chief ecclesiastical ruins are those of Missenden and Notley Abbey, the latter of which has been converted into farm buildings. There are many examples of early English and decorated architecture. The Church of Chetwode, near Buckingham (13th c.), contains some very fine examples of ancient glass-staining. Many events of historical interest occurred in this country.

It was the scene of contest in the civil wars of Stephen and John. At Chalfont St. Giles, Milton finished his *Paradise Lost*, and at Horton, he wrote *L'Allegro*. At Hampden lived the great patriot of that name; Waller was proprietor of Beaconsfield Manor; Atterbury was born at Milton; Stoke Poges Churchyard suggested Gray's *Elegy*, and is the place of his burial; at Olney, Cowper lived; at Gregories, near Beaconsfield, Burke died and was buried; Scott, the biblical commentator, was rector of Aston Sandford; Herschel's great telescope still stands at Slough, where he made most of his important discoveries; and at Stowe is a magnificent mansion—one of the finest in England, alike for extent, architecture and beauty of site. Pop. (1871) 175,879; (1881) 176,277.

BUCKLAND, Francis Trevelyan, a son of the Rev. Dr. Buckland (q. v.), born at Christ Church College, Oxford, December 17, 1826. He was educated at Winchester School, and at Christ Church College, Oxford. He devoted himself to the study of medicine; and after being house-surgeon of St. George's Hospital, London, was appointed assistant-surgeon to the 2d Life-guards in 1854, retiring in 1863. From his boyhood, he manifested an enthusiastic delight in natural history, especially when it could be applied practically to the cultivation of useful quadrupeds, birds, or fish, in which study he was encouraged and guided by his father. He contributed largely to the *Times*, *Field*, *Queen*, *Land and Water*, which he started along with Mr. W. Pfennell, and of which he was editor, &c. He was also the author of *Curiosities of Natural History* (1857; 2d series, 1860; 3d series, 1866); *Fish-hatching* (1863); *Logbook of a Fisherman and Zoologist* (1876); *Natural History of British Fishes* (1881); and *Notes and Jottings from Animal Life* (1882); also editor of a new edition of his father's Bridgewater Treatise (1858); and of *White's Selborne* (1876). B. was first secretary of the Acclimatization Society. He was an acute observer, and his writings on subjects of natural history in great part exhibit the results of fresh and original observations, which his sprightly style exhibits in a most interesting manner. For the greater part of a lifetime he took a great interest in fish-culture, and his advice on these subjects was sought by the Governments of Russia, Germany, France, America, and the colonies. He also, at his own cost, established under the Science and Art Department, South Kensington, a 'Museum of Economic Fish-culture.' In 1867, B. was appointed inspector of salmon fisheries for England and Wales; in 1870, special commissioner on the salmon fisheries of Scotland; and in 1877, on the Scotch herring

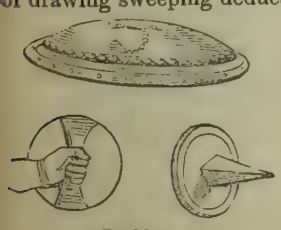
fisheries. B. died Dec. 19, 1880. He was not a follower of the new school of naturalists, and dissented from the conclusions of Darwin.

BUCKLAND, WILLIAM, D.D., a distinguished geologist, whose labors tended greatly to the advancement of science, was born at Axminster, Devonshire, England, in 1784. Educated at Winchester and Oxford, he was appointed, in 1813, Reader in Mineralogy in Oxford University. The same year, he was elected a Fellow of the Geological Society, and he was twice its president. In 1818, he became Reader in Geology at Oxford, and was elected Fellow of the Royal Society. In 1822, he received the Copley medal, for an account of an assemblage of fossil teeth and bones of 22 different animals, discovered in a cave at Kirkdale, Yorkshire; and in 1823, he published a treatise founded on it, entitled *Reliquiæ Diluvianæ, or Observations on Organic Remains, attesting the Action of a Universal Deluge*, a theory which he afterwards saw cause to modify. In 1825, B. was appointed a canon of Christ Church, Oxford. In 1827, he was chosen a member of the Council of the Royal Society; in 1832, he was elected president of the British Association at Oxford, its second meeting; and in 1836, he published his Bridgewater Treatise, *Geology and Mineralogy considered with Reference to Natural Theology* (2 vols. 8vo). To the Transactions of the Geological Society he contributed many valuable papers; and his sketch of the structure of the Alps, in the *Annals of Philosophy*, is esteemed one of the most interesting of his geological writings. In 1845, he was made Dean of Westminster, and in 1847 a trustee of the British Museum. Under his great and continuous labors to benefit others, his mental faculties gave way some years before his death, which took place August 14, 1856.

BUCKLA'NDIA, a magnificent and beautiful evergreen tree of the natural order *Hamamelideæ* (see WITCH-HAZEL), a native of the mountains. It grows unbranched to the height of 40 feet, the trunk sometimes 21 feet in girth at 5 feet from the ground. The foliage is thick, bright, and glossy. The timber is not valuable. Dr. Hooker thinks that this tree would probably succeed in the mild climate of the west of England.

BUCKLE, HENRY THOMAS, an author who attained a sudden notability in 1857 by the publication of the first volume of a work entitled *The History of Civilization in England*. He was born at Lee, in Kent, November 24, 1823, and was for a very short time at Dr. Holloway's school in Kentish-Town, near London. No other school and no university claims credit for his education, which nevertheless was in the highest degree liberal. An easy fortune, and a large library, enabled Mr. B. to gratify, without any sort of impediment or restraint, an all-absorbing love of letters. After bringing out a second volume of his work in 1861, he undertook a journey to the East, in order to restore his health and extend his knowledge. Having spent the winter in Egypt, he went over the desert to Syria, caught typhus fever by the way, and died at Damascus, May 1862.

B.'s plan involved, before tracing the particular history of English civilization, a general consideration of the progress of those European countries, England, France, Germany, Scotland, Spain, and America, in which the elements of modern civilization are originally found. The two volumes published are occupied with this preliminary examination, which they do not even complete. His objects, however, are clear. They are (1.) to discover what is the essential spirit of a nation's history apart from particular men and events, and (2.) to trace out the causes of the progress which has been made in England and France. Under the first head, B. endeavors to show that the spirit or character of a people is dependent on material circumstances, such as soil, climate, food, aspect of nature, and the like, and to be sought for in these; under the second head occurs the theory, the vigorous application of which by B. has startled and offended many readers—viz., that the progress of society depends upon scepticism; that the retarding force is credulity; and that the excessive 'protection' exercised by governments, the nobility, the church, &c., over the 'people,' has dwarfed and held back the spirit of freedom and civilization. These, and other positions, are defended by B. with great ingenuity and lucidity of argument and expression, and have been admitted, even by his opponents, to contain much sound truth. He is accused—perhaps not unjustly—of being often one-sided, and of drawing sweeping deductions from an imperfect survey of the facts. He is said to have been one of the best chess-players in the world. See his *Miscellaneous and Posthumous Works*, edited by Miss Helen Taylor; and the *Life and Writings of B.*, by A. H. Huth (1880).



Bucklers.

BU'CKLER, in old armor, was a kind of shield worn on the left arm. The bucklers worn by the *hastati*, or spearmen, among the ancient Romans, were about 4 feet long, by 2½ in width, made of boards, covered on the inside with linen and sheepskin, and on the outside with iron-plate. In the middle ages, the B. was round, oval, or square in shape, and was frequently made of wicker-work or of hide, strengthened by metal-plates.

BU'CKLES, metal instruments, consisting of a rim and tongue, used for fastening straps or bands in dress and harness. The use of B., instead of shoe-strings, was introduced into England during the reign of Charles II. They soon became very fashionable, attained an enormous size (the largest being called Artois buckles, after the Comte d'Artois, brother of the king of France), and were usually made of silver, set with diamonds, and other precious stones. In the latter half of last century the manufacture of B. was carried on most extensively in Birmingham, there being at one time not less that 4000 people employed in that town and its vicinity, who turned out 2,500,000 pairs of B. annually, at the average value of 2*s.* 6*d.* per pair. When the trade was at its height, however, fashion changed, and in 1791 we find buckle-makers petitioning the Prince of Wales for sympathy, on the ground that the introduction of shoe-strings had nearly ruined their trade. The prince promised to assist them as far as he could, by wearing B. himself, and enjoining his household to do the same; but fashion was too strong even for him, and B. became almost extinct. The opportunity, however, as is remarked by a writer in *Notes and Queries* for 1854, 'which buckles afford of ornament and expense has preserved them as a part of the court-dress; and of late years they have appeared a little in private society. They are generally, though not always, worn when a prince of the royal family is of the party; and at the king's private parties, although the rest of the dress be that usually worn, buckles are almost indispensable.' Large shoe-buckles, of silver or other metal, are still worn by the clergy of several continental countries, as part of their ordinary costume.

BU'CKSKIN is a fanciful name for a heavy-made, strong-twilled woollen fabric, for trouserings—highly milled to about the usual width for such goods—27 inches; and cropped and finished, with the pile or nap so shorn as to show the texture through it.

BUCKSTONE, J. B., a distinguished comedian and dramatic writer, was born in the suburbs of London, in 1802. Preferring the excitement of the stage to the monotony of an attorney's office, he sought and soon found an opportunity in a provincial town for the display of his theatrical abilities. After a probation in the country, he appeared at the Surrey Theater in 1823, and his success was so unequivocal, that he was soon engaged by the 'management' of the Adelphi Theater, where he continued for many years as leading low comedian.

He afterwards played at the Haymarket and Drury Lane Theaters, of the former of which he was lessee from 1853 till 1878. He died 31st October 1879. B.'s acting was not more noted for its comicality and humor, which never degenerates into vulgarity, than for its distinct appreciation of the peculiar traits in each individual character he assumed. In all his delineations there was the same broad general effect, but the details of each were wrought out with great care and minuteness. B. was also a prolific dramatic author, and of the 150 pieces he is said to have written for the stage, several have been highly popular. Among the best known are—*The Green Bushes, The Flowers of the Forest, Luke the Laborer, The Wreck Ashore, The Rough Diamond, Good for Nothing, the Irish Lion*, and *The Alarming Sacrifice*.

BU'CKTHORN (*Rhamnus*), a genus of shrubs or small trees of the natural order *Rhamnaceæ* (q. v.), distinguished by a bell-shaped 4–5-cleft calyx, which divides around the middle after flowering, the upper part falling away, and the base remaining and adhering to the fruit; which is globose, and sometimes succulent, sometimes rather dry or spongy, with 2–4 stones. The petals are sometimes wanting. Some of the species are dicœcious, some hermaphrodite. They are numerous, and natives of most of the tropical and temperate regions of the world.—The COMMON BUCKTHORN (*R. catharticus*) is a deciduous shrub or low tree, frequent in England and in other parts of Europe and the north of Asia. The leaves are ovate, crenate, and bright green; the branches spiny; the flowers small, yellowish-green, and densely clustered; male and female flowers on separate plants; the berries about the size of peas, globular, bluish-black, nauseous and violently purgative. They were formerly used in medicine, but now more rarely, and only in the form of a syrup prepared from their juice. They supply the *Sap Green* (q. v.) or Bladder Green of painters. The bark af-

Alder Buckthorn (*Rhamnus frangula*).

fords a beautiful yellow dye. The B. is sometimes planted for hedges, but is of too straggling a habit.—The ALDER BUCKTHORN, or BERRY-BEARING ALDER (*R. frangula*), is also a native of Britain, and is frequent in woods and thickets throughout Europe. It is a shrub, rarely a small tree, with spineless branches, oval entire leaves, and small, whitish, axillary flowers, which are in general somewhat clustered. The bark of the twigs is gray, and has a very disgusting smell and a nauseous bitter taste.

It was formerly used in medicine, along with that of the last species, and has recently been recommended in many quarters as a remedy for intermittent fevers. It contains principally an acrid bitter extractive, a volatile oil containing hydrocyanic acid, and a yellow coloring matter called *Rhamnin*. The berries are small and black, and violently purgative. It is objected to their use in medicine that much sickness and thirst attend it. The charcoal of the wood is light, and is used for the preparation of gunpowder. The bark, leaves, and berries are used for dyeing; the bark for dyeing yellow, and with preparations of iron, black; the unripe berries to dye wool green and yellow; the ripe berries to dye it bluish-gray, blue, and green. The flowers are peculiarly grateful to bees.—DYER'S BUCKTHORN (*R. infectorius*) is a low shrub, abundant in the south of Europe, whose unripe fruit yields a brilliant yellow dye. The berries and inner bark of *R. tinctorius*, a native of Hungary, are also used in dyeing; and the berries of *R. saxatilis*, a procumbent shrub, growing amongst rocks as far north as Switzerland. The *French Berries*, *Avignon Berries*, or *Yellow Berries* of dyers are the fruit of *R. infectorius*, *R. saxatilis*, *R. amygdalina* (or *oleoides*), and *R. Clusii*.—The SEA BUCKTHORN is a shrub of a different genus and order. See SALLOW-THORN.

BU'CKU, a name common to several small shrubs of the genus *Barosma* (formerly included in *Diosma*), natives of the Cape of Good Hope, the leaves of which are used in medicine—sometimes in the form of a powder, more generally of an infusion or a tincture—particularly on account of their powerful operation on the urinary organs, as in chronic inflammation of the bladder, urinary calculus, &c. They are also used in dyspepsia, rheumatism, and dropsy; and are stimulant and antispasmodic, diuretic, diaphoretic, and tonic. They generally appear in commerce mixed with stalks and fruit. They are smooth, leathery, and shining, more or less crenated or serrated, and are much covered with pellucid dots, which are glands filled with a strongly smelling yellowish volatile oil. The strong odor of B. leaves is generally regarded as disagreeable, but the Hottentots perfume themselves with them. They have a warm taste, resembling that of mint.—The genus *Barosma* belongs to the natural order *Rutaceæ*, and is distinguished by regular flowers with 5 petals, 5 fertile and 5 abortive scale-like stamens, anthers bearing a minute terminal gland, and a 5-lobed ovary. The species principally yielding the B. leaves of the shops are *B. serratifolia*, *B. crenata*, *B. crenulata*, and *B. venusta*.

BU'CKWHEAT (*Fagopyrum*), a genus of plants of the natural order *Polygoneæ* (q. v.), or according to many botanists, a subgenus of *Polygonum*, distinguished by the central embryo, and by racemes of flowers grouped in panicles. COMMON B. (*Fagopyrum esculentum*, or *Polygonum Fagopyrum*) is a native of the basin of the Volga, the shores of the Caspian Sea, and many parts of Central Asia, from which it is said to have been introduced by the Moors into Spain, and thence to have extended over Europe, in many parts of which, and in some places in Britain, it is now naturalized. Another account represents it as having been brought to Europe by the Crusaders. In France, it is called *Blé Sarrasin*, or Saracen wheat. It is cultivated on account of the farinaceous albumen of its seeds, which are used, as grain, for food of man and cattle. It is upright, branched, 1—3 feet in height; the leaves are between heart-shaped and arrow-shaped, the flowers pale-red, the seed (nut) black and triangular, the angles even (not toothed). The resemblance of this seed in form to the beech-nut is supposed to be the reason of the German name *Buchweizen* (beech-wheat), from which the English name is derived. B. is a very common crop in some parts of Europe, and of the United States of North America; but is seldom sown in Britain, except as food for pheasants. It requires continued dry weather in autumn for profitable harvesting, and this in the climate of Britain cannot well be reckoned on. In Germany, B. is much valued as a crop, particularly for moor-lands and other poor soils. In Bretagne, also, it is extensively cultivated as wheat. It yields very abundantly, and requires little attention and little manure. Forty bushels or more per acre may be expected, weighing 46 or 48 lbs. per bushel; and notwithstanding the resemblance of the seed to grain in its qualities and uses, wheat or any other cereal crop, generally succeeds well after B., if care has been taken to keep the land clear by tilling. The seed is most frequently used in the shape of groats, or made into pottage, and in the United States thin cakes are very often made of it. It is very nutritious, containing about 10 per cent. of gluten and 52 per cent. of starch, besides about 6 per cent. of gum and sugar. It is said to be as good as barley for fattening cattle, and better for horses than oats. But as the seed is covered with a very hard rind or thin shell, it must always be shelled before being given to cattle.

Poultry are very fond of it. Beer is sometimes brewed from it, and it yields a spirituous liquor of good quality; indeed, it is frequently used in gin-distilleries. As green fodder, the herbage of the plant is said to be more nutritious than clover; but it acts as a narcotic on sheep. Bees delight in its flowers, and in some parts of the United States it is sown on this account. In America the seed is usually sown broadcast over the land which has been ploughed in autumn or early spring, and well scarified or harrowed. About a bushel and a half of seed is required when sown broadcast, but a bushel is sufficient if drilled with a machine. In the latter case it should not be sown in narrower drills than one foot apart, but two feet is recommended as being better for the succeeding crop, as the wider intervals can be properly cultivated. It should not be sown in England before the middle of May, as the least frost is injurious. When the lower seeds are ripe it should be mown, as they are easily shed out if allowed to stand too long. When bread made from B. forms the principal food of the people, it is thought to have an injurious action on the brain. As a supplementary article, however, it is a favorite among all classes where it is raised.—TARTARIAN B. (*F.* or *P. Tataricum*) is distinguished by the toothed edges of the seeds and its more vigorous growth. It is hardy, and adapted for cold situations. It is a native of Siberia. It is very productive, but the seed falls out when ripe more readily than that of the common species; and the flour is darker colored, and somewhat bitter.—NOTCH-SEEDED B. (*F.* or *P. emarginatum*) is said to be a native of China. Its seeds are larger than those of Common B., and their angles are winged. When grown in Britain, many of its flowers are generally abortive.—PERENNIAL B. (*F.* or *P. cymosum*) is a native of Nepaul, very vigorous in its growth, but producing, at least in Britain, comparatively little seed.—The triangular black seed of Climbing B. or Blackbine (*F.* or *P. Convolvulus*), familiar to every one who has eaten oatmeal cakes or porridge, greatly resembles B., but is smaller. The plant—a very common weed in gardens and cornfields in Britain—also exhibits much similarity, notwithstanding its different habit and twining stem.—DYER'S B. is *Polygonum tinctorium*. See POLYGONEÆ.

BUCO'LIC, a term derived from the Greek, meaning 'belonging to herdsmen,' and equivalent to the Latin term *Pastoral*. See PASTORAL POETRY.

BU'CZACZ, a town of the Austrian Empire, in Galicia, 30 miles east-north-east of Stanislawow, on the Stripa, a considerable affluent of the Dniester. A treaty of peace between the Poles and the Turks was signed here in 1672. Pop. (1880) 9970.

BUD (*gemma*), in Botany, that part of a plant which contains the rudiments of leaves or flowers prior to their development. Buds are distinguished into *leaf-buds* and *flower-buds*, the former producing leaves, and having a power of extension into a branch; the latter producing flowers only, and ordinarily destitute of this power of extension. The different parts of the flower being regarded, however, as *leaf-organs* or altered leaves (see FLOWER), the flower-bud may be regarded as merely a modified leaf-bud; and it is well-known that by treatment which checks the luxuriant growth of a plant, it may be caused to produce flower-buds where only leaf-buds could otherwise have been expected to appear—a physiological fact, of which advantage is taken in various ways by gardeners, as by removing portions of the bark and even of the woody part of the stem, root-pruning, confining the roots in a flower-pot, &c. Buds usually appear in the axils of leaves, the terminal bud of a branch being no exception to this rule; and there is no leaf without one or more buds in its axil, although many never pass beyond the most rudimentary state. See BRANCH. In cold and temperate climates, buds are formed about midsummer, beginning to appear as soon as the young branch which bears them has itself been properly developed, and are generally covered with scales and often also coated with resinous matter, by which their tender contents are protected from the severity of winter; but in the trees of warm climates, the protection of scales is generally wanting. Within the leaf-bud, the future leaves may be discovered, often very curiously folded or rolled up, and the different forms and positions which the leaves assume in the bud, are very characteristic of different kinds of plants.

This is called the *vernation* (q. v.) of leaves, and is analogous to the *æstivation* (q. v.) of flowers. The buds of exogenous plants originate in cellular prolongations of the medullary rays bursting through the bark; those of endogenous plants are in communication with the cellular matter which lies between the bundles of woody tissue in the stem; and buds elongate into branches by the addition of new cellular matter to the extremity. Leaf-buds are capable of subsisting when separated from the parent plant and placed in favorable situations, developing themselves into new plants with the most exact correspondence in their characteristics to the parent plant; and of this gardeners avail themselves in the

process of *budding* (q. v.), and in various ways for the propagation of plants. Some plants propagate themselves by a natural detachment of buds (*bulbils* or *bulbelts*), modified into a character analogous to that of *bulbs* (q. v.); and bulbs themselves may indeed be regarded as subterranean leaf-buds with thickened scales. The *eyes* of the potato are also subterranean leaf-buds, the tuber being regarded as a thickened subterranean stem; and all plants with subterranean stems produce subterranean leaf-buds, sending above ground only herbaceous annual shoots, as Asparagus, the Banana, &c. Buds may be produced in exogenous plants from the extremity of any medullary ray, and may be made to spring from a leafless part of the stem by an incision, the effect of which is to direct greater supply of sap to the part immediately beneath it. In a few plants buds are produced on the edges, or even on the surface of leaves. In consequence of their power of independent existence, buds have been looked upon by some physiologists as distinct organized beings congregated in the tree or plant, a view of which involves exaggeration, and therefore error. Flower-buds can not be used for budding, or otherwise for propagation of the plant, but when removed from their original stock, always die.

Leaf-bud.

• Some of the lowest animals propagate themselves by buds (*gemmation*), and many of the zoophyte systems or polypidoms extend in this manner. See GEMMATION, REPRODUCTION, POLYPI, and ZOOPHYTES. And see the article BUDDING.

BU'DA (Slavonic, *Bu'din;* German *O'fen*), a city of Hungary, forming with Pesth (with which it is united by a magnificent suspension-bridge) the capital of the country, is situated on the right bank of the Danube, about 130 miles south-east of Vienna, in lat. 47° 29′ N., and long. 19° 3′ E. B. has a highly picturesque appearance, being built round the Schlossberg (Castle-hill) in the form of an amphitheater, in the midst of a district covered with vineyards. Crowning this center hill or rock, which has an elevation of 485 feet above the sea, is the citadel; the palace in which are preserved the royal insignia of Hungary; and an old Gothic church. Behind, and towering above the rock, rises the Blocksberg, strongly fortified, with a precipitous face to the Danube, the slopes of the other sides being occupied with houses. B. has many educational and charitable institutions; and a fine observatory crowns the Blocksberg. It has some celebrated hot sulphur springs, with a temperature of 117° 5′ F., from which it derives its German name, Ofen (Oven). Three of the baths erected by the Turks are still in a perfect state of preservation, and are much frequented by the common people. B. has some manufactures of silk, velvet, woollen, cotton, leather, and gunpowder; and cannon and type foundries; but its chief trade is in wine, of which it produces between four and five millions of gallons annually. This is known as the 'Ofenerwein,' and is of excellent quality. Pop. (1869) 53,998. B. is a place of great antiquity but its importance dates from 1240, when the fortress was erected on the Schlossberg. During the inroads of the Turks, it was regarded as the key of Christendom. It was captured by Solyman the Magnificent in 1526, but retaken in the following year by Ferdinand I., king of Bohemia. In 1541, it was again taken by Solyman, who introduced into it a garrison of 12,000 janizaries; and it remained in the possession of the Turks until 1686, when it was captured by the Duke of Lorraine. B. and Pesth (q. v.) were in 1872 incorporated with one another, the official name being the compound *Budapest*, of which the pop. in 1880 was 359,821.

BUDAO'N, BUDAUN, or BUDAYOON, a town of India, 140 miles north-west of Lucknow, giving its name to a British district of the Rohilcund division of the lieutenant-governorship of the North-west Provinces. It is situated in 28° 2′ N. lat., and 79° 11′ E. long. Its population was officially ascertained in 1872 to amount to 33,322. It was occupied by the mutineers and a body of liberated prisoners from Bareilly, June 1, 1857. The Europeans escaped by flight. It was captured by General Whitelock, April 19, 1858, and the rebels in this quarter was soon afterwards entirely subdued.—The district of Budaon contains an area of 2005 sq. m., and a pop. (1872) of 934,348, of which nearly six-sevenths are Hindus, and the remainder mostly Mussulmans. The district is a level, fertile tract on the Ganges and tributaries of it, of which the chief is the Ramgunga.

BUDÆUS (the Latinized form of *Guillaume Bude*) one of the greatest French scholars of his age, was born in Paris in 1467. He studied there and at Orleans. His works on philology, philosophy, and jurisprudence display extensive learning, but the two best known are the *De Asse et Partibus ejus* (Paris, 1514), which contains a very thorough investigation into ancient coins; and the *Commentarii Linguæ Græcæ* (Paris, 1519), which greatly advanced the study of Greek literature in France, and is still held in high estimation by classical scholars. B.'s knowledge of Greek was particularly good. His style both in Latin and French is nervous, but harsh, and abounds in Greek constructions. His abilities were manifested not only in literature, but in public business. Louis XII., twice sent him to Rome as ambassador; and Francis I. also employed him in several negotiations. At B.'s suggestion, Francis founded the *Collége de France*, and was also persuaded to refrain from prohibiting printing, which the bigotted Sorbonne had advised in 1533. During his life, B. held several important offices. He was Royal Librarian, Maître des Requêtes, and Provost of Paris. He died 23d August 1540. A collected edition of his works appeared at Basel in 1557. B. was suspected of leaning towards Calvanism. Certain circumstances render this highly probable. In his correspondence with his friend Erasmus, he repeatedly expresses his contempt for monks and ignorant ecclesiastics, and on one occasion terms the doctors of the Sorbonne 'prating sophists.' Besides, what is perhaps even more conclusive, shortly after his death, his widow and several members of his family went to Geneva, and openly abjured Catholicism.

BU'DDHISM, BUDDHA. The religion known as Buddhism (from the title of 'The Buddha,' meaning 'the Wise,' 'the Enlightened,' acquired by its founder) has existed now for 2460 years, and may be said to be the prevaling religion of the world. In Hindustan, the land of its birth, it has now little hold, except among the Nepaulese and some other northern tribes; but it bears full sway in Ceylon, and over the whole Eastern Peninsula; it divides the adherence of the Chinese with the systems of Confucius and Lao-tse, claiming perhaps two-thirds of the population; it prevails also in Japan (although not the established religion); and, north of the Himalayas, it is the religion of Tibet (where it assumes the form of Lamaism), and of the Mongolian population of Central Asia, and extends to the very north of Siberia, and even into Swedish Lapland. Its adherents are estimated at 400 millions —more than a third of the human race. Yet, till near the middle of this century, nothing was known in Europe respecting the nature and origin of this world-religion, beyond the vaguest notices and conjectures. About the year 1828, Mr. B. H. Hodgson, British resident at the court of Nepaul, where Buddhism prevails, discovered the existence of a large set of writings in the Sanscrit language, forming the national canonical books. These books have since been found to be the texts from which the Buddhist scriptures of Tibet, Mongolia, and China must have been translated. The books of the Ceylon Buddhists are in the language called Pali; and though not translations of the Nepaulese standards, they are found to agree with them in substance, and to be only another and somewhat later version of the same traditions. Translations from the Ceylon standards are used by the Buddhists of Burmah and Siam. Copies of the Sanscrit books of Nepaul, having been sent by Mr. Hodgson to the Asiatic Societies of London and Paris, engaged the attention of the eminent Oriental scholar, Eugène Burnouf, who published in 1844 his *Introduction to the History of Buddhism;* and this book may be said to have been the beginning of anything like correct information on the subject among the western nations.

The most diverse opinions had previously prevailed as to the time and place of the origin of Buddhism. Some looked upon it as a relic of what had been the original religion of Hindustan, before Brahmanism intruded and drove it out; a relic of a widespread primeval worship, whose ramifications it was endeavored to trace by identifying Buddha with the Woden of the Scandinavians, the Thoth or Hermes of the ancient Egyptians, and other mythological personages. Others held that it could not be older than Christianity, and must have originated in a blundering attempt to copy that religion—so striking are the many points of resemblance that present themselves. Although the means are still wanting of giving a circumstantial history of Buddhism, the main outline is no longer doubtful.

Oriental scholars now concur in fixing the date of its origin about the beginning of the 6th c. B.C., and in making it spring up in the north of Hindustan. Acccording to the Buddhist books, the founder of the religion was a prince of the name of Siddhartha, son of Suddhodana, king of Kapilavastu, which is placed somewhere on the confines of Oude and Nepaul. He is often called Sakya, which was the name of the family, and also Gautama, the name of the great 'Solar' race of which the family was a branch. The name Sakya often becomes Sakya-muni (*muni*, in San., means 'solitary,' and is allied to Gr. *monos*, the root of 'monk'), in allusion to the solitary habits assumed by the prince. To Gautama is frequently prefixed *Sramana*, meaning *ascetic*. Of the names, or rather titles, given to Siddhartha in his state of perfection, the most important is the *Buddha*,* which is from the root *budh*, to know, and according to Wilson, means properly, 'he to

*There is a confusing variety in the modes in which this name is spelled by European writers. S. Hardy, in his *Manual of Buddhism*, gives more than fifty forms that have come under his notice. Some of the more common are: Bud, Bod, Buth, Budh, Boodh, Bhood, Budo, Buddow, Boutta, Poota, Poth, Pot. The Chinese, owing to the meagreness of their articulations, seem to have been unable to come nearer to the real sound than Fo, Foe, or Fohi; from the same cause, they convert Brahma into Fan.

whom the truth is known:' it is indicative of the leading doctrine of his system. Others are—'The Blessed' (Bhagavat); 'the Venerable of the World;' 'the Bodhisatva,' the import of which will be afterwards explained. The history of this person is overlaid with a mass of extravagant and incredible legend; and at least one eminent Orientalist, Professor H. H. Wilson, thinks it still doubtful whether the Buddha was an actual historical personage, and not rather an allegorical figment. Agreeing that the doctrine was introduced about the time assigned, he thinks it more likely that it originated with a school formed of persons of various castes, comprising even Brahmans. But by Oriental authorities generally, the Buddha is received as the actual personal founder of the religion that goes by his name.

Assuming that the Buddha was a real person, and that there is a basis of fact under the mass of extravagant fable with which he is surrounded, the history of Buddhism may be thus briefly outlined: The Prince Siddhartha gives early indications of a contemplative, ascetic disposition; and his father, fearing lest he should desert his high station as Kshatriya (see HINDUISM and CASTE) and ruler, and take to a religious life, has him early married to a charming princess, and surrounded with all the splendor and dissipation of a luxurious court.

Twelve years spent in this environment only deepen the conviction, that all that life can offer is vanity and vexation of spirit. He is constantly brooding over the thought that old age, withered and joyless, is fast approaching; that loathsome or racking sickness may at any moment seize him; that death will at all events soon cut off all present sources of enjoyment, and usher in a new cycle of unknown trials and sufferings. These images hang like Damocles' swords over every proposed feast of pleasure, and make enjoyment impossible. He therefore resolves to try whether a life of austerity will not lead to peace; and, although his father seeks to detain him by setting guards on every outlet of the palace, he escapes, and begins the life of a religious mendicant, being now about 30 years old. To mark his breaking off all secular ties, he cuts off the long locks that were a sign of his high caste; and as the shortened hair turned upwards, he is always represented in figures with curly hair, which induced early European writers to consider him as of Ethiopian origin. He commences by studying all that the Brahmans can teach him, but finds their doctrine unsatisfactory. Six years of rigorous asceticism are equally vain; and resolving to return to a more genial life, he is deserted by his five disciples, and then undergoes a fierce temptation from the demon of wickedness. But no discouragement or opposition can divert Sakya-muni from the search after deliverance. He will conquer the secret by sheer force of thinking. He sits for weeks plunged in abstraction, revolving the causes of things. If we were not born, he reflects, we should not be subject to old age, misery, and death; therefore, the cause of these evils is birth. But whence comes birth or continued existence? Through a long concatenation of intermediate causes, he arrives at the conclusion that ignorance is the ultimate cause of existence; and therefore, with the removal of ignorance, existence and all its anxieties and miseries would be cut off at their source. Passing through successive stages of contemplation, he realizes this in his own person, and attains the perfect wisdom of the Buddha. The scene of this final triumph received the name of Bodhimanda (the seat of intelligence), and the tree under which he sat was called Bodhidruma (the tree of intelligence), whence Bo-tree. The Buddhists believe the spot to be the center of the earth. Twelve hundred years after the Buddha's death, Hiouen-Thsang, the Chinese Pilgrim, found the Bodhidruma—or a tree that passed for it—still standing. Although the religion of Buddha is extinct in the neighborhood, there are, about 5 miles from Gaya Proper, in Bahar, extensive ruins and an old dagoba, or a temple, which are believed to mark the place. Near the temple there flourished, in 1812, a peepul-tree, apparently 100 years old, which may have been planted in the place of the original Bo-tree.

Having arrived at the knowledge of the causes of misery, and of the means by which these causes are to be counteracted, the Buddha was now ready to lead others on the road to salvation. It was at Benares that he first preached, or, in the consecrated phrase, 'turned the wheel of the law;'* but the most important of his early converts was Bimbisara, the sovereign of Magadha (Bahar), whose dynasty continued for many centuries to patronize the new faith. During the forty years that he continued to preach his strange gospel, he appears to have traversed a great part of Northern India, combating the Brahmans, and everywhere making numerous converts. He died at Kusinagara (in Oude), at the age of 80, in the year 543 B.C.; and his body being burned, the relics were distributed among a number of contending claimants, and monumental tumuli were erected to preserve them. See TOPES.

*From a too literal understanding of this phrase have arisen, probably, those praying-wheels, or rather wheels for meditation, seen standing before Buddhist monasteries in Tibet and elsewhere. The doctrines of Buddha are inscribed on the wheel, which is then set in motion by a windlass, or even by horse power. The individual monks have portable ones, with which they perform their devotions wherever they may happen to be.

The most important point in the history of Buddhism, after the death of its founder, is that of the three councils which fixed the canon of the sacred scriptures and the discipline of the church. The Buddha had written nothing himself; but his chief followers, assembled in council immediately after his death, proceeded to reduce his teachings to writing. These canonical writings are divided into three classes, forming the Tripitaka, or 'triple basket.' The first class consist of the *Soutras*, or discourses of the Buddha; the second contains the *Vinaya*, or discipline; and the third the *Abhidharma*, or metaphysic. The first is evidently the fundamental text out of which all the subsequent writings have been elaborated. The other two councils probably revised and expanded the writings agreed upon at the first, adding voluminous commentaries. As to the dates of the other two councils, there are irreconcilable discrepancies in the accounts; but at all events the third was not later than 240 B.C., so that the Buddhist canonical scriptures, as they now exist, were fixed two centuries and a half before the Christian era. The Buddhist religion early manifested a zealous missionary spirit; and princes and even princesses, became devoted propagandists. A prince of the royal house of Magadha, Mahindo, carried the faith to Ceylon, 307 B.C. The Chinese annals speak of a Buddhist missionary as early as 217 B.C.; and the doctrine made such progress, that in 65 A.D. it was acknowledged by the Chinese emperor as a third state religion. The Chinese Buddhists have always looked on India as their 'holy land;' and, beginning with the 4th c. of our era, a stream of Buddhist pilgrims continued to flow from China to India during six centuries.

Several of these pilgrims have left accounts of their travels, which throw a light on the course of Buddhism in India, and on the internal state of the country in general, that is looked for in vain in the literature of India itself. See HIOUEN-THSANG. As to the spread of Buddhism north of the Himalayan mountains, we have the historical fact, that a Chinese general, having about the year 120 B.C. defeated the barbarous tribes to the north of the Desert of Gobi, brought back as a trophy a golden statue of the Buddha.

A prominent name in the history of Buddhism is that of Asoka, king of Magadha, in the 3d c. of our era, whose sway seems to have extended over the whole peninsula of Hindustan, and even over Ceylon. This prince was to Buddhism what Constantine was to Christianity. He was at first a persecutor of the faith, but being converted—by a miracle, according to the legend—he became its zealous propagator. Not, however, as princes usually promote their creed; for it is a distinguished characteristic of Buddhism, that it has never employed force, hardly even to resist aggression. Asoka showed his zeal by building and endowing viharas or monasteries, and raising topes and other monuments over the relics of Buddha and in spots remarkable as the scenes of his labors. Hiouen-Thsang, in the 7th c. of our era, found topes attributed to Asoka from the foot of the Hindu Kush to the extremity of the peninsula. There exist, also, in different parts of India, edicts inscribed on rocks and pillars, inculcating the doctrins of Buddha. The edicts are in the name of King Piyadasi; but Orientalists are almost unanimous in holding Piyadasi and Asoka to be one and the same. Not a single building or sculptured stone has been discovered in continental India of earlier date than the reign of this monarch, whose death is assigned to 226 B.C. A remarkable spirit of charity and tolerations runs through these royal sermons. The 'king beloved of the gods' desires to see the ascetics of all creeds living in all places, for they all teach the essential rules of conduct. 'A man ought to honor his own faith only; but he should never abuse the faith of others. . . . There are even circumstances where the religion of others ought to be honored, and in acting thus, a man fortifies his own faith, and assists the faith of others.'

For the glimpses we get of the state of Buddhism in India, we are indebted chiefly to the accounts of Chinese pilgrims. Fahian, at the end of the 4th c., found some appearances of decline in the east of Hindustan, its birthplace, but it was still strong in the Punjab and the north. In Ceylon, it was flourishing in full vigor, the ascetics or monks numbering from 50,000 to 60,000. In the 7th c.—that is, 1200 years after the death of the Buddha—Hiouen-Thsang represents it as widely dominant and flourishing, and patronized by powerful rajahs.

Its history was doubtless more or less checkered. The Brahmans, though little less tolerant than the followers of Buddha, seem to have been in some cases roused into active opposition; and some princes employed persecution to put down the new faith.

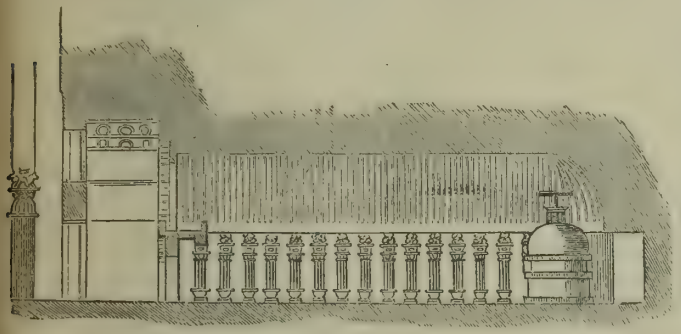
It was probably during the first four or five centuries of our era, and as a result of persecution, that Buddhists, driven from the great cities, retired among the hills of the west, and there constructed those cave-temples which, for their number, vastness, and elaborate structure, continue to excite the wonder of all who see them. There are reckoned to be not fewer than 900 Buddhist excavations still extant in India, nearly all within the presidency

of Bombay. How the destruction of the Buddhist faith in Hindustan came about—whether from internal corruption, or the persecution of powerful princes, adherents of the old faith—we are utterly in the dark. But it is certain that from the time of Hiouen-Thsang's visit, its decay must have been rapid beyond precedent; for about the 11th or 12th c., the last traces of it disappear from the Indian peninsula.

What, then, is the nature of this faith, which has been for so long, and is still, the sole light of so many human beings? In answering this question, we must confine ourselves here to a brief outline of the intellectual theory on which the system is based, and of the general character of its morality and ritual observances, as they were conceived by the founder and his more immediate followers; referring for the various forms which the external observances have assumed to the several countries where it is believed and practised. See BURMAH, CEYLON, CHINA, JAPAN, LAMAISM.

Buddhism is based on the same views of human existence, and the same philosophy of things in general, that prevailed among the Brahmans. It accepts without questioning and in its most exaggerated form, the doctrine of the transmigration of souls, which lies at the root of so much that is strange in the Eastern character.

For a particular account of this important doctrine or notion, which seems ingrained in the constitutions of Eastern minds, and without a knowledge of which no phase of thought or feeling among them can be understood, the reader is referred to TRANSMIGRATION; while the peculiar cosmogony or system of the universe with which it is associated, and which is substantially the same among Hindus and Buddhists, will be described under HINDUISM. It is sufficient here to say, that, according to Buddhist belief, when a man dies, he is immediately born again, or appears in a new shape; and that shape may, according to his merit or demerit, be any of the innumerable orders of being composing the Buddhist universe—from a clod to a divinity. If his demerit would not be sufficiently punished by a degraded earthly existence—in the form, for instance, of a woman or a slave, of a persecuted



Section of Buddhist Cave-temple at Karli—from Fergusson's *Handbook of Architecture*.

or a disgusting animal, of a plant, or even of a piece of inorganic matter—he will be born in some one of the 136 Buddhist hells, situated in the interior of the earth. These places of punishment have a regular gradation in the intensity of the suffering and in the length of time the sufferers live, the least term of life being 10 millions of years, the longer terms being almost beyond the powers of even Indian notation to express. A meritorious life, on the other hand, secures the next birth either in an exalted and happy position on earth, or as a blessed spirit, or even divinity, in one of the many heavens; in which the least duration of life is about 10 billions of years. But however long the life, whether of misery or of bliss, it has an end, and at its close the individual must be born again, and may again be either happy or miserable—either a god or, it may be, the vilest inanimate object.* The Buddha himself, before his last birth as Sakyamuni, had gone through every conceivable form of existence on the earth, in the air, and in the water, in hell, and in heaven, and had filled every condition in human life. When he attained the perfect knowledge of the Buddha, he was able to recall all these existences; and a great part of the Buddhist legendary literature is taken up in the narrating his exploits when he lived as an elephant, as a bird, as a stag, and so forth.

The Buddhist conception of the way in which the quality of actions—which is expressed in Pali by the word *Karma*, including both merit and demerit—determines the future condition of all sentient beings, is peculiar. They do not conceive any god or gods as being pleased or displeased by the actions, and as assigning the actors their future condition by way of punishment or of reward. The very idea of a god, as creating or in any way ruling the world, is utterly absent in the Buddhist system.

God is not so much as denied; he is simply not known. Contrary to the opinion once confidently and generally held, that a nation of atheists never existed, it is no longer to be disputed that the numerous Buddhist nations are essentially atheist; for they know no beings with greater supernatural power than any man is supposed capable of attaining to by virtue, austerity, and science; and a remarkable indication of this startling fact is to be seen in the circumstance, that some at least of the Buddhist nations—the Chinese, Mongols, and Tibetans—have no word in their languages to express the notion of God. The future condition of the Buddhist, then, is not assigned him by the Ruler of the universe; the 'Karma' of his actions determines it by a sort of virtue inherent in the nature of things—by the blind and unconscious concatenation of cause and effect. But the laws by which consequences are regulated seem dark, and even capricious. A bad action may lie dormant, as it were, for many existences; the taint, however, is there, and will some time or other break out. A Buddhist is thus never at a loss to account for any calamity that may befall himself or others.

Another basis of Buddhism is the assumption, that human existence is on the whole miserable, and a curse rather than a blessing. This notion, or rather feeling, is, like transmigration, common to Buddhism and Brahmanism, and is even more prominent in Buddhism than in the old faith. It is difficult for a European to conceive this state of mind, or to believe that it can be habitual in a whole people; and many signal errors in dealing with the Indian nations have arisen from overlooking the fact. The cause would seem to lie chiefly in the comparatively feeble physical organization of Easterns in general. With a vigorous animal vitality, there is a massive enjoyment in mere bodily existence sufficient to drown a large amount of irritation and suffering, leaving life still sweet and desirable; while the spontaneous activity attending this vigor, makes it a pleasure instead of a pain to contend with and conquer difficulties.

The Indian, on the contrary, even when he looks robust, has little intensity of animal vitality; and therefore, bodily existence, in itself, has to him little relish. Tedium of life, it is well known, arises more from negative than positive sources; and it requires but little bitter added to make his cup disgusting. So far, again, from finding activity a source of enjoyment, exertion is painful, and entire quiescence is, in his eyes, the highest state of conceivable enjoyment. When to this we add that want of security and peace, and that habitual oppression of the many by the few, with all the attendant degredation and positive suffering, which may be considered the normal state of things in the East, need we wonder that to men so constituted and so circumstanced, life should seem a burden, a thing rather to be feared than otherwise? The little value that Hindus set upon their lives is manifested in many ways. The punishment of death, again, has little or no terror for them, and is even sometimes coveted as an honor. For, in addition to the little value of their present existence, they have the most undoubting assurance that their soul, if dislodged from its present tenement, will forthwith find another, with a chance, at least, of its being a better one.

In the eyes, then, of Sakya-muni and his followers, sentient existence was hopelessly miserable. Misery was not a mere taint in it, the removal of which would make it happy; misery was its very essence. Death was no escape from this inevitable lot; for, according to the doctrine of transmigration, death was only a passage into some other form of existence equally doomed. Even the heaven and the state of godhead which form part of the cycle of changes in this system, were not final; and this thought poisoned what happiness they might be capable of yielding. Brahman philosophers had sought escape from this endless cycle of unsatisfying changes, by making the individual soul be absorbed in the universal spirit (Brahm); Gautama had the same object in view—viz., exemption from being born again; but he had not the same means of reaching it. His philosophy was utterly atheistic, like that of the original Sankhya school of philosophy, whose views he chiefly borrowed, and ignored a supreme God or Creator; it did not leave an impersonal Spirit of the universe into which the human soul could be absorbed. Gautama sees no escape but in what he calls NIRVANA, the exact nature of which has been matter of dispute. According to its etymology, the word means 'extinction,' 'blowing out,' as of a candle; and most Orientalists are agreed that in the Buddhist scriptures generally it is equivalent to annihilation. Even in those schools which attempt to draw a distinction, the distinction is of the most evanescent kind. See NIRVANA.

The key of the whole scheme of Buddhist salvation lies in what Gautama called his Four Sublime Verities. The first asserts that pain exists; the second, that the cause of pain is desire or attachment—the meaning of which will appear further on; the third, that pain can be ended by Nirvana; and the fourth shows the way that leads to Nirvana. This way to Nirvana consists in eight

* One legend makes Bhagavat, in order to impress upon the monks of a monastery the importance of their duties, point to a besom, and, by his supernatural insight, reveal to them that it had once been a novice, who had been negligent in sweeping the hall of assembly; the walls and pillars, again, he told them, had once existed as monks, who soiled the walls of the hall by spitting upon them.

things: right faith, right judgment, right language, right purpose, right practice, right obedience, right memory, and right meditation. In order to understand how this method is to lead to the proposed end, we must turn to the metaphysical part of the system contained in the 'concatenation of causes,' which may be looked upon as a development of the second 'verity'—namely, that the cause of pain is desire—or rather, as the analysis upon which that verity is founded. The immediate cause of pain is birth, for if we were not born, we should not be exposed to death or any of the ills of life. Birth, again, is caused by previous existence; it is only a transition from one state of existence into another. All the actions and affections of a being throughout his migrations leave their impressions, stains, attachments adhering to him, and the accumulation of these determines at each stage the peculiar modification of existence he must next assume. But for these adhesions, the soul would be free; not being bound down to migrate into any determinate condition of life, it would follow that it need not migrate at all. These adhesions or attachments, good and bad, depend upon desire, or rather, upon affection of any kind in the soul towards the objects; as if only what moved the soul to desire or avoidance could leave its impress upon it. We thus arrive at desire—including both the desire to possess, and the desire to avoid—as one link in the chain of causes of continued existence and pain. Beyond this the dependence of the links is very difficult to trace; for desire is said to be caused by perception, perception by contact, and so on, until we come to ideas. Ideas, however, are mere illusions, the results of ignorance or error, attributing durability and reality to that which is transitory and imaginary. Cut off this ignorance, bring the mind into a state in which it can see and feel the illusory nature of things, and forthwith the whole train vanishes; illusory ideas, distinction of forms, senses, contact, perception, desire, attachment, existence, birth, misery, old age, death!

Morality and Religious Observances.—The eight parts or particulars constituting the theoretical 'way' (to Nirvana), was developed by Gautama into a set of practical precepts enjoining the various duties of common life and of religion. They are all ostensibly intended as means of counteracting or destroying the chain of causes that tie men to existence and necessitate being born again, especially that most important link in the chain constituted by the attachments or desires resulting from former actions; although the special fitness of some of the precepts for that end is far from being apparent. It is is easy to understand how the austerities that are prescribed might subdue the passions and affections, and lessen the attachment to existence; but how the exercise of benevolence, of meekness, of regard to truth, of respect to parents, &c., on which Gautama laid so much stress, should have this effect, it is difficult to conceive. Luckily for the Buddhist world, Gautama's moral nature was better than his logic, or rather than the perverse assumptions from which his logic starts; and as he felt strongly—what all men have felt more or less—that these things are essentially right and good, he takes it for granted that they must contribute to what was in his eyes the chief good—escape from existence, or Nirvana. In delivering his precepts, the Buddha considers men as divided into two classes—those who have embraced the religious life (*Sramanas*), and those who continue in the world, or are laymen. These last are considered as too much attached to existence to feel any desire or have any hope of emancipation, at least at this stage. But there are certain precepts which it is necessary for all to obey, that they may not bring greater misery upon themselves in their next births, and rivet the bonds of existence more indissolubly. There are ten moral precepts or 'precepts of aversion.' Five of these are of universal obligation—viz., not to kill; not to steal; not to commit adultery; not to lie; not to be drunken. Other five are for those entering on the direct pursuit or Nirvana by embracing the religious life: to abstain from food out of season—that is, after mid-day; to abstain from dances, theatrical representations, songs, and music; to abstain from personal ornaments and perfumes; to abstain from a lofty and luxurious couch; to abstain from taking gold and silver. For the regular ascetics or monks, there are a number of special observances of a very severe kind. They are to dress only in rags, sewed together with their own hands, and to have a yellow cloak thrown over the rags. They are to eat only the simplest food, and to possess nothing except what they get by collecting alms from door to door in their wooden bowl. They are allowed only one meal, and that must be eaten before mid-day. For a part of the year, they are to live in forests, with no other shelter except the shadow of a tree, and there they must sit on their carpet even during sleep, to lie down being forbidden. They are allowed to enter the nearest village or town to beg food, but they must return to their forest before night.

Besides the absolutely necessary 'aversions and observances' above mentioned, the transgression of which must lead to misery in the next existence, there are certain virtues or 'perfections' of a supererogatory or transcendent kind, that tend directly to 'conduct to the other shore' (Nirvana). The most essential of these are almsgiving or charity, purity, patience, courage, contemplation, and knowledge. Charity or benevolence may be said to be the characteristic virtue of Buddhism—a charity boundless in its self-abnegation, and extending to every sentient being. The benevolent actions done by the Buddha himself, in the course of his many millions of migrations, were favorite themes with his followers. On one occasion, seeing a tigress starved and unable to feed her cubs, he hesitated not to make his body an oblation to charity, and allowed them to devour him. Benevolence to animals, with that tendency to exaggerate a right principle so characteristic of the East, is carried among the Buddhist monks to the length of avoiding the destruction of fleas and the most noxious vermin, which they remove from their persons with all tenderness.

There are other virtues of a secondary kind, though still highly commendable. Thus, not content with forbidding lying, the Buddha strictly enjoins the avoidance of all offensive and gross language, and of saying or repeating anything than can set others at enmity among themselves; it is a duty, on the contrary, especially for a sramana, to act on all occasions as a peacemaker. Patience under injury, and resignation in misfortune, are strongly inculcated. Humility, again, holds a no less prominent place among Buddhist graces than it does among the Christian. The Buddhist saints are to conceal their good works, and display their faults. As the outward expression of this sentiment of humility, Gautama instituted the practice of confession. Twice a month, at the new and at the full moon, the monks confessed their faults aloud before the assembly. This humiliation and repentance seems the only means of expiating sin that was known to Gautama. Confession was exacted of all believers, only not so frequently as of the monks. The edicts of Piyadasi recommend a general and public confession at least once in five years. The practice of public confession would seem to have died out by the time of Hiouen-Thsang's visit to India.

Such are the leading features of the moral code of the Buddha, of which it has been said, that 'for pureness, excellence, and wisdom, it is only second to that of the Divine Lawgiver himself.' But the original morality of Buddhism has, in the course of time, been disfigured by many subtilties, puerilities, and extravagances, derived from the casuistry of the various schools of later times; just as the casuistry of the Jesuits, for instance, perverted many of the precepts of Christianity. The theory on which the Buddha founds his whole system gives, it must be confessed, only too much scope to such perversions; for, on that theory, truth is to be spoken, self to be sacrificed, benevolence to be exercised, not for the sake of the good thus done to others, but solely for the effect of this conduct on the soul of the actor, in preparing him for escape from existence. To teach men 'the means of arriving at the other shore,' was another expression for teaching virtue; and that other shore was annihilation. On this principle, the Buddhist casuist can, like the Jewish, render of none effect the universal law of charity and the duty of respecting and aiding parents, on which the Buddha laid such stress. Thus, a Bikshu—that is, one who has engaged to lead a life of self-denial, celibacy, and mendicancy, and is thus on the high road to Nirvana—is forbidden to look at or converse with a female, lest any disturbing emotion should ruffle the serene indifference of his soul; and so important is this, that 'if his mother have fallen into a river, and be drowning, he shall not give her his hand to help her out; if there be a pole at hand, he may reach that to her; but if not, she must drown.'—*Wilson.*

Contemplation and science or knowledge (i. e., of the concatenation of causes and effects) are ranked as virtues in Buddhism, and hold a prominent place among the means of attaining Nirvana. It is reserved, in fact, for abstract contemplation to effect the final steps of the deliverance. Thought is the highest faculty of man, and, in the mind of an Eastern philosopher, the mightiest of all forces. A king who had become a convert to Buddhism is represented as seating himself with his legs crossed, and his mind collected; and 'cleaving with the thunderbolt of science, the mountain of ignorance,' he saw before him the desired state. It is in this cross-legged, contemplative position that the Buddha is almost always represented—that crowning intellectual act of his, when, seated under the Bo-tree (q. v.), he attained the full knowledge of the Buddha, saw the illusory nature of all things, broke the last bonds that tied him to existence, and stood delivered for evermore from the necessity of being born again, being considered the culmination of his character, and the highest object of imitation to all his followers.

'Complete' Nirvana or extinction cannot, of course, take place till death; but this state of preparation for it, called simply Nirvana, seems attainable during life, and was, in fact, attained by Gautama himself. The process by which the state is attained is called *Dhyana*, and is neither more nor less than ecstasy or trance, which plays so important a part among mystics of all religions. The individual is described as losing one feeling after another, until perfect apathy is attained, and he reaches a region 'where there are neither ideas, nor the idea of the absence of ideas!'

The *ritual* or *worship* of Buddhism—if worship it can be called—is very simple in its character. There are no priests, or clergy, properly so called. The *Sramanas* or *Bikshus* (mendicants) are simply a religious order—a kind of monks, who, in order to the more speedy attainment of Nirvana, have entered on a course of greater sanctity and austerity than ordinary men; they have no sacraments to administer or rites to perform for the people, for every Buddhist is his own priest. The only thing like a clerical function they discharge, is to read the scriptures or discourses of the Buddha in stated assemblies of the people held for that purpose. They have also everywhere, except in China, a monopoly of education; and thus in Buddhist countries education, whatever may be its quality, is very generally diffused. In some countries, the monks are exceedingly numerous; around Lhassa in Tibet, for instance, they are said to be one-third of the population. They live in *viharas* or monasteries, and subsist partly by endowments, but mostly by charity. Except in Tibet, they are not allowed to engage in any secular occupation. The vow is not irrevocable. This incubus of monachism constitutes the great weakness of Buddhism in its social aspect. Further particulars regarding Buddhist monks and monasteries, as well as the forms of Buddhist worship generally, will be given when speaking of the countries where the religion prevails. See LAMAISM.

Colossal Gautama near Amarapura, Burmah.

The adoration of the statues of the Buddha and of his relics, is the chief external ceremony of the religion. This, with prayer and the repetition of sacred formulas, constitutes the ritual. The centers of the worship are the temples containing statues, and the topes or tumuli erected over the relics of the Buddha, or of his distinguished apostles, or on spots consecrated as the scenes of the Buddha's acts. The central object in a Buddhist temple, corresponding to the altar in a Roman Catholic church, is an image of the Buddha, or a dagoba or shrine containing his relics. Here flowers,* fruit, and incense are daily offered, and processions are made with singing of hymns. Of the relics of the Buddha, the most famous are the *teeth* that are preserved with intense veneration in various places. Hiouen-Thsang saw more than a dozen of them in different parts of India; and the great monarch Ciladitya was on the eve of making war on the king of Cashmere for the possession of one, which, although by no means the largest, was yet an inch and a half long. The tooth of the Buddha preserved in Ceylon, a piece of ivory about the size of the little-finger, is exhibited very rarely, and then only with permission of the English government—so great is the concourse and so intense the excitement. See CEYLON.

There appears at first sight to be an inconsistency between this seeming worship of the Buddha, and the theory by which he is considered as no longer existing. Yet the two things are really not irreconcilable; not more so, at least, than theory and practice often are. With all their admiration of the Buddha, his followers have never made a god of him. Gautama is only the last Buddha—the Buddha of the present cycle. He had predecessors in the cycles that are past (twenty-four Buddhas of the past are enumerated, and Gautama could even tell their names); and when, at the end of the present cycle, all things shall be reduced to their elements, and the knowledge of the way of salvation shall perish with all things else; then, in the new world that shall spring up, another Buddha will appear, again to reveal to the renascent beings the way to Nirvana.

Gautama foretold that Mitraya, one of his earliest adherents, should be the next Buddha† (the Buddha of the future), and he gratified several of his followers with a like prospect in after-cycles. The Buddha was thus no greater than any mortal may aspire to become. The prodigious and supernatural powers which the legends represent him as possessing, are quite in accordance with Indian ideas; for even the Brahmans believe that by virtue, austerities, and science, a man may acquire power to make the gods tremble on their thrones.

The Buddha, then, is not a god; he is the ideal of what any man may become; and the great object of Buddhist worship is to keep this ideal vividly in the minds of the believers. In the presence of the statue, the tooth, or the footprint, the devout believer vividly recalls the example of him who trod the path that leads to deliverance. This veneration of the memory of Buddha is perhaps hardly distinguishable, among the ignorant, from worship of him as a present god; but in theory, the ritual is strictly commemorative, and does not necessarily involve idolatry, any more than the garlands laid on the tomb of a parent by a pious child. See TOPE.

The prayers addressed to the Buddha are more difficult to reconcile with the belief in his having ceased to exist. It is improbable, indeed, that the original scheme of Buddhism contemplated either the adoration of the statues of the Buddha, or the offering of prayers to him after his death. These are an after-growth—accretions upon the simple scheme of Gautama, and in a manner forced upon it during its struggle with other religions. For, a system of belief that seeks to supplant other systems, finds itself enticed to present something to rival and outdo them, if possible, in every point. Even the Christian church, in the middle ages, adopted with this view many of the rites and legends of paganism that were quite inconsistent with its own character; merely casting over them a slight disguise, and giving them Christian names. Prayer, too, is natural to man—an irrepressible instinct, as it were, and had to be gratified. And then the inconsistency in uttering prayers when there is no one to hear or answer, glaring as it appears to us, is by no means great to the Eastern mind. Prayers, like other sacred formulas, are conceived less as influencing the will of any superior being to grant the request, than as working in some magical way—producing their effects by a blind force inherent in themselves. They are, in short, mere incantations or charms.

Even the prayers of a Brahman, who believes in the existence of gods, do not act so much by inclining the deity addressed to favor the petitioner, as by compelling him through their mysterious potency—through the operation of a law above the will of the highest gods. The Buddhist, then, may well believe that a formula of prayer in the name of 'the Venerable of the world' will be potent for his good in this way, without troubling himself to think whether any conscious being hears it or not.

The element in Buddhism which more than any other, perhaps, gave it an advantage over all surrounding religions, and led to its surprising extension, was the spirit of universal charity and sympathy that it breathed, as contrasted with the exclusiveness of caste. In this respect, it held much the same relation to Brahmanism that Christianity did to Judaism. It was, in fact, a reaction against the exclusiveness and formalism of Brahmanism—an attempt to render it more catholic, and to throw off its intolerable burden of ceremonies. Buddhism did not expressly abolish caste, but only declared that all followers of the Buddha who embraced the religious life were thereby released from its restrictions; in the bosom of a community who had all equally renounced the world, high and low, the twice-born Brahman and the outcast were brethren. This was the very way that Christianity dealt with the slavery of the ancient world. This opening of its ranks to all classes and to both sexes—for women were admitted to equal hopes and privileges with men, and one of Gautama's early female disciples is to be the supreme Buddha of a future cycle—no doubt gave Buddhism one great advantage over Brahmanism. The Buddha, says M. Müller, 'addressed himself to castes and outcasts. He promised salvation to all; and he commanded his disciples to preach his doctrine in all places and to all men. A sense of duty extending from the narrow limits of the house, the village, and the country, to the widest circle of mankind, a feeling of sympathy and brotherhood towards all men, the idea, in fact of humanity, were first pronounced by Buddha.' This led to that remarkable missionary movement, already adverted to, which, beginning 300 B.C., sent forth a succession of devoted men, who spent their lives in spreading the faith of Buddha over all parts of Asia.

In the characteristic above mentioned, and in many other respects, the reader cannot fail to remark the striking resemblance that Buddhism presents to Christianity, and this in spite of the perverse theory on which it is founded. So numerous and surprising are the analogies and coincidences, that Mrs. Speir, in her book on *Life in Ancient India*, 'could almost imagine that before God planted Christianity upon earth, he took a branch from the luxuriant tree, and threw it down to India.'

It would be superfluous to attempt here any formal refutation of the religion of the Buddha. To the readers of this work, the fundamental errors of the theory will be apparent enough. By

* The quantity of flowers used as offerings is prodigious. A royal devotee in Ceylon, in the 15th c., offered on one occasion 6,480,320 flowers at the shrine of the tooth. At one temple it was provided that there should be offered 'every day 100,000 flowers, and each day a different flower.'

† One who is on the way to become a supreme Buddha, and has arrived at that stage when he has only one more birth to undergo, is styled a *Bodhisatva* (having the essence of knowledge): a mere candidate for Nirvana is an *arhat* (venerable).

giving prominence to the extravagances and almost inconceivable puerilities and absurdities with which the system has been overloaded, it would have been easy to make it look sufficiently ridiculous. But this is not to depict, it is to caricature. It is only too common for Christian writers to treat of heathen religions in such fashion. The only fair—the only *true* account of any religion, is that which enables the reader to conceive how human beings may have come to believe it and live by it. It is this object that has been chiefly kept in view in this meagre sketch of a vast subject. See Oldenberg's excellent treatise, *Buddha* (1881; Eng. transl. 1882); Spence Hardy's *Manual of Buddhism;* Koeppen's great work, *Die Religion des Buddha* (1857); *Buddhism*, by Rhys Davids (1879); Saint-Hairle's *Le Bouddha;* Max Müller *On Buddhist Nihilism;* and the works of Eitel, Schlagintweit, and Alabaster on Chinese, Tibetan, and Siamese Buddhism respectively.

BUDDING, sometimes called INOCULATION, is an operation analogous to GRAFTING (q. v.), or indeed may be regarded as merely a peculiar mode of grafting, in which a leaf-bud is used as a graft instead of a young shoot. It is generally preferred for trees which are apt to throw out much gum when wounded, as the plum, cherry, peach, apricot, and stone-fruits in general, also for roses and many other flowering shrubs. The time for it is when the bud is perfectly formed, about or a little after midsummer. The subjoined cut represents the various parts in budding: *a* is the bud cut out, with a shield of bark attached to it; *b*, the stem, with a slit in the bark to receive the shield attached to the bud; *c*, the bud inserted and the leaf cut away. The bud to be employed is taken, by means of a sharp knife, from the branch on which it has grown—generally a branch of the former year—a small portion of the bark and young wood being taken with it, extending to about half an inch above and three-quarters of an inch below the bud. The woody part is then separated from the bark and bud; but care is to be taken that the bud itself is not injured, which, however, is always the case when the operation is attempted before the bud is sufficiently matured, and is indicated by a hollow left at the bud when the wood has been removed. A longitudinal and a transverse cut are made in the bark of the stock intended to receive the bud, in the form of the letter T; the bark is raised on both sides, for which purpose the handle of the *budding-knife* generally terminates in a thin ivory blade, and the bud is inserted, the bark attached to the bud being cut across so as to join exactly to the transverse cut in that of the stock, that the bud may be nourished by the descending sap.

The leaf in the axil of which the bud grew is cut off. The newly inserted bud is for a time preserved in its place, and prevented from too much access of air by strands of bass-matting. The process just described is distinctively called *shield-budding*, and is the most common method of budding. Other methods are occasionally employed, as *reversed shield-budding*, in which the incisions are in the form of the letter T reversed, which is sometimes practised with trees of the orange family and others in which there is a great flow of descending sap; and *scallop-budding*, in which a thin slip of bark is removed from the stock, and a similar slip bearing the bud is placed upon it, the upper edge and one of the lateral edges being made to fit exactly. Scallop-budding may be performed in spring, and if it fails, the ordinary method may be resorted to in summer. Budding is also sometimes performed by taking a tube of bark with one or more buds from a small branch, and placing it upon a branch of a similar thickness in the stock, from which the bark has been removed.

BUDDLE'A, a genus of shrubs of the natural order *Scrophularineæ*, of which many species are known, all natives of the warmer parts of the world, and some of them much admired for their beautiful flowers. *B. Neemda* has received the praise of being one of the most beautiful plants of India. *B. globosa*, a native of Chili, with downy branches, lanceolate leaves, and globose heads of orange-colored flowers, is hardy enough to endure the climate of most parts of England, and has become a very common ornament of gardens, but in Scotland it needs the protection of the greenhouse or frame.

BUDE BURNER and BUDE LIGHT. The Bude Burner, so called from the name of the residence of the inventor, Mr. Gurney, consists of two, three, or more concentric argand burners, each inner one rising a little above the outer. On the same principle, a powerful light is produced by a number of flat flames disposed in concentric circles like the petals of a rose.—The Bude Light, also the invention of Mr. Gurney, depends upon introducing oxygen into the center of the flame instead of air, as in the common argand. A light of the most dazzling brilliancy is thus produced.

—BUDE is a small but growing watering-place on the north coast of Cornwall, 18 miles N.W. of Launceston. The cliffs here are grand, and the country around is interesting.

BU'DGET, from the same source as the French *bougette*, means a small bag, and has been used metaphorically to express a compact collection of things, as a budget of news, a budget of inventions, and the like. Water-budgets or buckets were a very honorable blazon on a coat-armorial, as generally conformed in honor of some valiant feat for supplying an army with water. Guillim, in his *Display of Heraldry*, thinks, the three mighty men in David's army who broke into the host of the Philistines, and drew water from the well of Bethlehem, 'deserved to have been remunerated with such armorial marks on their coat-armors for their valor.'

The term, 'The Budget,' is in Britain, from long usage, applied to that miscellaneous collection of matters which aggregate into the annual financial statement made to parliament by the Chancellor of the Exchequer. It contains two leading elements—a statement how the nation's account of charge and discharge stands in relation to the past, and all explanation of the probable expenditure of the ensuing year, with a scheme of the method in which it is to be met, whether by the existing or new taxes, or by loan. The statement of the budget is always an important, sometimes a very exciting occasion; as, for instance, Sir Robert Peel's adoption of an income-tax in 1842, and his legislation for free trade in 1846. Another instance is Mr. Gladstone's reduction of the wine-duties and treaty with France in 1860.

BUDHA'NUH, a town of India, in the British district of Mozuffurnuggur, North-west Provinces, on the route from Kurnoul to Meerut, 43 miles south from Kurnoul. The surrounding country is wooded and well cultivated, and the bazar of the town is well supplied. Pop. (1872) 6162.

BUDOS HEGY, a mountain belonging to the Carpathians, on the eastern border of Transylvania, in lat. 46° 12′ N., and long. 25° 40′ E. It is quite isolated, steep, and of conical shape, densely wooded on the lower slopes, and has an elevation of 7340 feet. It has numerous caverns, that emit sulphurous exhalations, and from its base issue strong sulphuric springs.

BU'DWEIS, a town of Bohemia, situated on the Moldau, about 77 miles south of Prague. B. is well built, is partly fortified, and has an old cathedral, manufactures of woollens, stoneware, machines, lead-pencils, saltpetre, &c. It has also a brisk trade in grain, wood, coals, and salt. There are numerous schools, both for education in the Bohemian and in the German tongue. The Slavic name of B. is *Budejowice*. Pop. (1880) 23,845. In the neighborhood is an old feudal fortress, the *Schloss Frauenberg*, one of the seats of Prince Schwarzenberg, and a fine new Gothic castle also belonging to the same nobleman. Here he keeps herds of wild swine for the chase.

BUEN AY'RÉ in Spanish, or BON AIR in French, an island in that subdivision of the West Indies which runs parallel with the coast of Venezuela. It is in lat. 12° 20′ N., and long. 68° 27′ W., being 30 miles to the east of Curaçao, which, like itself, belongs to the Dutch. B. A. produces cattle and salt. It measures 20 miles by 4, and contains about 4000 inhabitants. It has a tolerable harbor on its leeward or south-west side.

BUE'NOS AYRÉS, a city of South America, on the right bank of the Plata, which here, at a distance of 150 miles from the open sea, is 36 miles across. It stands in lat. 34° 36′ S., and long. 58° 24′ W. Its disadvantages as a maritime town are great; the flood-tides of the ocean, when backed by easterly winds, being apt to make the estuary overflow its banks; and again, when westerly winds prevail, the estuary loses both width and depth. Monte Video, on the opposite shore possesses a better harbor, and is nearer to the Atlantic, nor can it be doubted that, but for the greater facilities of B. A. in carrying on the inland trade, the former town would have proved a dangerous rival. Steam is rapidly placing both upon more equal terms. Of the trade, however, with Chili by Mendoza and the Andes—a trade which must always be carried on by land—B. A. must still command the monopoly. So familiar had B. A. become with landcarriage on an extensive scale, that its merchants, when blockaded in front during the war with Brazil, established, as it were, a new port of entry in the mouth of the Salado or Saladillo, at a distance of at least 150 miles. As a city, B. A. labors under some peculiar disadvantages. Its supplies of fresh water are received from the Plata in rudely constructed carts, though a thorough scheme of water-supply and drainage is now being carried out. Its immediate territory, purely alluvial, is almost as destitute of timber as of stones—the latter being brought either as ballast from Europe, or as freight from Martin Garcia, an island on the opposite side of the estuary; and the former from the province of Entre Rios, and from the islets of the Uruguay and the Parana.

Fuel is almost as scarce as building material—peach-trees and the withered thistles of the prairies yielding the only indigenous supplies. B. A., which appears to deserve its name of *good aire*,

contains (1869) 177,787 inhabitants—about a third of whom are of European birth or descent. Among the Europeans the vast majority are Spanish, Italian, French, and British. B. A. publishes newspapers in French, English, Italian, and German, as well as in Spanish. The city is partitioned into blocks of about 150 yards square, by granite-paved streets. New houses are everywhere springing up; tramways traverse it in every direction; and the value of property has enormously increased. The principal buildings are the cathedral and its dependent churches, Episcopalian and Presbyterian chapels, a foundling hospital, an orphan asylum, the university, a military college, several public schools, and the government offices; there are also printing establishments, and manufactories of cigars, carpets, furniture, and boots and shoes. The exports consist of precious metals, hides, beef, wool, skins, tallow, and horse-hair; and the imports of cottons, linens, woollens, jewelry, perfumery, and deals. The imports have an annual value of £8,000,000; exports, about £11,000,000. In each of the years 1879 and 1880, less than £1,000,000 worth of goods were imported from the United Kingdom, and over £2,000,000 were exported from B. A. thither. There was a Continental Exhibition held at B. A. in 1882. B. A. was founded in 1535; but was subsequently twice destroyed by the Indians. In 1806, to the glory of B., a British force, which had just captured the city, was obliged to surrender; and in 1807, another which attempted to recover the place, was repulsed with heavy loss; and these successes over so formidable a foe emboldened the colonists, three years afterwards, to throw off the yoke of Spain.

BUENOS AYRES, a province of the Argentine Confederation in South America, of which the city B. A. is capital, extends itself along the Atlantic, from the mouth of the Plata to that of the Rio Negro on the 41st parallel; on the N.E., it is washed by the Plata and the Parana as far as the Arroyo del Medio; on the N. and the adjacent section of the W., it touches the province of Santa Fé. Elsewhere, its borders cannot be defined, constantly advancing, by slow and perilous steps, into the domain of the aborigines, for here the contest is not with the wilderness itself, which is a boundless prairie, but with its tenants, who, having an unlimited supply of horses for all purposes, are secured, in their every foray, alike against famine and fatigue. Its area is estimated at 63,000 square miles, with a pop. of (1869) 495,107.

Besides the existing province of the name, it at one time comprised Uruguay or Banda Oriental, Paraguay, Bolivia, and the Argentine Confederation, being originally an appendage of Peru, under the immediate command of a captain-general, and becoming, in 1775, a separate vice-royalty of itself. Though the first three of these four division broke off chiefly in connection with the revolutionary struggle, yet the fourth continued, down to 1853, to recognize the city of B. A. as its head; and the inland states endeavored both by war and diplomacy to re-annex the maritime province to the republic, till, in June 1860, their object was obtained, and B. A. became once more a province in the Argentine Confederation.

The country approaches so nearly to a plain, that most of the rain which falls is either absorbed or evaporated, or lost in salt-lakes, comparatively little drainage entering the Parana or the Plata. The climate, though on the whole healthy and agreeable, is yet by no means steady or uniform. Every wind, in general, has, to a remarkable degree, its own weather—sultriness coming from the north, freshness from the south, moisture from the east, and storm from the west; and besides the periodical heats of every summer, successive years of more than ordinary drought occur. Agriculture, properly so called, is followed chiefly in the more temperate and humid districts of the eastern coast; while the interior presents almost uninterrupted pasturage to countless herds of horses and cattle. Under these circumstances, the business of grazing and hunting combined occupies or interests the great bulk of the population—a business that renders the province, whether as to the disposal of its productions or as to the supply of its wants, peculiarly dependent on that external commerce, which, throughout the whole of Spanish America, has naturally been identified with political freedom. Let it be added, that the Indians are intractable, and that the Africans, few in number at best, are principally menials; and it is seen at once why, in spite of national jealousies and sectarian prejudices, immigration from Europe has been not only tolerated by public opinion, but also encouraged by legislative enactment. Moreover, a comparatively congenial climate, as a recommendation to foreigners, has powerfully seconded the efforts of liberality and patriotism. It is perhaps mainly owing to this cause, which is common alike to Chili and to B. A., that these two districts, notwithstanding their full share of wars and troubles, have so decidedly outstriped the other fragments of the same colonial empire in all the elements of liberty and civilization. Hence their higher importance in the eyes of Europeans in general, and of Englishmen in particular. B. A. is the largest, most populous, and most flourishing of the provinces which comprise the Argentine Confederation. Numerous railways traverse it, emanating from the city of B. A., and extending to other parts of the republic. The annual immigration into B. A. is from 20,000 to 40,000.

BU'FFALO (*Bos Bubalus*), an animal of the ox tribe, very important and useful to man. It is a native of the East Indies, where it has been long domesticated, and from which it was carried to Egypt and to the south of Europe. It was introduced into Italy about the close of the 6th c. A.D., and is now very generally used as a beast of draught and of burden in that country, as it is also in India.

The B. is larger than the ox, and its limbs are stouter. Its form is more angular and clumsy; the head is larger in proportion to the size of the body; and the forehead is rather convex, and higher than broad; the dorsal line rises into a considerable elevation above the shoulders; the dewlap and the tail resemble those of the ox; the horns are large, slightly compressed, recline towards the neck, and have their points turned up. It is characteristic of the B., when walking or running, to carry the head with the muzzle projecting straight forward, and the horns laid back on the shoulders. The hair is irregular and bristly, often very thin, so that the smooth brown hide 'shines with an unpleasant polish in the sunlight.' In this as in other respects, the animal is adapted for marshy situations, which it naturally affects; preferring for its food the rank coarse herbage which they afford, delighting to immerse itself in water till only its head appears above the surface, in which condition it will remain for hours, and often enveloping itself in mud as a protection against insects. On account of these propensities, the buffaloes used as beasts of burden in India are seldom laden with any goods liable to be spoiled by water, as the animal is always ready to take an opportunity of lying down with his load in any river or pond which presents itself. In Italy, the B. seems nowhere more at home than in the Pontine Marshes and the pestilential Maremma. The very regions where malaria is most prevalent seems to be these most adapted to its constitution.

The B. is a very powerful animal, much more powerful than the ox, and capable of dragging or carrying a far heavier load. The female yields a much greater quantity of milk than a cow, and of excellent quality. It is from B. milk that the *ghee* or semi-fluid butter of India is made. The hide is greatly valued for its strength and durability, but the flesh is very inferior to that of the ox.

The B. exhibits a considerable amount of intelligence. In a state of domestication, it is capable of becoming very docile. In the south of Europe, it is generally managed by a ring passed through the cartilage of the nose, but in India by a mere rope. The Indian driver rides upon a B.; but these animals keep so closely together as they are driven along, that, if necessary, he walks from the back of one to that of another perfectly at his ease. In a wild state, the B. is savage and dangerous, and even in domestication it is apt to resent injury. The native princes of India make buffaloes and tigers fight in their public shows; and the B. is more than a match for the tiger, even in single combat. The appearance of a tiger excites a herd of buffaloes, much as we see oxen excited by the approach of a dog; and if his safety is not secured by flight, they kill him, tossing him from one to another with their horns, and trampling him with their feet.

The B. is used in some parts of the east in the shooting of waterfowl, being trained to the sport, and sold at a considerable price. The sportsman conceals himself behind the B., which, being a familiar sight, is not alarming to the birds.

The CAPE B. (*Bos Caffer*) is generally regarded as a distinct species. It seems never to have been reduced to the service of

Cape Buffalo.

man, although there is reason to believe it to be very capable of domestication. The horns are very large; they spread horizon-

tally over the top of the head, and are then bent down laterally, and turned upwards at the point. The head is carried, as by the common B., with projecting muzzle and reclining horns, but the bases of the horns nearly meet on the forehead, where they are from eight to ten inches broad. The length of a full-grown Cape B. is about 8 feet from the root of the horns to the tail, and the height 5½ feet. This animal is regarded as more formidable than any other in South Africa; and the hunter will more readily risk an encounter with a lion than offer any provocation to a B. without great advantages for the combat, or great facilities for escape.

The B. is still found in large herds in the interior of South Africa, but in Cape Colony, where it was once plentiful, it has now become comparatively rare. The hide is so thick and tough that the Caffres make shields of it, impenetrable to musket-shot; and the balls used by the huntsmen in shooting the animal are mixed with tin, and yet are often flattened by the resistance. The Cape B. grazes chiefly in the evening, and lies in woods and thickets during the day.

An attempt has been made to establish a genus, *Bubalus*, having the common B. for its type; but the characters lack precision, and the limits are uncertain.—The *Buffalo* of the Anglo-Americans is the American Bison. See BISON.

BUFFALO, a city of the state of New York, standing at the mouth of Buffalo River, which enters Lake Erie within 2 miles of its outlet, the Niagara River. In 1801, when B. was founded, the basin of its fresh-water sea contained certainly fewer than 50,000 inhabitants, and seemed cut off from commercial communication by the Niagara Falls on the east, and the currents of the Detroit and St. Clair on the west. But these and other natural disadvantages have been made to vanish. The construction of piers and breakwaters in the river and at its mouth have removed the bar, and given B. one of the best harbors on the lakes. Steam has brought Lakes Huron, Michigan, and Superior within easy reach. Its commerce is large, the grain trade being the most important item in it. The receipts of grain and flour during the decade 1864–74 amounted to 522,874,944 bushels. In the year 1881, there were received at B. 26,838,700 bushels of wheat, 1,941,000 bushels of flour, and 51,166 of maize, of which 17,750,000 bushels of wheat and 31,635,000 of maize were again exported. The elevators of B. hold 7,000 000 bushels. Next to the traffic in grain is that in live-stock. British improvements along the Niagara and the St. Lawrence, available as they are for sea-going ships, have rendered B. a maritime emporium. The Erie Canal, 364 miles long, has connected B. as its terminus with the tide-waters of the Hudson; while three other enterprises of the kind, commencing respectively at Erie, Cleveland, and Toledo, have linked Lake Erie at three or rather four points with the Ohio, and through it with the Mississippi. Since about 1862 its lake commerce has much decreased owing to the increase of railway facilities, and manufacturing industries have taken the lead. Among manufactures, that of iron is the chief. Ship-building is also largely carried on, and there are extensive wool-factories and numerous saw-mills. The rise of B. has been remarkably rapid; in 1810, there were 1508 inhabitants; (1830) 8653; (1850) 42,261; (1870) 117,714; and in 1880, 155,137. The city debt in 1880 was $8,211,934; and the valuation above $100,000,000. In 1814 the British burned B. In 1825 the Erie Canal was opened.

B. is situated in lat. 42° 53′ N., and long. 78° 55′ W. It is regularly built. Its streets are straight and broad—Main Street, in particular, being 2 miles long and 120 feet wide; and its squares, which are three in number, are shaded by rows of trees. The most prominent public buildings are the city and county hall, erected at a cost of 2,000,000 dollars, custom-house, post-office, arsenal, penitentiary, and an asylum for the insane. There are nearly 80 churches, a university, 8 daily newspapers, several libraries, &c. It is divided into five wards, and is governed by a mayor and council annually elected. See BUFFALO in AM. SUPP.

BUFFALO'RA, a small town of Lombardy, about 25 miles north-north-west of Pavia, on the Ticino, here crossed by a bridge. The Austrians commenced the Italian campaign of 1859 by entering Piedmont at this point. The bridge was partially blown up by Austrian Engineers. Pop. 1250.

BUFFET, an article of furniture formerly serving the same purpose as a sideboard, which has now superseded it. B. is the name given in France to a refreshment bar.

BUFF LEATHER is usually made out of salted and dried South American light ox and cow hides. After being limed in the usual way, they are unhaired and rounded, so that only the best part of the hide is made into buff leather. The grain and flesh being then scraped or cut off, the true cuticle, which is of a flexible fibrous nature, alone remains. The hide is next sprinkled over with cod-oil, and placed in the *stocks*, where it is worked for about 15 minutes. Having been taken out and partially dried, it is again submitted to a similar process of oiling and stocking; and during the first day, these operations may be repeated six times, decreasing daily for about a week, when one oiling and stocking in a day is sufficient. The hides are then placed in a stove, and subjected to aprocess called 'heating off,' after which they are scoured and rendered free from oiliness by being soaked in a strong lye of carbonate of potash. They are next worked well in the stocks, hot water being poured copiously upon them until the water runs off pure. Having been dried, they are subjected to a process called *grounding*—i. e., they are rubbed with a round knife, and also with pumice-stone and sand, until a smooth surface is produced. The leather, which is very pliant, and not liable to crack or rot, is now ready for the market, and is generally used for soldiers' belts and other army purposes.

During the early part of this century, the principal seat of the B. L. manufacture was in the neighborhood of Edinburgh, one manufacturer turning out previous to the battle of Waterloo, about 1300 hides per week. In peaceable times, the demand for B. L. is comparatively small, and the manufacture is now almost confined to London and the neighborhood, where the raw material is most readily procured, and the demand for the manufactured article is greatest. The natural color of the leather is light-yellow, but for some purposes it is bleached white. The precise chemical operation of the oil in the process of the manufacture is rather obscure, but as no glue can be got from hide that has been made into buff, the gelatine of the hide must have entered into combination with some of the constituents of the oil, and had its nature completely changed.

BU'FFO (Ital. from corrupt Latin *buffa*, a slap on the cheek, as practised by clowns and mountebanks in farces), an Italian theatrical term applied to an actor or operatic singer who takes the light or humorous part in an opera or play. A burlesque opera is called *opera buffa*, and a burlesque play *commedia buffa*.

BUFFON, GEORGE LOUIS LECLERC, COMTE DE, one of the most famous naturalists and writers of the 18th c., was born at Montbard, in Burgundy, September 7, 1707. He studied law at the college of Jesuits at Dijon, but showed so marked a predilection for astronomy and mathematics, that his father allowed him to follow his own inclinations. At Dijon he became acquainted with Lord Kingston, whose tutor, a man of learning and taste, directed the mind of B. to the study of the sciences. With Lord Kingston and his tutor, B. traveled through France and Italy, and came to England, where to improve his knowledge of our language he translated Newton's *Fluxions* and Hales's *Vegetable Statics*. In 1733 he wrote several original essays, which gained notice in the Academy, of which he had been made a member. His *general* love of science received a definite impulse toward zoology by his appointment, in 1739, as intendant of the royal garden and museum. Hitherto zoology consisting of a series of unconnected observations and fruitless attempts at classification, had been commonly regarded by educated readers as a dry study, and by savans as play-work. B. first conceived the idea of making it attractive to the first of these classes, and of securing for it, at the same time, the respect of the second. His plan was assuredly comprehensive enough, since he aimed at nothing less than a collection of all the known facts of physical investigation, and a systematic arrangement of these, to assist the author in forming a theory of nature; but B. possessed neither the science nor the patience necessary for such a task.

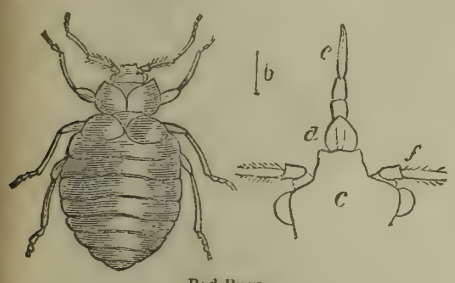
Endowed, however, with a brilliantly rhetorical imagination, and always inclined to deliver himself from doubts and ignorance by sparkling hypotheses, the elaboration of which cost him little trouble, he contrived to produce a work which, if not severely scientific in its method, at least shone with what many then conceived to be the brightest literary lustre. However, it is not to be denied that many of his views are very ingenious, although later researches have completely exploded them. The *Natural History* of B. made an epoch in the study of the natural sciences, though it has now little or no scientific value. His attempted explanations of natural phenomena were opposed by Condillac, who, with Helvetius, Diderot, D'Alembert, and others, also ridiculed, with a certain degree of justice, the excessive pomp of style used by Buffon. The most insignificant part of B.'s treatise is the mineralogy, for which he was quite unqualified by the deficiencies of his chemical, mathematical, and physical knowledge. The systematic and anatomical arrangement of the mammalia was executed by Daubenton, the colleague of Buffon. B.'s works passed through numerous editions, and several were translated into most of the languages of Europe. The best complete edition is the *Histoire Naturelle Générale et Particulière*, in 36 volumes (Par. 1749—1788). After receiving several high honors, being elevated to the rank of Comte de B. by Louis XV., and treated with great distinction by Louis XVI., B. died in Paris, April 16, 1788. In person and carriage, B. was noble; as a Parisian academician, and a self-complacent, theoretical naturalist, dressed in courtly style, pursuing his pleasant studies in the *allées* of the Royal Garden, and largely participating in the vices of his time, B. was quite a model of a French philosopher of the 18th century. His son,

Henri Leclerc, Comte de B., born 1764, was attached, at the outbreak of the revolution, to the party of the Duke of Orleans, and fell under the guillotine. His last words were: '*Citoyens, je me nomme Buffon.*'

BUFFOO'N (Fr. *bouffon*), a low jester. The Italian *buffo* (from *buffa*, a farce) is the name given to a comic singer in an opera. In the corrupt Latinity of the middle age, *buffa* meant a slap on the cheek; and in the Italian, *buffare* signifies the puffing of wind through the mouth. It is probably from the favorite trick played by clowns in farces—one swelling out his cheeks with wind, the other slapping them, so as to make a ludicrous explosion—that the terms *buffones* in Latin, *buffoni* in Italian, *bouffons* in French, and in English *buffoon*, were derived. In Italy, the *buffo cantante* is distinct from the *buffo comico;* the former having greater musical talent, and sustaining a more important part, the latter having greater license in jocoseness. The voice of a *buffo cantante* is generally a bass, but sometimes a tenor buffo is introduced.

BUG, or BOG. There are two rivers of this name in Russian Poland. The Western B., the largest tributary of the Vistula, rises in Austrian Galicia, and after a course of about 450 English miles, and receiving numerous tributaries, it joins the Vistula at the fortress of Modlin, near Warsaw. It is navigable for a considerable distance. The Eastern B., the Hypanis of the ancients, rises in Podolia, and flows south into the estuary of the Dnieper. Its length is more than 400 miles. It is navigable for small-craft as far as Wosnessensk. At the junction of the Ingul with the B., stands the city of Nicolaiew (q. v.).

BUG, a name applied to a large family of insects; *Cimicidæ*, of the order *Hemiptera* (q. v.), sub-order *Heteroptera*, and often still further extended in its signification so as to include the whole of that sub-order, the insects of the section *Geocorisæ* being designated land-bugs, and those of the section *Hydrocorisæ*, water-bugs, the latter including water-scorpions, boat-flies, &c. All these insects and particularly the land-bugs, although some of them are radiant in beautiful colors, have a strong resemblance in form and structure to the annoying and disgusting HOUSE B. or BED B. (*Cimex lectularius*). The statement that this insect was introduced into England with timber brought from America to rebuild London after the great fire of 1666, must be rejected as erroneous; for although it appears to have been comparatively rare in England, it was well-known in some parts of Europe long before that time, and is mentioned by Dioscorides. The Bed B. is destitute of wings—an anomalous peculiarity, as the insects of its order, and even of the same family, are generally furnished with them. The body is very flat, of a somewhat oval form; the whole insect is of a dirty rust color, emits an offensive odor, and is about three-sixteenths of an inch in length; the legs are moderately long, and capable of being employed for pretty rapid motion; the antennæ are thread-like and very slender, about half the length of the body; the mouth is formed for suction alone, and is furnished with a sort of proboscis, which is three-jointed, forms a sheath for the true sucker, and when not in use is recurved under the head and thorax. The B. lurks during the day in crevices of walls, of bedsteads, and of other furniture, but is sufficiently active during the night; and when it finds opportunity, sucks blood until it distends itself. It seems, however, to be capable of subsisting long without food. Young bugs resemble their parents in most things, except size and the want of *elytra*, insects of this order not undergoing such marvelous transformations as those of some other orders.



Bed Bugs.

a, the insect, magnified; *b*, its natural length; *c*, the head, upper side; *d*, labrum; *e*, proboscis extended; *f*, base of antennæ—very highly magnified.

The best preventive of bugs in a house is *scrupulous attention to cleanliness;* but where the nuisance exists, it is not easily removed, and various means are employed for this purpose, of which one of the best and safest is thorough washing with spirit of turpentine, although recourse is even had to washing with a solution of corrosive sublimate.—Other species of B. (*Cimex*) suck the blood of some of the inferior vertebrate animals, as pigeons, swallows, bats, &c.; but the greater number of insects of the B. family live by sucking the juices of vegetables. A small species (*Tingis pyri*), which sucks the leaves of the pear-tree, is very destructive in some parts of Europe, where it is popularly called the *tiger*. Some of these winged wood-bugs or field-bugs are capable of inflicting very painful wounds. Flying-bugs, 'enormous and fetid,' are among the pests of India. Night is the time of their activity. Warm countries generally have winged bugs of great size and beauty; but if touched or irritated, they 'exhale an odor that, once perceived, is never after forgotten.' A winged B., as large as a cockchafer, lodges in the thatch and roofing of houses in Chili, and sallies forth at night, like the Bed B., to suck blood, of which it takes as much as a common leech.—It is worthy of notice that a species of field-B. (*Acanthosoma grisea*), a native of Britain, is one of the few insects that have yet been observed to show affection and attention to their young. De Geer observed the female of this species, which inhabits the birch-tree, conducting a family of thirty or forty young ones as a hen does her chickens, showing great uneasiness when they seemed to be threatened with danger, and waiting by them instead of trying to make her own escape.

BUGEAUD, MARSHAL, was born at Limoges, in France, October 15, 1784. In his 20th year he entered the army as a private. His conspicuous bravery in the Prussian, Polish, and Spanish campaigns gained him rapid promotion. Shortly before the fall of Napoleon, B. was made a colonel, and in 1815 commanded the advance-guard of the army corps of the Alps. He afterwards retired to his estate, but was called into public life by the July revolution of 1830. He was elected deputy for Perigueux, and gained the esteem of Louis-Philippe, who created him a marshal. In 1835, he voted against electoral reforms and universal suffrage, denounced 'the tyranny of the press,' and soon contrived to make himself very unpopular. In December 1840, he was appointed governor general of Algiers. He immediately set about organizing the celebrated irregular force known as the Zouaves, and in a few years the French arms were everywhere triumphant over the Arab tribes. The cruelty of some of B.'s proceedings excited strong feelings of reprobation at the time, as well in France as in Europe generally.

In 1844, he gained a victory over the Emperor of Marocco's forces at Isly, for which he was created Duc d'Isly. In the revolution of February 1848, Marshal B. had the command of the army in Paris, and would have dissuaded the king from signing the act of abdication; but panic made such counsel useless. Among all the friends of Louis-Philippe, Marshal B. seems to have been the only man who preserved firmness and presence of mind. When Louis Napolean became president, he intrusted the chief command of the army of the Alps to B., who died of cholera in Paris, June 9, 1849.

BUGENHAGEN, JOHANN, surnamed *Pomeranus*, or Dr. Pommer, one of Luther's chief helpers in the Reformation, was born at Wollin, near Stettin, in Pomerania, 1485; studied at Greifswald, and as early as 1503 became rector of the Treptow Academy. There he lived quietly, fulfilling the duties of his office until 1520, when his religious views, were changed by reading Luther's little book, *De Captivitate Babylonicâ*. B. was now seized, as it were, by the zealous spirit of the Reformation, and, to avoid the persecutions of the Catholic party, he betook himself to Wittenberg, where his talents procured for him in succession several high positions. B.'s remarkable philological and exegetical powers were of great service to Luther in his translation of the Bible. In 1525, he opened the controversy between Luther and Zwingli by a treatise against the latter, to which Zwingli ably replied. He possessed a superior talent for organization, establishing churches in Brunswick, Hamburg, Lubeck, and Pomerania. In 1537, he was called to Denmark by Christian III. to reform the ecclesiastical establishments of that country. He accomplished this so admirably, that the Danes to this day consider him their Reformer. In 1542, he returned to Wittenberg, and continued his energetic efforts to extend the new theology throughout his native land. He died 20th April 1558. His best work is his *Interpretatio in Librum Psalmorum* (Nürnberg, 1523).

BU'GLE (*Ajuga*), a genus of plants of the natural order *Labiatæ*, having an irregular corolla, with very short upper lip and trifid lower lip, the stamens protruding. The species are mostly natives of the colder parts of the Old World, and several are British. The Common B. (*A. reptans*) is abundant in moist pastures and woods. Its flowers are generally blue, but varieties occur with white and purplish flowers, which are often introduced into flower-borders. The Alpine B. (*A. alpina*) is one of the beautiful flowers of the Swiss Alps.

BU'GLOSS, a name popularly applied to many plants of the natural order *Borragineæ* (q. v.), as to the species of *Anchusa* or Alkanet (q. v.), &c. In some botanical works it is confined to the genus *Lycopsis*, a genus differing from *Anchusa* in little but the curiously curbed tube of the corolla, and of which one species, *L. arvensis*, is a common weed in cornfields in Britain. The beautiful genus *Echium* bears the English name of VIPER'S BUGLOSS.

BUHL-WORK, or BOOL-WORK, is the name applied to a sort of inlaying of brass scrolls and other ornamental patterns in wood. The name is derived from its inventor, Boule, an Italian cabinet-maker, who settled in France in the reign of Louis XIV. He employed veneers of dark-colored tortoise-shell, inlaid with

brass. Cabinets of his manufacture are highly prized, as are also those of his contemporary Reisner, a German, who used a ground of tulip-wood, inlaid with flowers, &c., in darker woods, and varied with margins and bands of light wood, with the grain crossed for contrast. This modification of B. W. is correctly called Reisner work. For details of the methods of working, see INLAYING and MOSAIC.

BUHREA'CH, or BHARAICH, a town of Oude, India, the principal place of a district of the same name. It is in N. lat. 27° 34', E. long. 81° 33'—65 m. N.E. of Lucknow. It is an old town, of considerable size, situated in a pleasant wooded plain, on the left bank of the Sarju. The houses are mostly built of mud and covered with thatch; but the mausoleums, mosques, and residences of merchants are of brick and lime-mortar. North-east of the town is the tomb of Selar, a reputed Mussulman saint, to which there is a great concourse of pilgrims annually in the month of May. Pop. (1871) 18,889; of district, 774,640.

BU'HRSTONE, a variety of quartz (q. v.), containing many small empty cells, which give it a peculiar roughness of surface, particularly adapting it for millstones. The name is given without reference to geological relations, but it is *vein quartz*, rather than true *quartz rock*, which ordinarily assumes the character of buhrstone. There are different varieties of B., some of which are more compact, or have smaller cells than others; and those in which the cells are small and very regularly distributed, about equal in diameter to the spaces between them, the stone being also as hard as rock-crystal, are most esteemed. Good B. is found at Conway in Wales, and at several places in Scotland; but the finest millstones are obtained from the quarries of La Ferté-sous-Jouarre, in the department of Seine-et-Marne, near Paris. A single millstone in one piece of 6 feet diameter, sells for about £50, and one formed of several pieces for about £33. It is not unusual to form millstones of pieces of B. cut into parallelopipeds, like great wedges of soap, and bound together by iron hoops.

The stone is found in beds or in detached masses, and the mode of quarrying is peculiar. When the mass is large it is cut out into the form of a huge cylinder; around this, grooves are cut, at distances of about 18 inches, the intended thickness of the millstones; into these grooves, wooden wedges are driven, and water is thrown upon the wedges, which, causing the wood to swell, splits the cylinder into the slices required.—Millstones are not always made of B., but sometimes of silicious gritstones, of sandstone, and even of granite. B. millstones are extremely durable.

BUILDING, the art of erecting or building houses and other edifices, in which several distinct professions are usually and more immediately concerned. At the head of the building-trade is the architect, who is employed to draw plans and make out specifications of the work to be performed. The builder acts ministerially; his duty consists in carrying out the plans put into his hands, according to certain stipulated terms. The profession of the architect demands not only much imaginative power, but great artistic skill, along with a practical knowledge of details. Endeavoring to realize the wishes of his employer, the architect devises what shall be the external effect and interior accommodation of a building, and portrays the whole on paper with rigorous accuracy. Besides general designs to give an idea of the structure and its interior arrangements, he furnishes the working plans or drawings, which are to guide the different mechanics—masons, joiners, &c.—in their several operations. These services of the architect, of course, involve much thought and labor, and he is therefore under the necessity of employing a staff of assistants, by whom the plans are executed under his orders. The making out of the specifications is a matter of careful study. To perform this part of his duty properly, the architect needs to be acquainted with the qualities of different kinds of materials; such as stone, lime, sand, bricks, wood, iron, &c. A knowledge of the strength of timber is particularly desirable. When the specifications are made out, they and the contract are subscribed by the builder. To insure as far as possible a faithful adherence to the specifications, the architect appoints a 'clerk of works' to keep watch over the whole operations, and who is authorized to check any seeming fault. During the whole proceedings, the architect is paramount. For the due execution of his plans, he feels that his professional reputation is at stake; and, accordingly, having involved his responsibility, the employer cannot with propriety interfere to make alterations while the work is in progress.

Such is the etiquette of the profession. Should alterations be desirable, they become matter for a fresh agreement among the parties. When the works are finished, the builder hands his account to the architect to be examined and checked. If satisfied of its correctness, he grants a certificate of the fact, and this is the warrant for payment by the employer. The builder having been settled with, the employer now pays the architect's fee, which closes the transaction. This fee may be one, two, or more per cent. on the entire cost of the B., according to local usage or terms agreed on; whatever it is, it covers all charges for advice, plans, and other professional trouble.

Builders undertake work by 'contract,' or by 'schedule of prices.' If by contract, they engage to execute the whole works for a stipulated sum. If by schedule of prices, they agree to abide by the measurements of valuators appointed by the architect. These valuators go over the works when finished, and, taking an exact account of everything, compare it with the account rendered by the builder; the architect being the ultimate referee. It is exceedingly important, for the sake of an amicable adjustment of accounts, that the builder should adhere scrupulously to the letter of the specifications—i. e., the covenant under which he has become bound. He can justify no departure from the specifications, on the plea that something as good has been given or done, or that he was not checked at the time by the clerk of works. Being explicitly a person employed to do a certain piece of work, in a certain way, he is in no respect entitled to substitute his own notions for those of his employers.

It may happen that a proprietor acts as his own architect, and employs a builder to execute his designs, on the understanding that he is to pay for everything according to a schedule of prices. In many instances, the builder is proprietor as well as architect, and merely carries out his own plans. Such is generally the case in the neighborhood of London, where builders speculate in leasing land and erecting rows of dwellings for sale. This plan is greatly facilitated by the opportunity of buying every article required in house-building ready for use; such as bricks, door-steps, hearthstones, joists, flooring, doors, windows, marble mantel-pieces, slates, &c. In fact, house-building in the metropolitan district is very much reduced to a system of purchasing and putting together certain articles from manufactories and depôts. For this kind of business, there may be said to be establishments for the sale of doors and windows, as there are shops for the sale of nails, locks, and hinges.

The application of a comprehensive manufacturing system in the preparation of various parts of a building is observable most particularly in certain establishments of great magnitude. The test is this—whether the builder conducts so gigantic a trade as to warrant him in setting up a steam-engine of great power, and in providing highly wrought machines for cutting and otherwise treating wood, stone, &c. When once this degree of magnitude is reached, the operations are conducted under very great advantage. The Crystal Palace in Hyde Park could never have been built at the stipulated cost, nor in the required space of time, but by the application of steam-power to work the machines which shaped and grooved the *two hundred miles* of sash-bars; by the resources of the largest English establishment in the glass-trade, in making one million square feet of sheet-glass; and by the skill and capital of our great iron manufacturers, in rapidly producing three thousand iron columns, and more than that number of iron girders. When the late Mr. Thomas Cubitt was engaged in the vast building operations at Belgravia (a district in the west of London owned by the Marquis of Westminster), his factory on the banks of the Thames was the most complete ever known in the trade. It exemplified both the principles adverted to above—the manufacture of various articles by steam-worked machinery; and the collecting of large stores of other articles made in a similar way by other firms. There was a store of drawing-room and parlor doors, a store of window-sashes, a store of street-doors, and stores of mantel-pieces, stone and marble steps, balusters, slates, knockers, bells, and all the materials for house-building from the coarsest to the finest. There was also observed that systematic gradation of kinds and dimensions which is so much attended to in the higher kinds of machinery, and which so much expedites all operations; seeing that one particular piece would not only fit into or against another, but into or against any one of a whole class to which that other belonged. A house built in this systematic way partakes a good deal in the nature of a large machine, in which all the parts fit together with very great accuracy. There can be little doubt that if skill and capital be judiciously applied in this way, a house ought to be better built and to cost less than if built in the ordinary unsystematic manner. It may also be mentioned here, that Mr. Cubitt was the owner of a very large brick-making establishment on the banks of the Medway, between Rochester and Maidstone, where steam-power was employed in all the operations of making bricks. Some of the great railway contractors, who have become millionaires, were originally house-builders, alive to the grand results producible by the combination of steam-worked machinery with the labor of well-organized bodies of men.

As an art, B. is of vast antiquity, and has assumed different forms, according to the necessities of mankind and the materials readily at their disposal. In ancient Egypt, Greece, and Italy, B. in stone rose to a high state of perfection, and till the present day it may be said that the greatest progress in the art is made only where stone of a manageable kind is conveniently at command. Rome, Paris, Lyon (with very many Italian and French cities),

Bordeaux, Brussels, Munich, Geneva, Vienna, Edinburgh, and Glasgow are specimens of what may be achieved in stone workable with the chisel; Aberdeen is mainly built of granite. On the other hand London, the greatest city within the bounds of civilization, is built of brick; so likewise are Manchester and Liverpool; also Amsterdam, Rotterdam, and other towns in Holland; and as a general fact, it would appear that wherever brick has to be resorted to, there the allied arts of architecture and building, as regards domestic accommodation and elegance of style, are on a poor scale. B. with stone of a superior kind is now becoming common in New York, Philadelphia, and some other American cities. It is not necessary to trace in this article the various processes embraced in the comprehensive term BUILDING; seeing that all the materials used, and all the operations conducted, are noticed under the proper headings in the Encyclopædia.

BUILDING ACT FOR LONDON AND ITS NEIGHBORHOOD. See METROPOLIS LOCAL MANAGEMENT ACT.

BUILDING LEASES. In the law of England, a building lease is a demise of land for a long term of years, the lessee covenanting to erect certain houses or edifices thereon, according to specification. By the 19 and 20 Vict. c. 120, amended by the 21 and 22 Vict., c. 77, and which acts also apply to Ireland, the Court of Chancery is empowered to authorize leases of settled estates and B. L., which shall take effect in possession within one year next after the making of the same; the term for such building lease being ninety-nine years; or where the court shall be satisfied that it is the usual custom of the district, and beneficial to the inheritance to grant B. L. for longer terms, then for such term as the court shall direct. By a subsequent enactment, it is declared that the term building lease shall include a repairing lease, but such repairing lease to be for a term not exceeding sixty years.

By the 5 and 6 Vict. c. 108—passed to enable ecclesiastical persons to grant long leases for building, repairs, or other improvements—it is enacted that any ecclesiastical corporations, aggregate or sole, excepting as mentioned in the act, may, with consent of the *Ecclesiastical Commissioners for England* (q. v.)—to which, where the lessor is incumbent of a benefice, the consent of the patron also must be added—demise by deed the corporate lands or houses for any term not exceeding ninety-nine years, to take effect in possession and not in reversion, to any person willing to improve or repair the same; provided, that on the grant of such leases, a small rent may be reserved during the six first years, with an increased rent afterwards; but no such lease is to comprise the usual house of residence, its out-buildings or pleasure-grounds. The act contains other regulations, and it declares generally that it is made without prejudice to any right that ecclesiastical persons have under the former law to grant or lease, whether by renewal or otherwise.

In the Scotch law, the term building lease is applied to the case of proprietors of entailed estates, who, in order to encourage the building of villages and houses upon property so settled, are to have it in their power to grant leases of land for the purpose of building, for any number of years not exceeding ninety-nine years. See this matter regulated by the 10 Geo. III. c. 51. By the 3 and 4 Vict. c. 48, proprietors of entailed estates in Scotland may feu or lease on long leases ground for the building of churches and schools, and for the dwelling-houses and gardens for the ministers and masters of the same, and also for burying-ground and playground attached to such churches and schools. See LEASE, LEASEHOLD, and GROUND-RENT.

BUI'LDING SOCI'ETIES. See BENEFIT SOCIETIES.

BUI'LDING STONE. The chemical composition of B. S. varies. The majority of kinds are more or less silicious, and are designated sandstones. These consist of particles of sand, united together by the force of cohesion, and by a small proportion of a natural cement; in some cases, ferruginous, consisting of a compound of iron; and in other instances, calcareous, composed of carbonate of lime. Igneous rocks furnish very durable B. S., though in general the hardness of the materials renders them so difficult to work, that they are seldom resorted to where softer stones can be procured. Thus, granite is largely employed in the construction of the houses in Aberdeen, in the erection of bridges, in the paving of streets, and wherever great durability is required. Greenstone and basalt are also occasionally used.

The B. S. employed in the new Houses of Parliament is a magnesian limestone, or a double carbonate of lime and magnesia, which is very close and compact in texture, and is soft enough to be easily cut with the chisel; unhappily it has not proved firm enough to resist weathering, having already shown signs of decay. The other forms of carbonate of lime exhibit considerable durability. Near Bath, and in the Isle of Portland, an oolitic limestone is quarried, which is easily cut, and stands well.

A very convenient and accurate way of determining the durability of a B. S.—in other words, its power of resisting the effects of frost and other atmospheric agencies—is to place a small block in a cold saturated solution of sulphate of soda; raise to the boiling point, so as to expel air from cavities in the stone, which then become filled with the solution; then allow to cool, and suspend the block of B. S. in air. Every now and then, it is dipped into the solution, and subsequently air-dried. The result is, that the sulphate of soda crystallizes on the outside, and partially in the interior of the block, and in this respect acts as water does when it is frozen during winter; and if the B. S. be porous, and liable to decay by natural agencies, it gradually breaks up, and particles scale off. The amount of this corrosion can be determined by weighing the detached portions. Some building stones contain iron pyrites in little nodules diffused here and there throughout the mass, and such become discolored from the pyrites being decomposed by atmospheric influence, and the brownish-red oxide of iron (rust) is left as a stain on the surface of the block. The liability to decay or to discoloration in a B. S. may be arrested to a great extent by coating the outer surface with boiled linseed-oil, which communicates a dark appearance to the stone, but prevents oxygen or moisture from gaining access to the block. Ordinary oil-paint is employed for the same purpose. For the preservation of B. S. from decay by means of various solutions, see STONE, PRESERVATION OF.

BUJALA'NCE, a city of Andalusia, Spain, about 20 miles east of Cordova. It is surrounded by a moat and a wall flanked with old towers, has an old Arab castle, and manufactures of woollens, glass, and pottery, exports of agricultural produce, and an important annual cattle-fair. Pop. about 9900.

BU'KKUM WOOD. See BRAZIL WOOD and SAPPAN WOOD.

BU'KKUR, a town of Sinde, about three miles east from the Indus, on a water-course derived from the great river, and flowing parallel with it, 190 miles west of Lahore. It is situated in a fertile district, and carries on an active commerce. Pop. 8000.

BU'KKUR, a fortified island of the Indus, in Sinde, in lat. 27° 39′ N., and long. 68° 56′ E. It is 400 yards from Roree on the left bank, and 100 from Sukkur on the right. In the ordinary state of low water, the western and eastern arms of the river are respectively 15 feet and 30 feet deep. In particularly dry seasons, however, the former has been known to disappear altogether, and even the latter is said to have occasionally been fordable. In 1839, a British force, on its march to Afghanistan, made a stepping-stone, as it were, of B. crossing the Indus, having joined it to either mainland by a bridge of boats. B. is no longer of any military value against a civilized assailant, commanded, as it is, on both sides by higher grounds. It is composed of limestone, being 800 yards long, and 300 broad, and rising 30 feet from the average level of the stream.

BUKOWI'NA, a duchy in the Cis-Leithan (non-Hungarian) section of the Austrian empire, on the Russian frontier; area, 4000 sq. m.; pop. (1880) 571,671 (of whom 41 per cent. are Ruthenian Slavs and 38 are Moldavians). It is traversed by offsets of the Carpathians, gives rise to many rivers, and abounds in wood, along with considerable mineral riches. Wood-cutting and mining afford occupation for a great number of the inhabitants. Large numbers of cattle are reared, and also excellent horses. B., till the end of the 15th c., belonged to Transylvania, when it came under the dominion of the Turks, by whom it was ceded to Austria in 1777. Czernowitz is the chief town.

BULACA'N, a town of Luzon, Philippines, at the head of the Bay of Manila, about twenty miles north-west of the city of that name. B. is chiefly composed of wooden-houses, but has spacious streets, manufactures of silken mats and other fabrics, and large sugar-boiling establishments. Pop. between 9000 and 10,000.

BULB, in Botany, a subterranean bud covered with imbricated scales, having at their base a flattened disc, which represents the proper stem of the plant, and from which the roots proceed downwards, whilst from the midst of the scales an annual herbaceous stem and leaves are sent up. The scales are regarded as modified leaves, and sometimes are all fleshy, as in the lily; sometimes the outer ones are membraneous, as in the onion, in which case the B. is said to be *tunicated*. The B. is popularly but erroneously regarded as the root or part of the root of the plant, and plants in which it is found are very generally described as *bulbous-rooted*. New buds are formed in the axils of its scales, which grow at the expense of the parent B., and gradually destroy it. In some plants, as the tiger-lily and some species of allium, leaf-buds (*bulbils* or *bulblets*) are developed on the stem above ground, which spontaneously separate and serve for the propagation of the plant, and which are entirely of the nature of bulbs, being formed of thickened scales sometimes so closely united as to form a solid mass.

The CORM (q. v.) was formerly regarded as a kind of B., and described as a solid B., but its structure is essentially different, although both it and the TUBER (q. v.) may be included in the description which Linnæus has given of the B. with reference to the purpose which it serves as 'the winter-quarters of the plant.' Many bulbs, if removed from the ground during the period when the vegetation of the plant is most dormant, may be kept in a dry place without injury for a considerable time, even for years.

Bulbs serve also for the preservation of plants in periods of drought, and are particularly frequent in those which delight in sandy soils. The abundance of 'bulbous-rooted' plants is a remarkable characteristic of the flora of the Cape of Good Hope. 'Bulbous-rooted' plants are very often distinguished by the beauty of their flowers, and many of them are among the most esteemed ornaments of gardens, green-houses, and stoves. The bulbs of tulips, hyacinths, and other favorite flowers are important articles of trade. Some bulbs, as that of the onion, are valuable as articles of food; others, as that of the squill, from their medicinal properties.

BU'LBUL, a Turkish name (used also in Persian) for the nightingale, which has found its way into English poetry through Byron's patronage. But the same name is given in India to a very different bird, *Pycnonotus hæmorrhous*, belonging to the great tribe of *Dentirostres*, and formerly ranked among the thrushes, to which it is pretty nearly allied. It is a little bird of brilliant plumage, and the male has a crest or tuft on its head. It is remarkable for its pugnacity; the Singhalese consider it the most *game* of all birds.

BULGA'RIA, an autonomous principality, tributary to Turkey, which till 1878 constituted the Turkish villayet of the Danube (Tuna). B. is bounded to the north by the Danube and the Dobrudscha, now Rumanian; on the east it has the Black Sea; on the south the Balkan range; and on the west, Servia and Rumelia. There are altogether between two and three millions of the Bulgarian race; of the 1,995,700 souls who formed, in 1881, the pop. of the state of B., the great majority are Bulgarians. The area of B. is about 24,600 sq. miles. The country slopes terrace-like from south to north, and from the west to the east, acquiring a plain-like character before reaching the Black Sea. The rivers are rapid and tributary to the Danube.

The soil in some parts is very fertile, producing great abundance of corn; in others, it does not yield sufficient for the consumption. There is excellent pasture-land, and the lower terraces are richly wooded. The exports include horned cattle, sheep, corn, wine, iron, wood, honey, wax; and otto of roses is an important article. The inhabitants are hard-working, hospitable, and fairly intelligent, but suspicious and greedy; their faith is that of the Greek Church. The prince, freely elected by the people, must be confirmed by the Porte with the assent of the Powers. The first choice of the Bulgarians was the Prince of Battenberg, a cousin of the Grand-duke of Hesse, who in 1879 became Alexander I. of Bulgaria. The government is Christian, and there is a national militia. The Berlin Congress decided that the military importance of B. should meanwhile be decreased by the demolition of all its fortresses.

The earliest known inhabitants of B. were the Mœsians, who contended long against the Romans, and allied themselves with Gothic and Slavonic tribes against the Greek empire. Anastasius, the Greek emperor, in 507, built an extensive wall to defend his territories from Mœsian invaders. In the 7th c., the Bulgarians, a people of Finnish origin, whose original seat was the banks of the Volga, conquered the Mœsians, and established the kingdom of Bulgaria; they soon lost their own language and customs, and became assimilated to the other Slavonic inhabitants. After being tributary to the Greek emperors, and contending for some time against Hungary, B. became subject to the Porte in 1392; but the frightful oppression of despotic and sanguinary pashas has not, even to the present day, robbed the inhabitants of a distinctively national life and love of freedom. In April 1876 an insurrection broke prematurely out in B., and was quenched in blood, the Bashi-bazouks or Turkish irregulars committing savage excesses. The atrocities in B., taken in connection with the Servian war and the condition of other Christian provinces of Turkey, led to diplomatic intervention; and in December a conference met at Constantinople, but without result. The war of 1877–78, between Russia and Turkey, followed. The Congress of Berlin, which revised the treaty of San Stefano, declined to sanction the erection of a Bulgarian principality extending from the Danube to the Ægean. But it constituted an autonomous, though tributary, Bulgaria north of the Balkans, and to the mainly Bulgarian province south of them, that of Eastern ROUMELIA (q. v.), it granted administrative autonomy.

The BULGARIAN LANGUAGE is divided into two dialects—Old Bulgarian and New Bulgarian; the former, the richest of the Slavonic dialects; the latter remarkable for its store of popular songs.

BULGARIN, THADDEUS, a Russian author, was born in Lithuania, 1789; fought in the campaign against France; but afterwards served under Napoleon. On Napoleon's fall, he devoted himself to literature. He wrote both in Polish and Russian; and ultimately settling in St. Petersburg, became a popular author. He composed several romances—of which *Demetrius* and *Mazeppa* are the best—and published different periodicals. His large work, *Russia in its Historical, Statistical, Geographical, and Literary Aspect*, was published at Riga, 1839—1841. He died in 1859.

BU'LKHEADS, in a ship, are the partitions between the several portions of the interior; whether to separate it into rooms, or as a safeguard in case of wreck.

Water-tight B. are among the improvements in modern ship-building; they are iron walls running athwart the hold, as a means of dividing it into several portions; the interior is thus cut off into cells, each water-tight in reference to its neighbors. When such a ship is leaking in any one of the compartments, there is thus a chance that the others may be kept dry until the damage is repaired. In iron steam-ships the water-tight bulkheads are generally placed transversely, but there are frequently longitudinal water-tight divisions also. The number and disposition of the compartments depends on the ship-owner and the ship-builder; but it is now the common practice to place the engines and boilers in water-tight sections, and experience has proved the special value of a collision-bulkhead in the bow. In iron-clads of the navy, such as the *Hercules* and the *Belleropon*, which have an inner bottom, there are nine transverse water-tight bulkheads. In the torpedo-ram *Polyphemus*, the principle of having numerous water-tight compartments in the lower part of the vessel has been carried as far as possible.

BULL (Lat. *bulla*, primarily, anything round or swelling) was originally the name of the capsule of the seal appended to letters from emperors or from the pope. Afterwards, the word was applied to the seal, and next to the document itself, as in the case of the celebrated Golden Bull of the Emperor Charles IV., which was so named from the golden capsule appended to imperial letters and other important documents by the Byzantine and Frank emperors as early as the 9th century. They are issued by the apostolic chancellor, and are dated 'from the day of incarnation,' whereas briefs are always dated 'from the day of the nativity.' The name is now applied exclusively to letters or documents issued in the name of the pope.

In cases of granting favors, &c., the seal is appended to the open letter by a yellow or red band of silk; but in the administration of justice, a gray hempen band is used. All bulls, excepting those addressed to the United Greek Christians, are written in Latin with Gothic letters, and on the rough side of the parchment. See BRIEF. All bear the name and title of the pope—for example, *Gregorius Episcopus Servus Servorum Dei*, &c., is prefixed; then follows a general introduction, in which the initial words are used to give a distinct name to the B., as in the examples: the B. *Exsurge Domine*, issued by Pope Leo X. against Luther in 1520; the B. *In Cœna Domini*, the celebrated B. against heretics, often reissued since 1536; the famous *Unigenitus*, or B. against Quesnel's writings, 1713; the *Dominus ac Redemptor Noster*, or B. for the abolition of the order of Jesuits; the *Ecclesia Christi*, or the B. which completed the *concordat* with France in 1801; the *De Salute Animarum*, or the B. for the regulation of the Catholic Church in Prussia. To every B., the leaden seal of the Church is appended, bearing on the obverse the arms of the pope, and on the reverse his name. Bulls issued during the interim between the election and consecration of a pope have no armorial bearings on the seal. A *bullarium* is a collection of papal bulls, as the *Bullarium Magnum Romanum a Leone Magno ad Benedictum XIII.* (19 vols., Luxembourg, 1727—1758), the *B. Romanum* (28 vols., Rome, 1737—1744), and the *B. Benedicti XIV.* (Mechlin, 1826—1827), and more recently, the continuation of the *Bullarium Romanum Magnum* by Barberini (Vienna, 1835).—From the same medieval Latin word *bulla* is derived the word *bulletin* (Italian, *bulletino*), commonly applied to dispatches from generals, reports of the health of royal personages, and on the continent, at least, to other brief authenticated documents, such as those of scientific societies, the best known of which are the bulletins of the St. Petersburg and Belgic academies. It is, moreover, used as a title for periodicals, and, in France, also designates the slips of paper on which electors write their votes.

BULL, OLE BORNEMANN, a famous violinist, was born 5th February 1810, at Bergen, in Norway. His father, it is said, attempted to coerce him into the study of theology, and would not permit a musical instrument about the house. This foolish treatment only gave a more decisive character to the peculiar genius of the boy. At the age of 18 he was placed at the university of Christiania, from which he is said to have been expelled for taking temporary charge of the orchestra at one of the theaters. In 1829 he went to Cassel, in Germany, to study under Spohr, but was so coldly received that he betook himself to the study of law at Göttingen. He was subsequently at Minden, whence, in consequence of a duel, he fled to Paris in 1831.

An unsuccessful attempt to drown himself in the Seine was the turning-point in his life. He thereafter acquired the patronage of a lady of rank, and rapidly rose to fame as a violinist. His style of playing was like that of Paganini. B., however, wished to excel his model in originality, and in triumphing over the most

extraordinary difficulties; but it was impossible for him to follow the flight of the great Italian, in whose brain some capricious musical demon seemed to lurk. Nevertheless, he was received in Italy with prodigious enthusiasm—Malibran herself embracing him on the stage at Naples. In 1836, he visited England, Scotland, and Ireland, and subsequently traveled in a professional capacity through Belgium, Holland, Russia, and Germany. After a long repose, he sailed for America, whence he returned in 1850; but he again went out, and was so successful, that he thought of retiring from public life. He purchased in Pennsylvania 125,000 acres of excellent ground, and founded a colony of Scandinavians. This turned out a complete failure, and B. fell back on his violin. He returned with a fortune to the United States in 1869, but visited Europe again in 1875. He died 18th August 1880.

BULL, GEORGE, D.D., a learned prelate and theological writer, born at Wells, Gloucestershire, England, March 25, 1634; studied at Oxford, whence he retired in 1649, having refused to take the commonwealth oath imposed by the parliament. Receiving holy orders, his first charge was the parish of St. George's, Bristol. In 1658, he obtained the rectory of Suddington St. Mary's, near that city; and in 1662, was presented to the vicarage of Suddington St. Peter's. In 1669, he published his *Harmonia Apostolica*, the object of which was to reconcile the apostles Paul and James on the subject of justification. This work occasioned considerable controversy among divines, and in answer, B. published his *Examen Censuræ* and *Apologia pro Harmonia*. In 1678, he was presented to a prebend in Gloucester Cathedral, and made Rector of Avening, Gloucestershire. In 1679, he was installed Archdeacon of Llandaff, and received the degree of D.D. from Oxford University. In 1685, he published his *Defensio Fidei Nicenæ*, against the Arians and Socinians, Tritheists and Sabellians; and in 1694, his *Judicium Ecclesiæ Catholicæ*, for which the thanks of the whole French clergy were sent to him through the celebrated Bossuet. His last work was his *Primitive and Apostolical Tradition*, &c. He was consecrated Bishop of St. Davids in 1705, and died February 17, 1709.

BU'LLA, a genus of Mollusca, which in the older systems, founded upon characters taken from the shell alone, contained a heterogeneous assemblage of species essentially very different. Some of those having been removed to other orders, according to their organization, the genus *Bulla*, and the family *Bullidæ*, of which it is the type, are placed in the order *Tectibranchiata* of Cuvier, an order of the class *Gasteropoda* (q. v.), and of that section of it called *Monœcia*, having the male and female organs of sex combined in the same individual. The *Bullidæ* have a convoluted and generally thin shell, which serves as a covering and protection for the gills, and which in some of them is large enough to form a retreat for the entire animal, in others, is itself enveloped in the mantle. This shell forms a sort of transition link between the flat calcareous plate enclosed in the mantles of the *Aplysiæ* or Sea-hares—to which B. is nearly allied—and the spiral shell of snails and other such conchiferous mollusks. The mouth of the shell is large, extending the whole length of the shell, widening towards one end, the lip acute. The gizzard of the *Bullidæ* is very muscular; and among its thick coats, in many species, are found calcareous bony plates, which being moved against each other by its muscles, serve to grind down the food. All the species are marine, some are found on the British coast. Some, from their form and fragility, are popularly called BUBBLE SHELLS, as the British *Bulla Hydatis*.

Bulla Aperta.

BU'LLACE (*Prunus insititia*), a shrub or small tree, larger and much less spiny than the sloe, but very closely allied to it, as it is also to the plum, so that many botanists regard them all as one species, an opinion much confirmed by the circumstance that the varieties pass into each other by imperceptible gradations. The B. may be regarded as a form intermediate between the plum and the sloe. Its leaves, however, are generally broader in proportion to their length than those of either of these, and its fruit-stalks more frequently in pairs; it differs also from both of them in its downy fruit-stalks, and in having the under side of its leaves permanently downy. The flowers are rather larger than even those of the plum; the fruit is larger than the sloe, generally globose, and, although it partakes in some degree both of the acidity and the roughness of the sloe, it is not unpleasant, especially after having been mellowed by frosts, and makes excellent pies or tarts. 'A bullace-pie is a standing dish at the harvest-home supper in the south of England, only it requires rather more sugar than the housewife is always willing to allow.' The B. is common in hedges, coppices, and banks in England, and in many parts of Europe. It is rare in Scotland.

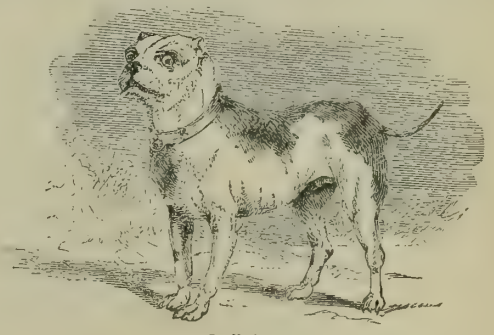
BU'LLÆ are collections of serous fluids of considerable size, situated immediately beneath the cuticle, and rising from the true skin. They differ from vesicles only in size; and no very definite line can be drawn between a large vesicle and a small bulla. They usually vary in diameter from a quarter of an inch to two inches. They may be followed by crusts or by ulcerations. They constitute a special order of skin-diseases, which includes Pemphigus and Rupia (q. v.).

BU'LLAS, a town of Spain, in the province of Murcia, and 26 miles west-north west of the town of Murcia. It is situated on a hill, 1840 feet above the sea. The streets are steep and unpaved. B. has manufactures of linen and hempen fabrics, earthenware, and brandy, and a considerable trade in manufactured goods and grain. Pop. 6145.

BU'LL-BAITING, a barbarous sport, once very popular in England, and in which all classes of society equally delighted, but now, through the progress of civilization, almost entirely confined to the lowest, and rare even among them. It consists in causing a bull to be attacked by dogs; and in order that the bull might be made as furious as possible, his nose was sometimes blown full of beaten pepper before he was turned loose. Another form of this sport was to fasten the bull to a stake, by a rope of some yards long, and to send bull-dogs against him, one at a time, which were trained to seize him by the nose, and when this was accomplished, it was called *pinning* the bull. But no small part of the enjoyment of the spectators was derived from the success with which the attacks of the dogs were met by the bull lowering his head to the ground, and receiving them on his horns, often tossing them to a great distance. In some places, B. took place regularly as a sort of annual festival, and funds were sometimes left to provide for it. King James I. of England greatly delighted in this sport. When the late Emperor Nicholas of Russia visited England, before his accession to the empire, he was present at a boxing-match and a B., which were got up to show him English tastes.

An equally barbarous sport, termed *Bull-running*, was formerly practised at Stamford and Tutbury, where men and women took the place of dogs, maddened the bull with hideous noise, and then pursued it with 'bull-clubs,' till the unfortunate animal expired beneath the blows of the brutal assailants.

BU'LL-DOG, a kind of dog which is regarded as peculiarly English, but concerning which it is doubted whether it has existed as a distinct race at least from the Roman era, or has more recently sprung up, as a variety of the mastiff, or a cross between the



Bull-dog.

mastiff and some other breed. Buffon, indeed, represesents the B. as the parent race, and the mastiff as derived from it, but this opinion is generally rejected as erroneous. The B. has been regarded as a distinct species by some naturalists, and named *Canis Anglicus*, *C. laniarius*, &c. It is much smaller than the mastiff, but is very strong and muscular. The breadth of muzzle is greater than in the mastiff, and the head is very large, almost appearing as of disproportionate size to the body. 'The forehead sinks between the eyes, and the line of the nose rises again at a considerable angle; the lower jaw projects beyond the upper, often showing the teeth, which altogether, with the frequent redness about the eyelids, produces a most forbidding aspect; the ears are partially drooping, unless the terrier blood is crossed in the animal, and the tail is carried high.' The hair is short, and the tail taper, and not bushy. The color may be ochry or reddish buff, brindled, fawn, or white, the last being preferred, and should be whole or unmixed, though dogs of two colors are exceedingly common. The B. used seldom to be seen except in the company of persons who delight in dog-fighting and other barbarous sports, but now has sometimes more reputable patrons. It was formerly much employed in bull-baiting, from which it derives its name. It is chiefly remarkable for its savage ferocity, and the pertinacity with which it retains its hold, as if its jaws were locked, and it could not let go. It will hang to the jaw or nose of a bull, although lifted from the ground. Colonel Hamilton Smith says he has seen one 'pinning an American bison, and holding his nose down, till the animal gradually brought forward its hind feet, and, crushing the dog to death, tore his muzzle out of the fangs, most dreadfully mangled.' The B. is also bold

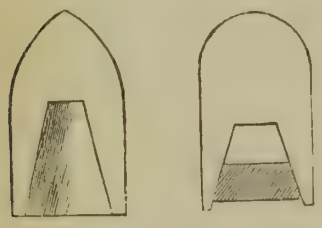
enough to attack any animal, however superior in size and strength.

The BULL-TERRIER is a cross between the B. and the terrier. It is smaller than the B., more lively and docile, and equally courageous. The ears are always pointed; the best color is white, with some black about the head. It is unrivalled in rat-catching. It is a great favorite as the companion of young men.

BULLER, CHARLES, born in Calcutta in 1806, was a gentleman whose name falls to be recorded more on account of the hopes which his death in 1848 disappointed, than for the performances of his life. He was educated at Harrow and Cambridge, at both of which he distinguished himself, and for a time studied in Edinburgh, where he had Mr. Thomas Carlyle for one of his tutors. He was called to the English bar in 1830, and entering parliament beform the Reform Bill, continued a member of the Lower House till his death. He was still but a rising man when he died. In politics, a philosophical radical, he occupied successively the posts of Judge-advocate-general and President of the Poor-law Commission under Whig governments. The interest taken in his career, and his popularity, were, it would seem, largely owing to his amiability and accomplishments for society.

BU'LLET is the leaden projectile discharged from a musket, fowling-piece, pistol, or similar weapon. When the smooth-bore muskets alone were used by British infantry, the bullets were made by casting. Molten lead was poured into moulds; and the moulds were dipped in cold water, to hasten the solidification of the lead. The moulds were cooled after every few times of using; and the lead was heated only just to the degree for maintaining fluidity. Bullets are now, however, made more expeditiously, and more truly spherical in form, by compressing machines, one form of which has been invented by Mr. George Napier. The lead is first fashioned into a rod about a yard long, by five or six eighths of an inch thick; this rod is passed between rollers to condense it; then between other rollers to press it into a row of nearly globular pieces; then a spherical die gives the proper form to each of these pieces; and, lastly, a treadle-worked punch separates them into bullets. With one of these machines, and two dies, nine boys can make 40,000 bullets in a day. Spherical bullets for the old muskets, carbines, and pistols varied from 14 to 20 to the pound, and from 0·60 to 0·68 of an inch in diameter. There is a particular ratio, depending on the specific gravity of lead, by which the number to the pound will give the diameter, or *vice versâ*.

Such bullets are, however, becoming every year less and less used in the army, being superseded by other forms better suited for rifles. These forms are singularly numerous. Robin's B. was egg-shaped, with the center of gravity at the larger end; Beaufoy's was ovoid, with a hemispherical cavity at one end; Manton's was a spherical ball put into a wooden cup, with projections on the exterior; Greener's was oval, with a plug of mixed metal driven into a hole barely large enough for it; Norton's, Delvigne's, Minié's, and others, are, or were, of various elongated shapes, mostly with some kind of plug, which, driven into the lead by the force of the explosion, causes it to fill up the grooves in the rifling of the barrel. This expanding or dilating action has been claimed by many inventors; but the government, in 1857, awarded Mr. Greener £1000, as the person who had practically solved the difficulty as far back as 1836. The bullets for the Enfield rifles are now made with extraordinary speed, by machinery of beautiful construction. The machine draws in a coil of leaden rod, unwinds it, cuts it to the required length, stamps out the bullets with steel dies, drops them into boxes, and conveys them away. Each machine, with its four dies, makes 7000 bullets per hour; and four such machines, in an easy day's work, turn out 300,000 bullets. So nearly are the machines automatic, that one man can attend them all. Other machines, attended by children, produce an equal number of little boxwood plugs for filling the cavity at the hinder end of the bullet. The differences between various bullets of modern invention are further noticed under CARTRIDGE, and BREECH-LOADING ARMS AND NEEDLE-GUNS.



Early Forms of Minié and Enfield Bullets.

BULLET-TREE, or BULLY-TREE, a tree found in Guiana, and valued for its wood, which is solid, heavy, close-grained, and durable, and also for its fruit, which is a drupe about the size of a cherry, and very delicious. It is supposed to belong to the genus *Mimusops* (natural order *Sapotaceæ*, q. v.).

BU'LLETIN. See BULL.

BU'LL-FIGHT. Combats of men with bulls, for the entertainment of the public, were common in Greece, particularly in Thessaly, and in Rome under the emperors, though in later times they were forbidden both by emperors and popes. They are still a favorite pastime in Spain and Mexico. In Spain, they were abolished by Charles IV.; but Joseph, Napoleon's brother, re-established them, out of policy, the mass of the Spanish population being passionately fond of the sport. The most magnificent bull-fights were at one time instituted by the monarchs themselves; at present, both in the capital and in the larger towns of Spain, they are held either as private speculations, or for the benefit of public institutions. In Madrid, the bull-fighting season commences in April, and lasts until November. During that time, there is at least one afternoon in every week devoted to the sport. The proceeds go to the funds of the General Hospital. The fights take place in a kind of circus, called the *Plaza de Toros*, round which the seats rise one above another, like the steps of a stair, with a tier of boxes over them. The *Plaza* is capable of containing from 10,000 to 12,000 people, who pay a high price of admission, considering the rate of wages in Spain; and all go attired in their best to the spectacle. The best Andalusian bulls are bred at Utrera, the best Castilian ones on the Jarama, near Aranjuez. The latter are the breed usually chosen for fight in Madrid. They are fiercer and more active, but inferior in strength to British animals. The horses engaged in the conflicts are worthless brutes, fit only for the knacker. The men employed in the fight are generally those who have been bred to it as a profession, but occasionally amateurs may take part in it. The B. has been described as a tragedy in three acts. The principal performers in the first are the *picadores*; in the second, the *chulos* are the only actors; the third and last act devolves solely on the *matador*. The *picadores* are all mounted, dressed like Spanish knights of the olden time, and armed with a lance; they take up their position in the middle of the circus, opposite the bull-stalls. The *chulos*, who are on foot, are gay with ribbons, and wear very bright-colored cloaks; they distribute themselves in the space between the barriers. The *matador*, *or* chief combatant, is also on foot. He is handsomely dressed, and holds in the right hand a naked sword, in the left the *muleta*, a small stick, with a piece of scarlet-colored-silk attached. On a sign given by the chief magistrate, a bull is let out from the stalls; the *picadores* stand ready in the arena waiting his charge. With a brave bull, they find all their skill requisite in acting on the defensive; with a cowardly one, they act on the offensive; and should their stabs be ineffectual in rousing the animal to the requisite fury, the poor beast is hooted by the crowd, and ultimately stabbed ingloriously in the spine.

Whenever a horse is wounded, the rider betakes himself to flight; and when either the above casualty happens, or a *picador* is thrown, the *chulos* rush in, and attract the bull by their cloaks, saving themselves, if need be, by leaping over the palisade which encloses the circus. At the same time, another *picador* calls off the bull's attention to himself by shouting. When the bull begins to flag, the *picadores* are succeeded by the *chulos*, who bring with them the *banderillas*—i. e., barbed darts about two feet long, ornamented with colored paper-flags, which they stick into the neck of the animal. Sometimes these darts have crackers attached to them, the explosion of which makes the bull furious. The *matador* now enters alone to complete the tragic business. As soon as the bull's eye catches the *muleta*, he generally rushes blindly at it; and then the *matador*, if he is well skilled, dexterously plunges the sword 'between the left shoulder and the blade,' and the animal drops dead at his feet. The victorious *matador* is greeted with acclamations, and not less so the bull, should he wound or even kill the *matador*, in which case another *matador* steps forth into the arena; but human life is rarely sacrificed. Eight or ten bulls are often despatched in a single day; twenty minutes being about the time usually taken to slay one.

In Madrid, in June 1833, 99 bulls were killed in the course of a single week. Bull-fighters are regarded as the lowest class in Spain. They are very ignorant and superstitious; and those who are killed on the spot, and die without confession, are denied burial rites.

BU'LL-FINCH (*Pyrrhula vulgaris*), a bird of the great family of *Fringillidæ* (q. v.), a little larger than the common linnet, and of a genus closely allied to the Grosbeaks and Crossbills. The genus is particularly characterized by the short, thick, rounded bill, of which the sides are inflated and bulging, and the tip of the upper mandible overhangs that of the lower one. The B. is a bird of very soft and dense plumage, of a delicate bluish-gray color above, the under parts of a bright tile-red, the crown of the head and the beak jet black, which color also appears in the greater wing and tail coverts, in the quills, and in the tail-feathers; the wings are crossed by a conspicuous white bar.

The colors of the female are less bright than those of the male. The tail of the B. is almost even. This bird is not unfrequent in England, Ireland, and the south of Scotland; and is found in most parts of Europe, from the south of Norway to the Mediterranean, extending eastward throughout Asia, even to Japan. It

frequents woods and gardens, builds its nest in trees or bushes a few feet from the ground, feeds chiefly on seeds and berries in winter, and in spring is excessively destructive to the buds of fruit-trees in those localities in which it is abundant, selecting the flower-buds, and apparently finding them the most palatable of all food. Selby says: 'I have known a pair of these birds to strip a considerable sized plum-tree of every bud in the space of two days.' On this account, gardners are sometimes compelled to wage war against the bull-finch.

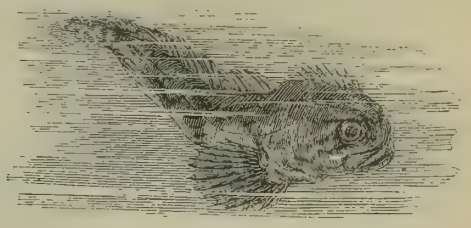
The song of this bird, in a wild state, is very simple, and has no particular quality to recommend it; but it is remarkably susceptible of improvement by education; and trained bull-finches of superior acquirements are sold at a very considerable price.

Bull-Finch.

Some of these birds learn to whistle an air very accurately, and with a power and variety of intonation far exceeding their natural song. The ability to whistle several airs well, is rare. The training of these birds is a work both of time and trouble; it is chiefly carried on in Germany. Not less than nine months of training are requisite; it begins when the bird is a mere nestling, and must be carefully continued till after the first moulting; for it is a curious circumstance, that all which has been previously acquired is very apt to be lost at that time, or is afterwards so imperfectly remembered that the bird is of little value. The B. is capable of very strong attachment to those who feed and caress it, and often becomes so thoroughly domesticated as to exhibit no desire for liberty.—Curious variations of plumage are sometimes observed in it.—Other species of the genus *Pyrrhula* are known, natives of different parts of the world; and in this genus some ornithologists include *Corythus* of Cuvier, of which one species, the Pine-finch (q. v.), or Pine Grosbeak, is a native of Britain.

BU'LL-FROG (*Rana pipiens*), a species of frog (q. v.) found in most parts of the United States and Canada, but chiefly abundant in the southern states. It is of a large size, eight to twelve inches long, of an olive-green color, clouded with black. It receives its name from the remarkable loudness of its voice, which has been compared to the bellowing of a distant bull, and comes in as a hollow bass in the frog concerts which takes place in the evening and all night long in marshy places in America. Its voice can be distinctly heard at a distance of forty or fifty yards. It sits for hours during the day, basking in the sun, near the margin of a stream, into which it plunges with a great leap on the least appearance of danger. It does not confine itself to insect and muluscuous food, like smaller frogs, but is said to be partial to young ducks, and to swallow them entire. Audubon says 'its flesh is tender, white, and affords excellent eating,' the hind legs, however, being the only part used for food. He adds that these parts make excellent bait for the larger cat-fish, and that he has generally used the gun for procuring them, loading with very small shot.

BU'LLHEAD, RIVER BULLHEAD, or MILLER'S THUMB (*Cottus Gobio*), a small fish, abundant in clear rivers and streams, in some parts of the British Islands, throughout the greater part of Europe, and in the north of Asia. It seldom exceeds four or five inches in length; is of a dark brown color on the upper parts, and white beneath; has rather large fins, with rays slightly produced into spines and prettily spotted; and in general appearance is not unlike the gunards (q. v.). It is, however, generally regarded as a disagreeable object to the sight, on account of the great size and depressed form of its head, from which it derives its English names; the name, Miller's Thumb, alluding to the broad rounded form which the last joint of the thumb of a miller used to acquire in times when machinery was ruder than now, by its continual employment in testing the quality of the flour produced, and in turning it over on the fingers for inspection, that it might be known if the mill was doing its work well. The appearance of the B. is rendered still more unattractive by the entire absence of scales, a characteristic of the genus to which it belongs, the whole body and head being covered with a soft skin. Yet it is said to be of a very delicate flavor, and in some countries is much sought after as an article of food. Its flesh, when boiled, is reddish, like that of the salmon. Izaak Walton speaks of angling for the B., and in his pleasant quaint style describes the habits of the fish: 'He does



Bullhead.

usually dwell and hide himself in holes, or amongst stones in clear water, and in very hot days will lie a long time very still, and sun himself, and will be easy to be seen upon any flat stone, or any gravel, at which time he will suffer an angler to put a hook baited with a small worm very near into his mouth, and he never refuses to bite, nor indeed to be caught, with the worst of anglers.'—The other British species of the genus *Cottus* (q. v.) are marine.

The name B. is not usually given to any of them. A sea-fish of a nearly allied genus (*Aspidophorus*) is sometimes called the ARMED BULLHEAD; it is also known as the POGGE (q. v.).—The River B. differs from the marine species of the same genus, in having only one short spine on each side of the head, on the *preoperculum*.

BULLINGER, HENRY, the friend of Zwingli, and one of the chief reformers in Switzerland, was born at Bremgarten, in the canton of Aargau, July 18, 1504. He studied at Cologne, where he became acquainted with the writings of Luther; and during the year 1527, he attended the theological expositions of Zwingli, and went along with the latter to the religious conference held at Bern in 1528, the result of which was the reformation of the canton. In 1529, he married Anna Adlischwyler, formerly a nun, who bore him eleven children. By a powerful sermon which he preached at Bremgarten, on Whitsunday 1529, B. induced his whole congregation to make a profession of Protestantism. In 1531, he was compelled by the Catholic party to flee from the canton, and went to Zurich, where in the following year he was appointed pastor of the principal church. In the controversy on the eucharist and the affairs of the Anabaptists, B. distinguished himself by his integrity and moderation; and in his house at Zurich several German theologians, compelled to leave their country, were hospitably sheltered. He took part in drawing up the first Helvetic Confession at Basel, in 1536, and in establishing a close relation between the Swiss and Anglican Churches. He died September 17, 1575. His writings are numerous. The most important is a *History of the Reformation*, which was first published at Zurich, 1838. His sermons have been translated into English. See the Lives of B. by Hess (1828) and Christoffel (1875).

BU'LLION usually means uncoined gold and silver, in bars or other masses; but in discussions on the currency, the term is frequently employed to signify the precious metals coined and uncoined. The origin of the word B. in its present sense, as well as that of the French *Billon* (q. v.), and the corresponding Spanish *vellon*, seems to be as follows: B. originally meant the mint, where the alloy for the coinage was prepared, and the coin stamped (either from the Lat. *bulla*, a round boss or stud, or stamp; or from the verb *bullare*, to boil or bubble); and hence it came in England to signify the standard metal of which the coins are made. In France, where the kings debased the currency much more than ever took place in England, *billon*, the mint, came to signify the base mixture issued therefrom.

It is a question not yet satisfactorily settled, how far any great increase in the supply of B. has that effect in lessening the value of money, and consequently raising prices, which has always been very naturally attributed to it. It may indeed be maintained with some plausibility, that if B. were capable of being produced to such an extent beyond the actual demand for it as to glut the market, it would cease to be that general standard of money value which it has become, just because it is of all others the article which is steadiest in requiring a certain outlay of labor to produce it. Rises in prices have accompanied large supplies of gold, but they have also accompanied large supplies of other commodities indicative of a a great increase in riches. It is certain that great increases in the supply of B. do not, as in the case of other goods, glut the market. For some years past, the supply of gold, owing to the new fields opened in America and Australia, has been quadrupled, with certainly no more influence on prices than what a general increase in prosperity might cause. There is, it will be observed, this great

difference between gold and other commodities, that besides what may be within the crust of the earth, there is a great mass which has been accumulating for thousands of years in the possession of mankind, which comes forth as it is wanted. A few millions of tons of iron, or bales of cotton, beyond the usual annual average, would perhaps add a few hundred per cent. to the available quantity for consumption; but a few millions of pounds worth of gold, having to be counted with all the gold in existence in the world, makes a scarcely perceptible addition to the stock.

The term B. is in this country associated with the memorable BULLION REPORT of 1810. In the year 1797, by what was called the Restriction Act (see BANK), the Bank of England was restrained from paying its notes in gold. There thus came to be two separate and independent currencies in the country—one of B., the other of paper. They came to differ in value from each other so much that in the year 1813, gold, of which the mint price was £3, 17*s*, 10*d*. per ounce, was actually worth, in bank paper, £5, 10*s*., or in other words, the one-pound bank-note was worth 14*s*. 2*d*. There were various opinions on the cause of this difference. Some people simply said, that gold was dear taking paper as the standard of value; others said, it was owing to our exports not balancing our imports; others, to too great facilities in discounting, by which money was advanced on bad security; and in general, it was held, that there could be no over-issue of paper-money if it were backed by good security, and employed only for genuine transactions, and not in fictitious credits.

In the meantime, the select committee on the high price of gold B., had been wishing to get, not through theories or speculations but through actual facts, at the truth. The work of the committee was chiefly conducted by Mr Horner, aided by Sir Robert Peel, then a young man; and both of them entered on the task without any prepossession, and the desire to find the truth. They established the conclusion, among other important truths, that paper-money is always liable to be over-issued, and consequently depreciated, unless it be at all times immediately convertible into gold, and the monetary policy of the empire was subsequently established on this principle. A full analysis of the B. report will be found in Macleod's *Dictionary of Political Economy*.

BULL'S EYE, among the rigging of a ship, is a sort of small pulley in the form of a ring, with a rope spliced round the outer edge, and another through a hole in the center.—B. E., in rifle practice, is the small black center within the circle on the target.

BULL TROUT (*Salmo Eriox* or *S. griseus*), a fish nearly allied to the salmon, and like it, migratory in its habits, ascending rivers, in which it deposits its spawn, but living chiefly in the sea. It occurs in many of the rivers of Britain, and is not unfrequently taken in the Tweed and its tributaries. It is frequently called the GRAY TROUT, sometimes simply the GRAY, and is the SEWEN of

Bull Trout (*Salmo crioc*).

the Welsh rivers. It sometimes attains the weight of 20 lbs., although it is more commonly under 15 lbs. weight. It is less elegant in form than the salmon; the head and nape of the neck are thicker in proportion; and the tail, beyond the adipose fin, is more bulky and muscular; the tail fin is square at the end in young fish (in some places called *whitlings*), and in older ones, becomes convex by the elongation of the central rays, whence the name *round-tail* sometimes given to this species. The scales are rather smaller than those of a salmon of equal size, and the color is less bright; the males in the spawning season being reddish brown, the females blackish gray; at other times the general color is like that of the salmon trout. The B. T. agrees with the salmon in having only a few teeth on the most anterior part of the *vomer* (the bone which runs down the center of the palate); while the salmon trout, the common trout, and the great lake-trout, have a long line of teeth there: the teeth are larger and stronger than those of the salmon; there are differences also in the form of the gill-covers. To anglers, the B. T. is next to the salmon as a prize, and by many is mistaken for it.

The flesh is paler in color, coarser, with much less flavor, and is much less esteemed.—The name B. T. has been also given to the HUCHO (*Salmo Hucho*), or salmon of the Danube, which sometimes attains the size of 30, or, it is said, even of 60 lbs.

BULOW, FRIED. WILH. VON, a famous Prussian general in the war of liberation, was born in 1755, entered the army young, and soon distinguished himself. When Prussia declared war with France in 1813, it was B. that commanded in the first successful encounter with the French at Möckern, April 5, and revived the self-confidence of the army after the adverse battle of Lützen. His victories over Oudinot and Ney at Grossbeeren and Dennewitz, saved Berlin, and inflicted severe loss on the enemy. He acted a conspicuous part in the battle of Leipsic, and by taking possession of Montmartre, finished the campaign of 1814. The king acknowledged his services by an estate worth £30,000, and the title of Count Dennewitz. In the campaign of 1815, he joined Blücher by forced marches, and headed the column that first came to the aid of Wellington at Waterloo. He died at Königsberg, 11th January 1818.

BULRAMP'UR, a town of Oude, India, near the frontier of Nepaul, in N. lat. 27° 24′, E. long. 82° 15′, on the Raptee, in a plain, 90 miles north-east from Lucknow. It is a town of considerable size, but mostly of mud houses, covered with thatch. From B. there is a magnificent view of Dhawalagiri. The town is on one of the most frequented routes between Lucknow and Nepaul, so that during spring and summer it is much thronged by traders, exchanging the products of Hindustan and Tibet. Pop. (1871) 14,026.

BU'LRUSH, an English popular name for large rush-like or reed-like plants growing in marshes, not very strictly limited to any particular kind. Some authors employ it in a restricted sense as the designation of plants of the genus *Typha*, also known as Cat's-tail or Reed-mace. See TYPHA. It is perhaps more commonly restricted to large species of the genus *Scirpus* (q. v.), also called Club-rush, and particularly to *S. lacustris*, a common British plant, found also in all the northern parts of the world, growing about the muddy margins of lakes and ponds, with a creeping root and round stems varying from 2 to 8 feet in height, which are almost leafless, and bear their flowers in compound umbels of small brown spikelets on their side. The root is astringent and diuretic, and was formerly employed in medicine; but the stems are the most useful part of the plant, being much employed for making chair-bottoms, mats, &c.; also by coopers for filling up spaces between the seams of casks, to which purpose their spongy nature particularly adapts them, and not unfrequently for thatching cottages.

Bulrush (*Scirpus lacustris*)
a, top of stem and flowers;
b, a single floret.

BU'LSAR, a seaport of India, in the British district of Surat, presidency of Bombay, on the estuary of a small river of the same name, which falls into the Gulf of Cambay. It is 44 miles south of Surat. It is a thriving place, with manufactures of ginghams, and a considerable trade in grain, salt, and sugar. Pop. (1871) 11,313, chiefly weavers and sailors, but partly also employed in agriculture.

BU'LTI, or LI'TTLE TIBE'T, a territory lying on the Upper Indus beyond the Himalaya, and forming a sort of debatable land between India and Tatary. It is immediately to the north of the Valley of Cashmere, with which it is politically connected by conquest. It occupies about 8000 square miles, extending in N. lat. between 34° 30′ and 36°, and in E. long. between 75° and 77°. With an average elevation of about 7000 feet above the sea, B. is surrounded by mountains of nearly the same height above its own level. Hence the temperature is such that only snow falls in what ought to be the rainy season, though in summer the thermometer ranges at noon from 70° to 90° F.

European fruits are said to be plentiful. The inhabitants are of the Mongolian race, and chiefly Mohammedans. Among the animals are the sha, the large-horned goat, the sheep, the musk-deer, and the ibis. The only town of consequence is the capital Iskardoh, which, in fact, sometimes gives its name to the whole province.

BULUBGU'RH, or BA LAMGARH, a town of India, the principal place of a jaghire of the same name, called also Furreedabad. The town is situated on the route from Delhi to Muttra, 29 miles south of Delhi, in a pleasant well-cultivated country. The town is not large, and is very crowded, surrounded by a high brick wall, with mud bastions and a deep ditch. The jaghire has an area of 190 sq. m., and its pop. is supposed to be about 57,000. The British have never interfered with the civil or criminal affairs of the jaghire, except when their interference was requested, dur-

ing the minority of the present rajah; but the Rajah of B. derives his rights from the British government. The revenue of the state is estimated at 160,000 rupees. The rajah maintains a small force of 100 cavalry and 350 infantry.

BU'LWARK, in military matters, was the old name for a rampart or bastion. In a ship, the bulwarks are the boarding above the level of the upper deck, nailed to the outside of the timber-heads and stanchions. In ordinary vessels they form a parapet, protecting the seamen from the waves, and prevent loose articles from being swept off the deck; in men-of-war they, in addition, serve to protect the men from an enemy's shot. In an inquiry made a few years ago concerning the availibility of merchant-steamers as ships of war, it was found that the bulwarks would not afford sufficient protection to the men from musket-shot; but that if the hammock-stanchions were fixed all around the bulwarks, and the men's hammocks placed in a netting upheld thereby, a very good protection might be obtained.

BULWER LYTTON, Sir Edward. See Lytton.

BULWER, Sir Henry Lytton, G.C.B., the Right Hon., diplomatist and author, an elder brother of the late Lord Lytton, was born in 1804, entered the diplomatic service in 1827, and was attached successively to the British Embassy at Berlin, Brussels, and the Hague. In 1830, he entered parliament, and during the following seven years he represented, in order, the constituencies of Wilton, Coventry, and Marylebone. In 1837, he became Secretary of Embassy at Constantinople, where he negotiated and concluded a treaty which is the foundation of our present commercial system in the East. In 1843, he was made Minister Plenipotentiary to the court of Madrid, and concluded the peace between Spain and Morocco in the following year. Whilst in Spain, his firmness and candor proved a source of great inconvenience to Narvaez, the Spanish soldier-diplomatist of that day, and who, pretending to have discovered the complicity of the British plenipotentiary in certain plots against the Spanish government, ordered him to leave Madrid. Both parties in the House of Commons approved of the whole course of B.'s conduct while at the court of Madrid, and her Majesty awarded to him the highest decorations of the order of the Bath. He afterwards proceeded to Washington, where he evinced equal art in conciliating the temper of the people, and maintaining the interests of his own country. In 1852, he was sent to Tuscany as envoy extraordinary; and in 1856 was nominated by Lord Palmerston commissioner at Bucharest for investigating the state of the Danubian Principalities. As British commissioner he called forth from every minister and from every government concerned the warmest expressions of approval, and all concurred in recommending him for the post of ambassador to the Ottoman Porte, on the return of Lord Stratford de Redcliffe, in the spring of 1858. Sir Henry Lytton became a peer in 1871, with the title of Lord Dalling and Bulwer. He died in 1872. His works include a *Life of Palmerston; Historical Characters; An Autumn in Greece; France, Social, Literary, and Political;* and a *Life of Byron.*

BU'MBOAT, a boat employed to carry provisions and other articles from harbors and ports to vessels lying at some distance from the shore. Boats of this kind belong to a class of petty traders, who, in England are, for the most part, women. The provisions commonly offered for sale are soft bread, butter, fruit, vegetables, fish, and fresh meat—the fish fried, and the meat roasted, if wanted. Among the other articles are included shirts, drawers, stockings, gloves, pipes, needles, thread, and a variety of odds and ends. The less respectable of the B. traders try to smuggle spirits on board; but if this is discovered, it leads to instant punishment. In fitting out and also in paying off ships in H.M. navy, the B. people are allowed on board for a certain length of time daily; but when a ship is in active commission, they come alongside only at meal-hours. Among the class of B. people generally, there is no little acuteness and enterprise.

They learn all particulars about ships going and coming, and will even write to far-distant ports to secure a vessel's patronage. In their dealings, they of course prefer ready-money, but in certain cases they give credit, and it is understood lose little by their liberality; for any attempt at evasion of payment by any of the crew, meets the displeasure of commanding officers. From Hongkong up to the Bogue Forts, and in other Chinese waters, bumboats frequently accompany vessels, and are apt to become troublesome. From Malta, and some other places in the Mediterranean, the bumboats also haunt vessels on short cruises, in the hope of doing a little trade.

BU'MKIN or BOO'MKIN (diminutive of *boom*), on shipboard, is a short boom which projects over each bow of the ship, to aid in extending the lower edge or clue of the foresail to windward—in nautical phrase, 'to board the fore tack to.' In a boat, the B. is a small outrigger over the stern, used for extending the mizzen.

BUMMALOTI (*Saurus ophiodon*), a fish of the family *Scopelidæ* or *Sauridæ*, often regarded as a subdivision of the great family *Salmonidæ*. It is a marine fish, a native of the coasts of India, particularly of the Bombay and Malabar coasts, from which it is exported in large quantities, salted and dried, to other parts of India, being highly esteemed for its rich flavor, and often used as a relish. In commerce, it is known not only by the name B., but by the singular appellation of *Bombay Duck*. It is a fish of elongated form, with large fins and a very large mouth, the gape of which extends far behind the eyes, and which is furnished with a great number of long, slender teeth, barbed at the points. It is extremely voracious.

BUNDELCU'ND, a territory of Hindustan, between Gwalior on the west, and the Jumna, which separates it from the Doab, on the north-east. The area formerly known as B. included four districts belonging to the British North-western Provinces (Banda, Jalun, Jhansi, and Hamirpur). Now B. is officially used only for the 'Bandalkhand Agency,' a subdivision of the Central India Agency, and in this sense is applied to a group of nine native states, and twenty-five petty jaghires under native princes. The area of the agency is 10,600 sq. m., and the pop. estimated (1872) at 1,278,000. Studded, as B. is, with isolated rocks rising precipitously from its surface—each of them a nucleus, as it were, of independence—it has generally been very much subdivided. Notwithstandtng that it is well watered, the climate renders irrigation indispensable; and it is accordingly interspersed, at the cost of great labor and ingenuity, with artificial dams. B. though not destitute of woodlands, presents rather jungle and copse than heavy timber. It is said to possess inexhaustible deposits of iron-ore and some coal. The principal towns of B. are Calpee, Jhansi, Callinger, Banda, Jalun, and Chaturpur. The first three are noticed in their places, Callinger being famous for its cave-temples, and Jhansi and Calpee having acquired celebrity in the mutiny of 1857—1858.

BU'NDI, or BOONDEE, a town of India, in N. lat. 25° 26', E. long. 75° 43', 190 miles south-west from Agra, the capital of a small state of the same name. It is situated in a valley nearly surrounded by rocky hills. The palace of the rajah is on the slope of the hill above the town, and is of great magnificence and beauty, consisting of a number of parts built at different dates, but harmonizing extremely well together. The town contains few notable edifices. It has two good bazaars, but it is a place of little commerce. It is celebrated for its iron manufactures.—The raj or state of Bundi has an area of 2291 sq. miles. A range of mountains, running north-east and south-west, divides two nearly equal level tracts—that on the south-east extending to the river Chumbul, and that on the north-west to the base of the mountains towards Ajmere. The climate is said to be unhealthy. Although the rajah and dominant portion of the inhabitants are Rajpoots, the greater part of the population, particularly in the mountains, are Meenas, supposed to be an aboriginal race, who are indefatigable freebooters. The military force of the state, including the troops of the feudal chiefs and the police force, is 6170 men. The revenue is about £50,000. Pop. of B. 224,000.

BU'NGALOW, a species of rural villa or house, so called in India. Bungalows which form the residence of Europeans, are of all sizes and styles, according to the taste and wealth of the owner. Some are of two stories, but more usually they consist of only a ground-floor, and are invariably surrounded with a verandah, the roof of which affords a shelter from the sun. In the chief cities of Calcutta, Madras, and Bombay some of the bungalows are really palatial residences, while in the mofussil they are of more moderate pretensions. In general, they are provided with exterior offices, to accommodate the large retinue of domestics common in Indian life. Besides these private bungalows, there are military bungalows on a large scale for accommodating soldiers in cantonments; likewise public bungalows, maintained by government for the accommodation of travelers, and in which seem to be blended the characters of an English road-side inn and an eastern caravanserai.

These bungalows, though they vary greatly in actual comfort, are all on the same plan. They are quadrangular in shape, one story high, with high-peaked roofs, thatched or tiled, projecting so as to form porticos and verandahs. The B. is divided into 'suits' of two, three, or four rooms, provided with bedsteads, tables and chairs; windows of glass, and framed glass doors. Off each room is a bath-room, and earthen jars of cool water. Travelers are expected to carry their servants, cooking-apparatus, wine, beer, bedding, &c., with them; but the khitmutgar of the better class of bungalows supplies table-ware, condiments, and even sometimes food and liquors, and he is usually skilled in cooking. Government charges one rupee, or two shillings a day, to each traveler for the use of the bungalow. A book is kept, in which travelers enter their names, the time of their arrival and departure, with the amount paid, and any remarks regarding the state of the B. and attendance he may think proper. Natives seldom stop in these public bangalows, for though legally open to all, they are almost exclusively resorted to by Europeans; and natives even of good

condition are fain to seek 'the squalid desolation of a tottering caravanserai,' or village 'dhurrumsala.' At every travelers' B. is stationed a government peon, who acts as watchman,, and is bound to assist travelers' servants in procuring supplies of fuel and food in the nearest village. The distance between each B, on the trunk-

Bungalow

road is generally about 12 or 15 miles—an Indian day's journey. The annexed cut represents a B. in the jungle. The introduction of railways will very soon put an end to the antique system of traveling in India—a fact greatly to be desired as its annoyances are great.

BU'NGAY, a market-town of the county of Suffolk, England, 30 miles north-north-east from Ipswich. It occupies the sides and summit of a gently rising hill, on the right bank of the Waveney, and is a well-built town, with wide streets, the principal ones diverging from the market-place. The town grew around Bungay Castle, which is supposed to have been erected by the Bigods, Earls of Norfolk, and of the walls of which some ruins still remain. The ruins of a Benedictine nunnery are also to be seen in the town. The Church of the Holy Trinity is an edifice with a round tower, supposed to be of the time of Edward the Confessor. There are numerous places of worship, belonging to different denominations, and schools, charitable institutions, assembly-rooms, &c. What was formerly the theater is now used as a corn-hall. B. carries on a considerable trade by the river Waveney in corn, malt, flour, coals, and lime. Pop. (1861) 3805; (1871) 3503.

BU'NIAS, a genus of plants of the natural order *Cruciferæ*, distinguished by *incumbent* linear spirally twisted cotyledons (q. v.), and a nut-like silicule (or round pod) with 2—4 cells. Only a few species are known, natives of the Levant. One of these, *B. Orientalis*, is cultivated in some countries—particularly in France—as a field-crop, for the sake of its leaves, which are used for feeding cattle. It was introduced into Britain more than 100 years since, but its cultivation has never become general, the amount of herbage which it yields being comparatively small. It is sometimes called HILL MUSTARD.

BU'NION is a term applied in Surgery to enlarged bursæ, or synovial sacs, situated in the anterior part of the foot, and especially over the metatarsal joint of the first or the fifth toe (see FOOT), and accompanied by more or less distortion of the joint. In the great majority of cases, bunions are directly produced by the pressure of badly-fitting boots; and if the boots are constructed of patent leather, or any material which stops the excreting action of the skin, this, too, may be regarded as an indirect cause of their formation. A bunion begins as a painful and tender spot over one of the metatarso-phalangeai joints; the part gradually enlarges, and there are indications of an effusion into a natural bursa or a newly-formed sac. The progress of the affection may stop here, the bursa remaining, and serving to protect the subjacent parts from pressure; but far more frequently it undergoes repeated attacks of inflammation, causing its enlargement; or becomes the seat of corns; or suppuration of the contents of the cyst ensues. The last accident may be followed either by obliteration of the cyst, and cure, or by a troublesome form of ulcer, especially in persons of languid circulation.

It is only in its early stage that there is any hope of removing the disease; subsequently, the treatment must be only palliative. The tender spot that precedes the enlargement should be covered by night with wet lint and oiled silk, while by day a boot or shoe exerting no pressure on the part should be worn. If the part is very tender, it may be covered during the day with soap-plaster spread on wash-leather. As soon as a cyst can be detected, the part should be occasionally treated with strong tincture of iodine, with the view of promoting absorption. The writer of the article on this subject in Holmes's *System of Surgery*, recommends an ointment of biniodide of mercury (ten grains to an ounce of lard) for the cure of bunions when uninflamed, and for such as have much fluid within them. It should not be applied so constantly as to blister the skin.. When, from any cause, inflammation takes place in the sac, water-dressing, or a poultice, should be applied; and as soon as there are definite signs of suppuration, a free incision should be made, which at once relieves the pain, and is often followed by a complete cure.

The ulcers resulting from the bursting of a bunion are very difficult to heal, especially in old persons whose circulation is languid. Stimulating local applications, such as ointment of resin, should be applied, while opium and stimulants should be prescribed for internal use, together with nourishing diet. Such ulcers, under the best treatment, not very unfrequently form the starting-point for senile gangrene.

BU'NION is a painful condition met with in the joints of the feet, most commonly at the junction of the great toe with its metatarsal bone. It is caused by a gradual displacement of the bones, the toe itself turning outwards, and leaving the head or further extremity of the metatarsal bone projecting inwards. Over the latter, the skin is generally thin, and occasionally a bursa (sac) is present between the skin and bone. The pressure of a boot causes this bursa to inflame, and this may go on to suppuration or painful ulceration. Rest, poulticing, and such remedies are generally sufficient to subdue any inflammatory attack, and wearing a shoe so constructed as to save the B. from pressure, will probably prevent a recurrence of painful symptoms; but amputation and excision of the ends of the bones have been resorted to for the cure of the troublesome distortion.

BUNKER'S HILL. See CHARLESTOWN.

BU'NKUM, a phrase used in the United States to signify an oratorical display in favor of a sham proposal, in order to catch popular applause. A member of the legislature, for example, desirous of standing well with his constituents, makes a flaming speech in favor of a measure in which they are interested; but with the knowledge that the measure is impracticable, and will not be carried. In fact, the speaker does not want to carry it; his sole object is to impose on his supporters, and acquire the character of a meritorious public leader. Such is speaking for bunkum. In some instances, the state legislatures enact laws brought forward on these dishonest grounds—the whole members, or at least a large majority of them, having no other object than bunkum. The consequence is, that many laws, agitated for by popular factions, remain a dead-letter, unless they happen to be enforced by clubs organized for the purpose. The word B. is said to be a corruption of Buncombe, the name of a county in N. Carolina, the representative of which informed Congress on one occasion that he was merely speaking 'for Buncombe.'

BUNSEN, CHRISTIAN KARL JOSIAS, BARON, one of the most distinguished statesmen and scholars of Germany, was born, 25th August 1791, at Korbach, in the principality of Waldeck, and studied philology at Göttingen (1809—1813) under Heyne. He had been appointed teacher in the Gymnasium of Göttingen in 1811, but quitted the position in 1813; and in pursuance of a course of study of Old and Middle High German, begun in company with Lachmann, and to extend his knowledge of the Germanic tongues, went to Holland, and afterwards to Copenhagen, where he learned Icelandic from Finn Magnussen. The historical works of Niebuhr and his character as a politician had filled B. with enthusiasm, and he spent some months of 1815 in Berlin, in order to become personally acquainted with the historian. In 1816, he went to Paris, and studied Persian and Arabic under Sylvestre de Sacy, and in the same year to Rome, where he married.

Niebuhr, then Prussian ambassador, took the greatest interest in the scientific pursuits of B., and procured (1818) his appointment as secretary to the embassy. The residence of the king of Prussia, Friedrich Wilhelm III., in Rome in 1822, had a decided influence on his subsequent career. In the course of a conversation in which B. had disagreed with the king, the latter asked his views on the Prussian ritual (*Agende*) and hymn-book question, then much agitated. Though these views were very different from what the king had been accustomed to hear, he took them in good part, and with expression of his personal regard, requested B. to continue in the state service. On Niebuhr's departure from Rome (1824), B. conducted the embassy provisionally for a time, and was then appointed resident minister (1827). Living in intimate intercourse with Niebuhr, B. had employed the time in deepening his investigation into the philosophy of language and religion; and had made, on the one hand, the philosophy of Plato and the constitutions of antiquity; on the other, biblical inquiries, church history, and liturgies—objects of special attention. Though not within the scope of the great plan of his life, he contributed largely to the *Beschreibung der Stadt Rom* (Description of Rome), 3 vols. (Stutt. 1830—1843); the greater part of the topographical communications on ancient Rome, and all the investigations into the early history of Christian Rome, are by him.—The first visit of Champollion to Rome formed an epoch in B.'s antiquarian studies.

He was a zealous hearer of Champollion himself, and also encouraged Lepsius (q. v.) to the study of hieroglyphics. The Archæological Institute, established in 1829, found in B. its most active supporter. When he founded the Protestant hospital on the Tarpeian Rock (1835), he also built, adjoining his own house, a place of meeting for the Institute; and labored earnestly for the cause of Protestantism. The king of Prussia had often asked his advice in the matter of the ritual, but had not adopted it. B. then, along with the chaplain, introduced (1825) into the chapel of the embassy at Rome a liturgy modelled after his own views, and sent a report (1828) to the king of the result. The king had this liturgy printed, and wrote the preface with his own hand. The work never came into the hands of the trade; but the most part of it was embodied in the *Allgemeine evang. Gesang- und Gebetbuch*, printed (1846) without the author's name, in the Rauhe Haus, Hamburg, which may be considered as the second edition of the *Versuch eines allgemeinen evang. Gesang- und Gebetbuchs* (Attempt at a General Evangelical Hymn and Prayer Book), Hamb. 1833.

In 1841, he was sent on a special mission to London, to negotiate the erection of an Anglo-Prussian bishopric in Jerusalem, and was shortly afterwards appointed ambassador at the English court. It is understood that, on occasion of a visit to Berlin in 1844, he was asked to write down his views on the question of granting a constitution to Prussia; and that in consequence he presented a series of memorials representing the urgency for a deliberative assembly, and also made a complete plan of a constitution closely resembling the English. In the Schleswig-Holstein question, B. strongly advocated the German view, in opposition to Denmark, and protested against the London Protocol of 1850. But in the midst of all his political duties, B. continued unabated his literary and philosophical pursuits, the results of which have from time to time appeared. His views regarding the part that Prussia should act in the Eastern question not being, it is understoood, in accordance with those of his court, he ceased, in 1854, to represent Prussia at the court of England and retired to Heidelberg. In the estimation of Englishmen, B. must ever hold a high place. No foreigner has ever shown a deeper appreciation of their national characteristics, or a heartier love of their social and political liberty. It must also be acknowledged that he has done service to the cause of enlightened Christianity, for, while in England, he was regarded by those who knew him both as the most philosophical and most reverent of lay-theologians. His chief works are: *De Jure Atheniensium Hæreditario* (Gött. 1813), *Die Kirche der Zukunft* (The Church of the Future—translated into English, and published by Longman), Hamb. 1845; *Ignatius von Antiochien und seine Zeit* (Ignatius of Antioch and his Time), Hamb. 1847; *Die drei echten und die vier unechten Briefe des Ignatius von Antiochien* (The Three Genuine and the Four Spurious Epistles of Ignatius of Antioch), Hamb. 1847; *Ægyptens Stelle in der Weltgeschichte* (Egypt's Place in the World's History—translated into English by Cottrell), Hamb. 1845—1857; *Die Basiliken des Christlichen Roms* (The Basilicas of Christian Rome), 1843; *Hippolytus und seine Zeit* (Hippolytus and his Time), 1851; *Christianity and Mankind*, 1854; *Gott in der Geschichte* (God in History), 1857, and the *Bibelwerk*, which B. hoped to make his chief work, of which only a part appeared before his death, which took place in 1860. See *Memoir* by his widow (1868).

BUNSEN, Robert Wilhelm, a distinguished German chemist, born at Göttingen, where his father was a professor, on March 31, 1811. He entered the university of his native town in 1828, where he devoted himself to the study of the natural sciences, especially to zoology and chemistry. He afterwards prosecuted his favorite studies at Paris, Berlin, and Vienna. After having held the post of professor at Cassel, Marburg, and Breslau successively, B. was, in 1852, appointed to the chair of chemistry at Heidelberg, where he has since remained. He has published numerous papers on physics and geology, as well as on chemistry. The charcoal pile and the burner which bear his name are in extensive use. That the hydrate of oxide of iron is an antidote to arsenic, is an important fact which was made known by him, along with his friend Berthold, in 1837. B. was the first to produce magnesium in large quantities; and, in 1860, he invented the magnesium light, which has proved so important to photography. But the greatest discovery with which his name is associated, is that of the spectrum analysis—made in conjunction with his friend Kirchhoff—which has been the means of working so many wonders in chemistry, and revealing so much to astronomers. Its first result was the discovery of two new metals. B. is not only a prolific discoverer in chemistry, but he has proved himself also one of its most successful teachers. His manner of demonstration is very happy. We have from his pen: *Descriptio Hygrometrorum* (Göttingen, 1830); *Eisenoxydhydrat* (2d ed., 1837); *Gasometrische Methoden* (1857; English by Roscoe); and other papers. The government of Baden made him privy-councillor in 1863.

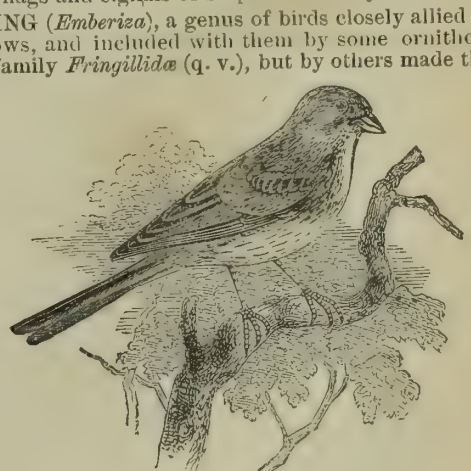
BUNT, a disease of wheat and other grains, or the parasitic fungus which causes that disease. The name B. is supposed to be a corruption of *burnt*, or at least derived from the same root, a derivation perhaps suggested by the analogy of *Brand* (q. v.). B. is also called *Pepper Brand*, and sometimes *Smut Ball*. It is one of the most common and injurious diseases of wheat, often affecting great part of a crop, although its prevalence has been greatly diminished by care on the part of farmers, and particularly by the selection of clean seed, and the dressing of the seed, before sowing, with some substance, which, without injuring its vitality, destroys that of the spores or granules of the fungus.

Even washing with water has a good effect, but greater benefit is derived from dressing with salt, quicklime, chloride of lime, Glauber's salt (sulphate of soda), and quicklime, or blue vitriol (sulphate of copper). Even arsenic and corrossive sublimate are used for this purpose. B. is now believed to be propagated by any contact of sound with unsound grain; by thrashing, which causes the B. dust to fly about; or by manure, in which the straw of infected grain bas been mixed. Upon this knowledge, the means now adopted for its prevention are founded. A considerable mixture of B. is not supposed to render flour absolutely unwholesome, at least when made into fermented bread, but the bread is of a peculiar flavor, and a very dark color. It is said that such flour is used to no small extent in the manufacture of gingerbread, the treacle disguising both the color and the flavor.

BU'NTER SA'NDSTEIN, or 'variegated sandstone,' is the lowest member of the Triassic Period. As the triass is more perfectly developed in Germany than in Britain, the German beds are considered the typical group of this period. The B. S. consists of various colored sandstones, interstratified with red marls and thin beds of limestone, which occasionally, as in the Harz, are oolitic, but in other places dolomitic. They attain a maximum thickness of 1500 feet. The English representatives of the B. S. are chiefly developed in Lancashire and Cheshire, and consist of red and mottled sandstones with beds of marl, and thick rather irregular bands of partially consolidated conglomerate called 'pebble beds.' Thirty species of fossil plants have been found in the B. S. near Strasburg, consisting chiefly of ferns, cycads, and conifers. But the most remarkable fossils in this formation are the remains of huge batrachians. Originally, the footprints which have been left by the animals on the moist sand were alone observed. From their resemblance to the impression made by a human hand, the animal producing them was provisionally named *Cheirotherium* (q. v.). The subsequent discovery and examination of the remains of teeth and bones in the same beds, have afforded sufficient materials to enable Owen to reconstruct an animal named by him *Labyrinthodon* (q. v.), which undoubtedly produced the footprints. These remains have been detected in Lancashire and Cheshire, as well as in Germany.

BU'NTINE, or BU'NTING, is a thin woollen material, of which the flags and signals of ships are usually made.

BU'NTING (*Emberiza*), a genus of birds closely allied to finches and sparrows, and included with them by some ornithologists in the great family *Fringillidæ* (q. v.), but by others made the type of



Common Bunting (*Emberiza miliaria*).

a distinct family, *Emberizidæ*, of which the most marked characteristics are a short, straight, conical bill; a curved form of the gape, produced by a narrowing of the sides of the upper mandible, and a corresponding enlargement of the under one, and a hard rounded knob on the palate or inner surface of the upper mandible. This knob probably aids in crushing the seeds, which are a principal part of the food of these birds. The species of the B. family are numerous, and are arranged in several genera. The true buntings (forming the restricted genus *Emberiza*) have the hind claw moderately short, curved, and strong, and the palatal knob large and bony. The Common B. or Corn B. (*E. miliaria*)—a bird considerably larger than a house-sparrow, brown, with darker streaks on the upper parts, whitish brown, with spots and lines of dark

brown on the under parts, and with a slightly forked tail—is frequent, particularly in low cultivated grounds in Britain, and in most parts of Europe, extending also into Asia, living in pairs during spring and summer, but in flocks in winter, and often visiting barn-yards at that season, along with chaffinches and sparrows. It is the largest of the British buntings. It is supposed that the winter flocks in Britain are much increased by migration from more northerly regions. This B. often passes the night on the ground in stubble-fields, and is taken in the nets employed for catching larks, and brought with them to market. It usually builds its nest on or very near the ground. Its notes are harsh and unmusical.—The REED B., or BLACK-HEADED B. (*E. Shoeniclus*), is a species common in marshy situations, both in Britain and on the continent of Europe; a very pretty little bird, with black head and throat, strikingly contrasted with the white nape and sides of the neck.—The CIRL B. (*E. Cirlus*), of which the head is olive-green, with black streaks, and with patches of bright lemon-yellow on the cheeks and over the eyes, is a rare British bird, and belongs chiefly to the south of Europe and the north of Africa. To this genus belong also the ORTOLAN (q. v.) and the YELLOW-HAMMER (q.v.).—The SNOW B. (q. v.), or SNOWFLAKE (*E. nivalis* of many authors), has been placed in the new genus *Plectrophanes*. The name B. has been often very vaguely used, and many species have been almost indiscriminately called buntings or finches. The palatal knob affords the best distinctive character. North America has a number of species of bunting.—The BLACK-THROATED B. (*E. Americana*) is extremely plentiful on the prairies of Texas and other south-western parts of the United States; extending, however, as far as to Ohio, and even to Massachusetts. In the middle and northern states, it occurs only as a summer bird of passage. In its habits, it closely resembles the Common B. of Europe; but the palatal knob is less hard.

BUNTING, JABEZ, an eminent Wesleyan minister, was born at Manchester in 1779. At the age of 20, he devoted himself to ministerial work, in which he was very successful. He was elected president of the annual conference in 1820, and again in 1828, 1836, 1844. In 1834, he was chosen president of the theological institution belonging to the Wesleyan Methodist body, and he acted as one of the secretaries to the Missionary Society in connection with his denomination, for a period of more than twenty years. He was the chief authority in all matters relating to the government and polity of Wesleyan Methodism. On his retirement from official life in 1857, his friends presented him with an annuity of £200, in consideration of the great services he had rendered to Methodism. He did not live, however, to profit by their kindness and forethought, having died in June 1858.

BUNYAN, JOHN, one of the most popular religious writers of any age, was born at Elstow, near Bedford, in 1628. He was brought up to his father's trade of tinker, and spent his youth in the practice of that humble craft, of which his name alone now serves to lessen somewhat the disrepute. It has generally been taken for granted that his early life was very loose and profligate, on the sole ground of his terrible self-accusations in after years, when, from the height of religious fervor and Puritan strictness, he looked back on dancing and bell-ringing as deadly sins. This point is satisfactorily disposed of by Macaulay (*Encycl. Britann.*, art. 'Bunyan'). In his 16th or 17th year, he enlisted in the Parliamentary army, and in 1645, was present at the siege of Leicester, where he escaped death by the substitution of a comrade in his place as sentry. Nothing further is known of his military career. After leaving the army, he married, and soon after began to be visited by those terrible compunctions of conscience, and fits of doubt, sometimes passing into despair, which, with some quieter intervals, made his life, for several years, a journey through that Valley of Humiliation of which he afterwards gave so vivid a picture. Hope and peace came at last, and in 1655, B. became a member of the Baptist congregation at Bedford. Soon after, he was chosen its pastor, and for five years ministered with extraordinary diligence and success, his preaching generally attracting great crowds. The act against conventicles, passed on the Restoration, put a stop to his labors; he was convicted, and sentenced to perpetual banishment.

In the meantime, he was committed to Bedford Jail, where he spent the next 12 years of his life, supporting the wants of his wife and children by making tagged laces, and ministering to all posterity by writing the *Pilgrim's Progress*. His library consisted of a Bible and Fox's *Martyrs*. He was at last released (but not by the interposition of a High Church bishop, as used to be said), and he at once resumed his work as a preacher, itinerating throughout the country. After the issuing of James II.'s declaration for liberty of conscience, he again settled in Bedford, and ministered to the Baptist congregation in Mill-lane till his death, at London, of fever, in 1688. B.'s whole works were published in 1736, in 2 vols. folio. The most popular of them, after the *Pilgrim's Progress*, are the *Holy War*—another allegory, much less successful—and *Grace Abounding to the Chief of Sinners*, an autobiographical narrative. It is supposed that no other book, except the Bible, has gone through so many editions, and attained to so wide a popularity, in all languages, as the *Pilgrim's Progress*. A facsimile reprint of the original edition of the *Pilgrim's Progress* was published in 1875. A statue of B. was unveiled at Bedford in 1874.

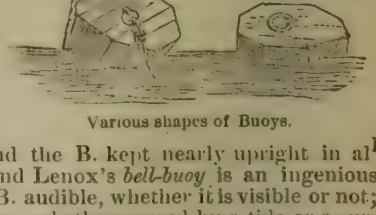
BU'NZLAU, a town of Prussia, in the province of Silesia, is situated on the Bober, about 25 miles west-north-west of Leignitz. B. has manufactures of woollens, linens, hosiery, tobacco, and earthenware, and a trade in grain. An obelisk to the Russian general, Kutusow, who died here in 1813, adorns the market-place. Pop. (1880) 10,790.

BU'NZLAU, JUNG or NEUE (*New Bunzlau*), a town of Bohemia, on the left bank of the Iser, a tributary of the Elbe, 31 miles north-east from Prague. It is well built of stone, has several churches, a Jewish synagogue, barracks, a hospital, a Piarist gymnasium, &c. It has manufactures of cotton and woollen fabrics, soap, and leather. It is said to have been founded by King Boleslaf in 973, and the fort built by him still exists. Its Bohemian name is *Mlada Boleslaw*. Pop. (1880) 9681.

BUOL-SCHAUENSTEIN, KARL FERD., COUNT, Austrian statesman, was born 17th May 1797. After filling subordinate diplomatic posts, he became ambassador at Carlsruhe in 1828, afterwards at Stuttgart (1838) and at Turin (1844). Leaving Turin on the outbreak of the war in 1848, he went as ambassador to St. Petersburg, and it fell to him to uphold the interest and dignity of his country, on occasion of the aid given by Russia in the Hungarian war. A not less difficult task was assigned him when, in 1851, he was sent to represent Austria in London; his address and conciliatory bearing contributed not a little to bring about a more friendly feeling between the two governments. On Schwarzenberg's death, B. was recalled to Vienna, and became foreign minister. In this position, he carried out the new politics of Austria no less firmly and successfully, though more moderately and quietly, than his predecessor. In the negotiations during and after the termination of the Crimean war, B. showed himself a skilful and able statesman

After defending with zeal and ingenuity, in diplomatic notes and circulars, the position which Austria had taken up with reference to Sardinia, B. suddenly, on the actual commencement of the Italian campaign of 1859, resigned his place, which was immediately filled by Count Rechberg. Failing health was the cause officially assigned for the step, but the general belief was, that it indicated a triumph of the war-party in the council of Francis Joseph. He died Oct. 28, 1865.

BUOY is a floating body, intended as a mark for the guidance of mariners. It is made either of wood or metal, and is mostly hollow, to make it float better. Buoys are generally moored by chains to the bed of the river or channel. They are of various shapes and sizes, and are painted of various colors, partly to render them conspicuous, and partly to distinguish them from one another. Sometimes floating buoys mark out the best channel for entering a dock; sometimes they warn the mariner away from sands, spits, and shoals; sometimes they mark out a continuous double line, as at Spithead, between which ships can alone with safety enter a harbor. The Trinity House has adopted a form of B., invented by Mr. Herbert, in which, by due attention to the center of flotation, and to the point where the mooring-chain is fixed, the tendency to pitch and roll is much lessened, and the B. kept nearly upright in all weathers. Messrs. Brown and Lenox's *bell-buoy* is an ingenious contrivance for rendering a B. audible, whether it is visible or not; so long as any stream of water, whether caused by a tide or a current, passes through the lower part of the B., it moves an undershot water-wheel, which rings a bell.



Various shapes of Buoys.

The lighting of coast buoys by means of compressed gas has been of late successfully attempted. Experiment proved that buoys 5 feet by 3 feet could contain enough of gas (made from shale-oil refuse or the like) to keep up a brilliant light for a month or more at a time.

BUOY'ANCY, of ships, is the amount of weight which can be buoyed up by the hull. The B. of a vessel is proportionate to the weight of water displaced by its presence (see HYDROSTATICS), and is found in this way. The cubic feet of the part of a vessel to be immersed being known, multiply it by the weight of a cubic foot of water (62·5 lbs.) and the product will be the weight of water displaced. From this subtract the weight of the vessel, and the result will be the B. or the weight a vessel will carry without

sinking lower than the given line. It is admitted, however, by naval architects, that all the old rules concerning B., displacement, and flotation, must undergo modification by the introduction of iron ships, paddle and screw propulsion, and the increased weight of broadside.

BUOY'-DUES. Buoys are under very stringent regulations, on account of their importance to the safety of ships. The public buoys, for guiding into channels, and warning from shoals and rocks, are usually marked on the best charts relating to that particular water-way. The corporation of the Trinity House has a peculiar jurisdiction over the buoys and beacons in the Thames, and along the Essex and Suffolk coasts; as well as on other coasts in England and Wales. All ships which enter the ports within this jurisdiction pay a small sum as buoy-dues. The payment is sometimes a tonnage rate, varying from 0½*d.* to 2*d.* per ton; sometimes a rate per vessel, varying from 4*d.* to 3*s.*; sometimes a payment on entering only, at others on departure as well as on entering; while some kinds of coasting vessels pay 5*s.* per annum, whatever may be the number of voyages. From the Thames buoys alone, the Trinity House receives £14,000 per annum as dues.

BU'PHAGA. See BEEFEATER.

BUPRE'STIS, a Linnæan genus of Coleopterous (q. v.) insects, now divided into a number of genera, and forming a tribe or family, *Buprestidæ*, of which some hundreds of species are known, most of them belonging to tropical countries, and remarkable for the splendor of their colors. The colors are generally metallic in

Buprestis Bicolor. Larva of Buprestis gigas.

their lustre, have frequently a burnished appearance, and are often beautifully irridescent. One of the largest species, *B. gigas*, is a native of Cayenne: it is about 2 inches long. The English and other European species are all comparatively small. Most of the species spend the night on trees, shrubs, and other plants, flying about during the hottest part of the day. Some of them are popularly known as GOLDEN BEETLES.

Plants are sometimes seen studded with them in the morning, as with gorgeous flowers. The golden *elytra* (wing-cases, see ELYTRA) of some species are used to enrich the embroidery of the Indian zenana; and the lustrous joints of the legs are strung on silken threads, and form necklaces and bracelets of singular brilliancy. The species of *Buprestidæ* found in England are few; none have yet been found in Scotland. The larvæ seem sometimes to be transported from one country to another in timber.

BUR, in an engraving, is a slight ridge of metal raised on the edges of a line by the *graver or the dry point*. As the bur produces an effect like a smear, it is usually regarded as a defect, and scraped off. Some etchers, however, take advantage of it to deepen their shadows, and Rembrandt made use of it in this way with telling effect.

BURANHEM, or BURUNHEM. See MONESIA BARK.

BU'RANO, an island and town of Northern Italy, in the Adriatic, about 5 miles north-east of Venice. The island supplies a large proportion of the vegetables consumed in Venice. B. has some lace-manufactures, boat-building, and an extensive ropework, but the inhabitants are chiefly employed in fishing. Pop. of town, 5000; of commune, 7000.

BU'RBOT (*Lota vulgaris*), a fish of the same genus with the Ling (q. v.), and of the same family with the Cod, Haddock, &c., being the only British fresh-water species of that family, *Gadidæ*. It is found in the Cam, the Trent, and other rivers of the eastern and midland counties of England, but is one of the most local of British fresh-water fishes. It is found also in various parts of the north of Europe, and at least as far south as Switzerland; in Siberia and other parts of Asia, even, it is said, in India. In English rivers, it often reaches 2 or 3 lbs. in weight, but has been taken of 8 lbs. weight; and in some parts of Europe, it is said to reach 10 or 12 lbs. weight. In appearance, the B. very much resembles the ling, but is rather thicker at the neck, and tapers rather more rapidly, although still of a somewhat elongated form. It has two dorsal fins, the first short, the second very long, and a very long anal fin. It differs from the ling in the form of the tail-fin, which is oval and slightly pointed; but agrees with it in having a single barbule on the lower jaw. It is of a yellowish-brown color, clouded and spotted with darker brown on the upper parts, the under parts lighter; the scales are small; and the whole body is

Burbot.

covered with a mucous secretion. The flesh is white, firm, and of good flavor; 'and as the B. is in its nature extremely hardy, few difficulties present themselves in the way of their increase in quantity, while the value of the fish would amply repay the trouble or the cost of the experiment.'—*Yarrell*. The B. is capable of living for a long time out of water. It is commonly taken by trimmers and night-lines, as it feeds principally during the night. Its food consists of small fishes, worms, mollusca, &c. Its liver yields an oil similar to cod-liver oil.

BURCKHARDT, JOHN LEWIS, an enterprising African traveler, was born at Lausanne, in Switzerland, November 24, 1784. In 1806, he came to London, and was introduced by Sir Joseph Banks to the African Association, which accepted his services to explore the route of Hornemann into the interior of Africa, and he embarked for Malta, February 14, 1809. He had previously qualified himself for the undertaking by a study of Arabic, and also by inuring himself to hunger, thirst, and exposure. From Malta he proceeded, under the disguise of an oriental dress and name, to Aleppo, where he studied about two years, at the end of which time he had become so proficient in the vulgar Arabic, that he could safely travel in the disguise of an oriental merchant. He visited Palmyra, Damascus, Lebanon, and other remarkable places, and then went to Cairo, his object being to proceed from thence to Fezzan, and then across the Sahara to Sudan. No opportunity offering itself at the time for that journey, he went into Nubia. No European traveler had before passed the Derr. In 1814, he traveled through the Nubian desert to the shore of the Red Sea and to Jeddah, whence he proceeded to Mecca, to study Islamism at its source. After staying four months in Mecca, he departed on a pilgrimage to Mount Arafat. So completely had he acquired the language and ideas of his fellow-pilgrims, that, when some doubt arose respecting his Mohammedan orthodoxy, he was thoroughly examined in the Koran, and was not only accepted as a true believer, but also highly commended as a great Moslem scholar. In 1815, he returned to Cairo, and in the following year ascended Mount Sinai. The Fezzan caravan, for which he had waited so long, was at last about to depart, and B. had made all his preparations for accompanying it, when he was seized with dysentery at Cairo, which terminated his life in a few days, October 15, 1817, at the early age of 33. As a holy *sheik*, he was interred with all funeral honors by the Turks in the Moslem burial-ground. His collection of oriental MSS., in 350 volumes, was left to the university of Cambridge. His journals of travel, remarkable alike for their interest and evident truthfulness, were published by the African Association. B. was a man born to be a traveler and discoverer; his inherent love of adventure was accompanied by an observant power of the highest order. His personal character recommended him to all with whom he came in contact, and his loss was greatly deplored, not only in England, but in Europe. His works are—*Travels in Nubia*, 1819; *Travels in Syria and the Holy Land*, 1822; *Travels in Arabia*, 1829; *Notes on the Bedouins and Wahabis*, 1830; and *Manners and Customs of the Modern Egyptians*, 1830.

BU'RDEN, a term of law in Scotland, used to signify any restriction, limitation, or encumbrance affecting either person or property. Burdens are said to be personal or real. Where a party is taken bound by acceptance of a right to pay a certain sum to another, but where there is no clause charging the subject conveyed with the sum, the burden is said to be *personal;* that is, it will be binding upon the receiver and his representatives, but will constitute no real encumbrance on the lands, or other subject conveyed, nor amount, indeed, to anything more than a mere personal obligation on the granter. But where the right is expressly granted under the burden of a specific sum, which is declared a burden or charge on the lands themselves, or where the right is declared null if the sum be not paid, the burden is said to be *real.*

By the 10 and 11 Vict. c. 48, real burdens need not be inserted in full in conveyances, if they have already been set forth in an instrument of title, in which case, they may be referred to in the terms, or as nearly as may be in the terms, set forth in schedule

C annexed to the act. A similar provision is made in regard to lands held in burgage tenure, by the 10 and 11 Vict. c 49.

BU'RDEN, or BU'RTHEN, of a ship. See TONNAGE.

BURDEN OF PROOF, in legal procedure, signifies the obligation to establish by evidence certain disputed facts; and, as a general rule, this burden lies on the party asserting the affirmative of the issue to be tried or question in dispute, according to the maxim *ei incumbit probatio qui dicit non qui negat*—that is, proof is incumbent on him who asserts, not on him who denies. The principle of the law is, that the B. of P. is on the party who would fail if no evidence were adduced on either side. Accordingly, it almost always rests on the plaintiff in an action, or on the party asserting the facts on which the result of the litigation must depend. In one case tried before the late Baron Alderson, that learned judge laid down that the proper test was, *which party would be successful, if no evidence at all were given?* the B. of P., of course, falling on the party not in that position. This test has since been generally adopted and applied; but Mr. Best, in his learned work on the *Principles of Evidence*, improves on it by the suggestion, that in strict accuracy the test ought to be, 'which party would be successful, if no evidence at all, *or no more evidence*, as the case may be, were given?' a consideration on which the discretion and judgment of counsel frequently depend.

But although such, in general, is the position of the plaintiff, it sometimes happens that the B. of P. is imposed on the defendant, in consequence of his having the affirmative of the material issue to be tried.

It is this rule as to the B. of P. that demonstrates the real nature of the plea of *not guilty* in a criminal prosecution, and which divests that plea of the objections to it which are frequently heard expressed by over-scrupulous sentimentalists; for the meaning of that plea is not necessarily an assertion by the prisoner that he is absolutely guiltless or innocent, but that he wishes to be tried, and that as the B. of P. is on the prosecutor, while he has meanwhile the presumption of innocence in his favor.—Besides the work referred to, see on the subject of this article Starkie on the *Law of Evidence in England*, and Dickson on the same subject in Scotland.

BURDENS, PUBLIC. See PUBLIC BURDENS.

BURDER, REV. GEORGE, an active and influential minister of the Congregational body, was born in London, June 1752. After studying some time as an artist, he devoted himself to the ministry, and in 1778 was appointed pastor of an Independent Church at Lancaster. He afterwards removed to Coventry, and in 1803 to London. Here he became secretary to the London Missionary Society, and editor of the *Evangelical Magazine*, the duties of which offices he discharged with great zeal, until failing health compelled him to resign. B. took a prominent part in all the religious movements of his time. He died May 1832. His *Village Sermons* have been translated into several European languages; and he was the author of other series of sermons and publications which have had an immense circulation.

BURDETT, SIR FRANCIS, Bart., the most popular English politician of his time, born January 25, 1770. Educated at Westminster School and Oxford University, he spent some years on the continent, and was a witness to the progress of the first French Revolution. In 1793 he married Sophia, youngest daughter of Thomas Coutts, Esq., the wealthy London banker, and in 1796 was elected M.P. for Boroughbridge, Yorkshire. In 1797, on the death of his grandfather, he succeeded to the baronetcy. In the House of Commons, he made himself conspicuous by his opposition to government and the war, and his advocacy of parliamentary reform, Catholic emancipation, and other liberal measures, most of which were afterwards carried. One of the most effective political speakers of that excited period, he for many years prominently occupied public attention, and was the idol of the London populace. Having succeeded in obtaining a parliamentary inquiry into the abuses of the metropolitan prisons, he became, in 1802, a candidate for Middlesex. He was first returned, then unseated, and after a second contest, defeated.

At the general election of 1806, B. again became a candidate for Middlesex, but was defeated. In May 1807, he fought a duel with Mr. James Paull, one of the candidates for Westminster the previous year. Soon after, he was returned, with Lord Cochrane, for Westminster, which he represented for nearly thirty years. B. having in 1810 published, in Cobbett's *Political Register*, a Letter to his Constituents, declaring the conduct of the House of Commons illegal in imprisoning John Gale Jones, the Speaker's warrant was issued for his apprehension, as being guilty of a breach of privilege. Refusing to surrender, he for two days barricaded his house; the populace supported him in his resistance, and in a street contest between them and the military some lives were lost; but on April 9, the sergeant-at-arms, aided by the police and military, obtained an entrance, and conveyed him to the Tower. The prorogation of parliament restored him to liberty. Prosecuted in 1819 for a libel contained in a Letter to his Constituents, strongly animadverting on the proceedings of the magistrates and yeomanry at the memorable Manchester meeting, he was sentenced to three months' imprisonment in the King's Bench, and to pay a fine of £1000. In 1835, he deserted the Liberal party, and joined the Conservatives. In 1837, he was returned for Wiltshire. He died in 1844.

BURDETT COUTTS, THE RIGHT HON. ANGELA GEORGINA, BARONESS, daughter of Sir Francis Burdett, was born in 1814. In 1837, she inherited much of the property of her grandfather, Thomas Coutts, the banker, on the death of his widow, who died Duchess of St. Albans. The liberal and public-spirited use she has made of this wealth, in her efforts to mitigate the sufferings of her fellow-creatures and the lower animals, has rendered her name well known and deservedly popular. Besides spending large sums of money in building and endowing several churches and schools, she endowed the three colonial bishopries of Cape Town, Adelaide, and British Columbia, at an outlay of about £50,000, and founded an establishment in South Australia for the improvement of the aborigines. In her zeal for the good of her own sex, she effected important reforms in the teaching of girls at the National Schools, and established a shelter and reformatory for fallen women. To the city of London she has presented, besides several handsome fountains, the Columbia Market, Bethnal Green, for the supply of good and wholesome food in a poor district. She also built Columbia Square, consisting of model dwellings at low rents, for about 300 families; and, taking great interest in emigration, has assisted many poor families in their passage and outfit. Her private charities have been on a corresponding scale; and she is also a liberal patroness of art. In 1871, she accepted a peerage from government. In 1872, the freedom of the City of London was conferred upon her; and in 1874 also that of Edinburgh. In 1881, she was married to Mr. Ashmead Burdett-Coutts Bartlett.

BU'RDOCK (*Arctium*), a genus of plants of the great natural order *Compositæ* (q. v.), tribe *Cynarocephalæ*. The heads of flowers are globose, or nearly so; and each of the scales of the involucre runs out into a long rigid prickle, which is hooked at the point. By means of these hooks, the flower-head, popularly called a *bur*, readily lays hold of the clothes of a passer-by, the wool of a sheep, or the like, and thus the seeds are transported from one place to another, the short hairy pappus being insufficient to waft them far on the wind. The common B. (*A. Lappa*), of which varieties very slightly distinguished have sometimes been described as species (*A. Bardana*, &c.), is abundant in waste and bushy places, by waysides, &c., in Britain and throughout Europe, scarcely, however, growing except in rich land. Its root is biennial, large and fleshy, somewhat carrot-shaped; the root-leaves large, stalked, heart-shaped; the stem stiff, upright, somewhat branched and leafy, three feet or more high. The whole aspect of the plant is coarse, and it is somewhat clammy to the touch. The root is sometimes used in medicine, being diaphoretic and diuretic, and acting upon the cutaneous system and the kidneys. It is capable of being made a substitute for sarsaparilla. When fresh, it has a disagreeable smell, but when dry, it is inodorous; it has a sweetish mucilaginous taste, becoming afterwards bitterish and rather acrid, and contains chiefly inulin, bitter extractive, mucilage sugar, and a little tannin. In many countries, the roots, young shoots, and young leaves of B. are used in soups; and the plant is cultivated for this use in Japan. The roots are said to resemble artichokes in taste. The leaves and their expressed juice are sometimes applied to burns and suppurations.

Burdock.

BURDWA'N, a city in the district and province of the same name, in the government of Bengal, on the Grand Trunk Road from the Hoogly to the N.W. Provinces, in lat. 23° 12′ N., and long. 87° 56′ E., 74 miles from Calcutta, with which it is connected by railway. In point of architecture it is a miserable place—an aggregate as it were, of second-rate suburbs. Pop. (1871) 32,321.

BURDWA'N, the district of the last-mentioned city, lying between Beerbhoom on the north, and Hoogly on the south. It stretches in N. lat. from 22° 52′ to 23° 40′, and in E. long. from 87° 21′ to 88° 23′. It has an area of 3523 square miles, with (1871) 2,034,745 inhabitants, or 577 to the square mile—a proportion which certainly seems to justify a name that signifies *productive-*

The district is largely engaged in the refining of sugar. It exports also iron and coal; chiefly, however, brought from the mines of Bancoorah, the district on the west. Next to the capital, Cutwa and Culna are the chief towns.—The *division* of B. has an area of 12,719 sq. m., and a pop. (1871) of 7,286,957.

BUREAU, a French word signifying a writing-table or desk; also an office for transacting business, a department of government, or the officials that carry it on. BUREAUCRACY is popularly applied to signify the kind of government, exemplified in many continental states, where a host of government officials, regularly organized and subordinated, and responsible only to their chiefs, interfere with and control every detail of public and private life—the evil which the Germans call 'much-government' (*vielregieren*).

BUREN, MARTIN VAN, a president of the United States of America (1837—1841), born at Kinderhook, in Columbia, New-York, December 5, 1782. Educated for the bar, he was elected, in 1812, senator in the legislative assembly of New York, and in 1821 took his seat in Congress, where he supported democratic measures. In 1829 he was made Secretary of State, and in 1837 he succeeded General Jackson in the presidency, being elected by a majority of twenty-four votes over his rivals, Clay, Webster, and Harrison. On beginning the duties of his office, he found himself involved in such financial perplexities, that he immediately summoned Congress to an extraordinary session, and proposed an entire separation of state finances from the banks of the Union, a proposition which was decisively rejected, and B.'s popularity was greatly damaged. In 1840, he had to yield his place to General Harrison, the Whig candidate; and in 1844, when he again stood for the presidency, he was defeated by Polk. The result of this vote divided the Democrats into two parties, one of which, at a convention at Utica, unanimously declared for Van B. as president for 1848; but his election was prevented by the military renown of General Taylor, who left both Van B. and Cass with minorities. In 1856, he was again named for the presidency; but the majority of the Democratic party preferred Mr. Buchanan. He died July 1862.

BURG, a town of Prussia, in the province of Saxony, situated on the Ihle, about 13 miles north-east of Magdeburg. It is walled, and has long been famous for its extensive woollen manufactures. It has also manufactures of linen, yarn, steel, pottery, and leather; dye-works, distilleries, foundries, &c., and a large trade in agricultural produce. Pop. (1880) 15,877.

BURGAGE TENURE is a species of holding in the law of real property which prevailed both in England and Scotland, although somewhat differently regarded in these two countries. In England, it is a species of free *socage* (q. v.) holding, and it prevails where the king or other person is lord of an ancient borough in which the tenements are held by a certain and determinate rent, and subject to a variety of customs, the principal and most remarkable of which is that called *Borough English* (q. v.). Among the other customs was a law that the wife shall be endowed with all her husband's tenements, and not with the third part only, as at common law.

In Scotland, by this tenure is meant a peculiar sort of military holding affecting property in royal burghs, the sovereign being superior or over-lord, and each individual proprietor or burgess holding direct of the crown, for the *reddendo* or service of *watching and warding* (q. v.). This service is otherwise termed 'service of burgh used and wont,' and is now merely nominal. Although the burgesses hold immediately of the crown, they do not receive their formal entry directly from the sovereign, but from the magistrates of the burgh, as the crown's commissioners. If the burgh, as such, ceases to exist, the crown does not thereby lose its rights over the proprietors, for they continue as crown vassals (q. v.). The statutes 31 and 32 Vict. c. 101, and 32 and 33 Vict. c. 116, abolished many useless forms in this tenure. See TENURE of LAND.

BURGAS, or BURGHAZ, a town of Turkey, in the province of Eastern Roumelia, on a promontory in the Black Sea, about 76 miles north-east of Adrianople. B., which is well built and clean, has manufactures of pottery of a superior kind and a good trade in agricultural produce. Pop. about 6000. The Gulf of Burgas, at the head of which the town is situated, is about 14 miles in length, and has a depth varying from 5 to 12 fathoms.

BU'RGEO ISLANDS, belonging to England, and lying between Newfoundland and Cape Breton, in lat. 47° 33′ N., and long. 57° 44′ W. Besides being valuable as a fishing-station, they occupy a commanding position with respect to British North America in general, and the Gulf of St. Lawrence in particular. The group has 700 inhabitants.

BURGER, GOTTFRIED AUGUST, one of the most popular German poets, was born, January 1, 1748, at Molmerswende, near Halberstadt, in Prussian Saxony. In his boyhood, he displayed no capacity for hard study, and was particularly averse to Latin; but he at the same time showed a relish for verse, though destitute of any other model than the Psalm-book. In 1764, he went to Halle, and applied himself to theology. In 1768, he abandoned this science for jurisprudence, which he studied at Göttingen. Here his conduct was careless and immoral, and he would probably have sunk into obscurity, if the intimacy which he happily formed with Voss, the two Stolbergs, and other young poets, had not stirred up his better nature, and inspired him with an earnest ambition to excel. He labored hard at the classics of ancient and modern times, but the study of Shakspeare and Percy's *Reliques* had the greatest influence in deciding the style of poetry which he was to adopt. With regard to the intrinsic merits of his poems, which consist chiefly of ballads and songs, even German critics—such as Schiller, Gervinus, and Vilmar—differ widely in their opinions; but all agree in praising the popular style and fluent, spirited versification of his ballads, *Leonora*, *Lenardo and Blandine*, the *Parson's Daughter of Taubenhayn*, the *Wild Huntsman*, &c. B.'s life was spent in great poverty and misery, partly the result of misfortune, and partly induced by his own errors. He married thrice, in two instances very unhappily; lost his property by an unfortunate speculation; and, though the favorite poet of the German people, was left to earn his bread by translations and similar literary labors. He died June 8, 1794. Though a popular writer, B. was very careful as to style, and was one of the first who wrote good hexameter verse in German. Since 1798 there have been numerous complete and partial editions of his works. See B.'s life by Döring (1826), and by Pröhle (1856).

BU'RGERMEISTER, the German title of the chief magistrate of a city or town, analogous to the French *maire*, the English *mayor*, and the Scotch *provost*.

BU'RGESS, or BU'RGHER, from the same origin as borough, means, when taken in a general sense, much the same thing as the word citizen, but has a variety of special meanings, according to local institutions. In French literature, the word *bourgeois* is generally used to personify the excess of plebeian vulgarity; while, on the other hand, in England, the aristocratic member of parliament for a city is technically called a burgess. In almost all parts of Europe, when used in a technical sense, the word means a person who holds some peculiar privilege in a town or municipal corporation. The burgesses of the European towns, indeed, were, and still nominally are, an interesting relic of ancient Roman institutions, existing in contest and rivalry with the institutions of feudality. The B., with a different name, is virtually the civis or citizen of the Roman municipality. It was a rank always of some moment, but especially valuable when the citizenship was of Rome, the metropolis. St. Paul, when he was to be scourged, raised the alarm of the chief captain by stating that he was a Roman. Such an event might often have happened in the middle ages, when a B., brought before the court of a feudal lord, claimed the privilege of pleading in his own burgal court, or the king's tribunal. The European monarchs found it their interest to support the burgesses, as a check on the influence of the feudal aristocracy; and thus was nourished the great system of city communities, which have exercised so important an influence on the fate of the world. See MUNICIPALITY.

In the law of England, a B. is a member of the corporation of a corporated town, or he may be described as a freeman duly admitted as a member of the corporate body. This privilege was, and, to some extent, still is, acquired by birth or servitude—that is, by being born of a freeman, or by apprenticeship for seven years within the borough to a freeman. It might also be obtained by gift or purchase; and the Municipal Corporation Act, the 5 and 6 Will. IV. c. 76—with the exception of abolishing the last-mentioned mode of admission by gift or purchase—expressly reserves the rights of such freemen and their families; and it also provides for making up and preservation of a list of burgesses so admitted, to be called the *Freeman's Roll* (q. v.). In that act, a burgess is defined to be a male person, who, on the last day of August in any year, shall have occupied any house, warehouse, counting-house, or shop within the borough, during that year and the whole of the two preceding years; and during such occupation shall also have been an inhabitant householder within the borough, or within seven miles thereof.

As the law now stands, every person of full age (and this includes females) who on the last day of July shall have occupied any house, warehouse, counting-house, shop or other building within the burough during the whole of the preceding twelve months, and also shall have resided within seven miles of the borough, shall, if duly enrolled, be a burgess and member of the body corporate of the mayor, alderman, and burgesses of such borough, provided he shall have paid his burough rates up to the preceding January, and shall not have been in receipt of parochial relief. The premises occupied need not be the same throughout the year if they are within the borough, 35 and 36 Vict. c. 55 See TOWN-COUNCIL. The vote is by ballot.

In the Scotch law, the old definition of B. is still maintained. This is very similar to the old English one above mentioned, with the addition of admission to the privilege *by election of the magistrates of the burgh*—the burgesses taking, on the occasion of their admission, a quaint form of oath, in which they confess the religion of the country, loyalty to the Queen, to the provost and bailies of the burgh and their officers, and declaring, *inter alia*, that they will 'make concord where discord is, to the utmost of their power.' By the Scotch Municipal Reform Act 3 and 4 Will. IV. c. 76, s. 14, it was enacted that councillors must be entered burgesses of the burgh before their induction, but now, any councillor is at once made a B. by minute of council. One of the peculiar privileges of a B. in Scotland, that of his heir having a right to *heirship movables*, was abolished by the statue 31 and 32 Vict. c. 101, s. 160, Titles to Land (Scotland) Act. An act assimilating the law of Scotland to that of England respecting the creation of burgesses was passed in 1876.

BURGESS LIST AND BURGESS ROLL are lists made under the provisions of the Municipal Corporation Act, 5 and 6 Will. IV. c. 76, amended by 20 and 21 Vict. c. 50, and 32 and 33 Vict. c. 55. The overseers of the poor of every parish wholly or in part within any borough, are directed to make out an alphabetical list, called the *burgess list*, of all persons who may be entitled or qualified to be enrolled on the burgess roll of that year, such list to be open for persual by any person, without the payment of any fee, at all reasonable hours, between the 1st (when the list must be signed and delivered) and 15th days of September in every year. This list is afterwards revised by the revising barrister, and the names of those persons allowed, on revision, to remain, are then transferred to the *Burgess Roll*, which is copied into a general alphabetical list in a book provided for that purpose by the town-clerk or clerk of the peace, and which book must be completed on or before the 22d of October in every year; every such book being the burgess roll of the burgesses entitled to vote for councillors, assessors, and auditors of the burough.

Copies of such burgess roll, so completed, shall be made in writing, or printed for delivery and sale to all persons applying for the same, on payment of a reasonable price for each copy. There are other regulations respecting these lists, and with respect to neglect and informality in making up the burgess roll. Every person of full age, who occupies a house, warehouse, counting-house, shop, or other building within the borough for twelve months, and resident in or within seven miles, shall, if duly enrolled, be a burgess, 32 and 33 Vict. c. 55.

In regard to Scotland, it has been already explained (see BURGESS), that persons entitled to the privileges of burgesses must be admitted according to the old form, and councillors, before induction, may, by a minute of council, be made burgesses, 23 and 24 Vict. c. 47. But the list, which corresponds to the English burgess roll, is the list of municipal *electors* qualified according to the provisions of the 3 and 4 Will. IV. cc. 76, 77; 31 and 32 Vict. c. 108; and 33 and 34 Vict. c. 92, relating to royal burghs in Scotland.

BURGH is a descriptive name of towns and cities in Scotland, corresponding to the English word *Borough* (q. v.). There were *burghs of barony*, *free burghs*, *burghs of regality*, and *royal burghs*. Since 1832, there have been what are called *parliamentary burghs*—that is, towns or burghs not being royal burghs, but sending or contributing to send representatives to parliament, under the Act 2 and 3 Will. IV. c. 65. By the General Police Act for Scotland, the word B. was declared to mean also any populous place, the boundaries of which are fixed by the act. Among parliamentary burghs are Paisley, Greenock, Leith, Kilmarnock, Falkirk, Hamilton, Peterhead, &c.; and by the 3 and 4 Will. IV. c. 77, 15 and 16 Vict. c. 32, 16 and 17 Vict. c. 26, 31 and 32 Vict. c. 108, 33 and 34 Vict. c. 92, 35 and 36 Vict. c. 33, a code is given for the election of their magistrates and councillors, and for the appointment of other officers; the election being with the persons qualified to vote for a member of parliament—to be concluded in Paisley, Greenock, Leith, and Kilmarnock, by open poll in one day, the polling-books to be summed up, and the result declared by the provost; in Falkirk, Hamilton, Musselburgh, Airdrie, Port-Glasgow, Peterhead, Portobello, Cromarty, and Oban, to be by signed lists: a third of the council to go out, and others to be elected every year; and the provost and magistrates to be chosen by the council from their own number.

The police of burghs, and everything regarding their draining, cleaning, lighting, &c., are regulated by the Police (Scotland) Act, 20 and 21 Vict. c. 72, and the Public Health (Scotland) Act, 30 and 31 Vict. c. 101.

BURGHS OF BARONY are corporations consisting of the inhabitants of determinate tracts of ground within the *Barony* (q. v.), and municipally governed by magistrates, whose election is either dependent on the baron or lord of the district, or vested in the inhabitants themselves. Sometimes their charter of incorporation gave them power to create subordinate corporations and crafts, as in royal burghs; but all exclusive privileges of trading in burghs are abolished by the 9 and 10 Vict. c. 17. In other respects, the general corporate law of the country applies to burghs of barony, as to which see below, BURGHS, ROYAL. They have power to administer their common good, to elect their burgh-officers, to make bye-laws, and their burgesses are entitled to challenge the sale or other disposition of the burgh's property.

BURGHS, FREE, were burghs of barony enfranchised by crown charter with rights of trade, both home and foreign, but subjected, at the same time, to the same class of public burdens and taxation which royal burghs had to bear as the price of their peculiar privileges. Since the gradual decay and ultimate suppression of commercial monopoly, this class of burghs has become extinct, or rather *all* burghs may now be said to be *free*.

BURGHS OF REGALITY were burghs of baronies, spiritual or temporal, enfranchised by crown charter, with regal or exclusive criminal jurisdiction within their own territories, and thence called *regalities* (q. v.). Some of these burghs of regality, especially those which were dependent on the greater bishops and abbots, were of high antiquity, and possessed jurisdiction and privilege of trade only distinguishable from those of royal burghs, by being more circumscribed in their limits. Since the abolition of hereditary jurisdictions, by the Act 20 Geo. II. c. 43, the distinction between burghs of regality and burghs of barony has ceased to be of any practical importance.

BURGHS, ROYAL. A royal burgh is a corporate body deriving its existence, constitution, and rights, from a royal charter—such charter being either actual and express, or presumed to have existed, and by the accident of war and time, to have perished. By a Scotch act passed in 1469, a constitution was given to royal burghs, by which the right of appointing their successors belonged to the old councils, the act also containing the singular provision, that when the new council was chosen, the members of it, *along with those of the old council*, should choose all the office-bearers of the burgh, each craft or trade corporation being represented at the election by one of themselves.

But this simple plan was not universally adopted, and the election gradually lost its former free and popular form—a close and exclusive proceeding being ultimately established in its place. This 'close system,' as it has been called, notwithstanding its repugnancy to the spirit of the times, and modern ideas of public administration, continued in force until the year 1833, when an act of parliament was passed, the 3 and 4 Will. IV. c. 76, amended by the 4 and 5 Will. IV. c. 87, and the 16 Vict. c. 26, by which it was abolished, and an entirely new constitution given to royal burghs, with the exception of nine of them, which, on account of the smallness of their population, were left unchanged till the passing of the Municipal Elections Amendment Act (Scotland) in 1868. These nine burghs were: *Dornoch*, *New Galloway*, *Culross*, *Lochmaben*, *Bervie*, *Wester Anstruther*, *Kilrenny*, *Kinghorn*, and *Kintore*. Of the other royal burghs, being those to which the reforming acts apply, the principal are—EDINBURGH, *Glasgow*, *Aberdeen*, *Dundee*, *Perth*, *Dunfermline*, *Dumfries*, and *Inverness*. The leading provisions of these acts are as follows: All persons within the burgh qualified under the Parliamentary Reform Act, 2 and 3 Will. IV. c. 65, in respect of property or occupancy of premises, and who have resided for six months next previous to the last day of June, within the royalty, or within seven miles of it, are entitled to vote in the election of councillors. In such burghs as do not now send members to parliament, property of the same value is required for the qualification, and claims for this privilege must be lodged with the town-clerk on or before the 21st of July, in a particular form. The councillors are chosen from among the electors residing, or personally carrying on business, within the royalty; and where there is a body of burgesses in the burgh, each councillor, before his induction, must be entered a burgess—a requisite clearly unnecessary for the purposes of the municipal administration contemplated by the act, and which, it is expected, will be done away. The number of councillors in each burgh is such as, by the *sett* or constitution existing at the passing of the act, formed the common council, or where this was variable, the smallest number making a full council.

The electors of Edinburgh, Glasgow, Aberdeen, Dundee, Perth, Dunfermline, Dumfries, and Inverness, are divided into wards or districts. At the election immediately succeding the passing of the act, each ward elected six councillors; but as every year the third part of the council goes out of office, in the order prescribed by the act, two councillors are now annually chosen by each ward, there being no bar, however, to the re-election of an outgoing councillor. The electors in other burghs choose the whole council exactly as these wards do their proportion of it, and consequently elect each year a third part in place of that which has retired. Upon the third lawful day after the election succeeding the passing of the act, the councillors meet and choose, by a plurality of voices, a provost, bailies, treasurer, and other office-bearers, as existing in the council by the sett or usage of the burgh; and vacancies occuring among such office-bearers, in consequence of the an-

nual retirement of the third part of the council, are directed to be supplied from the councillors in like manner, as soon as the election of the new third has taken place, the first attending magistrate having a casting vote in cases of equality. Vacancies taking place during the year by death or resignation are supplied, *ad interim*, by the remaining members of the council, and the persons so elected by the councillors retire at the succeeding election. The rights of the guildry, trades, &c., to elect their own dean of guild, etc., are still preserved; but they are now no longer recognized as official or constituent members of the council, their functions being performed by a member of the council, elected by a majority of the councillors. In Aberdeen, Dundee, and Perth, however, the dean of guild, and in Edinburgh and Glasgow, the convener of trades and the dean of guild are, *ex officio*, members of council; and the electors in all the above-named burghs choose such a number of councillors as, together with these officers, makes up the proper number. No magistrate or councillor can be town-clerk. The magistrates and council possess the same powers of administration and jurisdiction as were enjoyed by the magistrates and town-council before the passing of the act; and none of them is responsible for the debts of the burgh, or the acts of his predecessors, otherwise than as a citizen or burgess. The existing council in all burghs royal must every year make up, on or before the 15th of October, a state of their affairs, to be kept in the town-clerk's or treasurer's office.

The police of burghs and other populous places, and the paving, draining, cleansing, lighting, and improving the same, are regulated by the 25 and 26 Vict. c. 101, which repeals several previous acts. In this act 'burgh' is defined to mean all burghs and populous places whose boundaries have been fixed; and it is provided that the sheriff may fix the boundaries and so constitute a burgh in this sense, for purposes of improvement and police, at the instance of seven or more householders.

BURGHERS, a name popularly given to a religious denomination in Scotland. See UNITED PRESBYTERIAN CHURCH.

BURGH ACRES are acres or small patches of land lying in the neighborhood of *Royal Burghs* (q. v.), usually feued or leased out to burgesses or persons resident within the burgh. A Scotch act of parliament, passed in 1695, relating to the division or partition of lands lying runrig, excepts burgh acres, or, as the act calls them, 'burrow and incorporat acres,' from its provisions; but this is to be understood only of royal burghs, and not of burghs of barony or others.

BURGHS, CONVENTION OF. See CONVENTION OF ROYAL BURGHS.

BURGKMAIR, HANS, a noted old German painter and wood-engraver, was born at Augsburg, 1473. He was the father-in-law of the elder Holbein, and the friend of Albert Dürer, whose influence is manifest in B.'s works. Several excellent paintings by B. are preserved in the galleries of Munich, Berlin, Augsburg, and Vienna. But he is best known as a wood-engraver; his cuts amounting in all to nearly 700. Among the most celebrated of these is his 'Triumph of the Emperor Maximilian,' in 135 cuts, with a description by the emperor himself. Another fine series of 237 cuts, called 'The Wise King,' represents the deeds of Maximilian. B. is supposed to have died about the year 1559.

BU'RGLARY (through the old Fr. from Lat. *burgi latro*, a robber of a burg or enclosure), in the criminal law of England, is defined to be a breaking and entering the mansion-house of another in the night, with intent to commit some felony within the same, whether such intent be executed or not. It is peculiar to this crime, that it can only be committed in the *night-time*, which, by the 24 and 25 Vict. c. 96, s. 51, is considered as commencing at nine in the evening, and concluding at six in the morning of the next day. The next requisite of the crime, according to the definition we have given, relates to the *place* of its commission. It must be in a *mansion*-house, for such is the technical expression; but this is construed to mean any private dwelling, or any building temporarily or permanently used for that purpose. It cannot be committed in a distant barn, warehouse, or the like, unless there be a communication with the dwelling-house, nor in a house where no one resides.

But it is B. to break into a house which is used as an occasional residence, and which the owner is in the habit of leaving for a short period, with the intention of returning, even although no one be in the house at the time of the offence. A chamber in a college, or an inn of court, is also within the meaning of a mansion-house; so likewise is a room or lodging in any private house, if the owner and the lodger enter by different outer doors; but if they both enter by one outer door, then the house is described as that of the owner. For the same reason, a building belonging to a corporation, and separately inhabited by the officers of the body corporate, is the mansion-house of the corporation, and not of the officers. Again, a shop which is part of another man's house, and hired merely for the purpose of work or trade, is not a dwelling-house, but B. may also by express enactment be committed in it, though the punishment is not quite so severe. This offence cannot be committed in a tent or booth erected in a market or fair, though the owner may lodge therein, for his doing so makes it no more B. to break open such an erection, than it would be to uncover a tilted wagon under the same circumstances. But it may be committed by breaking open a church, which, according o Sir Edward Coke, is *domus mansionalis Dei*, that is, the mansion-house of God, and is now expressly protected.

As to the *manner* of committing B., it is laid down by Blackstone that there must be both a breaking and an entry to complete it. There must, in general, be an actual breaking, a substantial and forcible irruption—as, at least, by breaking, or taking out the glass of, or otherwise opening a window; picking a lock or opening it with a key; nay, by lifting up the latch of a door, or unloosening any other fastening, But if a person leaves his doors or windows open, it is his own folly and negligence, and if a man enters therein, it is no B.; yet if he afterwards unlocks an inner or chamber door, it is so. To come down a chimney is held a burglarious entry, for that is as much closed as the nature of things will admit; so also to knock at a door, and upon its being opened, to rush in with a felonious intent; or, under pretence of taking lodgings, to fall upon the landlord, and rob him If the servant conspires with a robber, and lets him into the house by night, this is B. in both.

The *intent* must also appear, otherwise the offence will amount only to a trespass; and it must be an intent to commit felony, which may be inferred from the conduct of the offender while in the house.

The punishment for this crime is now regulated by the act 24 and 25 Vict. c. 96, called the Larceny Consolidation Act. The provisions are to the effect, that any one convicted of B. shall be liable to penal servitude for life, or any term not less than five years, or to be imprisoned for any term not more than two years; and in the case of imprisonment, hard labor and solitary confinement may be superadded. It is further enacted, that whosoever shall burglariously break and enter into any dwelling-house, and shall assault with intent to murder any person being therein; or shall stab, cut, wound, beat, or strike any such person, shall be guilty of felony, and suffer penal servitude for five to seven years, or two years' imprisonment and hard labor. And by the same statute, section 58, it is enacted that any person found *by night*, armed with any dangerous or offensive weapon or instrument, or with housebreaking implements, or with face blackened or disguised, with intent to enter any buildings, and to commit felony therein; or if he be found by night in any building with intent to commit a felony therein—is liable to penal servitude for five years, or imprisonment not exceeding two years; and in case of a second conviction, is liable either to such imprisonment, or to penal servitude for a period not less than five years, and not exceeding ten years.

Blackstone observes, that this offence was anciently called Hamesecken, as, he adds, it is in Scotland to this day. But the Scotch law on this subject has some points of difference—hamesecken, or hamesucken, as it is spelled in the Scotch books, not being quite identical with B.: thus, the former is an offence exclusively against the *person*, and it may be committed in the daytime as well as at night; and there are other points of dissimilarity. The Scotch law relating to *housebreaking* and *stouthrief* affords analogies. See HAIMSUCKEN, HOUSEBREAKING, STOUTHRIEF, LARCENY, ROBBERY, ASSAULT.

BURGLEN, a village of Switzerland, in the canton of Uri, about two miles from Altorf. It is celebrated as the birthplace of William Tell. The supposed site of the patriot's house is now occupied by a chapel, upon the walls of which are represented certain well-known scenes from his history. Pop. about 1500.

BU'RGOMASTER. See GULL.

BU'RGOS, a city of Spain, capital of the new province of the same name, and of the former kingdom of Old Castile, is situated in a fertile valley at the foot of the Sierra d'Oca, and on the right bank of the river Arlanzon, in lat. 42° 20′ N., and long. 3° 45′ W. Pop. (1879) 29,683. B. is very ancient, having been founded in 844. Many of the gloomy old houses of its early history still remain. In the castle of B., Edward I. of England was married to Eleanor of Castile. The cathedral of B., founded in 1221, is one of the noblest specimens of Gothic architecture in Spain. Its various chapels are rich in fine sculpture and tombs. It was the birthplace of the Cid (q. v.). B. has manufactures of woollens, linens, and hats, but it depends chiefly on the traffic which its position on the great road from France and the northern Spanish provinces to Madrid secures it. B. has several charitable and educational institutions. It formerly had a much larger population—as many as 50,000—but on the removal of the court to Madrid in the 16th c., B. began to decline in population and importance. It was further greatly injured in November 1808 by the French, who sacked it. In 1812, the castle was four times unsuccessfully besieged by Wellington, who, however, took it in the following

year, when the French blew it up, as well as the fortifications.—The province of B. has an area of 5650 square miles, and a population, in 1877, of 332,461. The surface is elevated, the soil fertile, yielding grain and fruits. The hills afford rich pasturage; and the minerals gold, silver, iron, lead, and copper are found.

BURGOYNE, JOHN, a British general and dramatist, natural son of Lord Bingley, early entered the army, and in August 1759 was appointed lieutenant-colonel commandant of the 16th Light Dragoons. In 1761 he served at Belle Isle, and in 1762 commanded a force sent into Portugal for the defence of that kingdom against the Spaniards, when he surprised and captured Alcantara. In 1776 he served in North America, and in the summer of 1777 he was appointed to the command of a large force ordered to penetrate from Canada into the rebellious districts. The early part of the expedition was marked by his capture of Ticonderoga; but neglecting to preserve his communications with Canada, he encountered the greatest difficulties, and was at last obliged to surrender with his army to General Gates, at Saratoga.

Soon after his return to England, having been denied an audience of the king, and refused a court-martial, he went over to the opposition party, and voluntarily resigned all his appointments. On a change of ministry, at the close of the American war, he was appointed commander-in-chief in Ireland. This office he resigned two years after, and subsequently seems to have devoted his time to light literature. He was the author of some pamphlets in defence of his conduct, and of *The Maid of the Oaks* (1780), *The Heiress* (1786), and other stock dramatic pieces. B. was one of the managers for conducting the impeachment of Warren Hastings. He died in 1792. See *Episodes from the Life and Letters of B.*, by Barrington and Fonblanque (1876).

BURGOYNE, SIR JOHN FOX, Bart., an eminent engineer-officer, born in 1782, entered the Royal Engineers in 1798. From 1800 to 1807, he served in the Mediterranean; was with Moore at Corunna in 1809; and served under Sir Arthur Wellesley in the Peninsula till the conclusion of the war in 1814, being present at all its sieges. In 1814, he was commanding engineer of the expedition to New Orleans, and in 1826 of that sent to Portugal. In 1851 he obtained the rank of lieutenant-general, and in 1854 was made D.C.L. of Oxford University. In the Crimean war he was chief of the engineering department of the British army till recalled in 1855. For his services at Sebastopol, he received from the Sultan the order of the Medjidie, and from the French emperor that of grand officer of the Legion of Honor. He was made general in 1855, and created a baronet in 1856. He died 7th October 1871.

BU'RGUNDY, the name of a once independent kingdom of wide extent, but most frequently used of an old French province (Fr. *Bourgogne*), now divided between the departments of Côte-d'Or, Saone-et-Loire, and Yonne. The ancient Burgundians (*Burgundi* or *Burgundiones*), originally a German tribe, were at first settled on the banks of the Oder and the Vistula, and afterwards extended themselves to the Rhine and the Neckar, and, in 407 penetrated into Roman Gaul. Their conversion to Christianity took place in the course of eight days! They adopted a brief Arian confession of faith, and were baptized. From 407 to 534, the kingdom of B. was several times divided; and in 451, Gundicar, king of B., with 10,000 men, confronted Attila, but was defeated and slain.

In 534, B. passed under the rule of the Franks; but the weak government of the later Carlovingian kings allowed a part of it once more to assert a separate existence as a dependency of the empire under Boso of Vienne in 832. Boso's realm, known as Cisjuran B., or the kingdom of Arelate (Arles) lay mainly in the basin of the Rhone. A second Burgundian state arose about the same time in the country between the Saone and the Reuss, and was known as Transjuran or Upper Burgundy. These states united in 930, were for a time powerful and famous; but in 1038 on the extinction of the royal dynasty, B. became part of the German empire. It was afterwards broken into several fragments, which were gradually absorbed by France.

A similar fate befell the third Burgundian state, the dukedom of B. or lower B., which was formed by a brother of Boso. Yet the Dukes of B. played a large part in the history of mediæval Europe, and were long the dangerous rivals of the French kings. The nucleus of the dukedom was in Lower B., the region which afterwards became the French province of B., to the north and west of the other Burgundian realms; but the second line of dukes, beginning in 1363 with Philip the Hardy, son of the French king John, held under their sway not only Franche Comté and adjoining portions of France proper, but great part of the Low Countries. Charles the Bold (q. v.) was one of the most powerful sovereigns of Europe. Louis XI. of France succeeded in incorporating the duchy with the kingdom of France.

BURGUNDY, LOUIS, DUKE OF, the grandson of Louis XIV. of France, and Dauphin of France after the death of his father, was born at Versailles in 1682. Even in childhood he was ungovernable, and became excessively violent and haughty, and abandoned to all gross and sensual passions. Although educated under the care of the Abbé Fénélon, he used, when 30 years of age, to divert himself with drowning flies in oil, and blowing up living frogs with gunpowder. He had the misfortune to be deformed; his deportment and manners were undignified, and his mind imbued with bigotry. When only about 15 years of age, he was married to the Princess Adelaide of Savoy, and spent his time wholly in amusements in the company of his spouse and of the ladies of the court. Nevertheless, in 1701, he was nominally appointed generalissimo of the army, really under the command of the Duke de Vendôme, and is said to have shown some spirit in a cavalry-fight at Nimeguen; but he quarrelled with Vendôme, chiefly because he had once been compelled to establish his head-quarters in a nunnery. He lost the respect of the army, and was exposed to many humiliations, partly proceeding from intrigues set on foot against him out of envy by his father.

He returned to the court more eccentric, gloomy, and unsociable than before. But when he became, on his father's death, the second person in the kingdom, all his defects vanished from the sight of the courtiers, and flattery bestowed on him the title of the Great Dauphin. He died suddenly in the year 1712. A few days previously, his wife and her son, the Duke of Bretagne, had died, and the same hearse carried father, mother, and child to St. Denis. The Duke of Orleans, subsequently regent, and his daughter, the Duchess of Berri, were accused, but without reason, of having caused them to be poisoned.

BURGUNDY PITCH, a resinous substance prepared from common frankincense (q. v.), the spontaneous exudation of the Norway spruce-fir (*Abies excelsa*; see FIR) by melting it in hot water; by which means it is freed from a considerable part of the volatile oil which it contains. By straining it through a coarse cloth, impurities are also removed. B. P. is of a yellowish white color, hard and brittle when cold, but softening by the heat of the hand, and readily adhering to the skin. It has a not unpleasant resinous odor, and a slightly bitter taste. It is used in medicine as an external application only, and generally acts as a mild irritant. A very common application of it is as a plaster in complaints of the chest, and in rheumatic complaints. It enters also as an ingredient with resin, oils, &c., into a compound plaster of similar use. The B. P. of commerce is now principally brought from Hamburg; but the greater part of what is sold under the name is really manufactured of common rosin and palm oil, or from American turpentine. It has a fuller yellow color than the genuine B. P., and a less agreeable odor.

BURGUNDY WINES are chiefly the produce of vineyards cultivated on the hilly lands forming the Côte d'Or, between Dijon and Chalons. These hills average about from 800 to 1000 feet in height; the vineyards ascend up the slopes in terraces, and spread along the table-land on the summit. 'In richness of flavor and in perfume, and all the more delicate qualities of the juice of the grape, the wines grown here unquestionably rank as the finest in the world.' The most celebrated of the *red* wines of Burgundy are the Closvougeot (near Beaune), Nuits, Chambertin (the favorite wine of Louis XIV. as well as of Napoleon), the Romanée-Conti, Richebourg, Volmay, and Pomard. Of other red wines of Burgundy not grown on the Côte d'Or, those of Pitoy, Perrière, Preaux, and Auxerre, are held in most repute. The *white* wines of Burgundy are also the finest in France, but being produced in less quantity, they have less celebrity. The quantity of wine annually produced in Burgundy averages 3,500,000 hectolitres (77,000,000 gallons), of which only about a fifth is consumed in the district.

BURIAL, a word of Teut. origin (Ang.-Sax. *birgan*, to conceal), is applied to the prevalent method among civilized nations of disposing of the dead, by hiding them in the earth. As there is almost nothing else so deeply interesting to the living as the disposal of those whom they have loved and lost, so there is perhaps nothing else so distinctive of the condition and character of a people as the method in which they treat their dead. Hence, funeral customs associate themselves with a wide variety of sentiments, from gentle and rational sorrow, up to deification of the departed, accompanied sometimes with cruelty and ferocity towards the living. People of a low and barbarous type carelessly permit the remains of the dead to lie in the way of the living, and there are a few instances in which the object of artificial arrangements has been to preserve a decorated portion of the body—as, for instance, a gilded skull—among survivors. The general tendency of mankind, however, has always been to bury the dead out of sight of the living; and various as the methods of accomplishing this end have been, they have resolved themselves into three great classifications: 1. The simple closing up of the body in earth or stone; 2. The burning of the body, and the entombing of the cinders; and, 8. The embalming of the body. The first of these seems to be the earliest form of which we have any record, and it is the form most amply sanctioned by

the existing practice of the civilized world. It is the method referred to in the earliest Scriptures; and all are familiar with the touching scene in which Abraham buries Sarah in the cave in the land of Canaan which belonged to Ephron, but was, after a solemn and courteous negotiation, secured to Abraham for a possession to bury his dead in (Gen. c. 23). The horrible fate of being left unburied, either from scorn or neglect, is powerfully told in the prophecy of Jeremiah against Jehoiakim: 'He shall be buried with the burial of an ass, drawn and cast forth beyond the gates of Jerusalem.' There is frequent allusion in the later Scriptures, and especially in the New Testament, to the embalming of the body in antiseptics and fragrant substances; and the burning of the bodies of Saul and his sons is accounted for by commentators on the supposition that they were too far decayed to be embalmed. The Israelites may have learned the practice of embalming from the Egyptians, among whom it was an art so greatly cultivated and extensively practised, that Egyptian corpses, as inoffensive as any article of wood or stone, are scattered over Europe in museums, and are even to be found as curiosities in private houses. The soil and climate of Upper Egypt seem to have afforted facilities for embalming unmatched in any other part of the world; and in other places the vestiges of the practice are comparatively rare, though it is usual even yet to embalm royal corpses, and in some places to preserve a series of mummies, as in the vault of the monastery of Kreuzberg, at Bonn, where the monks have been successively preserved in their costume for centuries.

The practice of incremation, or of the burning of the body, and the entombing of the ashes, deserves more inquiry than it has yet obtained. In Greece, in Etruria—both before and after it came under the Romans—and in the north of Europe, the simple burial of the body, and its prior reduction to ashes, were both practised, and sometimes contemporaneously. The tombs of Etruria are rich in art, much of it going to the adornment of the urns of baked clay in which the ashes of the dead are kept. Vessels of *terra-cotta*, or cooked earth, containing human remains, have been found, often so large that they appeared to have served as coffins for containing the whole body. Vessels of this kind were found in the valley of the Scamander by some British officers while spending their leisure time after the siege of Sebastopol, upon the ground supposed to have been occupied by the besiegers of Troy. Smaller cinerary urns have been found over so extensive a portion of the world, that it is difficult to define the limits to which they belong. The Danish antiquaries say, that in their stone period, when the use of metals was unknown, the dead were all buried unburned in stone chambers, and that the burning of the bodies and the preservation of the ashes in urns came in with the age of bronze. These antiquaries associate with the older system those amorphous mounds of earth or stone called barrows or tumuli, which are to be found all over the north of Europe. Mr. Bremner, in traveling among the steppes of the Ukraine, saw multitudes of these small mounds, which reminded him at once of what he had seen on the plain of Troy, at Upsala in Sweden, in Scotland, and in Ireland. The Irish tumulus of New Grange is perhaps the most remarkable of all, forming a connecting link between the simple barrow on the moor and the pyramids of Egypt, which are the perfection of the same kind of structure applied to the same purpose—the burial of the distinguished dead. These structures open up a large field of curious inquiry. The simple theory, that they were raised over the dead, has lately been disturbed by the discovery that many of them are not artificial, but reiics of sheets of alluvial matter, the mass of which has been carried away; and even in these, human remains have been found, the natural mounds having been used as monuments. Even when human remains are connected with barrows, cromlechs, or the large shapeless pillars commonly called Druidical, it is often questionable whether the monument was made to receive such remains. It is certainly ascertained to have been a practice in ancient times to bury bodies in tombs which were themselves ancient when they received their inmates.

Some of the grandest buildings in the world have been tombs; such are the pyramids, the castle of St. Angelo, the tomb of Cæcilia Metella, and many temples scattered over Hindustan and other eastern countries. Thus, the respect paid by the living to the dead has preserved for the world many magnificent fruits of architectural genius and labor. A notion that the dead may require the things they have been fond of in life, has also preserved to the existing world many relics of the customs of past ages. The tombs of Egypt have supplied an immense quantity of them, which have taught the present age more of the manners of ancient nations than all the learned books that have been written. It is an awful remembrance, at the same time, that inanimate things were not all that the dead were expected to take with them. Herodotus tells us of favorite horses and slaves sacrificed at the holocaust of the dead chief. The same thing has been done in our own day in Ashantee. In many countries, the wives had the doom, or privilege, as it was thought, of departing with their husbands; and down to the present generation the practice has lived in full vigor in the Hindu sutti. Among the Jews, the Greeks, the Romans, and many ancient nations, the dead were buried beyond the towns. The 'stop, traveler!' was a usual memorandum on Roman tombs. In Christian countries, if the remains of the saint to whom a church was dedicated could be obtained—or anything passing for the remains—they were buried near the altar in the choir. It became a prevalent desire to be buried near these saints, and the bodies of men eminent for their piety, or high in rank, came thus to be buried in churches. The extension of the practice was the origin of churchyards. These, in crowded towns, became offensive and unhealthy. It can scarcely be said that this practice, so detrimental to the public health, as the burial within churches, was checked in this country until the whole system of intramural interment, as it was called, was attacked, about the year 1844, by Mr. Chadwick and other sanitary reformers. Measures were afterwards carried for shutting graveyards in crowded cities, and placing interments in open cemeteries under sanitary control. The first great measure was passed in 1850, when the Board of Health was made a Burial Board for the Metropolis, and power was given to the Privy Council to close the city graveyards. The act was modified two years afterwards, by transferring the duties of managing cemeteries to local boards appointed by the vestries. It was in London that the danger was most urgent and the remedy immediate. It was extended to the English provinces in 1853, and to Scotland in 1855. See CREMATION.

In England, burial in some part of the parish churchyard is a common law right, which may be enforced by mandamus—that is, every person may be buried in the parish where he dies. But the body of a parishioner cannot be interred in an iron coffin or vault, or even in any particular part of a churchyard, as for instance, the family vault, without an additional fee.

The fact that the only religious service which can at present be conducted at the grave is that of the Church of England, has led of late years to the repeated proposal in parliament of measures to permit dissenters to have their own services performed in the churchyard—as yet without result.

By the canons of the Church of England, clergymen cannot refuse or delay to bury any corpse that is brought to the church or churchyard; on the other hand, a conspiracy to prevent a B. is an indictable offence, and so is the wilfully obstructing a clergyman in reading the B.-service in a parish church. It is a popular error that a creditor can arrest or detain the body of a deceased debtor; and the doing such an act is indictable as a misdemeanor. It is also an error that permitting a funeral procession to pass over private grounds creates a public right of way. By the 3 Geo. IV. c. 126, s. 32, the inhabitants of any parish, township, or place, when going to or returning from attending funerals of persons in England who have died and are to be buried there, are exempted from any toll within these limits. And by the 4 Geo. IV. c. 49, s. 36, the same regulation is extended to Scotland; the only difference being, that in the latter case the limitation of the district is described by the word *parish* alone. The 6 and 7 Will. IV., c. 86, regulates the registry of deaths. The 4 Geo. IV. c. 52 abolished the barbarous mode of burying persons found *felo de se*, and directs that their B. shall take place without any marks of ignominy, privately in the parish churchyard, between the hours of nine and twelve at night, under the direction of the coroner. The B. of dead bodies cast on shore is enforced by 48 Geo. III., c. 75. See Wharton's *Law Lexicon*.

In Scotland, the right of B. in a churchyard is an incident of property in the parish; but it is a mere right of B., and there is not necessarily any corresponding ownership in the *solum* or ground of the churchyard. In Edinburgh, however, the right to special B.-places in churchyards is recognized.—For B. in cemeteries in England and Scotland, see CEMETERY.

BURIAL ACTS. These are the 15 and 16 Vict. c. 85, for London; the 16 and 17 Vict. c. 134, the 17 and 18 Vict. c. 87, and the 18 and 19 Vict. cc. 79 and 128, for places in England beyond the limits of the metropolis—all as amended by the 20 and 21 Vict. c. 81, and the 22 Vict. c. 1, 23 and 24 Vict. c. 64, 25 and 26 Vict. c. 100, 34 and 35 Vict. c. 33. These acts were rendered necessary when it was resolved on sanitary grounds to put a stop to burials in populous places, which could only be effectually done by giving power to parishes to acquire other burial-grounds in rural places. These statutes have long been proverbial for their confusion (e. g. 20 and 21 Vict., which proposes in the preamble to amend 18 and 19 Vict. c. 78, really amends c. 79), and relate to the appointment of burial-boards for parishes—the authorizing new burial places, proper sanitary regulations, the control by the government and by order in council, and many other details too numerous to specify here. Our readers must be content with our referring them to the acts themselves, or to their lawyers.

The corresponding acts for Scotland are the 18 and 19 Vict. c. 68, amended by the 20 and 21 Vict. c. 42, and 29 and 30 Vict. c. 50.

BU'RIAL SOCI'ETIES are friendly societies constituted in the usual manner, and with the express object of supplying a fund for paying the funeral expenses of the members on their death. See FRIENDLY SOCIETIES. It became customary to enter the names not only of adults, but of children, in such societies. The proceedings of the criminal courts have shown that, in some instances, children on whose lives such an insurance was effected have been killed or allowed to die of neglect, and the alarm created by such instances, was enhanced by the discovery that children were frequently insured in more than one society. To obviate this calamitous use of a beneficial arrangement, it was provided that no insurance of a child under six years of age in a burial society should be legal. It was attested to the Select Committee of the Commons on Friendly Societies in 1849, that the practice of such insurances continued in uncertified societies; and at the same time it was stated on behalf of the friendly societies: 'In our long experience with these societies in Liverpool, in which are nearly 100,000 members, approximating to nearly one-third of the population of this great town, we have not had one instance of death by violence for the sake of the burial money.' In the Friendly Societies Act of 1850, and in subsequent enactments, stringent arrangements for certifying the cause of death have been adopted as a sufficient protection from this crime.

BURIDAN, JEAN, a scholastic metaphysician of the nominalist party, was born at Bethune, in Artois, in the 14th c., and studied at Paris under Occam, where he also became a teacher of philosophy. The events of his life, as well as the manner of his death, are very obscure. One account states, that he was thrown into the Seine, by command of Marguerite de Bourgogne, daughter-in-law of Philippe le Bel, whose infidelities he had rebuked. Another, later, but less mythical-looking account, states that B. was driven from France as a disciple of Occam, and fled to Austria, where he founded a school. His elucidations of Aristotle are among his most useful writings. In his *Logic*, his great endeavor was to facilitate the discovery of middle terms for all kinds of syllogisms. The celebrated sophism known to the schoolmen under the name of BURIDAN'S ASS, has been discussed at superfluous length, and with needless ingenuity, by Bayle. It is not at all likely that it was ever adduced by B., but more probably by his adversaries, who wished to ridicule his metaphysical doctrine of *Determinism*—viz., that in every mental and bodily action the will must be determined by something out of itself. The sophism referred to is, that if a hungry ass be placed exactly between two bundles of hay of equal size and attractiveness, it must starve, as there is nothing to determine the will of the animal towards either bundle. His chief works are—*Summula Dialectica* (Paris, 1487), *Compendium Logicæ* (Venice, 1489; Oxford, 1637), *In Aristotelis Metaphysica* (Paris, 1518).

BU'RIN, or GRAVER, the principal instrument used in copper-engraving, is made of tempered steel, and is of prismatic form, the graving end being ground off obliquely to a short point. The style of a master is frequently described by the expressions *soft* B., *graphic* B., *brilliant* B., or whatever other character may belong to it.

BURITI PALM (*Mauritia vinifera*, see MAURITIA), a beautiful palm, which grows in great abundance in the swamps of some parts of the north of Brazil. It is one of the loftiest of palms. Its leaves are fan-shaped, and form a large globular head at the top of the stem. It produces a great number of nuts about the size of a small hen's egg, covered with rhomboidal scales arranged in a spiral manner. Between these scales and the albuminous substance of the nut, there is an oily reddish pulp, which is boiled with sugar, and made into a sweet-meat. An emulsion is also prepared from it, which, when sweetened with sugar, is a very palatable beverage, but if much used, is said to tinge the skin of a yellow color. The juice of the stem also makes a very agreeable drink; but to obtain it, the tree must be cut down, when several holes about 6 inches square, 3 inches deep, and 6 feet apart, are cut in the trunk with a small axe; and these in a short time are filled with a reddish-colored liquid, having much the flavor of sweet wine.

BURKE, EDMUND, a philosopher and politician, distinguished over all the men of his times for eloquence and political foresight, was born in 1730, in Dublin, where his father had an extensive practice as an attorney. As a school-boy, he displayed those traits of character and the germs of those powers which ultimately gave him greatness. In 1744, B. entered the university of Dublin, of which he became a scholar. His undergraduate course was not unmarked by the ordinary distinctions of successful application; but it would appear that he mainly devoted himself to his favorite studies of poetry, oratory, history, and metaphysics. In February 1748, he graduated B.A., and in 1751 took his degree as Master of Arts. In the interval (1750), being destined for the English bar, he proceeded to London, to keep his terms at the Middle Temple. To legal studies, however, he never took kindly, and ultimately he abandoned the idea of becoming a barrister. During the years 1750—1756 he would appear to have occupied himself in traveling through England, enjoying the society of literary men, in study, and finally in writing for various periodicals.

B., when yet at the university, had achieved a local reputation for literary talent and eloquence. Among the compositions of his undergraduate life, the most noticeable perhaps is his translation of the conclusion of the second Georgic of Virgil, which shows poetic talent of no mean order. His first important publication, however, was the celebrated *Vindication of Natural Society*, written in imitation and ridicule of the style and reasoning of Lord Bolingbroke, in which, with well-concealed irony, he confutes his lordship's views of society by a *reductio ad absurdum*. This work, published anonymously in 1756, at the age of 26, attracted considerable attention. Soon after, in the same year, appeared his well-known essay, *A Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful*—a work containing a comprehensive induction of the various *sources* of the ideas referred to, but which must be pronounced a failure, so far as it pretends to analyze into their primary elements the emotions of the sublime and beautiful.

The essay on the *Sublime and Beautiful* attained a rapid popularity, and its author soon found himself courted by all the eminent men of his time. Garrick was already one of his friends; among them he soon could count Reynolds, Soame Jenyns, Lord Lyttelton, Warburton, Hume, and Dr. Johnson. Notwithstanding this popularity, however, his progress continued slow; for three years yet, he had to occupy himself with periodical writing, devoting his leisure principally to political subjects. What is considered a joint work of B. and his cousin, William Bourke, appeared in 1757—viz., *An Account of the European Settlements in America*—and shows how carefully at this date he had studied the condition of the colonies. In 1761, Mr. W. G. Hamilton ('Singlespeech Hamilton'), then Secretary for Ireland, having appointed him his private secretary, he returned to Dublin, where, during two years' service, he demonstrated his aptitude for political business, receiving in 1763, in reward of his services, a pension on the Irish establishment of £300, which, however, he did not long enjoy.

Returning to London, B., in 1764, along with Reynolds, founded the Literary Club, the history of which is associated with almost every considerable name in the literature of the period. But literary society did not call off his attention from the chances of a political career. He became private secretary to the Marquis of Rockingham, on his becoming premier, and at the same time entered parliament as member for Wendover. Here his eloquence at once made him the reputation of being 'the first man in the Commons.' The Rockingham administration, however, lived only a few months, and with it terminated this his second political employment. To trace his subsequent career in parliament is more than the limits of this article will allow; it must suffice to state briefly that his parliamentary life extended from 1766 to 1794 without intermission; that he was successively member for Wendover, Bristol, and Malton; twice held the post of Paymaster of the Forces, once under Rockingham, and again under Lord North, with the standing of a privy councillor; that after a career in parliament remarkable for the laboriousness, earnestness, and brilliancy with which every duty was discharged, and extending over nearly 30 years, he retired at last, receiving the thanks of the Commons for his numerous public services, and rewarded by government, on the express request of his sovereign, with pensions amounting in all to £3700. It would be wrong, however, to omit that as Paymaster of the Forces he, with a scrupulous regard to public economy, sacrificed all the perquisites of his office, exhibiting a severe integrity unexampled among public men; and that in his relation with the constituency of Bristol, which was alienated from him by his advocacy of the claims of the Roman Catholics and of the opening up of the trade of Ireland, he was the first to maintain the doctrine of the independence of parliamentary representatives—that they are not machines to vote for measures approved by their constituencies simply for that reason, but men and thinkers chosen by them to calmly consider and legislate for the good of the commonwealth. It must also be mentioned, that during his career he rendered more important service to the cause of humanity than any man of his time: he prepared the way for the abolition of the slave-trade, a measure which was destined to ripen to success in the hands of Wilberforce; he advocated the cause of humanity in India against the voracious greed of stockholders, who regarded millions simply as materials for plunder, and largely contributed to improve the government of that country. Towards America he advocated a policy of justice and conciliation, which, had it been adopted, would have averted the horrors of the War of Independence, and retained the colonies in amity with the mother-country. And to the advocacy of every cause which he espoused, he brought a capacity for patient research that was unlimited, and an eloquence that has never been transcended.

Before proceeding to remark on the character and powers of B., a very brief notice must be taken of his leading literary efforts connected with his political labors. Little more than a catalogue

can here be given of them. Omitting a variety of letters—several on the condition of Ireland—notice must be taken of his *Observations on a Pamphlet on the Present State of the Nation*, being his first political pamphlet published in 1769, in answer to one variously ascribed to Fox or Grenville. In 1770, he published a pamphlet, *On the Cause of the Present Discontents*. On the 13th February 1788, he commenced his celebrated speech opening the trial of Warren Hastings (q. v.), the most remarkable trial, perhaps, in the history of the world. This speech lasted over four days, and has been characterized as 'a tempest of invective and eloquence.' No idea can be conveyed of the effect which it produced. The trial lasted seven years, and closed with another great and splendid oration from B., lasting over nine days. Hastings, it is well-known, was acquitted. While this trial was advancing, B. found time to take part in all the current business. In 1790 appeared his *Reflections on the Revolution of France*, which sold in tens of thousands, and it is said to have produced an effect never produced before or since by any political essay. Hereafter, the world showered honors on B., of which space forbids even the enumeration. Having, in 1791, withdrawn from the Whigs on the French question, he offered for the consideration of government, *Thoughts on French Affairs*, which, however, was not published till after his death. *Heads for Consideration on the Present State of Affairs*, and *Reply to a Noble Lord*, next followed, the latter being relative to himself personally. His last work, *Thoughts on a Regicide Peace*, showed that he retained to the end of his life his whole powers unimpaired.

Few men have been the subjects of higher panegyric than B., and on the whole, few have better deserved praise. He was noble minded, pure in his life, and a purist in politics. Intellectually, he was most richly endowed ; with much imagination, rare powers of observation, and indefatigable industry, there was no subject which he could not master, and none which, having mastered, he could not expound with unparalleled richness of language. But with these virtues and powers were conjoined defects, which, without bating their greatness, largely neutralized their influence

He was, it may be said, too literary to be a philosopher, and too philosophic to be a politician. His career would seem to illustrate this position. His oratory astounded by its brilliancy rather than persuaded by its tone and argument; and in the long-run, the eloquence which failed to command the reason, ceased to captivate the ear.

The man who at first evoked the enthusiasm of the House by the brilliancy and power of his eloquence, did actually at last empty it by persistence in the monotonous splendors of his speeches. Passionate, and in a great degree untractable, he was unsuited for party politics, and drifted from all his connections, breaking up slowly all party ties, and even the ties of friendship, till he reached at last a state of almost political isolation. At the same time, it must not be forgotten how great an influence he, half philosopher half politician, exercised on the counsels of the state; many of his views on politics and public economy were anticipations of science, as many of his previsions of the course of events were prophecies.

B. died on the 7th July 1797, in his 68th year. A collected edition of his works in quarto was published in 1827. The latest edition is that of the Clarendon Press, begun in 1866. The best biography of B. is Mr. J. Macknight's. See also Morley's *Edmund Burke, a Historical Study* (1869).

BURKING. See ANATOMY (in Law).

BURLEIGH, WILLIAM CECIL, LORD. See CECIL.

BURLE'SQUE (from Ital. *burla*, jest, mockery), denoting a style of speaking, acting, writing, drawing, is a low and rude grade of the comic. The legitimate comic brings together contrasts with a final view to harmonizing and reconciling them; the B. distorts and caricatures, and brings the incongruities into stronger relief. The farce is the B. of comedy. Deformities and monstrosities that excite disgust do not belong to the burlesque. The lofty and the abject, the great and the little are conjoined, with the sole view of exciting a laugh. Nor does the true B. turn real greatness and nobility into laughter, but only sham greatness —false pathos, and all hollow pretension and affectation. The B. style appears to have been unknown to the ancients; it originated among the Italians, more particularly with the poet Berni (q. v.). The genuinely national *buffone* of the Italians personates the burlesque. Carlo Gozzi, in his tragi-comedies, is perhaps the greatest in the B. vein. Scarron among the French, and *Hudibras* in English, are examples. Parody (q. v.) or Travesty (q. v.) is a species of burlesque. See FARCE.

BURLE'TTA, a comic operetta or musical farce.

BU'RLINGTON, the name of three cities of some note in the United States.—1. A port of entry in New Jersey, on the Delaware, about twenty miles above Philadelphia, with which, as well as with New York, it is connected by the Camden and Amboy Railway. It possesses an Episcopalian college, founded in 1846. Pop. (1880) 6090, with about 13,000 tons of shipping.—2. The second city in Vermont. It is beautifully situated on the east shore of Lake Champlain. It communicates with the St. Lawrence by means of the Richelieu River and the Chambly Canal; while through the Champlain Canal it has access to the Hudson. It has railway communication with all parts of the United States and Canada. The Vermont University crowns the slope on which the city stands. Pop. (1880) 11,364.—3. A city of Iowa, on the right bank of the Mississippi, 207 m. by rail W.S.W. of Chicago. It occupies a natural amphitheater formed by the limestone bluffs which slope backward from the river. It carries on a large commerce, and there are numerous foundries, breweries, soap-works, pork-packing establishments, flour-mills, and saw-mills. The city is the center of considerable railway communications, and possesses among its educational institutions Business College and Baptist University. Pop. (1870) 14,933; (1880) 19,450.

BURLINGTON. See BRIDLINGTON.

BU'RMAH, EMPIRE OF, called also the EMPIRE OF AVA, an important kingdom of the Indo-Chinese peninsula, formerly of great extent; but by two contests with the British power in India, it lost several provinces, and is now, in its widest sense and including tributary states, comprehended between 19° 29′ and 28° N. lat., and 93° and 100° E. long., having an area of about 188,000 square miles, and a scanty population estimated at from 3,000,000 to 4,000,000. It is bounded on the N. by mountains, separating it from Assam and Tibet; on the E., by China; on the S , by the British province of Pegu; and on the W., by Munipore and mountain ranges dividing it from Tipperah, Chittagong, and Aracan. The Burman empire, as it now exists, has three well-marked divisions : 1. Northern B., inhabited chiefly by Singphos, Shans, and other tribes; 2. B. proper; 3. the Eastern Shan tributary states. The area of B. proper, from lat. 24° N. to the frontier of Pegu, is 44,450 square miles, with a population of about 1,200,000.

Physical features.—From the eastern extremity of the great transverse mountain-barrier of Northern India, longitudinal ranges strike away southwards and between, two of these the Burman territories are situated. The country slopes from the highland regions of the north towards the coast, and has been fitly described as 'a varied surface of rolling upland, interspersed with alluvial basins and sudden ridges of hill.'

The principal river, the Irrawaddy (q. v.), having its source amid the snowy mountains from which descends the Brahmaputra, is the great commercial highway of the country, through the heart of which it takes its course. Passing Amarapura, Ava, and other towns, it enters Pegu, and, 90 miles below Prome, divides into an eastern and western branch, the former flowing past Rangoon, the latter forming the Bassein river. The Kyen-dwen is its principal tributary. To the east of the Irrawaddy, the Salween, after an almost parallel course, enters the British territories in nearly the same latitude.

Climate.—On the coast, only two seasons are known—the dry and the rainy, which are regulated by the north-east and the south-west monsoons; but in B. proper, less rain falls, and there are three seasons—the cold, the hot and the rainy. Some showers fall in May or June, but the great rains last from the middle of August to the end of October. The cool season is from the middle of October till the beginning of April, and from this month till the great rains is the hot part of the year, the thermometer ranging from 85° to 100°. The climate is, on the whole, healthy, but the jungles are very pestiferous.

Minerals.—B. has vast fields of mineral wealth, but little enterprise and capital are brought to bear upon them. There are gold mines at Bamo, near the Chinese frontier. Auriferous sand is found in many of the streams. Silver is obtained at Bau-dwen, likewise on the confines of China, and also in the Shan country, from whence comes the chief supply of lead. Iron is quarried at Poukpa, a lofty mountain a few miles east of Pagan. The celebrated ruby mines of B. are situated 60 or 70 miles north-east from the capital, and are jealously guarded. Sapphires of great size are found in the same stratum, but are more rare. The annual value of the gems is estimated at from £12,000 to £15,000 sterling, and they are the property of the king. Wells of the mineral oil, petroleum, are worked at Ye-nan-gyoung, on the Irrawaddy, above Prome. Marble, noble serpentine, and amber are likewise found in large quantities.

Vegetable productions.—A few only of the most striking of these can be noticed. Of the graceful palm-tribe (*Palmaceæ*), the cocoa-nut, the betel, the palmyra, and the nipa, or water-palm, are the most prized. The useful bamboo is widely diffused. The teak, of which B. possesses inexhaustible forests, and the hopæa, are amongst the most valuable of the timber-trees. Forests of pine grow to the eastward of Amarapura. The wood-oil tree is found on the higher Salween, one trunk of which will produce from 30 to 40 gallons of oil every season.

The staple fruit of the country is the plantain or banana. The

jack is prized by the natives. The mango reaches the height of 100 feet, and produces a delicious fruit. Rice, wheat, tobacco, indigo, and cotton are cultivated.

Animals.—The *Felidæ*, or cat family, abound, tigers, leopards, and tiger-cats being met with in every part of the country. Of the *Pachydermata*, the elephant and rhinoceros are the most noteworthy. The elephant, buffalo, and Indian ox have been domesticated.

Ethnology.—The Burmans belong to that branch of the Mongolidæ characterized by a monosyllabic language; they are short-headed, broad-skulled, and flat-faced. The hair is black, and the skin of a deep brown color. Their *dress* is simple, but peculiar. The *in-gie*, a white linen jacket, is common to both sexes. Wrapped round the lower part of the body, the men wear the *put-so*, which is several yards in length; the women the *te-mine*, a scant garment of cotton or silk. Silks, muslins, and valuable gold ornaments are worn on special occasions. Betel-nut chewing and cigar-smoking are greatly practised by both men and women. The Burmans are, generally speaking, fine, well-made men, and excel in wrestling, boxing, rowing, football, and other athletic exercises; they are clever as carpenters and smiths. Burman houses are made of a framework of bamboo, thatched with the leaf of the water-palm, and are invariably raised on posts several feet from the ground. The women are more industrious than the men; they buy, sell, weave, and attend to the domestic concerns. Both sexes delight in merry-making, feasting, buffoonery, and sightseeing. A *pooay*, or theatrical representation, is a very favorite amusement, and a buffalo-fight attracts crowds of spectators. The Burman has little patriotism, but is attached to his home. Without individual cruelty, he is indifferent to the shedding of blood by his rulers. Though temperate and hardy, he dislikes discipline and continued employment; and when in power, is too often arrogant, arbitrary, and corrupt.

Besides the true Burman, a great variety of races inhabit the Burman territories. *Talaings*, or *Mons*, descendants of the ancient Peguans, are pretty well amalgamated with the Burmans. The *Shans*, or *Tai*, perhaps the most numerous and widely diffused of the Indo-Chinese peoples, are scattered over the peninsula, from Munipore to Bangkok. Of the eastern Shan states, some are tributary to B., others to Siam, while those west of the Irrawaddy are wholly under Burman rule.

The *Singphos* cluster round the mountains of the north, and along the western mountain-boundary of Burmah, wild *Kyhens*, and many tribes under different names, live in varying degrees of civilization. The *Karens* are met with chiefly in Southern Burmah.

Religion.—Buddhism (q. v.) is the prevailing religion of B., where it has been preserved in great purity. Its monuments—temples, shrines, and monasteries—are innumerable; its festivals are carefully observed, and its monastic system is fully established in every part of the kingdom. While directing the reader to the special article on BUDDHISM for an account of its doctrines, history, &c., we may here glance at its development, institutions, and edifices among the Burmans.

The members of the monastic fraternity are known in B. as *pon-gyees*, meaning 'great glory;' but the Pali word is *rahan*, or holy man. The pon-gyees are not priests, in the usual acceptation of the term, but rather monks. Their religious ministrations are confined to sermons, and they do not interfere with the worship of the people. They are a very numerous class, living in monasteries, or *kyoungs*, and may at once be known by their yellow robes (the color of mourning), shaven heads, and bare feet. They subsist wholly by the charity of the people, which, however, they well repay by instructing the boys of the country. The kyoungs are thus converted into national schools. The vows of a pon-gyee include celibacy, poverty, and the renunciation of the world; but from these he may at any time be released, and return to a secular life. Hence, nearly every youth assumes the yellow robe for a time, as a meritorious act, or for the purpose of study, and the ceremony of making a pon-gyee is one of great importance. The ostensible object of the brotherhood is the more perfect observance of the laws of Buddha. The order is composed of five classes—viz., young men who wear the yellow robe and live in the kyoungs, but are not professed members; those on whom the title and character of pon-gyees have been solemnly conferred with the usual ceremonies; the heads or governors of the several communities; provincials, whose jurisdiction extends over their respective provinces; and, lastly, a superior general, or great master, who directs the affairs of the order throughout the empire.

No provision is made for religion by the government, but it meets with liberal support from the people. A pon-gyee is held in profound veneration; his person is sacred, and he is addressed by the lordly title of *pra* or *phra;* nor does this reverence terminate with his death. On the decease of a distinguished member, his body is embalmed, while the limbs are swathed in linen, varnished, and even gilded. The mummy is then placed on a highly decorated cenotaph, and preserved, sometimes for months, until the grand day of funeral. The Burman rites of cremation are very remarkable, but we cannot here enlarge upon them. On the whole, a favorable opinion may be passed on the monastic fraternity of B.; although abuses have crept in, discipline is more lax than formerly, and many doubtless assume the yellow robe from unworthy motives.

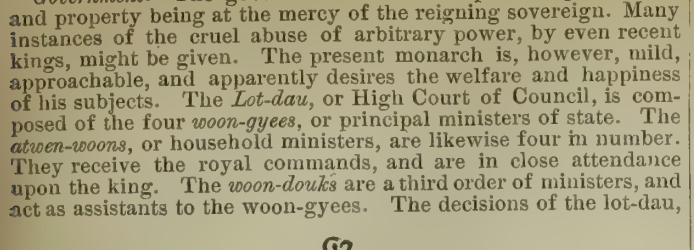
In B., the last Buddha is worshiped under the name of Gautama. His images crowd the temples, and many are of gigantic size. The days of worship are at the new and full moon, and seven days after each; but the whole time, from the full moon of July to the full moon of October, is devoted by the Burmans to a stricter observance of the ceremonies of their religion. During the latter month, several religious festivals take place, which are so many social gatherings and occasions for grand displays of dress, dancing, music, and feasting. At such times, barges full of gaily-dressed people, the women dancing to the monotonous dissonance of a Burman band, may be seen gliding along the rivers to some shrine of peculiar sanctity. The worship on these occasions has been described by an eye-witness, in 1857, as follows: 'Arrived at the shrines and tempels, the people suddenly turn from pleasure to devotion. Men bearing ornamental paper-umberellas, fruits, flowers, and other offerings, crowd the image-houses, present their gifts to the favorite idol, make their *shek-ho*, and say their prayers with all dispatch. Others are gluing more gold-leaf on the face of the image, or saluting him with crackers, the explosion of which in nowise interferes with the serenity of the worshipers. The women for the most part remain outside, kneeling on the sward, just at the entrance of the temple, where a view can be obtained of the image within.' On another occasion, we read: 'The principal temple being under repair, was much crowded by bamboo scaffolding, and new pillars were being put up, each bearing an inscription with the name of the donor. . . . . The umbrellas brought as offerings were so numerous, that one could with difficulty thread a passage through them. Some were pure white, others white and gold, while many boasted all the colors of the rainbow. They were made of paper, beautifully cut into various patterns. There were numerous altars and images, and numberless little Gautamas; but a deep niche or cave, at the far end of which was a fat idol, with a yellow cloth wrapped round him, seemed a place of peculiar sanctity. This recess would have been quite dark, had it not been for the numberless tapers of yellow wax that were burning before the image. The closeness of the place, the smoke from the candles, and the fumes from the quantity of crackers constantly being let off, rendered respiration almost impossible. An old pon-gyee, however, the only one I ever saw in a temple, seemed quite in his element; the shaven bristly head and coarse features looking ugly enough to serve for some favorite idol, and he seemed a fitting embodiment of so senseless and degrading a worship. Offerings of flowers, paper-ornaments, flags, and candles were scattered about in profusion. The beating a bell with a deer's horn, the explosion of crackers, and the rapid mutterings of prayers, made up a din of sounds, the suitable accompaniment of so misdirected a devotion.'

The rosary is in general use, and the Pali words *Aneitya! doka! anatta!* expressing the transitory nature of all sublunary things, are very often repeated. The Burman is singularly free from fanaticism in the exercise of his religion, and his most sacred temples may be freely entered by the stranger without offence; indeed, the impartial observer will hardly fail to admit that Buddhism, in the absence of a purer creed, possesses considerable influence for good in the country under consideration. 'It teaches man to combat, control, and master the passions of his heart, to make reason predominate over sense, mind over matter, and to practise the virtues required for the attainment of these objects.'

The sacred edifices are of three kinds: 1. The tope, dagoba, or *shrine* (*Zadee* or *Tsa-dee*), a monument erected to the last Buddha, is a solid, bell-shaped mass of plastered brickwork, tapering to the summit, which is crowned by the *tee*, or umbrella, of open ironwork. 2. The *temple*, in which are many images of Gautama. The most remarkable specimen of Burman temple-architecture is the *Ananda* of Pagan. The ground-plan takes the form of a perfect Greek cross; and a tapering spire, with a gilded tee at the height of 168 feet from the foundation, crowns the whole. 3. The *kyoung* or monastery (*vihara*) is generally constructed with a roof of several diminishing stages, and is often elaborately adorned. Burman architecture 'differs essentially from that of India in the frequent use of the pointed arch, not only for doors and windows, but also in the vaulted coverings of passages.'

Cities.—Mandalay, the present capital of B., and seat of royalty, is situated 3 miles from the Irrawaddy, a little to the north of Amarapura and Ava. It is laid out in three parallelograms, one within another, of which the inner two are walled; the palace occupies the center. Ava and Amarapura, each at one time the capital of the empire, are now almost entirely deserted. Pagan represents the past of B., and is remarkable for its magnificent ruins of temple-architecture extending over 8 square miles; the prevailing type is the cruciform vaulted temple.

Government.—The government of B. is a pure despotism, life and property being at the mercy of the reigning sovereign. Many instances of the cruel abuse of arbitrary power, by even recent kings, might be given. The present monarch is, however, mild, approachable, and apparently desires the welfare and happiness of his subjects. The *Lot-dau*, or High Court of Council, is composed of the four *woon-gyees*, or principal ministers of state. The *atwen-woons*, or household ministers, are likewise four in number. They receive the royal commands, and are in close attendance upon the king. The *woon-douks* are a third order of ministers, and act as assistants to the woon-gyees. The decisions of the lot-dau,



Specimen of Burmese Writing.

when sanctioned by the king, become law. The *Dam-a-that*, a Burman translation of the *Institutes of Menu*, is also in force. White umbrellas and white elephants are regarded as insignia of royalty. The 'Lord White Elephant,' indeed, is looked on as an estate of the realm, a mark of universal sovereignty, and a sacred being. It has a palace, a minister, and numerous attendants.—The *military power* of the country is not great, and of musketeers it is probable that the king could not command more than 18,000.

The *civilization* of B., is not retrograde—which the ruins of Pagan would almost seem to indicate—is stationary and stereotyped, like that of China. All the wealth of the country is lavished on the sacred edifices, £10,000 sterling being sometimes expended on the gilding and beautifying of a single shrine or temple, whilst roads, bridges, and works of public utility are neglected.

The *vernacular tongue* of B. belongs to the monosyllabic class of languages, and is without inflection; the character is formed of circles and segments of circles. It is engraved on prepared strips of palm-leaf, and a number of these form a book. Printing is unknown except where introduced by the missionaries. *Pali* is the language of the religious literature.

Commerce.—Since B. was deprived of its harbors and maritime districts, its foreign commerce has been very limited. The principal exports (from B. Proper) consist of Sesamum oil, teak-timber, petroleum, sweet-oil, tobacco, lackered boxes, gold-leaf, silver, lead, copper, stick-lac, indigo, cocoa-nuts; ponies, wheat, pulse, and cotton. The imports (into the Burman Empire) are *ngapee* (a paste of rank pickled fish, which is eaten with rice, the staple food of the Burman), paddy, rice, dried fish, salt—all these being imported by thousands of tons annually; cotton piece-goods, silk do., and woollens. B. carries on an overland traffic with China, exporting cotton and importing silk. A commercial treaty with Britain was concluded in 1867, but has remained almost a dead letter.

The standard *currency* of B., called *yowet-ni* (red-leaf), is silver, but there is no coinage. This metal is used, however, of varying degress of purity, which complicates mercantile transactions, and assayers are employed to find the value of the metal.

History.—Of the early and mythical history of B., nothing need here be said. The kingdoms of Ava and Pegu long centended for mastery. The latter was in its zenith in about 1580 A.D. Passing on to 1752, it appears that the Peguans, after a period of subjection, obtained the advantage. At this time, however, Alompra, or *Aloung Pra*, the most celebrated warrior-king in Burman history, rose to power, founded the present dynasty, subdued the Peguans, and incorporated their country, as well as many neighboring states, with his own. The Burman empire attained its greatest expansion in 1822. The wars of 1822—1824 and 1852 with the British, reduced B. to its present limits. The savage excesses of the king of B. led in 1879 to the withdrawal of the British ambassador and his staff. See Yule's *Narrative of the Mission in* 1855; Fytche's *Burma Past and Present* (1878); the excellent work, *The Burman: his Life and Notions*, by Shway Yoe (1882); Vincenti's *Land of the White Elephant* (1874); Gordon's *Burmah and its Inhabitants* (1876); Anderson's *Mandalay to Momien* (1876); M'Mahon's *The Karens and the Golden Chersonese* (1876).

BURMAH, BRITISH, includes the three maritime provinces of India beyond the Ganges, which were united under one local administration in 1862. It extends along the eastern side of the Bay of Bengal, from 20° 50′ to 10° 50′ N. lat. It has a coast-line of fully 900 English miles, and a total area of 88,556 sq. m., distributed as follows: Aracan, 14,526; Pegu, 27,300; Tenasserim, 46,730.

The whole of this territory was taken from the king of Burmah in the two wars provoked by him.

Akyab, Rangoon, and Maulmain are the principal seaports of Aracan, Pegu, and Tenasserim respectively. Pegu is the most prosperous of these three divisions, and has made the most progress within recent times. Pop. of B. (1881) 3,704,253. The Burmans (including Aracanese and Talcins, or Peguens) number about two millions. Of the other races—Karens, Shans, Chinese, and Hindus—the Karens are the most numerous and interesting. —See Forbes *British Burma* (1879).

BURMANN, PETER, the most important member of a Dutch family celebrated for learning, was born at Utrecht 1668, studied law at the university of that city and of Leyden, and, after taking his degree in 1688, traveled through Germany and Switzerland. After practising as an advocate for some years, he was appointed professor of history and rhetoric in the university of Utrecht; which office he subsequently exchanged for the professorship of Greek. In 1715, after the death of Perizonius, he removed to the university of Leyden, where he died 31st March 1741.

His literary career was very active, and his hot temper and intolerant spirit involved him in many controversies. Among his most distinguished adversaries were Le Clerc and Bentley. His chief works are editions of the Latin classics—Petronius, Velleius Paterculus, Quintilian, Valerius Flaccus, Phædrus, Ovid, the Poëtæ Minores, Suetonius, Lucan. The first of these appeared in 1709, and the last in 1740. They are characterized less by taste and critical acumen than by learning, fulness of matter and beauty of type.

BURN, RICHARD, was born in 1720 at the village of Winton, in Westmoreland. After being educated at Queen's College, Oxford, he received the living of Orton, in his native county, which he continued to hold until his death in 1785. He is widely known as the compiler of two very useful law-books, the *Justice of the Peace* and *Ecclesiastical Law*, which have each passed through many editions. He also published a *History of the Poor-laws*, an edition of Blackstone's *Commentaries*, and several sermons and works of a religious nature.

BURNES, SIR ALEXANDER, a distinguished traveler in Central Asia, was born at Montrose, in Scotland, 1805, where his father, who was a cousin of Robert Burns the poet, was an active magistrate. He early entered the Indian army, and his knowledge of Oriental languages gained him rapid promotion. After performing some important missions for the Indian Government, he was, at his own suggestion, sent on an expedition into Central Asia. Starting from Lahore on the 11th February 1832, B., having adopted the dress and usage of the Afghans for greater safety, passed through Peshawur and Cabul, and crossing the Indian Caucasus, reached Balkh on the 9th June.

Thence he passed on to Bokhara, Astrabad, and Teheran, and journeying through Ispahan and Shiraz, reached Bushire on the Persian Gulf, from whence he embarked for India. He received the special thanks of the governor-general for his travels; and on his return to England in 1833, he received a warm welcome from the India House and Board of Control, and was highly honored by the Royal Geographical and other societies. In September 1839, having previously, for his important services, been knighted and promoted to the rank of lieutenant-colonel, he was appointed political resident at Cabul, where he was murdered on the breaking out of the insurrection in that city in November 1841—a tragedy re-enacted in 1879, when Sir Louis Cavagnari, newly appointed resident in Cabul, was massacred with his staff and guards. B. was author of *Travels into Bokhara* and a work on *Cabul*.

BURNET, the English name of two genera of plants, *Sanguisorba* and *Poterium*, belonging to the natural order *Sanguisorbeæ* (q. v.)—very generally regarded as a sub-order of *Rosaceæ*—which have much resemblance to one another, and receive a common name also in other languages. *Sanguisorba* has hermaphrodite flowers with four stamens; in *Poterium*, the flowers are polygamous, and the stamens indefinite in number. In both, the calyx is 4-fid, and the corolla wanting.—GREAT B. (*Sanguisorba officinalis*) is common in meadows in all parts of Europe, and not unfrequent in some parts of England, particularly where the soil is calcareous. It has a stem 1—2 feet high, pinnate leaves, with about four pair of ovate serrated leaflets and an odd one; the flowers are crowded in dark red spikes. It is cultivated in Germany for feeding cattle, and is much esteemed for this use, as it grows well even on very

poor soils, and the produce is abundant. Cattle are very fond of it. The root is astringent, and was formerly used in medicine.—COMMON B. (*Poterium Sanguisorba*) grows in sunny places on hills in the middle and south of Europe, and is common in England,

Great Burnet (*Sanguisorba officinalis*): *a*, a leaf; *b*, spikes of flowers; *c*, a flower.

Common Burnet (*Poterium Sanguisorba*).

especially in the chalk districts. In habit and foliage, it much resembles the Great B., but the leaflets are smaller, and the flowers are in heads of a dull purplish color.

It has been much cultivated in some parts of England as a substitute for clover on chalky soils, and is relished by cattle. It forms great part of the natural pasture of the South Downs, and of the excellent sheep-walks of Salisbury Plain. It is regarded as a plant particularly suitable for poor arid soils. It is sometimes cultivated in gardens, and its leaves, which are slightly astringent, are used in salads or soups. They are said to form one of the ingredients of the famous *cool tankard*, and the name *Poterium* is from a Greek word signifying a drinking vessel.—Both this and the preceding are perennial plants.—There are several other species both of *Sanguisorba* and *Poterium*, some of the latter shrubby, natives chiefly of the warmer temperate parts of the world.

BURNET, GILBERT, Bishop of Salisbury, was born at Edinburgh on the 18th September 1643. He was educated at home, and afterwards at Marischal College, Aberdeen, where he pursued his studies so diligently, that he took his degree of M.A. before he was fourteen. In the course of a year he made up his mind to enter the church, and read so hard at theology, that in less than three years he had mastered the chief systems of divinity, besides having gone over the Old and New Testaments in the original, with all the Commentaries of note in his time. In 1663, he visited Cambridge, Oxford, and London, where he met with many of the leading divines of England. Next year, he passed over into Holland, and perfected his knowledge of Hebrew under a learned rabbin of Amsterdam. In 1665, he was presented to the parish of Saltoun, where he remained five years. In 1669, he was appointed Professor of Divinity in the university of Glasgow, but having mixed himself up in the politico-ecclesiastical affairs of the time, he brought upon himself the enmity of Lauderdale, and found it prudent to resign his chair in 1674. He now removed to London, and was made preacher at the Rolls' Chapel by Sir Harbottle Grimston, and afterwards lecturer at St. Clement's. In 1676, he published his *Memoires of the Dukes of Hamilton*, and in 1679, the first volume of his *History of the Reformation*, which procured him a vote of thanks from both Houses of Parliament. Next year appeared *Some Passages in the Life and Death of the Earl of Rochester*, in which B. records the religious interviews which he had with that profligate nobleman during his last illness, and which led to the latter's conviction of the truth of Christianity. In 1681, he published his second volume of his *History of the Reformation*, and in 1682, his *Life of Sir Matthew Hale*. The efforts which had previously been made, were now repeated, to induce him to break with the liberal and moderate party, and to attach himself to the king. He was offered the bishopric of Chichester, but refused it. In 1683, he narrowly escaped being brought into trouble in regard to the Ryehouse plot.

He conducted the defence, attended the execution, and vindicated the memory of his friend Lord William Russell. The king exhibited his unkingly spite by depriving B. of his St. Clement's lectureship. On the accession of James II., he went to the continent, and traveled through France, Italy, Switzerland, and Germany. In 1684, he was introduced to the Prince of Orange, with whom he became a great favorite, and by whom he was frequently consulted in reference to the great scheme for the deliverance of England. When William came over, B. accompanied him in the capacity of royal chaplain, and shortly after, was appointed Bishop of Salisbury. He entered on the duties of his diocese with great ardor; but his first pastoral letter, in which he founded the right of William to the throne on conquest, gave so much offence to both Houses of Parliament, that they ordered it to be burned by the hands of the common hangman. William, however, who knew the excellent qualities of the bishop, was not greatly impressed by this solemn performance, and continued to trust B. to the end of his life. In 1698, B. was appointed preceptor to the Duke of Gloucester; in 1699, he published his celebrated exposition of the 39 Articles, which was condemned as heterodox by that not very competent assembly, the House of Lords. In 1714, appeared the third volume of his *History of the Reformation*. In the spring of 1715, he was attacked by a pleuritic fever, and carried off on the 17th of March, in the 72d year of his age. B. was thrice married: his first wife was remarkable for her beauty; the second, for her fortune; and the third, for her piety.

Soon after B.'s death, appeared *Bishop B.'s History of his Own Time, from the Restoration of King Charles II. to the Conclusion of the Treaty of Peace at Utrecht, in the Reign of Queen Anne* It was sarcastically but foolishly abused by the Tory writers of the day—Swift, Pope, Arbuthnot, and others. B. was a man of strict, almost of puritanic virtue; yet his charity, geniality, and moderation of sentiment might be imitated with advantage even in our own day. His style is neither elegant nor correct, and his judgment is not always reliable, yet, the honesty, earnestness, simplicity, and vigor of his writings, as well as their fulness of details, make his works very valuable to the student of history.

BURNET, JOHN, a painter, engraver, and author, was born at Fisherrow, near Edinburgh, March 1784. He was first brought under the notice of the public through his engravings of Wilkie's works, which he executed in a most admirable manner. Of his own paintings, the best known engraving is that of 'Greenwich Pensioners receiving News of the Battle of Trafalgar.' He has written several works on art, illustrated by drawings and engravings of his own, the most important of which is a *Practical Treatise on Painting*. He is also the author of *Rembrandt and his Works*, 4to, 1849; and in conjunction with Mr. Peter Cunningham, of *Life and Works of J. M. W. Turner*, 1852. He died in 1868.

BURNET, THOMAS, best known from his *Theory of the Earth*, was born in Yorkshire, 1635, and studied at Cambridge. After acting as traveling-tutor to several noblemen, he was elected Master of the Charter-house (1685), and later, succeeded Archbishop Tillotson as clerk of the closet to William III. But having (1692) published a work, *Archæologiæ Philosophicæ, sive Doctrina Antiqua de Rerum Originibus* (also in English), displaying great learning, but treating the Mosaic account of the Fall as an allegory, he was obliged to retire from the clerkship, and lived in the Charter-house till his death, in 1715. His *Telluris Theoria Sacra* (first part 1680; second, 1689) was written in Latin, but translated, or rather recomposed in English, by the author. It is an ingenious speculation, written in ignorance of the facts of the earth's structure, and is therefore a mere system of *cosmogony*, and not geology. But it abounds in sublime and poetical conceptions and descriptions, conveyed in language of extraordinary eloquence, and called forth the highest applause at the time.

BURNETT PRIZES, THE, are two theological premiums, founded by Mr. Burnett of Dens, Aberdeenshire. This gentleman (born 1729—died 1784) was a general merchant in Aberdeen, for many years during his lifetime spent £300 annually on the poor. On his death, he bequeathed the fortune he had made to found the above prizes, as well as for the establishment of funds to relieve poor persons and pauper lunatics, and to support a jail-chaplain in Aberdeen. He directed the prize-fund to be accumulated for 40 years at a time, and the prizes (not less than £1200 and £400) to be awarded to the authors of the two best treatises on 'The evidence that there is a Being all-powerful, wise, and good, by whom everything exists; and particularly to obviate difficulties regarding the wisdom and goodness of the Deity; and this independent of written revelation, and of the revelation of the Lord Jesus; and from the whole to point out the inferences most necessary and useful to mankind.' The competition is open to the whole world, and the prizes are adjudicated by three persons appointed by the trustees of the testator, together with the ministers of the Established Church of Aberdeen, and the principals and professors of King's and Marischal College, Aberdeen.

On the first competition in 1815, 50 essays were given in; and the judges awarded the first prize, £1200, to Dr. William Lawrence Brown, Principal of the Marischal College and University of Aberdeen, for an essay entitled *The Existence of a Supreme Creator;* and the second prize, £400, to the Rev. John Bird Sumner, afterwards Archbishop of Canterbury, for an essay entitled *Records of Creation*. On the second competition, in 1855, 208 essays were given in; and the judges, Rev. Baden Powell, Mr. Henry Rogers, and Mr. Isaac Taylor, awarded the first prize, £1800, to the Rev.

R. A. Thompson, Lincolnshire, for an essay entitled *Chrtstian Theism;* and the second prize, £600, to the Rev. Dr. John Tulloch, Principal of St. Mary's College, St. Andrews, for an essay on *Theism*. The above four essays have been published in accordance with Mr. Burnett's deed. It is expected that £10,000 will be available in 1895.

BURNETT'S DISINFECTING LIQUID AND ANTISEPTIC FLUID is a liquid introduced by Sir W. Burnett for the purpose of deodorizing the bilge-water of ships, sewerage-water, &c. It is a strong solution (sp. gr. 2) of chloride of zinc, accompanied by a small amount of chloride of iron; and when intended to be used, it is mixed with water in the proportion of one pint to five gallons of water. The liquid acts only as a *deodoriser* and *antiseptic* (see ANTISEPTICS), and does not yield any vapor which can exhibit the properties of a disinfectant (q. v.). It is of service in preserving dead animal tissues, as in the dissecting-room, and in jars containing anatomical specimens. It has little action on knives or steel instruments. When added to bilge or sewerage-water, the chloride of zinc (ZnCl) mainly acts by decomposing the offensive sulphide of ammonium (NH_4S), which it does by forming the sulphide of zinc (ZnS) and chloride of ammonium (NH_4Cl), both of which are odorless. The strong solution of chloride of zinc has also been applied to the preservation of timber, and the process of so treating wood is called, after its inventor, *Burnettising*. *Crewe's* disinfectant liquid is chemically the same as the above.

BURNEY, DR. CHARLES, a musical composer, celebrated as the author of the *General History of Music*, was born at Shrewsbury, 1726. Having studied music in his native city, in Chester, and under Dr. Arne in London, he commenced giving lessons in music himself. After composing three pieces—*Robin Hood*, *Alfred*, and *Queen Mab*—for Drury Lane, B. left London, and settled at Lynn, in Norfolk, where he designed his work on the *History of Music*. In 1770—1772, he traveled in France, Italy, the Netherlands, and Germany, collecting materials for his proposed work, and published an essay on the *Present State of Music in France and Italy*, &c. (2 vols., Lond. 1772). This was followed by his *General History of Music from the earliest Ages to the present Period* (4 vols., Lond. 1776—1789). Besides other minor works, B. wrote a *Life of Handel*, and nearly all the musical articles in *Rees's Cyclopædia*. He was appointed organist to the Hospital at Chelsea in 1789. He died in 1815.

He was intimately acquainted with many of the most eminent men of the day, including Edmund Burke and Dr. Johnson.—His second daughter, FRANCISCA B. (afterwards Madame D'Arblay), became distinguished as authoress of *Evelina*, *Cecilia*, *Georgina* and *Camilla*—novels formerly very popular, and still retaining some interest.

BURHAUNPU'R, a large town of India, in the territory of Gwalior, or possessions of Scindia's family, on the right bank of the Tapti, in N. lat. 21° 18′, E. long. 76° 20′, 280 miles north-east from Bombay. The banks of the Tapti are here bold, rising 60 or 70 feet above the stream. The town is surrounded by a rampart of brickwork, and contains a palace built by Akbar. A few of the wealthier merchants have good houses, built of teak, and profusely decorated with carvings. The most wealthy and influential are the Borahs, a Mohammedan tribe, who inhabit a distinct ward, which they shut up at night, excluding all other persons. There are manufactures of muslins, flowered silks, and brocades, for which the place was formerly famous, so that, in the 17th c., they were exported in great quantities to Persia, Egypt, Russia, and Poland.

BURNING GLASSES AND MIRRORS. See HEAT, LENS, and MIRROR.

BU'RNLEY, a thriving town and parliamentary borough in Lancashire, situated in a narrow vale on the banks of the Brun, near its junction with the North Calder, and 24 miles north of Manchester. Pop. (1871) of p. b., 44,320; (1881) 63,502. It has manufactures of cottons and woollens, calico-printing works, iron and brass foundries, machine-making works, breweries, tanneries, and rope-works. There are collieries in the vicinity, and traffic is facilitated by railways and canals, which unite it with the principal centers of trade in Lancashire and Yorkshire. B. returns one member to parliament.

A Roman vicinal way passed through the town, part of which is still known and used as the 'Long Causeway.' Roman coins, pottery, urns, &c., have been found near the town, and an extensive series of beacons, encampments, dikes, &c., occupy the slopes of the hills in the neighborhood for a linear distance of more than 10 miles. From the name of the river, *Brun*, and other circumstances, these slopes are supposed to furnish a very probable site of the battle of Brunnanburh, so celebrated in Saxon history.

BURNOUF, EUGENE, one of the most distinguished orientalists of modern times, was born at Paris, April 1, 1801, and after entering on the study of law, betook himself to the oriental languages, especially those of India and Persia. In conjunction with Professor Lassen of Bonn, he published, in 1826, *Essai sur le Pali*, which was followed, in 1827, by *Observations Grammaticales sur quelques Passages de l'Essai sur le Pali*. His great aim, however, at this time, was to obtain a complete knowledge of the remains of the religious literature in the Zend, or old Persic language, which had been neglected since the time of Anquetil du Perron, or, at least, not philologically and critically examined. B. undertook to decipher those curious MSS. which Anquetil du Perron had brought home with him, and which lay unregarded in the *Bibliothèque Impériale*. He commenced by causing the *chef-d'œuvre* of old Persic literature, the *Vendidad-Sadé* (one of the books of Zoroaster), to be lithographed with great care, and published from time to time in the *Journal Asiatique* the brilliant results of his laborious studies, which drew upon him the regard of the learned world. In 1834, he published the first volume of his *Commentaires sur le Yaçna l'un des Livres Liturgiques des Perses*, a work which, for the first time, rendered possible a knowledge not only of the dogmas, but also of the language of Zoroaster. It is a master-pieee of conscientious industry, united with copious lingual and antiquarian lore. His studies in the Zend language induced him to make an attempt to decipher the cuneiform inscriptions of Persepolis, in his *Mémoire sur deux Inscriptions Cunéiformes* (Par. 1836). In 1840, he published the text along with a translation of the *Bhâgavat-Purâna*, a system of Indian mythology and tradition. As the fruit of his study of the Sanscrit books of the Buddhists, appeared in 1845 the *Introduction à l'Histoire du Boudhisme*. See BUDDHISM. This great work absorbed for six years, the whole energies of B., who was now the recognized successor of Silvestre de Sacy. It is to be regretted that death did not permit him to continue his labors further. He died May 28, 1852.

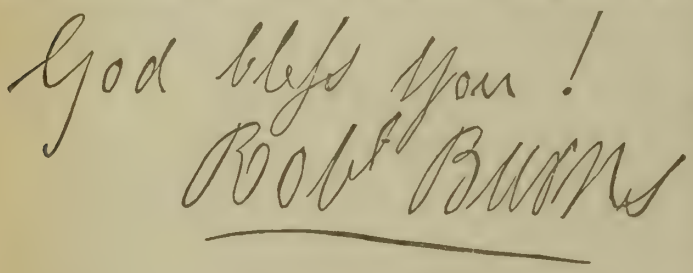
BURNS, REV. JABEZ, D.D., a Baptist minister, and one of the most prolific religious writers of the 19th century, was born at Oldham, near Manchester, in 1805, and was educated at Chester, and afterwards at Oldham Grammar-school. After helping his father as a medical practitioner, and acting as assistant in a drapery establishment, he joined the Methodist New Connection, and removed at the age of 21 to London. In 1828 and 1829, he published his first two works, *The Christian Sketch-book and the Spiritual Cabinet*, which gained him much popularity among the religious public. After having exercised the functions of the ministry at Perth, in Scotland, for a few years, he returned to London in 1835, to become minister of the General Baptist congregation assembling in New Church Street Chapel, Marylebone. Here his fame increased so much, that it was found necessary twice to enlarge his chapel during the first 25 years of his ministry, in order to afford room for the large numbers who flocked to hear him. He was elected by the body to which he belonged to fill various posts of honor, and lectured in all parts of the United Kingdom on temperance, peace, abolition of capital punishment, &c. In 1839, Dr. B. became editor of the *Temperance Journal*. About 1846, he received the degree or D.D. from the Wesleyan University of Middelton, Connecticut. Meantime his pen had not been idle, the number of his separate works being upwards of thirty, some of them consisting of a number of vols., and one of them, *Sketches and Skeletons of Sermons*, of 15 vols., having reached the 14th edition. The following are the names of a few: *Christian Exercises for every Lord's Day* (1858); *Christian Philosoyhy* (1849); *Deathbed Triumphs of Eminent Christians; Light for the House of Mourning* (1850); *Pulpit Cyclopædia*, 4 vols. (1846—1860); *Marriage Gift-book and Bridal Token* (1862); &c., which are all highly popular among a large section of the English and American evangelical religious world. Dr. B. died in 1876.

BURNS, ROBERT. the great lyric poet of Scotland, was born 25th January 1759, in a small cottage near Ayr. His father, then a nursery-gardener, and afterwards the occupant of a small farm, had to struggle all his life with poverty and misfortune, but made every exertion to give his children a good education; and the young poet enjoyed an amount of instruction and miscellaneous reading which, to those unacquainted with the habits of the Scottish peasantry, would seem incompatible with the straitened circumstances and early toil which were his lot. About his sixteenth year, he began composing verses in the Scottish dialect, which attracted notice in the vicinity, and extended the circle of his acquaintance; and thus he became exposed to temptations which, acting on an extremely sociable and passionate disposition, broke in upon the previous sobriety and correctness of his life. A small farm, on which he had entered with his brother in 1781, proved far from a prosperous undertaking; and being harassed and imbittered by other misfortunes—the results of imprudence—he resolved to leave his native land, and go to Jamaica. Partly to procure the means of paying his passage, he published a collection of his poems at Kilmarnock in 1786. The reception these met with was highly favorable, and his genius was recognized in quarters where he had not looked for notice. While preparing to embark,

he received a letter encouraging him to go to Edinburgh, and issue a new edition. This was the turning-point of his life. During his stay in the Scottish metropolis, he associated with all that was eminent in letters, rank, and fashion, and his conversational powers excited little less admiration than his poetry. The profits of the publication were considerabie, and enabled him to take the farm of Ellisland, near Dumfries, where he settled in 1788, having publicly ratified his marriage with Jean Armour. With his farm he conjoined the office of an exciseman; but after three or four years, he was obliged to give up farming, and from that time lived in Dumfries, dependent on his salary from the Excise, which, at first, only £50, never rose above £70. The striking contrasts in the lot of the rich and the poor with which his residence in Edinburgh had impressed him, made him hail the French Revolution with enthusiasm; and some imprudent expressions of his having been reported to the authorities, destroyed his prospects of promotion in the service, and only the interference of an influential friend prevented him from losing his office.

Such was then the terror of innovation, and the hatred of everything like liberal opinions, that many of the better classes, who had féted the poet, now shunned the 'Jacobin,' as they stigmatized him. Imbittered by what he felt to be injustice, he recklessly allowed those habits of dissipation to grow upon him which made the more respectable of all classes look coldly on him; and the remorse thus occasioned in his calmer moments aggravated that tendency to melancholy which the gloom and toil of his early years had probably implanted in his constitution. Broken in health, he died 21st July 1796.

The poetry of B. is purely the outpouring of the moment—the response of the feelings to the immediate circumstances of life. Its charm and power lie in the justness of the feelings expressed, and in the truthfulness and freshness which it derives direct from life. Seldom have such manliness, tendernes, and passion been united as in the songs of Burns. They formed the first awakening of



Autograph of Burns.

the spirit of true poetry in Britain after a long slumber. The popularity that B. instantly acquired has continued unabated, not only in his native Scotland, but wherever English is spoken; his poems have also been translated into every European tongue. Dr. Currie, of Liverpool, published the first collected edition of his poems and letters, with a life (4 vols. Lond. 1800). Several more complete collections have appeared since, such as that by Allan Cunningham (8 vols. Lond. 1834), and that by Mr. Scott Douglas, of which the first volumes appeared in 1877. A life of B., by Lockhart, appeared, Edin. 1828. In *The Life and Works of Burns* (Edin. 1851-2), by R. Chambers, the poems are incorporated in the narrative in chronological order.

In 1859, the centenary of B.'s birth was celebrated with unparalleled enthusiasm, not only in every city and almost every village of Scotland, but in the chief cities of England, and throughout America, the British colonies, and India.

BURNS AND SCALDS are injuries to the surface of the living body arising from excessive heat—a scald implying that the heat proceeded from a fluid medium, as boiling water; a burn, from a solid. The injury is much the same in both cases; therefore, the directions for the treatment of burns will be applicable also to scalds. These injuries may be divided into three classes: 1. Burns resulting in simple redness of the skin; 2. Burns resulting in vesication or blistering; 3. Burns resulting in sloughing, or death of the part. The first object, after the accident has occurred, is to relieve the suffering; and cold applied either in the form of ice or water seems in most cases to have almost a specific power in allaying pain and checking the advance of inflammation. In other cases, moderate warmth is found more efficacious, and we must be guided mainly by the sensations of the sufferer as to which of these remedies we make use of. In very severe cases, opium or chloroform may be employed. But if the injury the body has received be very serious, the patient complains less of pain than of cold; he shivers, is much depressed, and must be well supplied with stimulants, to prevent his dying from the shock.

The best local application is the Carron-oil, which derives its name from the famous ironworks, where it has been used for many years. It consists of equal parts of olive-oil and lime-water, and should be applied on linen rags or cotton wool. Blisters may be pricked, and the contained serum allowed to trickle away, but on no account is the raised skin to be removed. The dressings should not be changed oftener than cleanliness requires; and as each portion of the old dressing is removed, it must at once be replaced with fresh, so that as little exposure as possible of the burnt surface may take place. The main principle of treatment is exclusion of the air from the injured part; and so long as this is effected, it matters but little what remedial agent is employed. Great care must be taken in the trêatment of a sore resulting from a burn, that the contraction of a scar does not cause distortion of the neighboring parts.

When the clothes catch fire, the person should lie down on the floor, and roll herself, or be rolled, in the rug, table-cover, or anything sufficiently voluminous to stifle the flames; and afterwards the clothes, especially stockings, should be removed with great care, lest the cuticle should separate with them, which would materially increase the sufferings of the patient.

Extensive scalds or burns are very fatal to young children; and it must be remembered that their skin is more susceptible to external impressions, and will suffer from a degree of heat innocuous to an adult. Infants have frequently been scalded to death in too hot baths, or by too hot fomentations. The principles of treatment for burns produced by the contact of chemical agents to the skin, are the same as those for burns by fire.

BURNT OFFERING. See SACRIFICE.

BURNT SIE'NNA, a fine orange red pigment, transparent and permanent, used both in oil and water color painting. It is obtained by simply burning the ferruginous ochreous earth known as Terra di Sienna. Excellent greens are produced by mixing it with Prussian blue. It mixes well with other pigments generally, and dries quickly.

BURNT STONES, antique carnelians found in ruins, and seeming to have been acted upon by fire, having a dull appearance externally, but exhibiting a beautiful red color when held up to the light. They are sold at a very high price, particularly if to the natural beauty of the stone is added the merit of fine workmanship. They were once, however, more esteemed than now, and an imitation of them, by burning the upper surface of carnelians with a hot iron, was very fashionable.

BURNT U'MBER, a pigment of a russet-brown color, is semi-transparent, mixes well with other pigments, and dries quickly. It is obtained by burning umber, an ochreous earth containing manganese, and deriving its name from the place where it was first discovered—Umbria in Italy.

BURNTI'SLAND, a seaport town of Fifeshire, on the north shore of the Firth of Forth, about 8 miles north-north-west of Edinburgh. It consists of one long street, clean and well kept, with a back street running parallel, and some diverging lanes. B. is an important station of the North British Railway, having a steam-boat ferry connecting it with Granton, the station on the opposite side of the Forth. It has a commodious harbor which was greatly improved in 1876, and dock. Its trade consists principally of distilling, and the shipping of coal and iron; and in summer it is considerably resorted to as a convenient watering-place. It unites with Kinghorn, Dysart, and Kirkcaldy to send one member to parliament. Pop. (1871) 3422; (1881) 4271.

BURNU'GGUR, a town of India, in Guzerat, the territory of the Guicowar, 52 miles north from Ahmedabad, in N. lat. 23° 48', E. long. 72° 38'. It is a place of considerable trade, which is mostly in the hands of wealthy Brahmans. Pop. 12,000.

BURRIA'NA, a town of Spain, in the province of Castellon-de-la-Plana, about 8 miles south from the town of that name, is situated on the left bank of the Rio Seco, about one mile from its mouth in the Mediterranean. Pop. (1877) 10,058, who are chiefly engaged in agriculture and fishing; and exports wine, oil, and fruit.

BURRITT, ELIHU, a distinguished advocate of the doctrines of the Peace Society, and widely known as 'the learned blacksmith,' was born at New Britain in Connecticut, United States, in 1811. He was brought up to the trade of a blacksmith; but devoted all his leisure to study, especially to mathematics and languages. In the latter field of study, his range has been very wide, embracing more or less Latin, Greek, Hebrew, Arabic, and other oriental tongues, and almost all modern European and Slavonic languages. He is, however, much better known to the world as an earnest apostle of peace than as a scholar. To preach the doctrine of 'universal brotherhood,' he has traveled through Europe and the United States. His chief works are, *Sparks from the Anvil*, *Olive Leaves*, *Peace Papers*, and *Lectures and Speeches*. He has taken a prominent part in the Peace Congresses of Brussels, Paris, Frankfort, London, and Edinburgh; and in advocating an ocean penny-postage. For many years he resided in England,

part of the time as U. S. consul at Birmingham. He died 7th March 1879.

BURSARY (Fr. *bourse*, Lat. *bursa*, a purse), the annual proceed of a sum permanently invested for the maintenance of a student at a university. A number of small bursaries were till lately the only equivalents at the Scotch universities for the scholarships of the English. Their large number, and the small amount of each was, in course of time, found to have a prejudical effect, more particularly at Aberdeen, which possessed the largest number, and where a practice had obtained of multiplying bursars on the foundation, at the discretion of the senatus or patrons. Both the University Commissioners of 1831 and those of 1863 expressed their opinion that it was less provision for encouraging learning in its earlier stages than adequate inducements to persons who have passed the preliminary class to make learning the business of their lives, that was wanted in Scotland. The general effect of the ordinances issued by the Commissioners of 1863, in carrying out the directions of Act 21 and 22 Vict. c. 83, was to consolidate some of the smallest bursaries into others of greater value, and in some instances to remove restrictions that had proved injurious, while a large number was thrown open to competition. There are, however, still a large proportion of purely presentation bursaries, and in some there is a preference given to a particular name, or to natives of a particular district.

At Aberdeen, the commissioners founded eight scholarships of £65 annual value; at St. Andrews they so modified the Ramsay foundation as to found two scholarships of £60; and in Edinburgh they acquired funds sufficient to establish the Pitt and Mackenzie scholarships of £60 and £120 annual value. Since 1863, a large number of scholarships, tenable by graduates, and fellowships, have been founded by private individuals on a more liberal scale than the old bursaries, particularly in Edinburgh and Glasgow. At Edinburgh there are at present about 200 bursaries, of which above 100 are in arts, and 30 in theology; they vary in amount from £2, 15*s*. 6*d*. to £100. Among the most considerable of them are two of £90, founded in 1809 by Dr. Donald Grant, for students of his own surname; one founded by Sir John Macpherson in 1821, worth £88, for Highland students; the Jardine competition bursary of £40, four Lennie bursaries of £48, four Bruce bursaries of £30, and three of £40; two competition bursaries of £100 and £50 respectively, founded in 1860 by Mr. Patrick of Roughwood, for young men educated in Ayrshire; two bursaries founded in 1865 by Miss Scott of Horseliehill, and one by Miss Harrison in 1867, for £40 each; and two founded by the Rev. John Spence in 1867, for £50. The scholarships for graduates are about thirty, varying in amount from £60 to £120; and there are about eight fellowships varying from £100 to £160. Of 190 bursaries at Glasgow, many of them small, the most considerable are six founded by Lord Dundonald in 1672, four in philosophy, and two in divinity, of £40; two by Mr. Patrick, of £100 and £50 respectively; and the Brisbane medical bursary of £50, founded in 1877. Glasgow has also 14 exhibitions to Balliol College, Oxford, on the Snell foundation (q. v.), and about 30 scholarships of from £50 to £200, the highest being the four founded by George A. Clark, in 1872. At St. Andrews there are 81 bursaries belonging to the United College, varying in amount from £5 to £50; 20 belonging to St. Mary's, varying from £6 to £50; and 20 of the same value transferable from the United College, when the bursars proceed to the study of divinity; two Ramsay scholarships of £50; one Guthrie scholarship worth £100 the first year, and afterwards £50; one Patrick Kidd scholarship, worth about £40; and two scholarships of £50, founded by Mrs. Tyndal Bruce. At Aberdeen there are about 250 bursaries, varying from £5 to £50; and 11 scholarships of £65 to £70, tenable for four years, also some valuable exhibitions to Cambridge.

BU'RSLEM, a town of Staffordshire, on the Trent and Mersey Canal, in the pottery district, is on the branch of the North Staffordshire Railway. It forms part of the parl. burough of Stoke-upon-Trent. Pop. (1871) 25,562; (1881) 27,108. The abundance of coal and the variety of clays have made B., since the 17th c., one of the chief seats of the fictile manufacture. Porcelain and pottery of all kinds—Parian, iron and stone ware, &c.—are produced on a large scale, as well as encaustic tiles. There is also a glass manufactory here. The affairs of the town are managed by a 'local Board of Health.' At Birche's Head, a mile and a half from B., stands a large service reservoir of the Staffordshire Waterworks Company, from which the town and neighborhood are supplied with excellent water. A fine new town-hall was erected in 1865, which, besides the usual municipal offices, contains lecture rooms and news rooms. B. was the native place of Josiah Wedgwood, who in the middle of the 18th c. greatly improved the manufacture of pottery. A Wedgwood memorial institute was founded in 1863, to serve as a school of art, a free library, and a museum. An appropriate character is given to it by introducing into the ornamentation of the façade terra cotta mouldings, Wedgwood's jasper ware, &c.

BURTON, John Hill, advocate (member of the Scottish Bar), achieved for himself a place in the world of letters by a variety of works, all remarkable for ability, and several for original thought. B. was born at Aberdeen on the 22d of August 1809; his father was an officer in the army, and his mother the daughter of an Aberdeenshire laird. Having graduated at Marischal College, Aberdeen, he became an apprentice to the profession of law in his native city; which, however, he afterwards abandoned for the higher sphere of the Edinburgh bar. Here, with time on his hands, he devoted himself to study and letters. For a long series of years, from 1833 downwards, he was a contributor to the *Westminster Review* of articles on law, history, and political economy; and for several years he contributed to *Blackwood's Magazine* literary sketches. Among his original works may be mentioned, *The Life and Correspondence of David Hume*, 2 vols. (1846); *Lives of Simon Lord Lovat and Duncan Forbes of Culloden* (1847), both excellent biographies; *Political and Social Economy* (1849), which is a valuable, condensed and lucid contribution to the literature of social science; *Narratives from Criminal Trials in Scotland; A Manual of Scottish Law; A Treatise on the Law* (Scottish) *of Bankruptcy; The History of Scotland from the Revolution to the Extinction of the Last Jacobite Insurrection*, 2 vols. (1853); *The History of Scotland from Agricola's Invasion to the Revolution of* 1688, 7 vols. (1867—1870); *The Book-Hunter* (1862); *The Scot Abroad*, 2 vols. (1864); *The Cairngorum Mountains* (1864). A new edition of the *History of Scotland*, enlarged and partly rewritten, appeared in 8 vols., 1873. He edited vols. i. and ii. of the *Register of Privy Council* (Scotland) for 1545—1578; and issued *A History of the Reign of Queen Anne* in 1879. The high merits of B.'s historical works have been universally admitted.

He further edited the works of Jeremy Bentham (nominally in conjunction with the late Sir John Bowring), with an able introduction; and published a volume of *Benthamiana*. B. was, in 1854, appointed Secretary to the Prison Board of Scotland; and on the abolition of that Board in 1860, he remained as Stipendiary Manager and Secretary in connection with the Home Office. In 1877, B. was appointed one of the Prison Commissioners for Scotland. He held the old office of Historiographer Royal for Scotland, was LL.D. of Edinburg University, and D.C.L. of Oxford. He died 10th August 1881.

BURTON, Richard Francis, one of the most daring and successful of modern travelers, was born in 1821 in Norfolk. He is the son of Colonel J. N. Burton, and was educated in France and England. In 1842, he entered the Indian army, and served many years in Sindh. While in this employment, he exhibited a remarkable facility in acquiring the Eastern languages, and a still more remarkable dexterity in imitating the appearance and habits of the natives of India. In 1851, he published his first important work—*Sindh, and the Races that inhabit the Valley of the Indus*—full of graphic description, and interesting to all readers. B. had acquired a very familiar acquaintance with Hindustani, Persian, and Moultani. He had devoted special attention to Arabic, and had made such progress as to be able to speak it like a native. Possessed of these qualifications, he resolved to explore Arabia in the disguise of an Afghan pilgrim; and after a visit to England, he set out on his journey. Political commotions prevented him from traversing the whole country, as he intended; but his *Personal Narrative of a Pilgrimage to El Medinah and Meccah* (1855) records one of the most daring feats on record. A perpetual strain on the ingenuity was necessary to keep up his assumed character, most difficult in moments of fatigue, and in the midst of shrewd and observant fellow-travelers. The next journey undertaken by B. was into the country of the Somaulis, in Eastern Africa. It proved less successful than was anticipated. B.'s companion, Lieutenant Stroyan, was killed, and B. himself was wounded. He succeeded, however, in reaching Harar (q. v.), a most important town in Eastern Africa, not before visited by any European, and in penetrating a vast and populous region scarcely known to geographers. The journey led to a still more important series of expeditions—those to the country of the Upper Nile. Towards the end of 1856, B. set out in company with Lieutenant Speke, also of the Indian army, to ascertain the truth of the reports collected by the missionaries, that a vast sea existed in the heart of the continent. The journey is one of the most memorable of our time. It led to the discovery and exploration of the great lake of Tanganyika, and the opening up of the eastern part of the continent. B. was rewarded with the medal of the Geographical Society. His health had been affected by his African journeys, and he sought to recover it by a journey in North America, from which he brought the first reliable account of the Mormons.

In 1681, B. was appointed consul at Fernando Po, on the west coast of Africa, and while holding this appointment, he visited Cameroons Mountains, and went on a mission to the king of Dahomey, the incidents of both journeys being recorded in two of his most interesting works. B. has subsequently been consul at Santos in Brazil, and at Damascus; and on the death of Mr. Charles

Lever in 1872, B. succeeded him in the post of British consul at Trieste. In 1882, B. visited the gold-producing country of the Guinea coast, along with Captain Cameron.

The following is a list of the principal works of Captain B. not mentioned above: *Sindh, or the Unhappy Valley* (1851); *Goa and the Blue Mountains, or Six Months of Sick-leave* (1851); *Falconry in the Valley of the Indus* (1852); *First Footsteps in East Africa, or an Exploration of Harar* (1856); *The Lake Regions of Central Africa, or a Picture of Exploration* (1860); *The City or the Saints, and Across the Rocky Mountains to California* (1861); *Abeokuta, or the Cameroon Mountains* (1863); *The Nile Basin; A Mission to Gelele, King of Dahome, with notices of the so-called Amazons*, &c.; *Explorations in the Highlands of Brazil; Vikram and the Vampire; Zanzibar; Two Trips to Gorilla Land; Ultima Thule, or a Summer in Iceland; Etruscan Bologna* (1876); *Sind Revisited* (1877); *The Gold Mines of Midian* (1878); a translation of *Os Lusiadas* of Camoens (1881); *To the Gold Coast for Gold* (with Cameron, 1882); and a history of *The Sword* (1883).

BURTON, ROBERT, author of the *Anatomy of Melancholy*, was born at Lindley, in Leicestershire, in 1576, and studied at Brasenose and Christ Church, Oxford. In 1616, he was appointed to the vicarage of St. Thomas, and in 1628, to the rectory of Segrave in his native county. He appears, however, to have continued all his life at Christ Church, where he died in 1640, leaving legacies of £100 each to the Bodleian and Christ Church libraries, and as many of his books as they did not already possess. A monument was erected to his memory in Christ Church Cathedral. B. is described by Anthony Wood as a good mathematician, a dabbler in nativities, a well-read scholar, and a thorough-paced philologist. 'As he was by many accounted a severe student, and a melancholy and humorous person, so by others who knew him well, a person of great honesty, plain-dealing, and charity. I have heard some of the ancients of Christ Church often say that his company was very merry, facete, and juvenile.' His *Anatomy of Melancholy*, in which he appears under the title of Democritus Junior, is one of the most curious *melanges* of heterogeneous elements ever put together. It consists mainly of an extraordinary mass of quotations from old and obscure writers, strung on a thread of rambling reflection; often tiresomely pedantic, but relieved by quaint touches of humor and feeling. In his own lifetime, it was highly popular, and went through five editions; after that, it fell into comparative oblivion, but is now again popular among lovers of quaint literature. Dr. Johnson said it was the only book that ever took him out of bed two hours before his usual time.

BURTON-ON-TRENT, a market-town in Staffordshire, on the river Trent and the Midland Railway. The Grand Trunk Canal also passes the town, and enters the Trent below. A bridge of 34 arches, built before the Norman Conquest, here crossed the river, but was replaced in 1864 by a new one of 29 arches. The population of B. has been more than doubled within the last 20 years, being, in 1861, 18,745; in 1881, 39,285. This is owing to the rapid extension of the brewing of ale, which is the staple produce of the place. There are upwards of thirty breweries in B., some of them on a scale of unparalleled magnitude. The two establishments of Bass and Allsopp cover together more than 250 acres of ground, and can produce yearly about two million barrels of ale. There are, of course, extensive cooperages, and also iron-foundries. The public edifices are not particularly noticeable.

BU'RTSCHEID, or BORCE'TTE, a town of Rhenish, Prussia, about half a mile distant from Aix-la-Chapelle, with which it is connected by an avenue of trees. It has manufactures of woollen cloths and cassimeres, and celebrated sulphur springs, and baths, with a temperature of 106° to 155° F. Pop. (1880) 10,989.

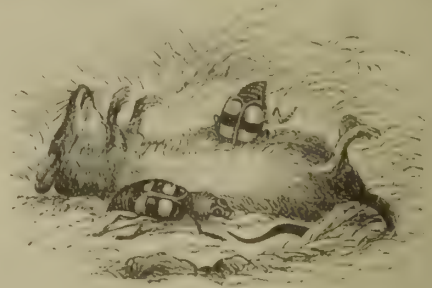
BU'RWHA, or, as Dr. Barth spells it, BA'RUWA, a town of Bornu, Central Africa, situated on the west bank of Lake Tchad, about 80 miles north-north-west of Kuka. The town, which consists of closely packed huts, is surrounded by high clay walls, which, however, 'owing to the high mounds of rubbish imbedding them on all sides,' afford no protection whatever from the attacks of the Tawarek, to whom the inhabitants have to pay tribute. Fish in great quantities are caught in the adjoining lake, and form the chief food of the inhabitants, as well as their only article of commerce. Pop. about 6000.

BU'RY, a flourishing manufacturing town in the south-east of Lancashire, on a rising ground backed by hills on the north and east, between the Irwell and the Roche, 9 miles north-west of Manchester. It was early a seat of the woollen manufactures, carried on by Flemings, but these, though still considerable, now yield in importance to those of cotton. Besides spinning and weaving factories, there are important print, bleach, paper, and dye works, and some large foundries and engine manufactories. In the vicinity are excellent freestone quarries, and abundant coal-mines. The town has been much improved in drainage, and an ample supply of water has been secured from a distance. Pop. (1871) 41,344; (1881) 49,746. B. returns one member to parliament. Some improvements in the cotton manufacture arose here—notably, the invention by John Kay of the fly-shuttle. The late Sir Robert Peel was born in B., where his father established his great print-works. A bronze statue of Sir Robert has been erected in the old market-place.

BURY ST. E'DMUNDS, or ST. E'DMUNDSBURY, an ancient borough in Suffolkshire, on the Upper Larke, 26 miles north-west of Ipswich. It is well built, and delightfully situated. Pop. (1871) 14,928; (1881) 16,211. It returns two members to parliament. It has a trade in agricultural produce, but no manufactures. A very complete system of drainage has been carried out, the sewage being conveyed to a distance, and, by means of pumps, applied to irrigation. A new Corn Exchange was erected in 1862; in 1864, the Suffolk General Hospital was rebuilt. B. received its name from Edmund, the Saxon king and martyr, who was crowned here on Christmas Day, 856; taken prisoner, and put to death by the Danes. On the site of his tomb, six priests founded a monastery; and here Canute raised a Benedictine abbey, which in time became the richest and most important in England, save that of Glastonbury. From 1020 to its dissolution by Henry VIII., it was ruled over by a line of 33 abbots. The abbot was a spiritual baron of parliament, had judicial authority in all causes within the liberty of B., had the power of inflicting capital punishment, and the privilege of coining. At the dissolution, the annual income was equivalent to £50,000 of our money. Of this magnificent establishment, little now remains but the western gate, erected in 1327, a noble relic of the decorated Gothic style; and the 'Church-gate,' a quadrangular tower of massive simplicity, 86 feet high. The churchyard, to which this tower formed the portal, includes, besides the abbey ruins and some other buildings, the fine old churches of St. Mary and St. James.

The celebrated grammar-school of B. was founded by King Edward VI. in 1550, and is free to sons of the inhabitants of the town. It has two scholarships at Cambridge, and 6 exhibitions to each university, and has produced many eminent scholars. Among the many religious and charitable institutions connected with the abbey, of which portions still exist, is St. Saviour's Hospital, founded by that notable abbot, Samson, whose life and actions, as recorded by Jocelyn of Brakelond, Mr. Carlyle has so vividly recalled in his *Past and Present*. The poet Lydgate was a monk in this abbey; and Sir Nicholas Bacon was born here. At B., King John first met his indomitable barons before he signed Magna Charta. Parliaments were held here in 1272, 1296, and 1446, the last of which ordered the arrest of Humphrey, the good Duke of Gloucester, who was found dead in his bed the morning after his arrest; and sovereigns, as late as Elizabeth's time, were often nobly entertained at St. Edmund's town. Three miles south-west of B., the Marquis of Bristol has a splendid seat, Ickworth Park, a circular pile 90 feet in diameter, and 140 feet high.

BU'RYING BEE'TLE (*Necrophorus*), a genus of Coleopterous (q. v.) insects, of the tribe or family *Silphales*, with short club-shaped antennæ, remarkable for their habit of burying the bodies



Burying Beetle.

of mice, moles, and other small animals, in order to deposit their eggs in them, and to provide a supply of food for their larvæ. Some of the species are natives of Britain, among which is *N. Vespillo*, the species of which the habits were first observed, which is, however, more common in some parts of continental Europe. It is a black beetle, about an inch long, with two bright orange bands across its back, and having an excessively fetid smell, which long adheres to whatever it touches.

Its sense of smell would seem to be extremely acute, and a dead animal soon attracts it, a pair generally arriving together, male and female, to feed upon the body, and the male to proceed to its interment, if sufficiently small, previous to which, however, they have sometimes to drag it to some distance to a place suitable for their purpose. The head of the insect is the only tool employed in the operation, and is held sloping outwards, and employed in a manner which exhibits great muscular power. A furrow is first made around the body, then another within the first, and so on till the earth is so excavated from beneath, that the body begins to

sink, when the insects, by great efforts, drag it down into the hole, and when it is fairly in, the excavated earth is thrown back over it. The female then lays her eggs in it; and when this is accomplished, and the cravings of appetite are satisfied, it is left for the larvæ, which are of a lengthened form, with six feet, whitish, and a brown head.—The known species of B. B. are mostly natives of Europe and of North America.

BUSACHI'NO, or BISAQUI'NO, a town of Sicily, in the province of Palermo, about 29 miles south-south-west of the city of that name. It has manufactures of linen, and a population of 9100.

BUSA'CO, a ridge or serra on the north side of the river Mondego, in the province of Beira, Portugal, about 20 miles north-north-east of Coimbra. Here Wellington, with 40,000 British and Portuguese troops, repulsed the attack of Massena with 65,000 French, 27th September, 1810. Unable to force the position, Massena turned it by a pass over an adjoining ridge, and Wellington retired behind the lines of Torres Vedras, which indeed it was his intention to do, even if there had been no battle.

BUSBY, RICHARD, the most famous of English schoolmasters, was born at Lutton, Northamptonshire, September 22, 1606. Educated at Westminster School, and Oxford, he was, in 1640, appointed head-master of Westminster School, the duties of which office he continued to discharge until his death in 1695. He is the type of Pedagogues alike for learning, assiduity, and the application of the birch. He was a most successful teacher, and at one time could point to no less than sixteen occupants of the bench of bishops who had been educated in his school; and altogether, he has the reputation of having 'bred up the greatest number of learned scholars that ever adorned any age or nation.' He published several works, but they were chiefly for school use.

BU'SCA, a town of Piedmont, situated on the left bank of the river Maira, an affluent of the Po, about 9 miles north-west of Coni. Excellent wine is produced in the vicinity. Pop. 9375.

BUSCHING, ANT. FRIEDR., a celebrated geographer, was born 27th September 1724, at Stadthagen, in the principality of Schaumburg-Lippe, Germany. He studied theology at Halle, where he enjoyed the friendship of Baumgarten. In 1754, he was appointed extraordinary professor of philosophy in Göttingen, but soon incurred the displeasure of the Hanoverian government by his religious heterodoxy. Göttingen thus becoming an unpleasant residence to him, he accepted an invitation, in 1761, to St. Petersburg as preacher to a Protestant congregation there. In 1765 he returned to Germany, and in 1766 was called to Berlin as Upper Consistorial Councillor and Director of a *gymnasium* in Berlin, where he died, 28th May 1793. Until the appearance of B.'s *Erdbeschreibung*, the first volume of which was published at Hamburg in 1754, neither Germany nor any other nation possessed a geographical work which made any pretension to scientific treatment or completeness of execution. The changes in the political arrangements of the world have, however deprived the work of its original value, but it has been corrected and edited by subsequent writers. Of his other numerous publications, the most important is the *Magazin für Historie und Geographie* (25 vols. Hamburg, 1767—1793).

BUSEMBAUM, HERMANN, a theologian of the order of the Jesuits, was born in 1600 at Nottelen, in Westphalia. About 1640, he taught ethical philosophy at Cologne, and later, was appointed rector of the College of Jesuits at Münster. He died 31st January 1668. His work entitled *Medulla Theologiæ Moralis* (1645), was celebrated as a standard authority in the seminaries of the Jesuits, though several of its propositions were condemned by the pope. It has gone through more than fifty editions. It was enlarged by the Jesuit Lacroix (1707), and re-edited, with improvements and additions, by the Jesuit Montausan in 1729, and again by Alfonso de Ligorio in 1757. As it was found that the work contained doctrine in favor of regicide, it was burned, by order of the parliament of Toulouse, on the occasion of an attempt made on the life of Louis XV. by Damiens in 1757. Subsequently, the Jesuits Zacharia and Franzoja of Padua wrote in defence of B.'s work.

BUSH ANTELOPE, BUSH BUCK, and BUSH GOAT, names common to a number of species of Antelope (q. v.), natives chiefly of the southern and western parts of Africa, forming a section of the genus *Antilope*, which some naturalists have attempted to erect in a distinct genus (*Philatomba* or *Cephalopus*). They are animals of more compact form, shorter limbs, and greater strength, but much less agility, than the true or typical antelopes. They are remarkable for the arched form of the back. They have short, straight, or slightly curved horns, situated far back, and generally peculiar to the male sex, with usually a long tuft of hair between them. They have no tear-pits, but instead of them, a naked glandular line, formed of two series of pores, on each cheek. They frequent jungles, thick forests, and beds of reeds, and when pursued, seek to escape by diving into a thicket. The common or white-backed B. A. of Sierra Leone (*Antilope sylvicultrix*) is about three feet high at the shoulder: it is a dull, heavy, awkward-looking animal; keeps concealed in the thickets during the day, living singly or in pairs, and feeds in the open spaces in the early mornings only. To shoot it, sportsmen place themselves on the margin of the woods, and watch their opportunity as it comes out to graze. Its flesh is more esteemed than that of the more agile antelopes. Nearly twenty other species are usually ranked in this section of antelopes, among which is the *Kleene Boc* (*Antilope pygmæa*) of South Africa, a species abundant in many parts of Cape Colony, of very small size, not more than one foot in height at the shoulder, and with horns only about 1½ inch in length. It is a timid, gentle animal, easily domesticated. It differs from the typical Bush Antelopes in the great activity which it displays.

BUSHEA'B, a low flat island in the Persian Gulf, about 11 miles from the Persian coast, in lat. 26° 50′ N., long. 53° 12′ E. It is about 18 miles long, narrow, and well peopled, with a town and harbor at its western extremity. Its proper name is *Khoshaub*, signifying 'good water.'

BU'SHEL [Fr. *boisseau*, allied to *boi(s)te*, box, butt; Lat. *butta*, a measure in general], a dry measure used in Britain for grain, fruit, &c. The quarter contains 8 bushels, and the bushel 8 gallons, the gallon measuring 277·274 cubic inches, and holding 10 lbs. avoirdupois of distilled water. Hence the imperial bushel contains 80 lbs. of water, and measures 2218·2 cubic inches.

BUSHIRE. See ABUHEHR.

BUSHMEN, or BOSJESMANS, are a nomadic race found in South Central Africa, especially in the Kalahari desert, where they subsist on game and the desert roots. In appearance the B. are thin and wiry; of low stature, poor and debased when found near the Cape, but of improved appearance and intelligence farther northwards. They do not cultivate the soil, build no huts, and do not gather round a king or chief; at one time a numerous race, they are now rapidly becoming extinct. In some of the mountain caves which they have inhabited, rude paintings are to be seen displaying real artistic talent. Although they resemble the Hottentots (q. v.) in color and features, the relationship between these two races is by no means clear. The languages of both abound in curious and unpleasant clicking sounds, but have little or nothing else in common.

Buskin.

BU'SKIN, a kind of half-boot, lacing tight to the leg. The ancient tragedians wore buskins (*cothurni*), often with thick soles, to add to their stature. Hence the B is often put for Tragedy, as the sock (*soccus*, a flat-soled shoe) for Comedy.

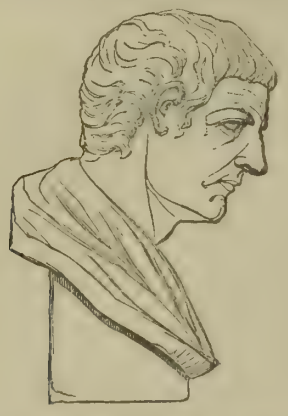
BUSSAHIR (better spelled *Bashahr*), one of the Punjab hill-states, on the lower slopes of the Himalayas (32° N. and 78° E. cross in its area). Much of its area is from 7000 to 12,000 feet above the sea. The Sutlej flows through the country from east to west. The district on the north of the Sutlej is called Kunawur, that on the south is B. Proper. The climate in the lower parts on the southern frontier is almost tropical, and there are many genial and fertile districts of mild temperate climate; other districts are near, and within the limits of perpetual snow. The vine succeeds admirably in many places, and it is supposed that some parts of this state, are extremely suitable for the culture of tea, which, indeed, is cultivated to some extent. Very rich deposits of copper ore have been discovered in Kunawur, and copper-mining is prosecuted near the south-west frontier. The inhabitants are little advanced in civilization; many of those in the more northern parts have strongly marked Mongolian features. Polyandry prevails among them, and the females left unmarried take refuge in Lamaic convents. The rajah and upper classes in the southern parts are Rajpoots, and the people generally are of Hindu race. Their observance of Hinduism, however, is very partial. The Rajah of B. holds his dignity by a grant from the East India Company, made on the expulsion of the Ghoorkas in 1815. The tribute paid is £340. The pop. is estimated at 90,000. Principal productions are opium, grain and woollen manufactures.

Bussu Palm.

BUSSU PALM (*Manicaria saccifera*), a South American palm-growing in the tidal swamps of the Amazon, the only known

species of its genus. The stem is only 10—15 feet high, curved or crooked, and deeply ringed. The leaves are simple or undivided, and are the largest of the kind produced by any known palm, being often 30 feet long, and 4 or 5 feet wide. They are simply branched, drooping, and the fruit is of an olive color, large, hard, and three-seeded. The leaves make excellent and durable thatch, being split down the midrib, and laid obliquely on the rafters, so that the furrows formed by the veins lie in a nearly vertical direction, and serve as so many little gutters to carry off the water. The spathe, taken off entire, is used by the Indians as a bag, or the larger ones are stretched out to make caps.

BUST (Ital. *busto;* Fr. *buste*), in plastic art, the name given to a sculptural representation of the head and upper part of the human body. The earliest busts formed by the ancients were probably those heads of Mercury which, when elevated on tall square blocks of stone, received the name of Hermæ (q. v.). These hermæ were afterwards frequently surmounted by representations



Bust of Aristotle.

of other divinities, such as Minerva; and as they gradually assumed more and more of the human form, they passed into busts, which were made of marble, bronze, &c. But it was not till very late in the history of art that busts, in the sense of portraits of individuals, came to be used, either in Greece or Rome; and it is remarkable that neither Greeks nor Romans designated them by any special name, for the Latin word *bustum* had a quite different meaning.

It was not till Alexander's time that busts were used for purposes of portraiture in Greeee; and most of the Roman busts which we possess belong to the period of the emperors. During the learned period of Greece, which commenced with Aristotle, portraits of men of letters formed an important department of art; and it became an object with the founders of museums and libraries to procure complete sets of them. The artists of this period exhibited remarkable ability in expressing the characters of the individuals whom they represented. In this way, we have well authenticated busts of Socrates, Plato, Zeno the Stoic, and other philosophers; of poets and orators, such as Isocrates and Demosthenes; of Athenian statesmen and distinguished women. In Rome, representations of the kings, and persons of distinction belonging to the earlier period, were probably made from the *imagines majorum* which every patrician preserved in his atrium, and which were commonly made of wax. These, no doubt, were often merely fanciful representations, partly taken, it may be, from the more prominent features which belonged to the existing members of the family. The earliest well authenticated Roman B. which we possess, is probably that of Scipio Africanus the Elder. During the empire, busts for the most part were accurate portraits, and still furnish us with the means of becoming acquainted with the features, not only of the emperors themselves, but of most other persons of distinction. Busts of poets and men of letters are far less frequently met with amongst the Romans than amongst the Greeks. The chief marks of the authenticity in these busts are the names which very frequently are inscribed on them, and, where these are not found, the comparison which we are enabled to make between them and coins. Private collectors of busts were not unknown in antiquity, as for example, M. Terrentius Varro and Pomponius Atticus. In our own time, King Louis I. of Bavaria made, in his celebrated Valhalla, the most remarkable collection of busts which perhaps anywhere exists. The first complete collection of engravings from antique busts was made by Fulvius Ursinius in his *Illustrium Imagines* (Rome, 1569, and Antwerp, 1606). Recently, we have been indebted to Visconti's *Iconographie Grecque* (Paris, 1811) and *Iconographie Romaine* (Paris, 1817) for a similar collection.

BU'STARD (*Otis*), a genus of birds, sometimes made the type of a family, *Otidæ*, usually ranked in the order *Grallæ* (q. v.). The general structure seems to agree best with that of the *Grallæ;* but there are points of strong resemblance to gallinaceous birds, both in the appearance and habits of the bustards; while their power of running, and the use which they make of their wings to aid in running, are indicative of a relation to the *Struthionidæ*, or ostrich tribe. They differ, however, from these birds in possessing wings quite capable of flight, although even when pressed by danger they often seek to escape by running, and the great B. of Europe has been pursued and taken by greyhounds.—Bustards are birds of bulky form, with long neck and long naked legs; the toes, three in number, all directed forward, short, united at the base, and edged with membrane; the wings rather rounded; the bill of moderate length, straight, or nearly so. They are mostly inhabitants of open plains, to which all their habits are adapted.—The GREAT B. (*Otis tarda*) was at one time plentiful in some parts of England, and was also an inhabitant of the south-east of Scotland; but extending cultivation, and the persecution to which it has been subjected, have now rendered it a very rare British bird. It is common in the south and east of Europe, and abounds in the wide steppes of Tatary. It is the largest of European birds, the male sometimes weighing nearly 30 lbs. The female is much smaller than the male. The plumage is of a pale chestnut color on the upper parts, beautifully varied with black—much white and black on the wings, the tail tipped with white. The tail is short, spreading, and rounded.

Great Bustard (*Otis tarda*).

A tuft or plume about seven inches long, springing from the chin, passes backwards and downwards on each side, in the summer dress of the male, partly concealing a long stripe of bare skin on each side of the neck. The anatomy of the male exhibits a remarkable peculiarity in a large bag or pouch, capable of holding several pints, the entrance to which is between the under-side of the tongue and the lower mandible. The use of this bag is unknown; but it has been conjectured to be for conveying water to the females and young, in wide arid plains. The Great B. feeds indiscriminately on animal and vegetable food, swallows frogs, mice, worms, &c., and is very fond of turnip-tops. Its flesh is highly esteemed for its flavor. It is polygamous. No difficulty is found in taming it, but all attempts to reduce it to a state of true domestication have hitherto failed, from its not breeding in the poultry-yard.—The LITTLE B. (*O. tetrax*), frequent in the south of Europe and north of Africa, is only an accidental visitant in Britain. It is not half the size of the Great Bustard. The BLACK-HEADED B. (*O. nigriceps*) is found in large flocks in the open plains of the Mahratta country. Its flesh is esteemed one of the greatest delicacies which India produces.—The KORI B. (*O. Kori*) of South Africa, a magnificent bird, standing upwards of five feet in height, has a similar reputation as one of the best kinds of game.—Australia possesses a B. (*O. Australasianus*) somewhat exceeding the Great B. of Europe in stature. It is called Wild Turkey by the colonists of New South Wales. Its plumage is finely freckled or spotted; the prevailing color is brown. It has become comparatively rare in the more settled districts, its flesh being particularly delicate and well flavored, but may be seen stalking majestically in the grassy plains, wherever human footsteps are still rare.

BUSTO-ARSI'ZIO, a town of Northern Italy, in the province of Milan, and 20 miles north-west from Milan. It stands in a fertile plain, which produces much wine. In one of the churches are numerous statues and fine paintings, by Daniel Crespi, a native of the town. Remains of ancient buildings show that B. was in ancient times of considerable importance. It is a place of active trade, and has a cotton-thread factory. Pop. of town and suburbs, 12,909.

BU'TCHER BIRD. See SHRIKE.

BUTCHERS' BROOM (*Ruscus*), a genus of plants of the nutural order *Liliaceæ*, with male and female flowers on separate plants, a perianth of six leaves, filaments united, one style, and the fruit a berry. The common B. B. (*R. aculeatus*) is a shrubby, or almost shrubby evergreen plant, with a biennial stem, 1—3 feet high, sending out many short branches and many ovate alternate sharp-pointed false leaves of the same substance as the branches, the flowers minute and arising from the disk of the false leaves, soli-

tary; the berries red, almost as large as wild-cherries, and of a sweetish taste. It is common in many parts of the south of Europe, and in the south of England, in woods and hedges. The English name is derived from the use made of the plant by butchers, to sweep their blocks. It grows well under trees or shrubs, and can often be advantageously introduced for ornamental purposes. The root was formerly used in medicine. It is aperient and diuretic.—*R. hypophyllum*, a native of Italy, had once a considerable reputation as a stimulant of the uterus.

Butchers' Broom (*Ruscus aculeatus*). *a*, branch, with flowers; *b*, a berry; *c*, a seed; *d*, a female flower.

BUTE, an island in the Firth of Clyde, Scotland, separated from the coast of Argyle by a narrow winding strait, called the Kyles of Bute, mostly under a mile wide, about 6 miles distant from the west coast or Ayrshire, and 8 miles north of Arran. It is about 16 miles long, of irregular breadth, and with an area of 60 square miles. The surface to the north is high, rugged, and barren; in the center and south, it is low and undulating, and comparatively fertile. The highest point rises 875 feet. The coast is rocky, and has some bays. The island has several small lakes. The climate is milder than in any other part of Scotland, and though moist, less so than on the west coast generally; hence, it is much resorted to by invalids. In the south, the soil is sandy; towards the north clay predominates. Most of the arable land is under tillage, and agriculture is in a good state. The chief crops are oats, turnips, and potatoes. Pop. (1881) 10,998. The principal town is Rothesay.

Most of the island belongs to the Marquis of Bute, whose beautiful seat, Mount Stuart, is about 4 miles south from Rothesay. Among the antiquities of B. are Rothesay Castle, Kames Castle, Kilmorie Castle, St. Blaine's Chapel, Dungyle, a remarkable vitrified fort on a high crag on the south-west coast, and the Devil's Caldron, a circular erection, the original purpose of which is not well known. B. and the neighboring isles were for many centuries subject to the Norwegians.

BUTESHIRE, a county in the southwest of Scotland, comprising the isles of Bute (q. v.) and Arran (q. v.), and the Cumbraes, Holy Isle, Pladda, Inchmarnoch, and other smaller islands. The area of the whole, according to the Ordnance Survey, is 225 square miles, or 143,977 statute acres. Pop. (1871) 16,977; (1881) 17,657. B. returns one member to parliament. The county town is Rothesay, in the island of Bute.

BUTE, JOHN STUART, third EARL OF, was born in 1713, and died in 1792. About 1737, he attracted the favorable notice of Frederick Prince of Wales, who made him one of his Lords of the Bedchamber. After the death of the prince, he became Groom of the Stole to his son, afterwards George III., over whose mind he obtained a strong influence. In March 1761, he was appointed one of the principal Secretaries of State; and from the 29th May 1762 to the 8th April 1763, he was Prime Minister. His government is memorable only as one of the most unpopular that ever held office in Britain, its fundamental principle being the supremacy of the royal prerogative, of which the executive government were merely the humble servants. Lord Bute was given to scientific pursuits, especially botany, and showed himself a liberal patron of literature and art. He married the only daugther of Lady Mary Wortley Montagu.

BU'TEA, a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, remarkable for the great length of the *standard* of the flower, and having a compressed one-seeded pod, membranaceous at the apex. The best known species are *B. frondosa* and *B. superba*, natives of India; and the former very widely diffused throughout that country, generally appearing as a sort of shrub in the neighborhood of villages, but in the jungles growing into a small tree. These trees present a gorgeous sight when covered with racemes of large deep scarlet flowers. They have trifoliate leaves, with roundish leaflets, velvety beneath. They yield a resinous exudation, which occurs in the form of lurid red tears, often covering the twigs, and is one of the kinds of Lac (q. v.) brought to the market in India. The juice of the tree is not red, and the lac is supposed to be elaborated by insects, but of what species is unknown.—*B. frondosa* is called the *Dhak* Tree in India. The bark and roots are very fibrous, and the fibre is used for calking boats. The flowers, called *Teesoo* or *Keesoo*, yield a beautiful yellow or orange dye.

BUTERA, a town of Sicily, in the province of Caltanisetta, and 8 miles north-north-west from Terranova. It stands on a height on the left bank of the Manfria. Ruins of great antiquity exist in the neighborhood, but the ancient name is unknown. In 853, B. was besieged for five months by the Saracens, who raised the siege on the surrender of 6000 people as slaves. B. was almost the last town in Sicily taken by the Normans, having held out against Count Roger till 1089. The present castle is of Norman erection, and contains a number of medieval antiquities. Pop. 5150.

BUTLER, BENJAMIN FRANKLIN, general of Volunteers, U. S. army, was born at Deerfield, New Hampshire, November 5, 1818. He graduated at Waterville College, Maine, in 1838, studied law at Lowell, Massachusetts, where he was admitted to the bar in 1841, and became distinguished as a criminal lawyer and democratic politician. He was a member of the state legislature in 1853, of the state senate in 1859—1860, and a delegate to the Democratic National Convention at Charleston and Baltimore in 1860, where he supported the nomination of Jefferson Davis and John C. Breckenridge, and was nominated as the Democratic candidate for governor of Massachusetts. B. had risen to the rank of brigadier-general of militia; and at the outbreak of the War of Secession, April 17, 1861, he marched with the 8th Massachusetts Brigade, and after a check at Great Bethal, was appointed to the command of Baltimore, and subsequently of Eastern Virginia with his head-quarters at Fortress Monroe. In February 1862, he commanded the military forces sent from Boston to Ship Island, near the mouth of the Mississippi; and after New Orleans had surrendered to the naval forces under Commander Farragut, he held military possession of the city, and by his severity, and especially by an, at least apparently, atrocious order respecting the treatment of women, brought upon himself the intense detestation of the Southern people, and a very general feeling of reprobation. Relieved of his command he returned to Fortress Monroe, acted under General Grant in his operations against Petersburg and Richmond, and, June 13, 1865, by his refusal to co-operate with the naval forces, caused the failure of the first attempt to take Fort Fisher, the chief defence of Wilmington. Returning to Massachusetts at the end of the war, he took an active part in politics as an extreme Radical, advocated the impeachment of President Johnson; In 1866 he was elected member of the House of Representatives, and has been repeatedly elected until 1878. See BUTLER, BENJAMIN F., in AM. SUPP.

BUTLER, JOSEPH, one of the most eminent of English divines, was born in 1692 at Wantage, in Berkshire, where his father kept a shop. With a view to the ministry of the Presbyterian Church, he attended a dissenting academy at Tewkesbury, in Gloucestershire. At the age of 22, he gave proof of high metaphysical ability in a letter to Dr. Samuel Clarke, usually appended to that celebrated writer's *a-priori* demonstration, to which it offers some objections. About this time, he made up his mind to join the Church of England, and in March 1714 entered Oriel College, Oxford. Soon after, he took orders. In 1718, he was appointed preacher at the Rolls Chapel, where he preached those remarkable sermons which he published in 1726. The first three, *On Human Nature*, constitute one of the most important contributions ever made to moral science. The scope of the reasoning is briefly, that virtue is consonant with, and vice a violation of, man's nature. In 1725 B. was presented to the rich benefice of Stanhope, in the county of Durham, to which he removed in the following year. Here he resided in great retirement till 1733. His friend Secker, the archbishop, desired to see him promoted to some more important position, and mentioned his name once to Queen Caroline. The queen thought he had been dead, and asked Archbishop Blackburne if it were not so. 'No, madam,' said the archbishop; 'but he is buried.' In 1733, B. became chaplain to his friend Lord Chancellor Talbot, and at the same time a prebendary of Rochester. In 1736, he published the great work of which the germs were contained in his three sermons, and which has entitled him, in the eyes of his eloquent disciple Chalmers, to be called 'the Bacon of theology.' The leading aim of the *Analogy* is to show, that all the objections to revealed religion are equally applicable to the whole constitution of nature, and that the general analogy between the principles of divine government, as revealed in the Scriptures, and those manifested in the course of nature, warrants the conclusion that they have one Author. Soon after the publication of this work, B. was appointed clerk of the closet to the queen, who greatly prized his conversation. In 1738, he was made Bishop of Bristol; in 1740, Dean of St. Paul's; and in 1750, he was translated to the see of Durham. He lived only to make one visitation of his diocese. His 'charge' on the occasion, in which he pointed out, with characteristic depth of insight, the importance of a due maintenance of the externals of religion, as a means of keeping alive the thought of it in the minds of the people, subjected him to much censure as betraying a tendency to Roman Catholicism—a charge unworthy now of serious notice. B.'s private character was such as became a Christian prelate: grave and judicious he was at the same time meek and generous.

His intercourse with his clergy and people was frank and hu-

mane; his episcopal treasures were wisely and munificently distributed, as not his own; and no anxious legatee looked with hope to his death. That event took place at Bath, June 16, 1752, and the good bishop's remains were buried in Bristol Cathedral. His works, notwithstanding a dry and uninteresting style, have gone through numerous editions. The best is that edited with a life, &c., by Fitzgerald.

BUTLER, SAMUEL, poet, was born at Strensham, Worcestershire, 1612. His father was a farmer in that place, and said to be a person of some education. Young B. after acquiring the rudiments of his education at home, was placed at the college school at Worcester. His progress there was rapid, and on leaving it he proceeded to one of the universities. After finishing his education, he was appointed clerk to T. Jeffreys, Esq., justice of the peace, and in his leisure hours devoted himself to the study of music and poetry. He afterwards entered the household of the Countess of Kent, which he left, and went to live with Sir Samuel Luke, who resided in the same county. After the king's restoration, he was made Secretary to the Earl of Carberry, which office he held till 1661. About this time, B. married a Mrs. Herbert, a lady of good family and some property, which, however, was afterwards lost by being invested in bad securities. He published the first part of *Hudibras* in 1663, and its reception at court was immediate and triumphant. It received all the favor Charles could spare from his spaniels and his mistresses, and he deigned even to garnish his royal conversation with its wit. The courtiers took up the fashion, the coffee-houses and taverns followed suit, and finally the mob went into raptures, in imitation of its betters. *Hudibras* was pirated within four weeks of its publication. The king had wit enough to see the merit of the work, but he lacked generosity to relieve the necessities of the writer. There seems to be no good reason to believe that B.'s palm ever tingled to the touch of royal pension or gratuity. Poverty is almost the only thing in B.'s life that one is certain of. In 1664, he published the second part of his book, and a third part appeared in 1678. He died in Rose Street, Covent Garden, in 1680; and while some say that he starved from pride, all agree that at his death he was very poor.

Hudibras is a kind of metrical *Don Quixote;* and if the work of Cervantes stands at the head of its class in the literature of Spain, *Hudibras* occupies the same place in the literature of England. The Puritans are the subjects of B.'s derision, and King Charles must have felt that the poet avenged for him the battle of Worcester. The weight, compression, and plenteousness of the wit is wonderful. *Hudibras* is like a mass of crystals, every point flashes. It is beyond any other book, of wit 'all compact.' B. thinks in witty couplets, he argues in them, he spears his foes with a jest, he routs and chases them into oblivion with unextinguishable laughter. His best things have become proverbs. His mass of wit has been grated down into common speech, and particles of it may be found any day glittering in the talk of English ploughmen and artizans.

BUTLER, WILLIAM ARCHER, a religious and philosophical writer of singularly high promise, was born in 1814, at Annerville, near Clonmel, Ireland. He was originally a Roman Catholic, but subsequently became a Protestant, and studied at Trinity College, Dublin, where he was appointed Professor of Moral Philosophy in 1837. He died in 1848. The principal work on which his reputation is based, is the *Lectures on the History of Ancient Philosophy*, edited with notes by W. Hepworth Thomson (Cambridge, 1856, 2 vols). These lectures are remarkable for their great learning, eloquence, and depth of judgment. Besides his lectures, there have appeared, *Sermons*, with a memoir by the Rev. Thomas Woodward (Dublin, 1849); *Letters on the Development of Christian Doctrine* (Dublin, 1850); *Letters on Romanism* (Lond. 1854).

BU'TLERAGE OF WINE, as described by Blackstone and Stephen, is a very ancient hereditary duty belonging to the crown, and is otherwise called the *prisage* of wines. This duty is taken notice of in the Great Roll of the Exchequer, 8 Richard I., still extant. Under the right to levy it, the crown should take two tons of wine from every ship (English or foreign) importing into England twenty tons or more, one before, and one behind the mast; which, by charter of Edward I., was exchanged into a duty of two shillings for every ton imported by merchant strangers, and called butlerage, because paid to the king's butler.

BU'TOMUS, a genus of aquatic plants, of which one species, *B. umbellatus*, is frequent in ditches and ponds in England, Ireland, and many parts of Europe, but is very rare in Scotland. It is popularly called Flowering Rush, and is one of the plants to which the praise has been assigned of being the most beautiful in the British flora. The leaves are all radical, 2—3 feet long, linear, triangular, their sharp edges sometimes cutting the mouths of cattle, whence the generic name (Gr. *ox-cutting*). The scape, or flowering stem, is longer than the leaves, terminating in a large umbel of rose-colored flowers, readily distinguished from those of all other British plants by having nine stamens, six in an outer, and three in an inner row.

Flowering Rush (*Butumous umbellatus*).

BU'TTER (Ger. *butter;* Fr. *beurre;* Lat. *butyrum*) is the fatty substance present in the milk of the mammalia, and capable of being extracted from it. In ancient times, the Hebrews seem to have made copious use of butter as food; but the Greeks and the Romans used it only as an ointment in their baths, and it is probable that the Greeks obtained their knowledge of the substance from the Scythians, Thracians, and Phrygians, whilst the Romans obtained it from Germany. In Southern Europe, at the present time, B. is very sparingly used; and in Italy, Spain, Portugal, and Southern France, is sold by apothecaries as a medicinal agent for external application. The amount of B. in cow's milk (q. v.) is about 4 per cent., though the kind of pasture, quantity of milk, and general condition, influence the relative quantity of the several ingredients of milk.

In the extraction of B., the milk is allowed to cool, and the cream which rises to the surface is skimmed off, and put into a large, deep, earthenware vessel, where it lies for several days till enough has been collected for a *churning*. (For the swifter methods of obtaining the cream by separators, see DAIRY.) Difference in treatment makes difference in butter. The B. and cream of Devonshire, famed for their superior richness, owe this in greater part to the mode of manipulating the milk, and not to the special character of that fluid, or to the richness of the pastures in those districts. The milk in Devonshire is not allowed to cool slowly, as elsewhere, but is at once placed in large deep pans, and carefully heated. A scum quickly rises, which is pushed to the side; and whenever the bubbles of steam appear, the milk is removed, and allowed to cool in the ordinary way, when a good deal of the milk thickens to the consistence of B., and is skimmed off as the celebrated *Devonshire clouted cream*. In England, the B. of Epping and Cambridge is highly esteemed; the Dutch B., in a salted form, is very largely consumed; of one-third of the foreign B. consumed in Great Britain, the largest supply is imported from Holland, France stands next, then Denmark and the United States.

In order to separate the B. from milk, recourse is always had to the process of agitation in CHURNS (q. v.). The principle involved in each and all of the forms of this apparatus is the thorough agitation of the contents, so as to cause the rupture of the minute fat globules present in the milk, and the incorporation or kneading of these ruptured fat globules into larger or smaller masses of butter. The cream is strained through cloth into the churn, to remove any foreign matter; and the agitators being set in motion, the friction of the movement, combined with the admission of air, and the chemical changes it induces, raises the temperature of the whole contents. At one time, it was thought that one great object of the agitation was the admission of the oxygen of the air, which becoming thoroughly incorporated with constituents of the milk, combined therewith, and, as a consequence, led to the separation of the butter. It is found, however, that B. can be obtained from milk by mere agitation, without the admission of the oxygen of the air. At the same time, in the ordinary way of churning, oxygen does play a subordinate part by combining with the sugar of the milk, and forming lactic acid, which in its turn *sours* the milk, and separates therefrom the caseine (q. v.)—cheese-matter—in minute clots or flakes, yielding what is commonly called *sour* or *butter milk*. The process of churning must be conducted at a medium rate. If too quickly performed, the B. is soft and frothy, and is said to be *burst;* whilst when too slowly made, it is highly tenacious, strong tasted, and badly flavored.

When all the B. has *come*, which is known by the particles agglutinating into irregular masses, the B. is *made* by taking the lumps, and well washing and kneading them on a wooden board in a tub of pure spring-water till all the butter-milk has been expressed; it is then divided into the requisite size of lumps, fashioned into rolls, or moulded into forms, and usually stamped with some device. In the making up of the B., the hands of the operator must be scrupulously clean, and be free from the slightest taint of soap. Persons who are subject to moist hands should

never knead B., as it is very liable to be contaminated by the slightest foreign matter, especially animal secretions; and it is better always for the operator to wash the hands with water containing some oatmeal before commencing. So important is this source of contamination regarded in our milk factories here, and in America, that every endeavor is made to get quit of manual labor in working the B., and *butter-workers* are commonly used. When newly prepared, the B. is called *fresh* or *sweet* B., and is of a yellow color, which is well known to be deeper as the pasture on which the cows have been fed is richer, and hence the poorer kinds of B. are often artificially colored with Arnotto (q. v.).

A large quantity of the B. sent into market has more or less common salt added, for the purpose of preserving it. For use within a week or two, the proportion of common salt employed is about half an ounce to two pounds of B., though, where it has to be kept for some time, as much as one ounce of salt to one pound of B. is used. The incorporation requires to be carefully and dexterously done, so that the resulting material may be uniform; and the better plan is to add only a portion of the salt at a time, and to knead and re-knead the B. till the whole is thoroughly mixed. When the less amount of salt has been employed, the result is *powdered* B., and the larger quantity yields *salt* butter. Much of the latter is closely packed in small wooden firkins or *kits*, and occasionally in stoneware, and sent into market. Great care must be taken to have these kits, and indeed to have every vessel used in the preparation, as clean or *sweet* as possible. Constant rinsings with cold water, and scaldings with boiling water, are resorted to. Attention must likewise be paid to the air of the apartments in which the operations are carried on, as a tainted air is very injurious.

The adulterations liable to be present in B. are an undue proportion of salt and water, and these run up occasionally to upwards of 33 per cent., or one-third of the total weight. Another adulteration is the presence of lactate of zinc, derived from the milk being placed in zinc pails and basins, from the impression that by some imaginary electrical influence an increase in the amount of cream will be the result; but though this is not attained, yet the milk tending to form lactic acid, the latter attacks the zinc vessel, and forms lactate of zinc, which dissolves in the milk, and thereby contaminates it, imparting an unpleasant taste, and, when present in larger quantity, leading to violent spasmodic vomiting. When B. is allowed to get old, it becomes rancid, and tastes and smells disagreeably. To some extent, an acid is formed, called Butyric Acid (q. v.). For the use of B. in diet, see FOOD and NUTRITION.

BUTTER, in Chemistry, is often applied generically to any substance of the consistence of B., and is therefore used to designate palm, cocoa-nut, shea, and nutmeg oils. It is also applied to certain metallic substances which have an oily aspect and consistence resembling melted B.; thus we have B. of antimony, bismuth, zinc, and tin.—BUTTER of Antimony is a thick, dense, oily compound, produced by acting upon the native sulphuret of antimony (SbS_3) by concentrated hydrochloric acid (HCl) and heat, when the oily chloride of antimony ($SbCl_3$) is formed. See ANTIMONY.

BUTTERINE, a substitute for butter, first manufactured in France, is now extensively produced in Holland and America. It is composed of OLEOMARGARINE (q. v.), amalgamated with milk, to which is sometimes added a small proportion of real butter.

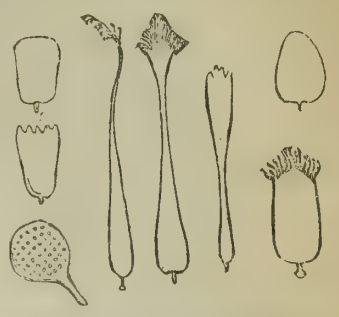
BUTTER, ROCK, a mineral which may be regarded as a variety of Alum (q. v.)—an iron alum, appearing as a pasty exudation from rocks that contain alum or its constituents, particularly alum-slate and other schistose rocks. It occurs at Hurlet alum-work, near Paisley, Scotland, and in a number of places on the continent of Europe. It is not unlike butter in color, varying from yellowish white to sulphur yellow. It is rather greasy to the touch, and is easily broken in pieces.

BUTTER TREE, a name given to several tropical trees, of different natural orders, the fruits of which yield concrete fixed oils, having the appearance and used for the purposes of butter. The B. trees of India and Africa belong to the genus *Bassia* (q. v.), of the natural order *Sapotaceæ;* the B. trees of Guiana and Brazil to the genus *Caryocar* (q. v.), of the natural order *Rhizobolaceæ*. The Oil-palms (q. v.), and the *Cocos butyracea* (see COCOA NUT), may also be regarded as B. trees, although not generally receiving that name.

BU'TTERCUP. See RANUNCULUS.

BU'TTERFISH. See GUNNEL.

BU'TTERFLY, the common English name of all the diurnal Lepidopterous (q. v.) insects, corresponding with the genus *Papilio*, as originally defined by Linnæus, but forming many genera in the most recent entomological systems. Butterflies exhibit a great similarity in almost all respects to other lepidopterous insects, the common characters of which will be found in the article on that order; but are distinguished even more than the rest of them generally, by brilliancy of coloring, which in butterflies also belongs to the under as well as the upper side of the wings, whilst the beauty of moths and hawk-moths appears chiefly on the upper side. Accordant with this circumstance, is the further peculiarity, that almost all butterflies, when at rest, usually hold their wings erect, the under side being thus chiefly exhibited; whilst the other lepidopterous insects, when at rest, hold their wings in a horizontal or somewhat inclined position, and some have them wrapped round the body. Butterflies are also the only lepidopterous insects which have no spines, bristles, or hooks on the margins of their wings, by which the second wing on each side can be attached to the first, but both when flying and at rest, have all their wings quite separate. The manner in which the scales of the wings are imbricated, gives those of butterflies a smoother appearance than those of moths and hawk-moths. The antennæ of butterflies are generally simple, slender, and elongated and terminated by a little club. Their caterpillars have always sixteen feet (see CATERPILLAR). The pupa or chrysalis is angular; is seldom enveloped in a cocoon; is generally suspended by the tail, by means of a silky substance, often to a leaf or twig, but is sometimes supported by bands around the middle; and generally exhibits more or less of that golden coloring from which both the names *aurelia* (Lat. *aurum*) and *chrysalis* (Gr. *chrysos*) are derived.



Various forms of Scales [highly magnified] from the Wings of Butterflies.

Butterflies are found in all parts of the world; they are to be seen during the sunshine of the brief summer extracting nectar from the flowers even of Greenland and Spitzbergen, but they are most numerous in the warmest regions; where however, many of them live chiefly in the shade of moist foliage, in woods and jungles. Dr. Hooker, describing the scenery on the banks of the Great Runjeet in the Sikkim Himalaya, says, that 'by far the most striking feature consisted in the amazing quantity of superb butterflies, large tropical swallow-tails, black, with scarlet or yellow eyes on their wings. They were seen everywhere, sailing majestically through the still hot air, or fluttering from one scorching rock to another, and especially loving to settle on the damp sand of the river edge, where they sat by thousands, with erect wings, balancing themselves with a rocking motion, as their heavy sails inclined them to one side or the other, resembling a crowded fleet of yachts on a calm day.'

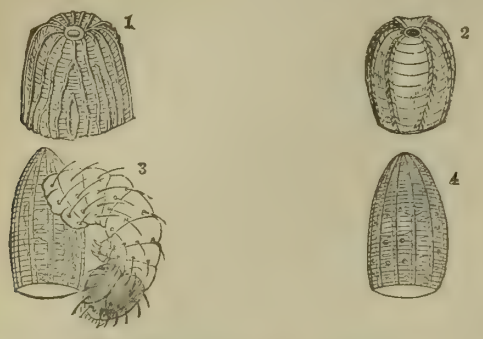
Butterflies possess no small power of wing; some of them, indeed, of which the wings are comparatively thin and delicate, are inferior in this respect, and have a sort of zigzag flight; but others soar in the air with a steady and continuous motion. Short-lived as they are all generally believed to be, some of the tropical species perform wonderful migrations; concerning which, however, nothing but the fact is yet well known. 'Frequently,' says Sir James Emerson Tennent in his work on *Ceylon*, 'the extraordinary sight presents itself of flights of these delicate creatures, generally of a white or pale yellow hue, apparently miles in breadth, and of such prodigious extension as to occupy hours and even days uninterruptedly in their passage, whence coming no one knows, whither going no one can tell.'

The number of species of B. is very great, and the arrangement of them has been found difficult, chiefly upon account of the great similarity in all important respects which prevails among them all. They are divided, however, into two well-marked sections, of which the first is characterized by having only a single pair of spurs or spines on the *tibiæ* (or fourth joints of the legs), placed at their lower extremity; whilst in the other section, the tibiæ of the hinder legs have two pair of spurs, one pair at each extremity. This distinction, seemingly unimportant in itself, is accompanied by other differences. The second section of butterflies may be regarded as forming a sort of connecting link between butterflies and hawk-moths. A few British species belong to it, but the species are generally tropical, and some of them, found in tropical America, are remarkable for their rapidity and power of flight, and for the migrations which they perform, besides being amongst 'the most splendid insects in creation,' a resplendent green, inimitable by art, relieving the velvet black of their wings, and varying with every change of light. The beautiful iridescence of the wings of these and many other butterflies is owing to the peculiar position of the scales.

Some groups of butterflies are remarkable for the imperfect development of the first pair of legs, so that they are generally described as having four legs instead of six.

The eggs of butterflies are deposited on the plants, the leaves of

which are to supply the food of the caterpillars. In cold and temperate climates, the eggs deposited in autumn are not hatched till the following spring; but it is believed that many species produce several broods in a year, as the eggs in summer may be hatched in a few days. The caterpillars of each species are generally confined to some particular kind of plant, the leaves of which they devour; their ravages are well known, but the excessive increase of their numbers is in part restrained by many enemies, and by none more than by the ichneumons (q. v.) and other insects which deposit their eggs in them, and the larvæ of which feed on them. The annexed cut represents a common species of B., with its larva and pupa; an account of B. transformations will be given under INSECT TRANSFORMATIONS.



Eggs of Butterflies, highly magnified:

1. Egg of Queen of Spain Fritillary (*Argynnis Lathonia*); 2. Egg of Peacock Butterfly (*Vanessa Io*); 3. Larva of Large Garden White Butterfly (*Pieris Brassicæ*), in the act of bursting from the egg; 4. Egg of same insect, ready to hatch, showing the head and curved body of enclosed caterpillar through the transparent envelope —For these illustrations we are indebted to Westwood's excellent treatise on British Butterflies.

Butterflies vary in size from less than an inch to almost a foot across the expanded wings. The largest species are tropical. Some of the species are very widely distributed: *Cynthia cardui*, of which the caterpillar feeds on the leaves of thistles, is found not only throughout Europe, but in Egypt, Barbary, Senegal, Cape Colony, Madagascar, China, Java, Australia, Brazil, and North America, being, in fact, one of the most widely distributed of all insects. The geographical limits of other species appear to be very restricted. The diversity of coloring is almost endless, but a prevalence of certain hues, or of certain modes of the disposal of them, is observable throughout large groups. The caterpillars of many species are variously furnished with spines, those of others—none of them British—have long fleshy prominences, horny at the tip, probably intended as means of defence. The hinder wings of many butterflies are curiously prolonged into tail-like appendages, one or more on each wing, which vary in form, being sometimes long and linear, sometimes broad and widening towards the extremity. These are, however, little seen in British species.

Large Garden White Butterfly (*Pieris Brassicæ*).
a, caterpillar; *b*, chrysalis: *c*, perfect insect.

Butterflies are chiefly known to us as objects of admiration and of pleasing contemplation, enhancing the charms of the most delightful weather, and always associated with the most lovely scenes, or—it must be added—as a cause of annoyance and vexation by the ravages of their caterpillar young in our fields and gardens. There is, however, one small species (*Euplæa humata*) which affords a supply of food to some of the wretched aborigines of Australia. Butterflies of this species congregate in such vast numbers on the masses of granite in the mountains, that they are collected by simply making smothered fires under the rocks, in the smoke of which they are suffocated. Bushels of them are thus procured, and they are baked by placing them on the heated ground, the down and wings removed, and the bodies made into cakes which resemble lumps of fat. The months of November, December, and January are quite a season of festivity from the abundance of this food.

Brief notices of a few of the principal kinds of B. will be found in other parts of this work. See CABBAGE BUTTERFLY, CAMBERWELL BEAUTY, PURPLE EMPEROR, &c.

BUTTERFLY FISH. See BLENNY.

BUTTERFLY WEED, or PLEURISY ROOT (*Asclepias tuberosa*, see ASCLEPIAS), a plant found in all parts of the United States, and which has obtained a considerable reputation for the medicinal virtues of its root. The root is large, formed of irregular tubers or spindle-shaped branches, externally yellowish brown, internally white, with a somewhat acrid nauseous taste when recent, merely bitter when dried.

It yields its properties to boiling water, and is usually administered in the form of a decoction, sometimes in that of a powder. It is diaphoretic and expectorant, and has been found useful in the commencement of pulmonary affections, in rheumatism, and in dysentery.—The stem of the plant is erect and hairy, with spreading branches; the leaves oblongo-lanceolate, alternate, hairy, and somewhat crowded; the flowers orange-yellow, forming numerous umbels.

BU'TTERMILK is the form of milk from which the butter or oily matter has been extracted. See BUTTER. Buttermilk contains the caseine, sugar and salts of ordinary milk, and is only deficient in oily matters. It is therefore nutritious, and is largely used in Ireland and Scotland as an article of food, being very generally partaken of with porridge and with potatoes. It may be drunk *ad libitum*, is a very agreeable cooling beverage, and is therefore useful in certain febrile and inflammatory conditions.

Butterwort (*Pinguicula vulgaris*):
a, the entire plant; *b*, a flower.

BU'TTERWORT (*Pinguicula*), a genus of plants of the natural order *Lentibulariaceæ* (q. v.), distinguished by a two-lipped calyx, the upper lip trifid, the lower bifid; a spurred corolla, two-lipped and gaping, the upper lip arched; and a globose germen. The species are small plants with only radical leaves, found in the bogs and marshes of different quarters of the world. Some of them possess much beauty when in flower, particularly *P. grandiflora*, a rare native of the south of France and of Ireland. The common B. (*P. vulgaris*) is abundant in the northern parts of Britain and of Europe. It has the power of coagulating milk. The Laplanders pour reindeer milk warm from the animal, upon the leaves of this plant, instantly strain it, and set it aside for two or three days, till it acquires the consistence of cream, and some degree of acidity, when it is with them a favorite article of food. A little of it in this state will produce the same effect on warm reindeer milk which was at first produced by the leaves of the plant. The origin of the English name B. is sometimes referred to the power of coagulating milk, sometimes to the peculiar sliminess of the leaves.

BU'TTISHOLZ, a village of Switzerland, in the canton of Lucerne, and 11 miles north-west from the city of that name. Near to B. is a large mound called the English Barrow, because here are buried 3000 Englishmen, followers of De Coucy, son-in-law of Edward III. of England, who, while devastating the cantons were defeated and killed by Swiss peasants in 1376.

BUTTMANN, PHILIPP KARL, one of the most distinguished philologists of modern times, was born at Frankfurt-on-the-Maine in 1764, and studied at Göttingen under Heyne. He became, in 1789, assistant in the Royal Library in Berlin, and rose successively to be secretary and librarian (1811). He held at the same time (1800—1808) a professorship in the Joachimsthal Gymnasium in Berlin, which he afterwards exchanged for a professorship in the newly founded university of that city. He died 21st June 1829. B. is best known by his Greek grammars, the *Griech. Grammatik* (Berl. 1792; 21st ed. by his son, Alexander Buttmann, 1863), and an abridgment of it, *Griech. Schulgram.* (14th ed. 1862); both have been translated into English. His *Lexilogus* (translated by Fishlake) and *Ausführliche Griech. Sprachlehre*, or Larger Greek Grammar, which have gone through several editions, are designed for scholars. In his *Mythologus*, he has collected his essays on the myths of the ancients.

BU'TTON. The term B. is applied to the well-known appendages to dress used for fastening or for ornament; and to a sort of oblong latch moving upon a pivot in the middle, used by joiners and cabinet-makers for fastening the lids of boxes, doors of presses, &c. The mass of fused metal found at the bottom of a crucible or cupel, after fusing or assaying, is also technically called a button.

The history of button-making is in many ways a curious one. Dating no further back as a trade of any importance than the reign of Elizabeth, it has undergone several extraordinary changes, produced chiefly by the ever-varying fashions in dress, but also by some simple, though ingenious inventions, as well as by foreign competition. In Great Britain, Birmingham has always been the principal seat of the button-manufacture. What has been called the 'Augustan age' of button-making in that city included the latter portion of last and the early part of the present century, when even tradesmen wore coats 'loaded with innumerable gilt buttons,' and when employers on a moderate scale in this manufacture were making incomes of from £2000 to £3000 a year, and their workmen from £2 to £4 per week.

Early in the present century, Mr. B. Sanders introduced the cloth-covered button, which initiated the change from those made of metal, and by which he rapidly made a fortune. His son, in 1825, effected the apparently trivial but really ingenious improvement of making it with a canvas tuft instead of a metal shank, by which both the button-holes and the garment itself were less subject to injury. This kind of button had an enormous sale, and is still much used. A further alteration was made on it by Mr. W. Elliott, who patented, in 1837, a mode of covering the button with silk, having a pattern in the center, the demand for which was at one time so great, that sixty looms were employed in London in making the special material required for them. In 1841, the old Dorsetshire wire and thread button was replaced by the 'three-fold linen button,' still considered by house-wives indispensable for underclothing, since neither washing nor mangling destroys it. It is said to be the invention of Mr. H. Jeffries, of Birmingham, but was patented by Mr. J. Aston, and continues to be made in vast numbers. A single English firm recently consumed in one year for this kind of button, 63,000 yards of cloth and 34 tons of metal, upon which 250 hands were employed.

Turning now to other materials which have had a great 'success' in their day, we find that buttons made of hoof, under the name of 'horn-buttons,' as introduced nearly 40 years ago by Mons. E. Bassot of Paris, were for a great many years most extensively manufactured at Birmingham, and sent to all parts of the world. In hoof-buttons the trade is now comparatively insignificant, and the French makers possess the market for what of it remains. Tweed clothing and fabrics in imitation of it have, through the necessity of matching their various colors, led to the buttons for them being made of a rather uncommon material, namely, vegetable ivory (q. v.). This substance, which is the fruit of a palm, somewhat resembles true ivory, but is rather softer. It can be readily turned in the lathe, and dyed of various colors. More than twenty tons of it, valued at from £25 to £30 per ton, are weekly consumed in Birmingham in making buttons, and it is also largely used for the same purpose in France and Germany.

What we have hitherto said refers principally to what manufacturers call the revolutions of the trade; but there are other important branches which have been less subject to change, chief among these being the so-called 'pearl buttons'—that is, buttons made of mother-of-pearl shells. This has long been a leading branch, and employs a greater number of hands than any other. Metal buttons, too, although not relatively so important as formerly, have never ceased to form a prominent section of the trade. They are a numerous class, and include all sorts for uniforms, trouser buttons, fancy buttons which are gilt, stamped, chased, or enamelled, and many cheap varieties in iron and other metals for export. Numerous kinds of composite buttons are also partly composed of metal. Glass buttons form another interesting branch, carried on to a considerable extent in Birmingham, but more largely in Bohemia and Paris; so also do porcelain buttons, which, although an English invention, are now almost exclusively made in France. Vulcanite (q. v.) buttons have been extensively made in the United States. As to other materials, a Birmingham manufacturer says it were easy to write out a long list from which buttons have been made, but very difficult to name one from which they have *not* been made.

We shall now describe briefly some of the processes in button-making, beginning with metal buttons. Circular discs, called 'blanks,' are first cut out of sheet brass or other metal by means of fly-presses, usually worked by girls. The fly-press consists of a verticle iron screw with a triple-thread, to which screw is attached a horizontal arm, bending downwards at the end to form a handle. A punch attached to the press rises and falls with the motion of this handle, and rapidly cuts out the blanks. When large quantities of one pattern are required, a self-feeding, self-acting machine is used, which cuts out the blanks in rows at one blow, turning them out at the rate of 2000 gross per day. After being annealed, the blanks are next made convex by a blow from a stamp. The shanks are formed of wire by a separate machine, which cuts off pieces, and bends them into loops of the required form. When these are soldered on, the buttons are dressed on a lathe. They are then gilded and burnished; some, however, are only lacquered; and some, though gilt, are finished in a dead or frosted style.—'Shell' buttons are those with a convex face, a flat or convex back, and hollow. These are made of two blanks, that forming the face being larger than the back to which the shank is attached.

These blanks are pressed into the required shape by dies worked in the fly-press, and then, by another die, the edge of the larger blank is lapped over the smaller, and thus attached without soldering. Livery and other buttons having a device in strong relief are stamped by a die placed in a stamping-press. See STAMPING OF METALS.

In making covered buttons, a metal blank is punched, and its edge is turned up by a die in a fly-press; then a smaller metal blank is punched with a hole in the middle, and of such size, that, when flat, it shall fit into the upturned edge of the first: this perforated blank, or *collet*, is next pressed into a concave or dished shape. Two cloth blanks—the face one of silk, and the other for the tuft of thin canvas—are now punched, one considerably larger than the front metal blank, the other somewhat smaller; the larger cloth blank is laid upon the flat face of the metal blank, which is filled with a disc of millboard or paper, and its edges turned over; these edges are covered by the smaller cloth, and then the collet laid upon them with its concavity towards the cloth. They are now all pressed together in a sort of die or mould, by which means the collet is flattened and spread out, while the upturned edge of the metal blank is turned forcibly over it, thus securing the collet, and with it the cloth which is strained tightly on the face, and its edges bound between the blank and the collet, so that the whole is firmly held together. The linen-covered button for underclothing, above referred to, is formed of a single brass ring with a groove or canal on one face. Into this the edges of the two round linen blanks are placed, so that when the edges of the groove are pressed firmly down, the button is entirely covered with linen.

Buttons with holes, technically called 'four-holes,' 'three-holes,' and 'two-holes,' when of pearl-shell, wood, bone, or ivory, are cut with a tubular saw, turned separately in a lathe, and drilled. When of metal, the blanks are punched, then stamped in dies to the required form; the holes are punched, and 'rymered,' to round the sharp edges that would otherwise cut the thread.—Glass buttons are most largely made by taking a rod of glass of any color, softening the end by heat, and pressing it into a mould, each half of which is fixed to one limb of a pair of pincers. The shank is placed into a hole in the mould before the melted glass is inserted.

According to an estimate published a few years ago by Mr. J. P. Turner of Birmingham, to whose paper we have been much indebted, the number of artisans employed in the button manufactures of that city was then as follows:

Making metal buttons of all kinds	1200
" covered buttons, including linen	1500
" pearl buttons	2000
" vegetable ivory buttons	700
" other kinds, as glass, horn, bone, wood, &c.	600
Total	6000

Probably about 1000 more are employed in London and elsewhere in Great Britain, and a large proportion of the whole are females. At that time, which was before the war with Germany, about 20,000 persons were employed in France, showing how much more largely the button industry has been developed in that country. Germany is a still greater producer, the cheaper kinds of fancy buttons made in the Rhenish provinces of Prussia, the glass buttons of Bohemia, and the pearl buttons of Vienna being more extensively exported than those of any other country. Buttons of various kinds are made on a large scale in the United States, but that country still imports them largely from Europe.

BU'TTONWOOD. See PLANE.

BU'TTRESS (Old Eng. *botress;* Fr. *buttée*), a projection for the purpose of giving additional support or strength to a wall. In the classical style, there were no buttresses, their place being, to a certain extent, supplied by pilasters, antæ, &c. The different stages of Gothic architecture are marked by the form of buttresses employed, almost as distinctly as by the form of the arch. The Norman B. was broad, often semicircular, sometimes dieing into the wall at the top, and never projecting from it to any great extent. Early English buttresses project much more boldly, and are considerably narrower, than the Norman. They are frequently broken into stages, which diminish in size as they ascend. In the decorated style, this division into stages is almost invariable,

the B. being often supplied with niches terminating in pinnacles, and very highly ornamented with carving, statues, &c. In the perpendicular style, they retain the forms which had been intro-

duced during the decorated period, the ornamentation, of course, being varied to suit the character of the style. Flying buttresses —i. e., buttresses in the form of a sloping arch, connecting the upper and central portions of an arched structure with the vertical

Flying Buttress, Westminster Abbey.

buttresses of the outer walls—were introduced into England at the period of the Early English, though they existed on the continent previously, where they continued to be used to a greater extent. They were also very common in Scotland. In England, they are generally called arch-buttresses.

BU'TUA ROOT. See CISSAMPELOS.

BUTY'RIC ACID may be best obtained by saponifying butter with potash, then adding dilute sulphuric acid till an acid reaction is attained, and distilling about one half of the mixture, adding a little water, and continuing the distillation till the residue is not acid. B. A. may also be obtained by allowing a small quantity of milk-curd to act upon a solution of sugar at a temperature of 77° to 86°, which excites a peculiar process of fermentation resulting in the formation of butyric acid. Some chalk is added to take up the B. A. whenever produced, and the better proportions to employ are 100 sugar, 8 to 10 fresh curd, and 50 chalk, with sufficient water to make a thin liquid. The butyrate of lime is left in the vessel, and on acting upon that by dilute hydrochloric or sulphuric acid, and redistilling, the free B. A. passes over in vapor, and is condensed. B. A. is a transparent, thin, oily liquid, with a most persistent rancid odor. It is mixable in all proportions in water, alcohol, ether, and oil of vitriol; has the specific gravity 973 (water being 1000), boils at 314°; though it volatilizes at ordinary temperatures, as appears from the rancid odor of its vapor. Its chemical symbol is $HO.C_8H_7O_3$, and it combines with bases, such as lime, soda, &c., to form salts.

BUTYRIC ETHER, or PINE-APPLE OIL, is an exceedingly fragrant oil obtained by distilling butyric acid (or the butyrate of lime), alcohol, and sulphuric acid. The material which passes over is the B. E., and is generally mixed with alcohol, and sold in commerce as *Artificial Pine-apple Oil*. It possesses the same very pleasant flavor which belongs to pine-apples, and there is little doubt that pine-apples owe their flavor to the presence of natural butyric ether. The artificial variety is now extensively used for flavoring confections, as pine-apple drops, for sophisticating bad rum, and for flavoring custards, ices, and creams, as also an acidulated drink or lemonade named Pine-apple Ale. B. E. alone cannot be used in perfumery for handkerchief use, as, when inhaled in even small quantity, it tends to cause irritation of the air tubes of the lungs and intense headache, but it is employed as one material in the manufacture of compound perfumes. It is composed of ordinary ether (C_4H_5O) and butyric acid ($C_8H_7O_3+HO$), and its strict chemical name and symbol is the butyrate of the oxide of ethyl ($C_4H_5O,C_8H_7O_3$). It is remarkable that a substance possessing such a disagreeable odor as butyric acid (that of rancid butter) should be capable of forming, in part at least, a substance with such a pleasant flavor as artificial pine-apple oil.

BUXA'R, a town of Shahabad, in Bahar, presidency of Bengal, situated on the right bank of the Ganges. It is chiefly remarkable as the scene of a victory gained in 1764 by Sir Hector Munro. At the head of 7072 men, of whom only 857 were Europeans, he defeated a native army of 40,000, and captured 133 guns. B. is 62 miles north-east of Benares, and 398 north-west of Calcutta. Pop. (1871) 13,446.

BUXBAU'MIA, a genus of Mosses, of which only one species is known, *B. aphylla*, a very rare British plant, remarkable for its apparent want of leaves; the whole plant above ground seeming to consist of a little conical bulb, with minute scales, which are, however, really its leaves.

BU'XTON, a town in Derbyshire, 33 miles north-west of Derby. It lies 900 feet above the sea, in a deep valley, surrounded by hills and moors, which have been tastefully planted; the only approach being by a narrow ravine, by which the Wye flows into the Derwent. The new part of the town is much under the level of the old. Five miles to the east of B. is Chee Tor, a perpendicular limestone rock, rising to a height of between 300 and 400 feet from the Wye. B. has for 300 years been famous for its calcareous springs, tepid (82° F.), and cold (discharging 120 gallons of water per minute), and its chalybeate springs. It is visited annually, from June to October, by 12,000 to 14,000 persons, the waters being taken for indigestion, gout, rheumatism, and nervous and cutaneous diseases. Nearly 5000 strangers can be accommodated at one time. There is an institution, called the Devonshire hospital, containing 100 beds, supported by subscription, where nearly 1000 patients are annually boarded and lodged free of charge. The baths and public walks are numerous. Much of the splendor of B. is due to the Dukes of Devonshire, one of whom, in the last century, at the cost of £120,000, erected an immense three-storied pile of buildings, of gritstone called the Crescent, a curve of 200 feet, with wings of 58 feet. It includes several hotels, a library, assembly rooms, &c. Near B. is the Diamond Hill, famous for its crystals; and Poole's Hole, a stalactitic cavern, 560 yards long.

The Romans had baths here. Mary Queen of Scots resided for some time at B., when in the custody of the Earl of Shrewsbury. B. is approached by railway both from north and south; and the baths, which were rebuilt some years ago, are considered among the finest in Europe. The town, which in 1871 had 3717 inhabitants, had 6021 in 1881. Four newspapers are published.

BUXTON, SIR THOMAS FOWELL, a man of singular earnestness and force of character, belonging to the class termed 'philanthropists,' was born in 1786 at Earl's Colne, Essex. The eldest son of a wealthy family, and early deprived of paternal guidance, his youth was distinguished chiefly by a strong development of animal energy, natural enough to a young Englishman whose full stature exceeded 6 feet 4 inches. At the university of Dublin, his mind at length asserted its claims, and the new consciousness of needing to raise the family fortunes animated him to extraordinary efforts. His preparatory education had been almost thrown away, but at 21 he left the university its most distinguished graduate. In that year he married a sister of the celebrated Mrs. Fry, and entered business as a brewer, with an energy which in due time was crowned with splendid prosperity. His warm religious and moral impulses soon brought him prominently forward as an advocate of philanthropic interests. Prison discipline formed one of the earliest subjects of his efforts. In 1818, he entered parliament as member for Weymouth, which he continued to represent for about 20 years, taking a prominent part in every debate on such questions as the amelioration of criminal law and of prison discipline, widow-burning and slave emancipation. The latter, in particular, engrossed a large share of his activity for many years, and no man on that side displayed more indomitable zeal and firmness in its advocacy. In 1837, he was rejected by his constituency, and refused ever after to stand for a borough. His philanthropic labors, however, terminated only with his life. In 1840, he received the well-merited distinction of a baronetcy. He

died on 19th February, 1845. See *Memoirs of Sir T. Fowell B.* (1848.)

BUXTORF, JOHANN, a celebrated orientalist, was born 25th December, 1564, at Kamen, in Westphalia; studied at Marburg, Herborn, Basel, and Geneva. After traveling through Germany and Switzerland, he settled at Basel, where he became professor of Hebrew in 1591. He died of the plague, 13th September, 1629. In a knowledge of rabbinical literature, he surpassed all his contemporaries. The two works which prove his extensive acquaintance with this recondite branch of theological study, are his *Biblia Hebraica Rabbinica* (Basel, 1618—1619), and his *Tiberias seu Commentarius Masorethicus* (Basel, 1620). The most useful of his grammatical works is the *Lexicon Hebraicum et Chaldaicum* (Basel, 1607).

BUXTORF, JOHANN, the son of the former, was born at Basel, 13th August 1599, and displayed at an early period a decided predilection for the same studies with his father. At five years of age—according to his rather credulous biographers—he could read German, Latin, and Hebrew. To perfect his knowledge of these tongues, he visited Holland, France, and Germany; and in 1630 was appointed to succeed his father in the chair of Hebrew at Basel, where he died 16th August 1664. Besides his *Lexicon Chaldaicum et Syriacum* (Basel, 1622), and a work of Maimonides, entitled *More Nevochim* (Basel, 1629), which is an exposition of obscure passages of the Old Testament, he published from MSS. of his father a *Lexicon Chaldaicum, Talmudicum, et Rabbinicum* (Basel, 1639), and *Concordantiæ Bibliorum Hebraicorum* (Basel, 1632).

BU'XUS. See BOX.

BUYING OF PLEAS by lawyers is prohibited by an old Scotch act passed in 1594. It is explained under the English term *champarty*, to which it is analogous.

BUYUKDEREH, a beautiful suburb of Constantinople, from which it is a few miles distant, situated on the Bosporus, in the midst of the most charming scenery. It forms the summer residence of many of the Christian ambassadors, some of whom have splendid mansions here.

BU'ZZARD (*Buteo*), a genus of *Accipitres* (q. v.), or birds of prey, of the family *Falconidæ*, having a rather small and weak bill, which bends from the base, and is not notched, as in falcons. The legs are short and strong, the tarsi covered with scales or with feathers, the toes short, and the claws strong. Buzzards may be regarded as an inferior kind of eagles; they do not possess courage equal to that of eagles and falcons, nor equal strength of bill or claws. They are large birds; the COMMON B. (*B. vulgaris*) measuring almost 4 feet from tip to tip of its outstretched wings. It is a bird still pretty common in Britain, although much less so than it formerly was. It is subject to variations of plumage; the prevailing color is brown, with a considerable mixture of black on the upper parts, and of white or grayish-white on the under.

Common Buzzard (*Buteo vulgaris*).

It is sluggish and inactive, in comparison with many other birds of the same family; is usually slow in its flight, and often sits long on a tree, watching for prey, which, when it perceives, it glides silently into the air, and sweeping rapidly down, seizes it in its claws. This B. is plentiful in all the wooded parts of Europe; it is found also in the north of Africa, and is known to exist in the western parts of Asia; but it is doubtful how far it extends over that continent, a distinct although very similar species occurring in the Himalaya Mountains. The Common B. is, however, a North American bird. Tame female buzzards have been known in several instances to exhibit so strong a propensity for incubation, and the rearing of young at the proper season, that they have hatched hens' eggs and brought up the chickens, although if chickens not of their own hatching were brought within their reach, they devoured them. Meat given to the B. nurse was carefully divided among her nurslings, but they found out by their own instincts the use of grain and other vegetable food.—The ROUGH-LEGGED B. (*B. lagopus*) is very similar to the Common B., but is at once distinguished by having the tarsi feathered to the toes, whilst in the Common B. they are covered with scales. It is a rarer British bird, yet not of unfrequent occurrence; it is very widely diffused, being found in the Old World from Lapland to the Cape of Good Hope, and equally common in North America. It is most frequently to be seen in marshy districts, and often skimming over marshes, where it makes prey of frogs.—The RED-TAILED HAWK of North America is a species of B. (*Buteo borealis*). It is in very bad repute among American farmers and housewives for its frequent invasion of poultry-yards, from which it has acquired the name of *Hen-hawk*.—Several other species of B. appear to be limited to particular parts of the world, as *Buteo Jackal*—so called from the resemblance of its voice to that of the jackal—to South Africa, and *B. melanosternon* to Australia. The Australian species has the head, chest, and center of the belly deep back.—The HONEY BUZZARDS (q. v.) belong to a different genus, although nearly allied to the true buzzards, as are also the HARRIERS (q. v.), of which the most common British species the Marsh Harrier, is sometimes called the *Moor Buzzard*.—BALD B. is a name of the OSPREY (q. v.).

BY'BLOS, an ancient city of Phœnicia, now called Jubeïl, situated at the base of the lower range of the Libanus, about halfway between Tripoli and Beyrout. B. was famous as the birthplace of Adonis, or Thammuz, in whose honor a splendid temple was erected, which attracted many worshipers. The name given to the town by the Jews was Giblah, and its inhabitants the Giblites are noticed in the Scriptures as stone-squarers and calkers of ships. A wall belonging, apparantly, to the era of the Crusades, surrounds the town, and the remains of a Roman theater are still visible.—B. was also the name of a town in the Egyptian Delta, celebrated for its manufacture of papyrus from the byblus or papyrus plant.

BY-LAWS are the private regulations which are usually made by corporate bodies for the control and government of the corporation. They are binding, unless contrary to the laws of the land, or to the charter, or act of incorporation, or, as it has been decided in England, unless they are manifestly unreasonable. Blackstone tells us that the right of making B. was allowed by the law of the Twelve Tables at Rome; and Mr. Stephen, in his *Commentaries*, states that in the law of England such a right is so much of course, as regards every corporation, that if the charter by which certain persons are incorporated give to a select body, out of their whole number, a power to make B. as to certain specified matters, the body at large is nevertheless at liberty to make them with regard to all matters not specified. Every corporation, too, can of course alter or repeal the B. which itself has made. By the Municipal Corporation Act, 5 and 6 Will. IV. c. 76, s. 90, borough councils have power to make B. for the government of the borough, and for the prevention and suppression of nuisances; such by-laws, however, not to be of force till the expiration of forty days after the same, or a copy, shall have been sent to one of the secretaries of state, during which period Her Majesty, with the advice of her privy council, may either disallow the B., or a part, or enlarge the time within which they shall not come into force. Railway companies are required to lay before the Board of Trade, for the approbation of that authority, certified copies of the B. and regulations by which the railway is governed, which B. may be disallowed by the Board. See CANAL, CARRIER, RAILWAY (From same root as BYRLAW.)

BYNG, GEORGE, VISCOUNT TORRINGTON, a British admiral, born January 27, 1663, eldest son of John Byng, Esq., of Wrotham, Kent, entered the navy as a volunteer at the age of 15, and rapidly rose to the rank of lieutenant. In 1688, he recommended himself to the Prince of Orange by his activity and zeal in attaching the officers of the fleet to the cause of the Revolution, and was advanced to the rank of captain. In 1702 he took part in the capturing and burning of the Spanish fleet at Vigo, and in the following year was made rear-admiral of the red. The attack on Gibraltar was solely confided to his command, and for his gallant conduct at the battle of Malaga he was knighted by Queen Anne. In 1708 he became admiral of the blue, and commanded a squadron fitted out to oppose an intended invasion of Scotland from France, on the part of the Pretender. He pursued the French fleet to the Firth of Forth, took one ship, and forced the fleet back to Dunkirk, on which occasion he was presented with the freedom of the city of Edinburgh. On the breaking out of the rebellion of 1715, he was appointed to the command of a squadron in the Downs, and for important services against the French, was created a baronet. In 1718, he commanded the English fleet sent

to Sicily for the protection of the neutrality of Italy, and gained a victory over the Spanish fleet off Messina. Soon after, he was appointed treasurer of the navy and rear-admiral of Great Britain. In January 1721, he was sworn one of the privy council, and in September following, created Baron Southhill and Viscount Torrington. On the revival of the Order of the Bath, in 1725, he was installed one of the knights; and, on the accession of George II., was nominated First Lord of the Admirality. He represented Plymouth in parliament from 1706 until 1721. Died January 17, 1733.

BYNG, JOHN, a brave but ill-fated British admiral, fourth son of the preceding, born in 1704, entered the navy early, served under his father, and, in 1727, became captain. In 1748, he had attained the rank of admiral of the red. In 1756, he was appointed to command a squadron of ten ships of the line in the Mediterranean, destined for the relief of Minorca, at that time blockaded by a French fleet under La Galissoniere. On the 20th May, B. made the signal to engage, which was obeyed by Rear-admiral West with such impetuosity that several of the enemy's ships were driven out of the line; but B. not advancing to his support, the French were allowed to escape, and Minorca was lost. The dissatisfaction in England, on the news arriving, was taken advantage of by the ministry to avert the public odium from their own inefficient measures. B. was tried by a court-martial, and condemned to death, for a breach of the 12th article of war, but recommended to mercy.

Sacrificed to the general indignation, he was shot on board the *Monarch*, at Portsmouth, March 14, 1757, meeting his fate with firmness and resignation. In the fleet, he was not popular, being a strict disciplinarian.

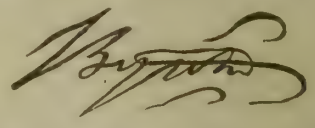
BYNKERSHOEK, CORNELIUS VAN, a Dutch jurisconsult, was born at Middelburg, in Zealand, 29th May 1673. He studied at the university of Franeker, took the degree of doctor in 1694, and immediately after commenced to practise as an advocate at the Hague. In 1703, he was elected by the states-general a member of the supreme court, and in the exercise of his functions, soon had occasion to observe how defective and vague was the common law of the country. In 1710, with a view to remedy this, he published the first part of his *Observationes Juris Romani;* in 1719, his *Opuscula Varii Argumenti;* and in 1724, he was elevated to the dignity of president of the supreme court. In 1733, appeared the rest of his *Observationes Juris Romani*. B. now began to devote himself earnestly to the study of Dutch and international law, acquiring, of the former in particular, a most extensive and solid knowledge. His great work on this subject is his *Quæstiones Juris Privati*, which he did not live to finish, and on the other, his *Quæstiones Juris Publici*. In addition to these, B. collected (from his notes) the decisions and proceedings of the supreme court in his time, under the title *Observationes Tumultuariæ*, and besides (what is perhaps his most valuable work) made a digest under the title of *Corpus Juris Hollandici et Zelandici*, of all the laws of his own country, whether statutory, or existing in the decisons of courts, or in the practice of the bar, or in the customs of particular places. He died 16th April 1743. A complete edition of his works was published by Professor Vicat of Geneva, in 1761.

BY'RGIUS, JUSTUS, or, more properly, JOBST BÜRGI, the inventor of various astronomical instruments, was born 28th February 1552, at Lichtensteig, in the canton of St. Gall, Switzerland. In 1579, he went into the service of the learned Landgraf of Hesse, Wilhelm IV. His first work was a celestial globe, the surface of which was plated with silver, and in which the stars were placed according to his own observations. The landgraf sent it to the Emperor Rudolf II., who thought it so beautiful, that in 1604, he appointed B. his own mechanician. B. subsequently went to Austria, but returned to Cassel in 1622, where he died in 1633. Many of his reputed discoveries and inventions are questioned, such as those of logarithms and the proportional compasses; but he seems to have hit upon something like both, while it is certain that he was the inventor of a method of resolving spherical triangles.

BY'RLAW, BI'RLAW, or BU'RLAW, the name given to a sort of popular jurisprudence formerly in use in Scotland, in villages and among husbandmen. Sir John Skene, writing in 1597, when the system was in full force, defines B. as '*leges rusticorum, de re rustica latæ*—laws made by husbandmen, concerning neighborhood to be kept among themselves.'—*Reg. Majest.* lib. iv. As the B. was enacted by the common consent of the villagers or neighbors, so it was administered by judges chosen by them from their own ranks. These judges were commonly called 'brylaw men,' a name which is still applied in some parts of Scotland to an arbiter, oddsman, or umpire. The courts which they held were called 'brylaw courts,' and took cognizance of disputes between neighbor and neighbor. B. seems to be an interesting survival of the system of the ancient Aryan village community; the word is derived from *burgh*.

BYRON, GEORGE GORDON, LORD, a great English poet, was was born in Holles Street, London, on the 22d of January 1788. He was the only son of Captain John Byron, of the Guards, and Catherine Gordon, of Gight, an heiress in Aberdeenshire. Captain Byron and his wife did not live happily. Domestic peace perished in the conflict of their ungovernable tempers. The husband's habits were profligate in the highest degree, and the wife's fortune was soon squandered in the debauch and at the gambling-table. Separated from her husband, the lady retired to the city of Aberdeen with her little lame boy, whom she passionately loved, her sole income at this time being about £130 per annum. In his 11th year, B. succeeded his grand-uncle, William Lord Byron; and mother and son immedietely left the north for Newstead Abbey, the ancient seat of the family, situated a few miles distant from Nottingham, in the romantic district which Sherwood Forest shadowed, and which was once familiar with the bugle of Robin Hood. On succeeding to the title, B. was placed at a private school at Dulwich, and thereafter sent to Harrow. The most remarkable thing about B.'s early years was his extraordinary attachments. Like almost every member of the poetic tribe, he 'had a passion for the name of Mary.' In his 8th year, in Aberdeenshire, he fell in love with Mary Duff. Margaret Parker, a cousin of his own, and who died early, was his next idol. His strongest passion was, however, for Mary Chaworth. This lady he first met when on a visit to Newstead in 1803, at which date he was in his 15th year. Miss Chaworth's father had been killed in a duel by Lord Byron, the grand-uncle of the poet, and marriage would have healed the family feud, and would have joined rich estates. But it was not to be.

Miss Chaworth was B.'s senior by two years, and evidently felt little flattered by the worship of the lame Harrow boy. Next year came the parting interview described in *The Dream*, with which every Englishman is familiar now as with a personal experience. In 1805, B. removed to Trinity College, Cambridge; and two years thereafter his first volume of verse, entitled *Hours of*



Idleness, was printed at Newark. The poems therein contained were not absolutely without merit, but they might have been written by any well-educated lad, who in addition to ordinary ability, possessed the slightest touch of poetic sensibility. The volume was fiercely assailed by Lord (then Mr.) Brougham in the *Edinburgh Review*, and his sarcasms stung B. into a poet. The satire, *English Bards and Scotch Reviewers*, was written in reply to the article in the *Edinburgh*, and the town was taken by a play of wit and a mastery of versification unequalled since the days of Pope. In the babble of praise that immediately arose, B. withdrew from England, visited the shores of the Mediterranean, and sojourned in Turkey and Greece. On his return in 1812, he published the first two cantos of *Childe Harold*, with immense success, and was at once enrolled among the great poets of his country. During the next two years, he produced *The Giaour*, *The Bride of Abydos*, *The Corsair*, and *Lara*. While these brilliant pieces were flowing from his pen, he was indulging in all the revelries and excesses of the metropolis. What was noblest in the man revolted at this mode of life, and, in an effort to escape from it, he married Miss Milbanke, daughter of Sir Ralph Milbanke, a baronet in the county of Durham. This union proved singularly infelicitous. It lasted only a year, and during that brief period, money embarrassments, recriminations, and all the miseries incident to an ill-assorted marriage were of frequent occurrence. After the birth of her child Ada, Lady Byron retired to her father's house, and refused to return. This event, from the celebrity of one of the parties, caused considerable excitement in the fashionable world. B. became the subject of all uncharitable tongues.

The most popular poet, he was for a space the most unpopular individual in the country. In one of his letters, written from Italy some years later, referring to the slanders current at the time, he thus expresses himself: 'I was accused of every monstrous vice by public rumor and private rancor. My name, which had been a knightly or a noble one since my fathers helped to conquer the kingdom for William the Norman, was tainted. I felt that if what was whispered, and muttered, and murmured was true, I was unfit for England; if false, England was unfit for me. I withdrew.' The separation from his wife, and the departure from England, mark a stage in B.'s genius. A new element of power had entered into his verse; the reader feels it quite distinctly in the magnificent burst of exultation that opens the third canto of the *Childe*—

Once more upon the waters, yet once more!

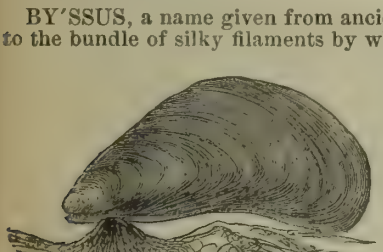
Misery and indignation stimulated him to remarkable activity.

Six months' stay at Geneva produced the third canto of *Childe Harold* and *The Prisoner of Chillon*. *Manfred* and *The Lament of Tasso* were written in 1817. The next year, he was at Venice, and finished *Childe Harold* there; and, in the gay and witty *Beppo*, made an experiment in the new field which he was afterwards to work so successfully. During the next three years, he produced the first five cantos of *Don Juan*, and a number of dramas of various merit, *Cain* and *Werner* being opposite poles. In 1822, he removed to Pisa, and worked there at *Don Juan*, which poem, with the exception of *The Vision of Judgment*, occupied his pen almost up to the close of his life. Morally, his Italian life was unsatisfactory, and his genius was tainted by his indulgences. At the close of his career, he was visited by a new inspiration; the sun, so long obscured, shone out gloriously at its setting. In the summer of 1823, he sailed for Greece, to aid the struggle for independence with his influence and money. He arrived at Missolonghi on the 4th of January 1824. There he found nothing but confusion and contending chiefs; but in three months, he succeeded in evoking some kind of order from the turbulent patriotic chaos. His health, however, began to fail. On the 9th of April, he was overtaken by a shower while on horseback, and fever and rheumatism followed. Medical aid was procured, and copious bleeding recommended; but this, B., with characteristic wilfulness, opposed. After twenty-four hours' insensibility, he expired on the evening of the 19th April 1824. His body was conveyed to England; and, denied a resting-place in Westminster Abbey, it rests in the family vault in the village church of Hucknall, near Newstead. A monument to B. was uncovered at Missilonghi in 1881, amid demonstrations of gratitude to his memory.

Lord B, is a remarkable instance of the fluctuations of literary fashion. Elevated to the highest pinnacle of fame in the heydey of his early popularity, he was unduly depressed after his death, when the false romance which he threw around himself and his writings began to wear away ; and it is only during the last twenty or thirty years that the proper place has been found for him in the public estimation. He is high, but not the highest. The resources of his intellect were amazing. He gained his first reputation as a depicter of the gloomy and stormful passions. After he wrote *Beppo*, he was surprised to find that he was a humorist; when he reached Greece, he discovered an ability for military organization. When all the school-girls of England fancied their handsome idol with a scowling brow and a curled lip, he was laughing in Italy, and declaring himself to be the most unromantic being in the world. And he was right. Take away all his oriental wrappings, and you discover an honest Englishman, who, above all things, hates cant and humbug. In *Don Juan* and his *Letters* there is a wonderful fund of wit, sarcasm, humor and knowledge of man. Few men had a clearer eye for fact and reality. His eloquence, pathos, and despair; his *Manfreds* and *Childe Harolds*, were only phases of his mind. Toward the close of his life, he was working toward his real strength, and that lay in wit and the direct representation of human life. If his years had been extended, he would in all liklihood have deserted poetry for prose, gaudy colored fiction for sober fact; and the assertion may be hazarded, that the English novel would have boasted of another and a greater Fielding. See the *Life, Letters and Journal*, of B., by Thomas Moore (1830); Leigh Hunt's *Lord B.* (1828); the Countess Guiccioli's *Recollections of Lord B.* (1869); and Prof. Nichol's short work on *Byron* (1880).

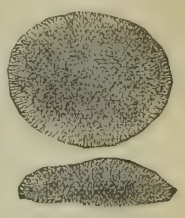
BYRON ISLAND is one of the Gilbert Islands in the Pacific Ocean, near the equator.

BY'SSUS, a name given from ancient Greek and Roman times to the bundle of silky filaments by which many lamellibranchiate mollusks—bivalve shells—attach themselves to rocks or other fixed substances. The B. springs from a cavity at the base of the solitary foot of the mollusk, and its fillaments, which are capable of being reproduced if destroyed, are secreted by a glandular tissue which occupies a furrow running nearly to the extremity of the foot. They are united together at the base in a common mass, and are often considerably divergent. They are guided to their place by the foot, and expand into a sort of disc at the point of attachment, so as to have a firm hold. A few common mussels in an aquarium readily afford an opportunity of observing the B., particularly when the filaments are attached to the glass-sides of the vessel. In the *Pinna* (q. v.) of the Mediterranean, the B. is remarkably long and delicate, has a beautiful silky luster, is very strong, and is capable of being woven into cloth, upon which a very high value is set; but the animal which produces it is now so rare, that it is almost exclusively an article of curiosity. This manufacture was known to the ancients.



Byssus of Common Mussel.

BYSSUS (Gr., a fine flaxen or silken substance), a genus established by Linnæus to include some of the lowest and most obscure forms of vegetation, and defined as having a substance like fine down or velvet, simple or feathered. Botanists sometimes ranked it among *Algæ*, sometimes among *Fungi;* it has been made the type of a group *Byssaceæ*, and placed among Lichens. Some have regarded this group as entitled to the rank of a distinct order, 'comprehending the filamentous fungi found in cellars, and similar plants;' but others reject the genus as altogether spurious. Some of the species once included in it have now been satisfactorily shown to be Lichens, others to be *Confervaceæ*, whilst many appear to be really not distinct vegetable forms but cryptogamic plants prevented by unfavorable circumstances from proper development. The green incrustations formerly regarded as species of B., have been found to be the primary germination of mosses, often species of *Polytrichum* and *Tortula*. It cannot be said, however, that the nature of all the vegetable forms which have been referred to the genus B., has yet been satisfactorily ascertained. Some of them are very phosphorescent, and are generally found where some higher form of vegetation is undergoing decay.



Black-rock Byssus (*Byssus nigra*).

BYSTROM, Joh. Nikolaus, a celebrated sculptor, was born 18th December 1783, at Philippstadt, in the province of Wermeland, Sweden, and educated under Sergell of Stockholm. In 1809, he obtained the highest prize in the Swedish Academy of Arts, and in the following year went to Rome, where he executed his first independent work, a 'Drunken Bacchante,' and sent it home. It was received with great approbation, and B. had to repeat it thrice. In 1815, he returned to Stockholm, and surprised the newly-elected crown prince by exhibiting a colossal statue of himself, which he had finished all but the head in Rome, and had found means to complete quietly in Stockholm. The crown-prince was highly gratified, and commissioned B. to execute colossal statues of Charles X., XI., and XII. After 1838, he resided in Stockholm; but returned to Rome in 1844, and died there March 13, 1848. His chief works are: 'A Nymph going into the Bath,' 'A reclining Juno suckling the Young Hercules,' 'Hygieia,' 'A Pandora combing her Hair,' 'A Dancing-girl,' a statue of Linnæus, and colossal statues of Charles XIII., Gustavus Adolphus, and Charles XIV. B. excels in the delineation of females and children, but his male figures want strength of character; his conceptions are always true to nature, his grouping skilful and pleasant, and his execution is clear and distinct.

BYTTNERIACEÆ, a natural order of oxogenous plants, sometimes united with the order *Sterculiaceæ* (q. v.), and also closely allied to *Malvaceæ* (q. v.), from which it differs, especially in the stamens not being columnar—although more or less united, generally into a cup or tube—also in the anthers being turned inwards, and 2-celled. The species of this order are trees, shrubs, or half-shrubby plants, abounding chiefly in tropical climates, although some are natives of the temperate zones. About 400 have been described. The flowers of many are beautiful. The most important product of the order is Cocoa (q. v.). The fruit of *Guazuma ulmifolia*, a native of Brazil, is eaten, being filled with a sweet and pleasant mucilage. The young bark of this tree yields, when macerated, a copious mucilage, and is therefore used in Martinique for clarifying sugar, as is that of *Kydia calycina* in the northern provinces of India. *Guazuma ulmifolia* was introduced into India, and at one time largely cultivated in the Madras presidency, under the name of Bastard Cedar, that its foliage and young shoots might be employed as fodder for cattle.

Its straight luxuriant young branches yield a strong fibre. The bark of other species of this order also affords a tough fibre, which is employed for making cordage, particularly that of *Microlæna* (or *Schillera*) *spectabilis* in the regions on the southern base of the Himalaya, *Abroma Augustum* in various parts of India, *Dombeya spectabilis* in Madagascar, and *D. umbellata* in the Isle of Bourbon. *Abroma augustum* has been especially recommended to attention and cultivation on account of its fibre, which is beautiful, white, fine and strong and is produced in great abundance. The plant grows to be a handsome small tree, having hairy lobed leaves and beautiful drooping purple flowers; but may be treated much as willows grown for basket-making, and in this way yields two, three, or four crops of cutting annually, which are peeled and the bark macerated in order to the separation of the fibre.

BY-TOWN, a town of Upper Canada, on the Ottawa, which took its name from Colonel By of the Royal Engineers. It is now *Ottawa* (q. v.), the capital of the Royal Dominion of Canada.

BYZA'NTINE ART. From the time of Constantine the Great, the emperors of the East arrogated to their imperial city the pre-eminence which, for so long a period, ancient Rome had actually possessed; and, as a necessary consequence of this assumption, Constantinople, or Byzantium, as it still continued sometimes to be called, became the rival of the mother-city in the richness and variety of its artistic monuments. In Rome, and, indeed, in the whole of Western Europe, the first effect produced by the influx of the mighty stream of barbarian life, and the consequent dissolution of existing society, was the almost total suppression of artistic effort. It was then that the artists of the West, willing and eager to avail themselves of the invitation held out to them, poured into Constantinople, carrying with them what yet remained of the artistic life of the ancient world. Byzantium was the hearth on which, during the dark period of the middle ages, those feeble sparks of ancient art were kept alive, which served to kindle the new and independent artistic life of the modern world. Not only were the painters and sculptors of Italy indebted to the art of Byzantium for the tradition of that ideal mode of conception to which the term classical is peculiarly applied, but artists in every department derived thence the elements of that technical knowledge without which the embodiment of such conceptions is impossible.

This practical acquaintance with the technical rudiments of their respective arts, which could scarcely have been derived from a mere examination of ancient works, was communicated to the fathers of Italian art by living Byzantines, some of them probably the descendants of those whom barbarian conquests had driven into the East, and whom the conquests of a still more barbarous race now restored to Western Europe. It is impossible to doubt that modern art was largely indebted to this circumstance for the marvelous stride which it took immediately after the taking of Constantinople by the Turks. But though its chief value may consist in its having thus transmitted to us the succession of antiquity, B. A. was by no means devoid of original and individual character; and it is only in so far as it possesses this, and not when regarded as a mere conservation of antique types and processes, that it takes rank as a school of art. The characteristic element in B. A. may be described as the earliest artistic recognition and representation to the senses of what was new and peculiar in Christian as opposed to heathen life. To the fullest extent to which it could claim a separate and individual existence, B. A. was Christian art; and consequently in Germany, where the subject has received more attention than in this country, two terms are frequently used as synonymous. The appearance of B. A., in this its only peculiar sense, dates from the age of Justinian, i. e., from the earlier half of the 6th c., and its productive period may be said to terminate with the conquest of the Eastern Empire by the Crusaders in 1204. But though its declension dates from this event, B. A. continued to exist in considerable vigor down to the final destruction of the Empire of the East in 1453; and even now may be seen as the inseparable handmaid of the Greek Church, both in Europe and in Asia. It is in this point of view, and more particularly as forming the basis of artistic life in Russia, that B. A. possesses its chief living interest in our day. What Rome was to the Western, Byzantium was to the Eastern European; and the relation of the latter to his mother-city, if it commenced at a somewhat later date, continued during the whole period of the middle ages.

Though the inhabitants of Eastern Europe thus derived their traditions of antiquity from a meaner source than the Romanic nations, they received them more unbroken; and, from first to last, were subjected to their influences during a much longer period. To them the living voice and hand continued to communicate what for nearly a thousand years Italians, Spaniards, and Franks had had to seek in the dead image and letter alone; and if anything still remains unrecorded of ancient thought, it doubtless dwells on Greek, and not on Roman or German tongues. Indolent, luxurious, and dissolute as their ancestors had been in classical times, the citizens of Constantinople were distinguished by an intellectual character, which, unfruitful and enfeebled though it was, was systematic, subtle, mystical, and pedantic. They were eminently an instructed people; but, like individuals whose glory is in the past, they were more conservative than original; and, however justly we may despise the chaff which they engendered, it is impossible to overestimate the value of the corns of gold which clung to their memories.

BYZANTINE ARCHITECTURE. The typical form of B. Architecture, at least as applied to ecclesiastical purposes, was fixed by the church of St. Sophia, which still exists as the great mosque of Constantinople. It was built, or rather rebuilt, by the orders of Justinian, the architects being Anthemius of Tralles, and Isodorus, the Elder, of Miletus, and completed 537 A.D. Though the largest and most magnificent, the church of St. Sophia was but one of twenty-five churches which were erected in the capital, and of a vastly greater number of ecclesiastical structures with which the provinces were adorned by the pious emperor. The style thus introduced largely influenced the architecture even of Western Europe; and in St. Mark's at Venice, the churches at Ravenna and elsewhere on the Adriatic, and even in the cathedral

Church of St. Sophia at Constantinople: Specimen of Byzantine Architecture.

of Aix-la-Chapelle, we have examples of churches almost purely Byzantine. The fundamental principle in the construction of Byzantine churches was an endlessly varied application of the Roman arch, whilst its exhibition in the form of the cupola was their most characteristic feature. In the St. Sophia, as was generally the case, the cupola covered the principal central portion of the church, and was supported by strong and lofty pillars, bound together by bold arches. To this central space were usually joined others of smaller size, which were covered by half-cupolas or arches of more ordinary construction. Though frequently in the form of a Greek cross, with the great cupola rising in the center, and smaller or semi-cupolas surmounting the four arms, neither this nor any other plan was consistently adhered to in Byzantine churches. The windows were always semicircular, similar to those in the Romanic churches of Germany, and in our own Saxon or early Norman churches; but the doors were frequently square-headed, after the classical model. Many of the details, such as the square capitals tapering downwards, and the bold projecting mouldings ornamented with foliage, seem to have owed their origin entirely to the ingenuity of Byzantine architects.

Byzantine Column.

The earlier Byzantine churches were profusely ornamented with mosaics, which, after the admixture of the Gothic element, and the adoption of the pointed arch, gave place to fresco-paintings. The constant use of the Apse (q. v.) is, after the cupola, perhaps their most marked feature. The following division into periods, though, like most divisions of the kind, somewhat arbitrary, has the authority of M. Couchaud, an eminent French architect, in its favor, and is, apparently, adopted by Parker: 1. From the time of Constantine to the middle of the 6th c.; 2. From the beginning of Justinian's reign down to the 11th c., which comprises the greater part of the existing buildings of the pure Byzantine type; 3. From the 11th c. to the conquest of Greece by the Turks, when the influence of the Venetian conquests is apparent in the intermixture of Italian and Gothic details and characteristics.

BYZANTINE SCULPTURE. When contrasted with the ignoble, tasteless, and meaningless productions of the later plastic art of Rome, that of Constantinople claims both admiration and respect. The figures are not deficient in dignity either in form or in attitude, and a deeply Christian spirit is traceable both in their general conception, and in their rich and significant symbolical accompaniments. In sculpture, as in architecture, the peculiar Byzantine type first exhibits itself towards the beginning of the 6th century. Alongside of unmistakable reminiscences of the antique, it exhibits characteristics which are as unquestionably oriental. The figures are positively laden, not with drapery alone, but with costume, which obscures the nobler and freer lines in which the ancients delighted. The execution is careful, even painful. All this becomes more and more the case as we advance in the order of time, the earliest Christian works, and those immediately suggested by the antique, exhibiting such faults only to a limited extent. Down to the 12th c., the defects which we have described were the worst which could be laid to the charge of B. sculpture, and it is scarcely earlier than the 13th c. that it assumes that mummy-like aspect by which it is too generally known. The art of carving in ivory was practised with great success at Constantinople, and in the examples of it which remain, the gradual decline—the *benumbing process*, as it has been aptly called—may be traced with great distinctness.

Of this species of work, in its earlier and better time, a fine specimen in alto-rilievo of the 'forty saints' may be seen in the museum at Berlin. The decorations of the churches, and of the sacred vessels used in the service of the altar, formed no insignificant objects of art in the better Byzantine period. Cups, plates, lamps, candlesticks, crosses, and the like, were either of gold or silver, and frequently adorned with jewels; whilst the altar itself, the chancel, and sometimes the whole interior of the church, were covered with precious metals, the panels being adorned with mosaics or frescoes.

BYZANTINE PAINTING. The same characteristics which we have ascribed to the sculpture belonged to the pictorial efforts of the artists of Byzantium, and of the neighboring countries who were mostly their imitators. The execution was careful and anxious rather than skilful, and such skill as still remained was exhibited in the mechanical perfection with which the guilding of the backgrounds and other details were managed. Of B. pictures, the best existing specimens are to be found in Italy, and belong especially to the school of Sienna. The picture of the Virgin in the church of St. Domenico at Sienna by Guido, bearing date 1221, deserves special mention. Much labor was expended on the illumination of MSS. of the Scriptures, and of these many beautiful examples, as fresh as when they were painted, may be seen in some of the larger public libraries of Europe. The chief interest attaching to B. painting consists in the parental relation in which it stood to the art of Italy. Cimabue may be regarded as its immediate heir; and in the works of Giotto, Leonardo da Vinci, Pietro Perugino, and even of Raphael in his earlier time, the traces of the inheritance are quite unmistakable. See PAINTING.

BYZA'NTINE EMPIRE, also styled the EAST ROMAN, EASTERN, or GREEK EMPIRE, was founded in 395 A.D., when Theodosius the Great, at his death, divided the Roman empire between his two sons, Arcadius and Honorius. The former, a weak and luxurious character, was made emperor of the eastern division, formerly included under the prefectures of the East and of Illyricum—namely, Syria, Asia Minor, and Pontus, stretching along the shores of the Black Sea in Asia; Egypt in Africa; and Thrace, Mœsia (now Bulgaria), Macedonia, Greece, and Crete in Europe. Arcadius left the government of the empire in the hands of his minister, Rufinus, from whom it passed to the eunuch Eutropius, and afterwards to Gainas, the murderer of Rufinus.

Gainas fell by his ambition in 401, and the shameless and avaricious Empress Eudoxia, ruled until the time of her death, 404. See ARCADIUS. After Theodosius II., a minor, under the guidance of the prefect Prætorio Anthemius, had held the reins during six years, he resigned the government in favor of his sister Pulcheria (Augusta), who ruled powerfully while her brother was kept apart from all state affairs. Western Illyria (comprehending Pannonia, Dalmatia, and Noricum) was ceded to the Eastern empire by the Roman emperor, Valentinian III.; and after several victories achieved by the Byzantine general, Ardaburius, over the Persians, a part of Armenia was also annexed. But, nevertheless, Thrace and Macedonia could only be secured from the destructive conquests of Attila by the payment of tribute. After the death of Theodosius II., Pulcheria married the senator Marcianus (450—457), whose firmness repelled the invasions of Attila. Marcianus was followed by Leo I., surnamed Macella (the Butcher), a Thracian of low birth, but elevated to the throne by the commander-in-chief, Aspar, who, being himself an Arian, would not venture to encounter the perils that sovereignty might have entailed on one of his religious views. Leo II., grandson of the former, succeeded, but died after a few months, in consequence of which the crown came into the possession of his father, Zeno (474—491), who was banished by Basiliscus (475), but who re-ascended the throne in 477. Though a weak and unpopular ruler, he contrived to retain his power in spite of several serious revolts. The internal distraction of the empire, to which, as at other times, religious strifes added considerably, increased greatly during the reign of Zeno, and the invasions of the Goths were prevented only by gifts and stratagems. Ariadne, widow of Zeno, by her second marriage, raised the courtier Silentiarius to the throne under the title Anastasius I. (491—518). By the help of the Goths, this monarch overthrew, after a six years' contest, the robber tribes of Mount Taurus. A new enemy, however, now appeared on the Danube in the Bulgarians, against whose desolating raids Anastasius built the Long Wall, to protect the peninsula on which Constantinople lies. The war with the Persians also broke out anew during his reign, and religious tumults often purpled the streets of Constantinople itself. After his death, the army raised Justinus I. to the throne. He maintained his position mainly through the favor of the clergy, whom he had conciliated by his severe persecution of heretics.

His nephew, Justinian (q. v.), succeeded (527—565), and became celebrated by his code of laws, and by the victories of his great generals, Belisarius (q. v.) and Narses (q. v.). But the rapid decline of the empire after his death showed that he had not been able to give it any internal consolidation or vitality. It was during the reign of Justinian that those pestilent contests of the Blues and Whites against the Greens and Reds (political factions so named from the colors respectively worn) first attained any consequence; and though the first disturbance was terribly chastised by Belisarius in 532, they continued to distract the capital periodically down to the 7th century. Justin II. (565—578), a weak man, governed by his wife, Sophia, yielded a part of Italy to the Longobards, was unsuccessful against the Persians, allowed the Avari to plunder the Danubian provinces, and ultimately became insane through vexation and anxiety. Tiberius, the captain of the guard, was then made regent, and after the death of Justin II., received the imperial dignity. He ruled with mildness and prudence (578—582), purchased a peace with the Avari, concluded the war with Persia, and left as his successor the commander-in-chief, Mauricius, who reigned from 582 to 602. Having replaced on the throne the Persian king, Kosroes II., who had been banished by his subjects, he thus secured the peace of his eastern frontiers; but, on the other hand, the war against the Avari did not prosper. His niggardly treatment of the army caused a military insurrection, in which he was slain along with his son; and Phocas, one of his generals, was elevated to the throne. Phocas proved a bad ruler. Through his monstrous vices, tyranny, and incapacity for government, the empire lapsed into still deeper anarchy. Suddenly, however, a deliverer appeared in the person of Heraclius (q. v.), son of the exarch or governor-general of Africa, who headed a conspiracy, marched to Constantinople, overthrew the tyrant, and ascended the throne, 610. But great as was the genius of Heraclius, he had to submit to twelve years of defeat before he could organize and discipline a victorious army. In 622, he opened those magnificent campaigns in which the power of Persia was crushed, and which, in the opinion of Gibbon, were equal to those of Scipio or Hannibal. He lived, however, to see more formidable foes in the Arabs, who, inspired by fanatic zeal, and led by the Calif Omar, captured, during 635—641, the countries on the Euphrates, with Syria, Judæa, and Egypt.

The power of the Greeks, which was demanded to resist the Arabian invasions, was miserably divided and weakened by their unending religious quarrels, especially the controversy of the Orthodox against the Monothelites (q. v.). The empire was breaking asunder, and Heraclius, now worn out with the fatigues of war, had abandoned his enfeebled senses to pleasure, and his enfeebled intellect to theological discussions. He died in 641. Constantine III., who succeeded his father, Heraclius, also died soon after, and was followed by Heracleonas, who lost the crown, and was mutilated in an insurrection. The next Ruler was Constans, son of Constantine III., who ruled from 642 to 668, made himself odious by cruelty, and perished in an insurrection. His son, Constantine IV., Pogonatus (668—685), enforced a treaty of peace on the invading Arabs (675) by his successful use of the Greek fire in warfare. On the other side, he was compelled to pay tribute in 680 to the Bulgarians, who had established themselves in ancient Mœsia. Justinian II. (685—711), son and successor of Pogonatus, was victorious in war against the Monothelite Maronite); but was defeated by the Bulgarians (688), and by the Arabs (692). His cruelty caused an insurrection, at the head of which was Leontius, who, in 695, deposed him, cut off his nose (hence his surname *Rhinotmetus*), and banished him to the Taurio Chersonese; in 705, he was restored to the throne, but adversity had taught him no wisdom. A part of his subjects revolted, and the king, abandoned by his army and by the Bulgarians, was assassinated in 711. With him the dynasty of Heraclius expired.

Philippicus Bardanes (the leader of the last insurrection against Justinian II.), was next raised to the throne (711); but having made himself odious by favoring the metaphysical tenets of the Monothelites, he was deposed, and brutally deprived of eyesight (713). His successor, Anastasius II., prudently screened himself from a mutinous army by retiring into a monastery (716), and left the crown to Theodosius III., who abdicated in 717, when Leo, the Isaurian, and general of the army of the East, did not recognize him, and marched with hostile intent to Constantinople. Leo (q. v.) himself ascended the throne in 717, and drove back the Arabs from Constantinople, but unhappily gave occasion, in 726, for that contest concerning the worship of images, which rent the empire for more than a century. In 728, the exarchate of Ravenna was lost, and the eastern provinces became the prey of the Arabs, over whom, however, he won a great victory in Phrygia. He died in 741. Constantine V. (741—775), son of Leo III., on account of his zeal as an iconoclast, was hated by the monks, who gave him the surname 'Copronymos,' because (according to their malicious and uncleanly statement) he had polluted the font at his baptism. He was a brave ruler, recovered from the Arabs parts of Syria and Armenia, and ultimately defeated the Bulgarians, against whom he had long been unsuccessful.

His son, Leo IV. (775—780), was a mild ruler; but by the ability of his generals, he made the boundaries of his empire

secure against the Arabs. After him, Constantine VI. ascended the throne under the guardianship of his ambitious mother, Irene (q. v.), who raised a powerful party in favor of image-worship. Constantine having made an attempt to liberate himself from the influence of his mother and her paramour, Stauratius, Irene barbarously caused her own son to be blinded (797). He died soon after this atrocity; and Irene, who had boldly conceived the design of marrying the Emperor Charlemagne, and thus uniting the east and west of Europe in one vast realm, excited the opposition, which, in 802, placed her treasurer, Nicephorus, on the throne. Irene was banished to Lesbos, where she died in 803. Nicephorus, who fell in battle against the Bulgarians (811), was succeeded by his son, Stauratius, who soon yielded the throne to his brother-in-law, Michael I., from whom it was taken by the Armenian general, Leo V., a powerful ruler, who conquered the Bulgarians, but fell (820) in a conspiracy excited by his zeal against image worship. Michael II., the Stammerer, was raised from a dungeon to the throne, and ruled until 829. In his reign, Crete and Sicily passed into the hands of the Arabs. Under the rule of his son, Theophilus, who is praised by the Byzantine historians for his love of justice (829—842), the general Manuel, gained some indecisive victories over the Arabs. Theodora, widow of Theophilus, and guardian of Michael III. (842—867), brought the controversy about images to a close at the council of Nicæa (842), when the worship of these was fully sanctioned and re-introduced. During this reign, the government busied itself in the persecution of the Paulicians (q. v.), while the Arabs devastated the Asiatic provinces. Theodora, having been banished to a convent by her son, the government was for some time held by Bardas, uncle of Michael III., and after his assassination, by Basilius I., the Macedonian, who caused Michael to be put to death, and afterwards ruled ably from 867 to 886. But though on the whole successful against the Arabs, the latter contrived to make themselves masters of Syracuse. His dynasty (the Macedonian) maintained itself on the Byzantine throne, with some few interruptions, until 1056. The reign of his son, Leo VI., the Philosopher, (886—912), was not prosperous.

The inroads of the Bulgarians and of the Arabs, who, in 904, plundered Thessalonica, continued to increase during the government of his son, Constantine VII., Porphyrogenitus, who ruled mildly but feebly (912—959). Under his son, the dissolute Romanus II. (959—963), Crete was retaken from the Arabs by the vigor of his general, Nicephorus Phocas, who, on the death of the emperor, married his widow, Theophania. She, however, caused him to be murdered in 969, as she wished to marry John Tzimiskes, who ruled till 976, and, like his predecessor, was victorious against the Arabs and Bulgarians, as also the Russians, who about this time began to emerge from obscurity as an enemy of the Byzantine power. His successor, Basilius II. (976—1025), the son of Romanus, conquered the Bulgarian kingdom, and attached it as a province to the empire, which it remained till 1186, when it again became independent. His brother, Constantine VIII. (1025—1028), did not resemble him. Romanus III. next ascended the throne, but was assassinated by his wife, Zoe, a profligate but crafty princess, who raised successively to the imperial dignity Michael IV. (1034), Michael V. (1041), and Constantine IX. (1042). Meanwhile, Russians and Arabs devastated the realm. In Asia, the Seljuk Turks proved dangerous enemies; while in Lower Italy, the Normans narrowed the Byzantine power to the possession of Otranto. After Constantine's death in 1054, Theodora, sister of Zoe, was elected empress; and on her death in 1056, Michael VI., who was deposed by Isaac I., Comnenus.

With Isaac I., Comnenus, who came to the throne in 1057, the dynasty of the Comnenian emperors began. He retired to a monastery (1059), and was succeeded by Constantine X., whose widow, Eudocia, married Romanus IV., and raised him to the throne. Romanus was deposed in 1071 by Michael VII. (son of Constantine X.), who, in his turn, was dethroned by Nicephorus III. (1078), who reigned until 1081, when he was deposed by Alexius I., Comnenus (q. v.), (1081—1118). This last reign was marked by the commencement of the Crusades. The successors of Alexius—his son, Kalo-Joannes (1118—1143), and Manuel I. (1143—1180)—were able rulers, and victorious in their engagements with the Turks. Manuel's son, Alexius II., was murdered by his guardian, Andronicus (grandson of Alexius I.), who raised himself to the throne. He was the last prince of the Comnenian dynasty, and fell in an insurrection excited by his own cruelty, 1185.

After the first turbulent reign of Isaac II., who was blinded and deposed by his brother, Alexius III, who took the surname of Comnenus in 1195, the Crusaders restored Isaac to the throne (1203), and also crowned his son Alexius IV.; but the restless citizens of Constantinople elected Nicholas Kanabus, who took the title of Alexius V., and pursuing the usual bloody course, put his predecessor to death.

In 1204, the French and the Venetians (collectively named *Latins*) advanced on Constantinople, and captured the city, April 12, having made themselves masters of the European provinces. The whole was divided into four parts, of which the first, including the metropolis, fell to the lot of Baldwin, Count of Flanders, who was made emperor, and to whom the other participants in the expedition did fealty for their respective shares. The Venetians obtained the coasts of the Adriatic and Ægean seas, a part of the Morea, and several islands; Bonifacius, Count of Montferrat, Macedonia and part of Greece; several dukedoms, countships, &c., were also established at Athens, Philippopolis, and other places for French knights; while a number of Greek princes, both on the mainland and in the islands, maintained their independence. In the west of Asia Minor, Theodorus Lascaris, who had been elected emperor at Constantinople, formally transferred the seat of government to Nicæa; and finally, in the north-east of Asia Minor, the governor of the province of Colchis, Alexius Comnenus, ruled at Trebizond with absolute authority; while one of his successors, John Comnenus, even assumed the title of emperor. At Constantinople, neither Baldwin nor his successors could strengthen the sinking empire. Baldwin himself died (1206) a prisoner in the hands of the Bulgarians. After him came his brother, Henry, who ruled bravely and wisely till 1216. For the next four years, the empire was actually without a ruler, and a prey to utter anarchy. In 1221, Robert, son of Peter, Count of Auxerre and Courtenay, came to the throne; and was succeeded by John of Brienne, titular king of Jerusalem (1228—1237); and the latter by Baldwin II. (1237—1261).

During these reigns, a great part of the empire was seized by John Vatazes, successor of Theodorus Lascaris of Nicæa (1222—1255). This ruler was followed in Nicæa by Theodorus II. (1255—1259), whose son, Johannes, during his minority, was superseded by Michael VIII., Palæologus, who, by the help of the Genoese, captured Constantinople (July 25, 1261), and thus put an end to the Latin dynasty; though some few Latin principalities maintained themselves till the fall of the Byzantine empire.

Michael, the first of the Palæologi, a powerful prince, really endeavored to strengthen the realm; but by his unhappy attempt to unite the Greek Church with the Latin, from which it had decisively separated (1054), he gave great offence to the clergy and the people. His son, Andronicus II., who came to the throne, 1282, re-established the Greek ritual. After the death of his son and co-regent, Michael IX. (1320), Andronicus II. was compelled to divide the throne with his grandson, Andronicus III., who became sole emperor, 1328. This monarch unsuccessfully opposed the Turks, who took Nicæa and Nicomedia in 1339, and wasted the European coasts. He died in 1341. Under his son, Johannes V., the Turks first gained a firm footing in the European provinces, and spreading themselves from Gallipoli (which they captured in 1357) over other districts. Sultan Murad took Adrianople, 1361, and make it the seat of government. He and his follower, Bajazet, conquered all the Byzantine territories as far as Constantinople. Manuel II., son and successor of Johannes, was besieged in Canstantinople by Bajazet, who defeated an army under Sigismund of Hungary, at Nicopolis, in 1396, and compelled the Byzantine monarch to cede to the Turks one of the main streets of the city, which was saved from capture only by Timur's incursions into the Turkish territories, 1402. By this diversion Manuel recovered some portion of the Byzantine provinces; but made so little use of the occasion, that, in 1422, the metropolis was again besieged by Murad II., who, after he had overthrown the force sent to aid the emperor by Ladislaus, king of Hungary, at the battle of Varna, made Constantinople, in 1444, the limit of the domains of Johannes VI., son of Manuel, and compelled him to pay tribute. Constantine XI., brother of Johannes, bravely but fruitlessly contended against the overwhelming Turkish forces, and fell heroically in the defence of Constantinople, which was captured by Mohammed II., May 29, 1453, when the B. E. was brought to a close. The petty Latin princes who existed here and there in Greece, and the despots, Demetrius and Thomas, who ruled in the Morea, were subdued by Mohammed in 1460; while David, a member of the Comnenian dynasty, the last emperor of Trebizond, submitted in 1461.

It has hitherto been usual for authors dealing with the bloody record of dynastic crimes in the B. E. to affirm that the history of the world never witnessed so degraded a caricature of imperial government. Against all such summary statements Mr. Freeman and others energetically protest; declaring that careful study brings the fairer side into relief, and that, on the whole, the history of the fall of the B. E. is the record of a noble struggle against overwhelming odds.

The constitution of the B. E. was founded on the institutions of of Diocletian and Constantine the Great, and was purely despotic. The emperors who were consecrated by the Patriarchs of Constantinople, claimed, as the true descendants of the Cæsars, a sovereignty over the West as well as the East, and styled themselves 'rulers of the Romans,' even after Charlemagne had founded a new dynasty. Though great influence was at various times exercised by the clergy as well as by women, courtiers, and ministers,

the emperors were pure autocrats, having supreme power in all departments of government, and being themselves superior to all laws. By pompous titles, by great splendor of costume, and by a strict observance of an elaborately minute court ceremonial, as well as by the cruel penalties inflicted for any insult offered to the imperial dignity, or to the dignity of the emperor's relatives, they kept themselves sacredly apart from the people. Gradually everything disappeared that might have been a check upon the utter despotism of the supreme power. As early as the 6th c., the consulate was absorbed into the mass of imperial honors, while the traces of the senate which Constantine had established at Byzantium, and which was composed of those on whom the emperor had bestowed the dignity of patriciate, as well as the chartered privileges of the towns, had entirely vanished in the 10th century. The privy council, to whom the conduct of the state was intrusted, was arbitrarily chosen by the emperor. The state-officials were very numerous, and their respective ranks carefully distinguished. They were raised far above the populace by titles and privileges, but were utterly dependent on the throne. Among these, the *Domestici* (including many eunuchs), clamed the highest rank as immediate attendants on the emperor. The rank of the *Curopalates*, who had charge of the four chief imperial palaces, became in course of time, subordinate to that of the *Protovestiarius*, who was invested with the highest dignity of all.

The Domestici were made commanders-in-chief of the army. Among them, the *Domesticus* of the East (styled, *par excellence*, *Megadomesticus*) held the highest rank, and finally, under the Palæologi, was considered the first civil and military officer of the realm. The provinces were ruled by governors bound to contribute certain sums to the royal revenue, which gave rise to oppressive exactions. No distinction was made between the state-revenue and the privy-purse. For military service, the land was divided into districts (*Themata*); and the army, down to the later times, consisted almost entirely of foreign mercenary troops, the imperial body-guard, or *Spatharii*, who were mainly Germans, holding the highest rank. The admiral of the fleet was styled *Megas Dux*. In the midst of constant internal and external disturbances, the administration of justice was grossly neglected and abused, though Justinian and other emperors earnestly endeavored to establish just laws.

BYZA'NTINE HISTORIANS are those Greek writers who have handled the history of the Byzantine empire. They are divided into three classes—1. Those whose works refer exclusively to Byzantine history; 2. Those who professedly occupy themselves with universal history, but at the same time treat Byzantine history at disproportionate length; 3. Those who write on Byzantine customs, antiquities, architecture, &c. The B. H. are far from faultless, yet, as they are the only sources of information regarding the vast empire of the East, they are invaluable to us. The most interesting and instructive among them, however, are those who confine their attention to a limited number of years, and to the events which transpired under their own observation, or in which they took part. The principal B. H. were collected and published at Paris in 36 vols., with Latin translations under the editorship of P. Philippe Labbé, a Jesuit and his successors (1648—1711). This magnificent collection was reprinted, with additions, at Venice, 1727—1733. In 1828, Niebuhr, assisted by Bekker, the Dindorfs, and others, began a *Corpus Scriptorum Historiæ Byzantinæ*, carried on till 1855, and continued in 1872 by the *Bibliotheca Græca Medii Ævi*.

BYZA'NTINES, in Numismatics, is the term applied to coins of the Byzantine empire. Byzantine coins are of gold, silver, and bronze; bear impressions distinct from those of the earlier Roman coins; and were copied in several countries where the Byzantine standard was adopted. The commercial relations of the Eastern empire served to distribute its coinage over almost all the then known world. It was current in India, as well as in the north of Europe. Recently, an increased attention has been paid to the study of Byzantine coins as aids to history.—Saulcy, *Essai de Classification de Suites Monétaires Byzantines* (Metz, 1836).

BYZA'NTIUM, a city which stood on the Thracian Bosporus, was first founded by emigrants from Megara in 667 B.C., and rapidly rose to importance as a seat of commerce. Its position was at once secure and enchanting; it commanded the shores of Europe and Asia, had magnificent facilities for trade, and was also encircled with rich, picturesque, and varied scenery. After a time of subjugation under Darius Hystaspes, B. was liberated from the Persian yoke by Pausanias. Along with other Grecian seaports, B. revolted from Athens in 440 B.C., but was captured by Alcibiades (408). Lysander recovered it for the Lacedæmonians in 405. Shortly afterwards, it renewed its alliance with Athens, and in 390, Thrasybulus altered its form of government from an oligarchy into a democracy. When Athens again acquired a dangerous importance as a naval power, B., in 356, leagued itself with Chios, Rhodes, and King Mausolus II. of Caria, and crippled the trade of the former city; with which, however, it again formed an alliance, through the influence of Demosthenes, in opposition to Philip of Macedon, who, in 341—340 B.C., vainly besieged Byzantium. Under Alexander the Great, B. retained a certain degree of independence. For some time, B. was tributary to the Gauls, who settled in Thrace, after the death of Brennus (280 B.C.). After the second Punic war, when the Romans began to interfere in the affairs of Grecian and Asiatic cities, B. attached itself to Rome, and, retaining almost entire its former liberties, maintained also its commercial importance. In the civil war between Septimius Severus and Pescennius Niger, B. sided with the latter. It was therefore besieged by Severus, and, after a brave defence of three years' duration, was captured in 196 A.D., and reduced to ruin. Severus, repenting of the desolation which he had made, rebuilt a part of the city under the name of *Augusta Antonina*, and ornamented it with baths, porticos, &c. Caracalla restored to the inhabitants their ancient privileges; and, in 330 A.D., under the name of New Rome or Constantinople, it was made the metropolis of the Roman empire. See CONSTANTINOPLE.

THE third letter in all the alphabets derived from the Roman. It corresponds in place to the Greek gamma (Γ), and had originally the same sound—viz., that of *g* in *gun;* as is expressly recorded, and as is proved by very old inscriptions, on which we read *leciones, lece*, for what were afterwards written *legiones, lege*. This medial or flat guttural sound of *c* was at an early period of Roman history lost in the sharp guttural or *k*-sound (see ALPHABET), and this continued to be the pronunciation of the letter *c* in Latin down at least to the 8th c. of the Christian era, not only in such words as *comes, clamo*, but also before the vowels *e* and *i*. Such Latin words as *Cicero, fecit*, are uniformly represented in Greek by *Kikero, phekit;* and in the times of the Empire, the Germans borrowed *Kaiser, keller*, from *Cæsar, cellarium*.

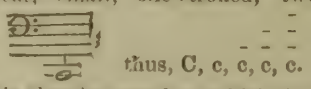
It seems difficult, at first sight, to account for the same letter having sounds so different as those heard in *call* and in *civil*. The beginning of the transition is to be found in the effect produced upon certain consonants by their standing before *i* followed by a vowel. Thus, in *nation, ti* has the effect of *sh;* and out of *diurnal* has sprung *journal*. In such combinations, *i* is originally a semivowel having the force of *y*, and it is easy to see that *tyon, dyur*, pronounced in one syllable, cannot but slide into the sibilant or hissing sounds of *shon, jur*. A precisely similar effect is produced on the *k*-sound before *ia, iu, io;* in Lucius, Porcia, or rather Lukyus, Porkya, *ky* tends to slide into a hissing sound similar to that of *ty* and *dy*. This tendency showed itself early in the Latin tongue; and in the vulgar Latin of later ages, and in the Romanic tongues that sprang out of it, it fully developed itself, so that the Italian came to pronounce *Lucia* as if written *Lutshia*. Combinations like *ceo, cea*, are little different from *cio* and *cia*, and would naturally follow the same course; and the *s* sound being once associated with the letter *c* in these positions, was gradually extended to it in cases where the *e* or *i* was not followed by a vowel.

The Anglo-Saxon alphabet resembled the Roman, from which it sprang, in having no *k*, and in always using *c* with the sound of *k; king* and *keen* were spelled *cyning* and *cene*. It was so also without *q*, for which *cw* was used—*quick* being spelled *cwic*. By a process analogous to that described above, such Anglo-Saxon words as *ceorl, ceosan* (pro. *kyorl, kyosan*), became transformed into the English *churl, choose*. And this suggests a natural explanation of the multitude of cases where the *c* of the Latin has been transformed into *ch* in French, and has passed in this form into English—e. g., Lat. *caput*, Fr. *chef*, Eng. *chief;* Lat. *caminus*, Eng. *chimney;* Lat. *carmen*, Eng. *charm*. For as the Anglo-Saxons turned the *karl* or *korl* of the other Gothic nations into *kyorl*, so doubtless the Romanized Gauls corrupted the pronunciation of the Latin *camera*, for example, into *kyamera* (compare Eng. *cart*, pro. by some *kyart*), which would then readily slide into *chambre*.

In the other Germanic alphabets, which were derived partly from the Roman and partly from the Greek, the Greek *kappa* or *k* is used almost to the exclusion of *c*, which, in German, Swedish, &c., appears only in words borrowed from the Romanic languages. See letter K.

In modern English, *c* is pronounced like *k* before the vowels *a, o, u*, and like *s* before *e, i*, and *y;* and where the sharp gutteral sound has to be represented before *e, i*, and *y*, the Germanic *k* has superseded the Anglo-Saxon *c*, as in *king, keen*. In so far as mere sound is concerned, *c* is a superfluous letter in English; in every case its power could be represented either by *k* or by *s*. In the corresponding words of the several Aryan languages, we find various substitutions for *c*, thus: Lat. *calamus*, Eng. *halm* (stalk), Rus. *soloma;* Lat. *cord-*, Eng. *heart*, Rus. *serdtse;* Lat. *collum*, Ger. *hals* (neck); Lat. *acer* (sharp), Fr. *aigre*, Eng. *eager;* Lat. *duc-* (lead or draw), Ger. *zoq*, Eng. *tug;* Gr. *pepo*, Lat. *coquo*, Eng. *cook;* Lat. *dictus*, Ital. *ditto*. C sometimes disappears before *l* and *r;* thus: Gr. *kleo* (to sound one's fame, allied to *kaleo*, to call or shout), Lat. *laudo*, to praise, Ger. *laut*, voice, Eng. *loud*, Old Ger. *hlud*, fame (hence Hludwig or Clodowig, Clovis, Louis).

C, in music, is the name of one of the notes of the gamut. The scale of C major has neither flats nor sharps, and therefore is called the natural scale. The different octaves of the gamut, beginning with C, are called by the Germans the great, small, one-stroked, two-stroked, &c., beginning with



thus, C, c, c, c, c.

C is also the sound on which the system of music is founded, and from which the mathematical proportions of intervals are taken; that is, a string of a given length sounding C, when divided into certain proportions, is made to produce harmonically the intervals of the different fundamental chords.

C MAJOR, the first of the twelve major keys in modern music; being the natural scale, it has no signature.

C MINOR, the tonic minor of C major, has three flats for its signature—viz., B flat, E flat, and A flat.

CAABA. See KAABA.

CAA'ING WHALE (*Globicephalus deductor*), an interesting cataceous animal which has been very generally included by naturalists in the genus *Delphinus* with dolphins (q. v.) and porpoises (q. v.), being named by some *Delphinus melas* (Gr. black), by others *D. globiceps*, from the round form of its head, but which has recently been separated from the true dolphins, either as a species of porpoise (*Phocæna*), or as the type of a distinct genus, *Globicephalus*, principally characterized by the rounded muzzle, and the convex and rounded top of the head. The general form of the animal is not unlike that of the common porpoise, but it is much larger, being from 16 to 24 feet in length. The body is thick, its circumference at the origin of the dorsal fin, where it is greatest being rather more than 10 feet, tapering towards the tail, which is deeply forked. The pectoral fins are remarkably long and narrow, fully 5 feet in length, differing very much in this respect from those of every other known cetaceous animal. The whole number of vertebræ is 55. The color is black, with a white

streak from the throat to the vent; and the skin is beautifully smooth, shining like oiled silk.

The C. W. feeds on cod, ling, and other large fishes, but also to a great extent on cephalopodous mollusca, the cuttle-fish indeed, seeming to be its principal food. It is the most gregarious of all the Cetacea, great shoals or herds being usually seen together in the northern seas which it inhabits. These herds exhibit the same propensity with flocks of sheep, when pressed by any danger, to follow their leaders, so that when they are hemmed in by boats, if one break through to the open sea, all escape; but if

Caaing Whale.

one is driven ashore, the rest rush forward with such blind impetuosity as to strand themselves upon the beach, where they become an easy prey and rich prize to their pursuers. The appearance of a herd of caaing whales in a northern bay produces a scene of great excitement, and every boat is in requisition. From 50 to 100 whales are often captured, and it is recorded that 1110 were killed, in the winter of 1809—1810, at Hvalfiord, in Iceland. The word *caaing* is not the Scottish form of *calling*, as has been supposed, but is a totally different Scotch word, which signifies *driving*. C. W. appears to be originally an Orkney or Zetland name. The same animal is known to sailors as the Black Whale, the Howling Whale, the Social Whale, and the Pilot-fish.—Another species of the same genus, *G. Rissoanus*, 9 or 10 feet long, the male of a bluish-white color, the female brown, both sexes marked with irregular white lines and brown spots, is found in the Mediterranean.

CABAGA'N, a thriving town, situated at the northern extremity of the island of Luzon, one of the Philippines. Pop. upwards of 11,000.

CABA'L, a term employed to denote a small, intriguing, factious party in the state, and also a union of several such, which, for political or personal ends, agree to modify or sacrifice their principles. The word wes used to describe an English ministry in the reign of Charles II., the initials of whose names composed CABAL.—viz., Clifford, Ashley, Buckingham, Arlington, and Lauderdale. This was not the origin of the word, however, as some have supposed; but merely the ingenious application of a word previously in use, and which appears to have been derived from the French *cabale*, possessing a similar signification.

CABANIS, PIERRE JEAN GEORGES, a French physician, philosophical writer, and partisan of Mirabeau in the Revolution, was born at Cosnac, in the department of the Charente-Inférieure, 1757. When he had completed his studies in Paris (1773), he went to Warsaw, in the capacity of secretary to a Polish magnate. On his return to Paris, he was for some time engaged in literary pursuits, from which he turned his attention to an earnest study of medicine. At the outbreak of the Revolution, he attached himself to the liberal side, but detested the cruelties which followed. For Mirabeau, whose opinions he received, he wrote a work on national education, which was published after the death of that great orator (1791). C. was one of the Council of Five Hundred, afterwards a member of the senate, and administrator of the hospitals of Paris. He died May 5, 1808. His chief work, *Rapports du Physique et du Moral de l'Homme*, completed in 1802, gained its author a considerable reputation as a writer and a philosopher. The work displays no mean power of observation and analysis, but is characterized by a sensationalism so absolute, that it seems at first sight as if the author were burlesquing with grave irony the doctrines of his brother-materialists. He denies that the soul is an entity; it is only a faculty; and declares the brain to be merely a particular organ specially fitted to produce thought, as the stomach and the intestines perform the function of digestion. C. traces this grotesque analogy through all its niceties, and at last triumphantly concludes, 'that the brain digests impressions and organically secretes thought!'

CABATUAN, a city of the province of Iloilo, on the Island of Panay, one of the Philippines. It is situated on the banks of the river Tiguin, which so abounds with crocodiles that fishing is unsafe. Navigation is very uncertain, the river being sometimes nearly dry, while at others it overflows its banks, and deluges the surrounding country. The city was founded in 1732, and possesses a populaton of 23,000, who are chiefly engaged in the production of rice, and of cocoa-nut oil.

CABAZERA, capital of the province of Cagayan, island of Luzon, Philippines. Pop. 15,000. Tobacco is grown very extensively in the province, and its manufacture affords employment to large numbers of people.

CA'BBAGE (*Brassica oleracea;* see BRASSICA), a plant in most general cultivation for culinary purposes in Europe and other countries, cultivated also to a considerable extent for feeding cattle. It is a native of the Rocky shores of Britain and other parts of Europe, more plentiful on the shores of the Mediterranean than in more northern latitudes, and in its wild state is generally from a foot to two feet high. This plant has been cultivated in Europe from time immemorial; it has likewise been cultivated from an early period in gardens and about villages in India. Few plants show so great a tendency to vary in their form through cultivation; and among the varieties of this one species are reckoned several of our most esteemed culinary vegetables, such as Kale (q. v.) or Greens, Borecole, Colewort (q. v.) Savoy (q. v.), Kohl Rabi (q. v.) Cauliflower (q. v.), and Broccoli (q. v.).—plants which differ much in their appearance and in the particular qualities for which they are valuable, both from each other and from the original wild plant.

The wild C. has smooth sea-green leaves, waved and variously indented; the boiling of the leaves, or their forming close heads at a certain stage of the growth of the plant, so that the inner leaves are blanched, is peculiar to those cultivated varieties which commonly receive the name of cabbage.

The ordinary varieties of C. are often called by the general name of *White C.*, to distinguish them from the *Red C.*, which is of a deep brownish-red or purplish color, and is chiefly used for pickling, for which purpose it is much esteemed. The *Tree C.*, or *Cow C.*, is a variety cultivated for cattle, especially in the Channel Islands and the north of France, of which the leaves do not close together into compact heads, but which is remarkable for its great height—reaching, when it is in flower, ten feet on rich soils—and for its branching stem. The stems of this kind are sometimes used as stakes for pease, and even as cross-spars for thatched roofs.

The *Portugal* or *Tranxuda C.*, also known as *Couve Troncluda*, is a variety remarkable for its delicacy, and for the large midribs of its leaves, which are often used like sea-kale. It is an article of luxury like cauliflower, and requires a somewhat similar cultivation.—C. seed is sown either in spring or autumn, and the seedlings transplanted in rows at distances of two feet or upwards, according to the size of the variety. They are often planted closer, and the alternate plants cut young for open greens, for which the sprouts that arise from the stem of some varieties after the head has been cut off are also used. Cabbages require a rich, well-manured soil, and the earth about the roots ought to be often stirred. By sowing and planting at different dates and of different varieties, a succession is secured in the garden; and when winter approaches, part of the principal crop may be taken up and laid in a sloping position, so that only the heads are above the earth, in which way they are generally preserved without injury. In some places, cabbages, are completely buried in the earth, the plants not being allowed to touch each other; and this method succeeds well in peaty or sandy soils.

The C., considered as food, contains more than 90 per cent. of water, and therefore cannot be very nutritious: 100 parts of the ordinary C. consist of

Extractive	2·34
Gummy matters	2 89
Resin	0·05
Vegetable albumen	0·29
Green fecula	0·63
Water and salts	93·80

The digestibility of C. varies according as it is partaken of raw or boiled: thus, raw C. alone is digested in 2½ hours; raw C. with vinegar, in 2 hours; and boiled C. takes 4½ hours. Immense quantities of cabbages are used in Germany as *Sauer Kraut* (q. v.).

CABBAGE BARK. See ANDIRA.

CA'BBAGE BUTTERFLY, a name common to several species of butterfly, the larvæ of which devour the leaves of cruciferous plants, especially of the cabbage tribe, and are popularly known as cabbage-worms or kale-worms. The LARGE C. B., or Large White Garden Butterfly (*Pontia Brassicæ*, or *Pieris Brassicæ*), is one of the most common of British butterflies. It is white; the

wings tipped and spotted with black. The wings, when expanded, measure from 2½ to 3 inches across. The antennæ terminate in an ovoid club. The female lays her eggs, which are conical and bright yellow, in clusters of 20 or 30, on the leaves of the plants which are the destined food of the caterpillars.

The caterpillars, when fully grown, are about 1 inch or 1½ inch long, and are excessively voracious, eating twice their own weight of cabbage-leaf in 24 hours. When full grown, they suspend themselves by their tails, often under ledges of garden-walls, or similar projections, and are metamorphosed into shining pale-green chrysalids, spotted with black, from which the perfect insect emerges, either in the same season or after the lapse of a winter—no longer to devour cabbage-leaves, but to subsist delicately upon honey, which it sucks from flowers. See INSECTS.—The SMALL C. B., or Small Garden White Butterfly, sometimes called the TURNIP BUTTERFLY (*Pontia* or *Pieris Rapæ*), very much resembles the Large C. B., but the expanse of the wings is only about 2 inches. The eggs are laid singly on the under side of the leaves of cabbages, turnips, &c., and the caterpillars, which are of a velvety appearance, pale green, with a yellow line along the back, and a yellow dotted line on each side, sometimes appear in great numbers, and prove very destructive. They bore into the hearts of cabbages, instead of merely stripping the leaves, like those of the last species, and thus are a greater pest, even when comparatively few. The chrysalis is of a pale reddish-brown, color freckled with black.—A third species, also common in Britain, the GREEN-VEINED WHITE BUTTERFLY (*Pontia* or *Pieris Napi*), very nearly resembles the small cabbage butterfly.—The excessive multiplication of these insects is generally prevented by small birds, which devour them and their caterpillars, and by insects of the *Ichneumon* (q. v.) tribe, which lay their eggs in the caterpillars, that their own larvæ may feed on them.

CABBAGE FLY (*Anthomyia Brassicæ*), a fly of the same family with the house-fly, flesh-fly, &c., and of which the larvæ or maggots often do great injury to the roots of the cabbages, and sometimes to those of turnips. It is of the same genus with the fly generally known as the Turnip Fly (q. v.), and also with the Potato Fly (q. v.), Beet Fly (q. v.), &c. It is about one-fourth of an inch in length, and half an inch in expanse of wings; of an ash-gray color; the male having a silvery gray face, and a long black streak on the forehead; the female, a silvery white face, without any black streak; the abdomen of the male is linear, that of the female terminates conically; the eyes of the male nearly meet on the crown, those of the female are distant, with a broad black stripe between them. The larva is very similar to that of the flesh-fly—yellowish white, tapering to the head, which has two black hooks. The pupa is rust-colored and horny.

CABBAGE MOTH (*Mamestra* or *Noctua Brassicæ*), a species of moth, the caterpillar of which feeds on cabbage and turnip leaves, and is sometimes very destructive. The caterpillar is greenish-black, and changes to a brown pupa in autumn. The perfect insect is of a rich mottled-brown color, the upper wings clouded and waved with darker brown, and having pale and white spots, a yellowish line near the fringe, the fringe dotted with black and ochre, the underwings brownish and white.

CABBAGE PALM, or CABBAGE TREE, a name given in different countries to different species of Palm, the great terminal bud of which—the Palm Cabbage—is eaten like cabbage. The C. P. of the West Indies is *Areca oleracea*. The Southern States of America have also their C. P. or Cabbage Tree, otherwise called the Palmetto (*Chamærops Palmetto*). See ARECA, EUTERPE, PALM, and PALMETTO.

CA'BBALA (from Heb. *kibbel*, to receive), the received doctrine, by which is not to be understood the popularly accepted doctrine, but that inner or mystical interpretation of the Law which the Cabbalists allege that Moses received from God in the mount, and subsequently taught to Joshua, who in his turn communicated it to the seventy elders, and which has ever since been the treasure of the select Jews. Since the 12th c., the study of this secret lore has gradually resulted in a distinct school and literature, the elements of which, however, are already visible in the Macedonian epoch, and the real or historical source of which is to be found in the eastern doctrine of emanation. In Philo, in the Talmud, &c., we certainly find theologico-philosophical conceptions, which were at a later period taken up and modified; but the first book on cosmogony is *Jezirah*, a production of the 7th c., attributed to Akiba. After the second half of the 12th c., the Cabbalistic doctrines, which had at first been confined to such high themes as God and creation, began to include exegesis, ethics, and philosophy, and so became a kind of mystical religious philosophy. The numerous cabbalistic writings composed during the three subsequent centuries, professed to teach the secret or mystical sense of Holy Writ, and the principles on which it is grounded, the higher meaning of the Law, as well as the method of performing miracles, by the use of divine names and sacred incantations. The cabbalists, moreover, prepared books, which they attributed to the oldest authorities—for instance, *Sohar*, a work written in Aramaic, during the 13th c., and fathered upon Simeon-ben-Joachai, a scholar of Akiba. This became the Bible of the Cabbalistic neophytes. The chief opponents of the Cabbalists were the philosophers, and in part the Talmudists. Towards the close of the 16th c., the Cabbalistic wisdom, which by that time had degenerated into magic and word-juggling, received a new impulse from its teachers in Palestine and Italy. Since the time of Reuchlin, many Christian scholars have investigated the subject.

CABEIRI, divinities anciently worshiped in Egypt, Phœnicia, Asia Minor, and Greece. The ancients have left us very obscure notices of the C., and learned men have been unable to reach any satisfactory conclusions with regard to them and their worship. It is certain that the worship had both its mysteries and its orgies, and it appears also that the C. were amongst the inferior divinities, and regarded as dwelling upon the earth, like the Curetes, Corybantes, and Dactyles, and were probably representatives of the powers of nature.

CA'BÉS, or KHABS, GULF OF (ancient *Syrtis Minor*), an inlet of the Mediterranean Sea, lying between the islands of Kerkenna and Jerba, on the north-east coast of Africa, in lat. about 34° N., and long. from 10° to 11° E. The town of Cabes (ancient *Tacapæ*) stands at the head of the gulf.

CABET, ÉTIENNE, a notable French communist, was born at Dijon, January 2, 1788, and educated for the bar, but turned his attention to literature and politics. Under the Restoration, he was one of the leaders of the Carbonari (q. v.), and in 1831 was elected deputy for the department of Côte d'Or. Soon afterwards, he published a *History of the July Revolution* (1832), started a Radical Sunday paper, *Le Populaire* (1833), and, on account of an article in this paper, was sentenced to two years imprisonment, but escaped to London. Here he wrote brochures against the July government, and began his communistic studies. After the amnesty, 1839, he returned to Paris, and published a *History of the French Revolution* (4 vols., 1840), bestowing great praise on the old Jacobines. He attracted far more notice by his *Voyage en Icarie* (1840), a 'philosophical and social romance,' describing a communistic Utopia. The work obtained great popularity among the working-classes of Paris. C. next proceeded to turn his 'philosophical romance' into a reality, and published (1847) in his journal, *Le Populaire*, the statutes for the formation of an 'Icarian colony' on the Red River in Texas; inviting his followers to emigrate. The first division sailed on the 2d February 1848, but a short experience convinced them that Texas was anything but a Utopia. Their complaints reached Europe, but did not deter C. from embarking at the head of a second band of colonists. On his arrival, he learned that the Mormons had just been expelled from Nauvoo, in Illinois, and that their city was left deserted. The Icariens established themselves there in May 1850. C. now returned to France, to repel the accusations against his probity which had been circulated during his absence, and to obtain a reversal of the judgment which had been formerly pronounced against him, 30th September 1849. Having succeeded in this, he went back to Nauvoo, where he governed, as a sort of dictator, his petty colony, until 1856, when he was deprived of his office, and obliged to flee to St. Louis, where he died 9th December of the same year. C. was a shallow thinker, a weak ruler, and a poor writer; but his success, such as it was, is a proof of what can be accomplished by what has been termed, with more vigor than elegance, 'pig-headed perseverance.'

CABE'ZA DEL BUEY, a small town of Spain, in the province of Badajos, 86 miles east-south-east of the town of Badajos, on the north slope of the Sierra el Pedrose. The town is tolerably well built, and has a number of churches and other public buildings. Pop. 5395, engaged chiefly in the manufacture of woollen and linen cloths.

CABEZO'N DE LA SAL, a town of Spain, in the province of Valladolid, about 7 miles north-north-east of the city of that name. It is situated on the Pisuerga, and is celebrated as the scene of one of the first battles of the Peninsular campaign in which the Spaniards were signally defeated by the French. Pop. 2000.

CA'BIN is the general name for a room or apartment on shipboard. In ships of war, the living-rooms of the admirals and captains are called 'state' cabins, and are fitted up with much elegance, with a gallery or balcony projecting at the stern. The chief officers below the captain have their cabins on either side of the main-deck; while those of the subordinate commissioned officers are, in large ships, on either side of the lower or orlop deck. All the cabins of a ship of war are enclosed by light panelling, which is quickly removable when preparing for action.

CA'BINET (Ital. *gabinetto*), a small chamber set apart for some special purpose, such as the conservation of works of art, antiquities, specimens of natural objects, models, and the like. From signifying the chamber in which such collections are contained, the term C. has recently come to be employed by us, in imitation

of the French, to signify the collections themselves, and this even when they fill many rooms or galleries. It often means simply a small room appended to a larger one, when it is also called an anteroom, a retiring-room, and the like. See CLOSET.—CABINET PICTURE, a picture suited for a cabinet or small room. C. pictures are generally small in size, highly finished, and thus suited for close inspection.

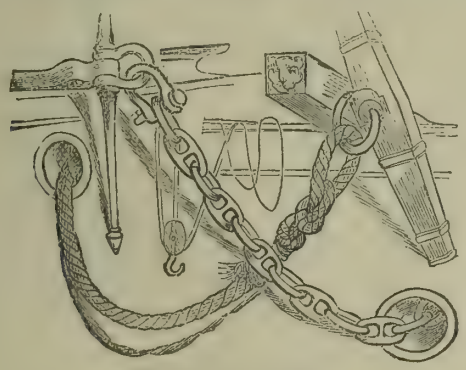
CABINET. See MINISTRY.

CA'BLE is either a large rope, or a chain of iron links, chiefly employed on shipboard to suspend and retain the anchors. Rope cables are made of the best hemp, twisted into a mass of great compactness and strength. The circumference varies from about 3 inches to 26. A certain number of yarns are twisted to form a *lissum;* three lissums are twisted in an opposite direction to form a *strand;* and three strands are twisted (in the same direction as the yarns in a lissum) to form a *cable.* The number of yarns in a C. of given size is not always alike, because the yarns slightly vary in thickness; but the following is one among many tables which have been prepared relating to cables of 120 fathoms, and of the usual degrees of thickness :

Inches. Circumference.		Yarns.		Lbs.
3	=	48	=	192
6	=	174	=	696
9	=	393	=	1572
12	=	699	=	2796
15	=	1093	=	4372
18	=	1574	=	6296
20	=	1943	=	7772

Some cables are made with four strands, but three is the common number. If a C. be twisted too much, it is stiff; if too little, it is weak. The strength of a C. of 18 inches' circumference is found to be about 60 tons; and for other dimensions, the strength varies according to the cube of the diameter. On shipboard, cables receive the names of *chief* cables, *bower* cables, &c., according to the anchor to which they are attached. During the great war ending in 1815, the largest ships in the British navy carried ten cables, most of which were about two feet, or a little more, in circumference. Although ships seldom anchor at a greater depth than 40 fathoms, it is not deemed safe to trust the anchor to one C. of the usual length; two are spliced together at the ends. The hempen cables now made are generally 101 fathoms; but 100 fathoms in practical seamanship denotes 'a cable's length,' and is really the length of a chain cable.

CHAIN CABLES are made of links, the length of each of which is generally about six diameters of the iron of which it is made, and the breadth about three and a half diameters. In government contracts, chain cables are required to be made in 12½ fathoms



Chain and Hemp Cables.

lengths, with one swivel in the middle of every alternate length, and one joining-shackle in each length. The stay-pins, to strengthen the links, are of cast iron. The bar or rod from which each link is made, has the two ends cut diagonally; it is bent into the form of a nearly complete oval ring; and then the two ends are joined and welded, the stay-pin being at the same time introduced at the proper place. Besides the ordinary links, there are end-links, joining-shackles, splicing-tails, mooring-swivels, and bending-swivels.

The sizes of chain cables are denoted by the thickness of the rod-iron selected for the links. The following table gives certain ascertained quantities concerning the cables in ordinary use:

Thickness of Iron.	Weight of Stay-pin	Weight per Fathom.	Breaking Strain.
½ inch.	½ oz.	13½ lbs.	6 tons.
1 "	3½ "	54 "	24 "
1½ "	12 "	121 "	60 "
2 "	23 "	215 "	99 "
2½ "	40 "	272 "	126 "

By the Chain Cables Act of 1871, certain bodies are licensed to erect machines for testing all chain cables and anchors ; and it is forbidden to sell or purchase, under a penalty of £50, any chain cable or any anchor weighing more than 168 lbs., which has not been duly tested. Minor alterations were introduced by a later Act (1874), leaving the main rules intact.

CABLE-MOULDING, in Architecture is a moulding cut in the form of a rope, the twisting being prominently shown. It was much used in the later Norman style.

CABLING, the moulding by which the hollow parts in the flutes of columns and pilasters in classical architecture are often partially filled. The C. seldom extends beyond a third part of the shaft from the ground.

CABO'CHED, or CABO'SSED an heraldic term, from the old French word *caboche*, the head. When the head of an animal is borne, without any part of the neck, and exhibited full in face, it is said to be caboched.

Stag's Head Caboched.

CABOO'SE, or CAMBOOSE (Danish, *kabyse*, a cook's room in a ship ; Ger. *kabuse*, a little room), is the name of the kitchen or cook-room in a merchant-ship. In coasting-vessels, the term is applied to a portable cast-iron stove on the deck, where food is cooked.

CABOT, the name of two Venetians, father and son, both celebrated as navigators and discoverers.—GIOVANNI CABOT, or CABOTTO, the father, whose business compelled him to reside much in Bristol, was appointed by Henry VII., March 5, 1496, to the command of a squadron of five vessels on a voyage of discovery in the Atlantic Ocean. In this expedition he was accompanied by his sons Ludovico, Sebastiano (born at Bristol, 1477), and Sanzio. On the 24th of June, 1497, the coast of Labrador, North America, was sighted. The merit of this discovery has been generally ascribed to the navigator's second son, Sebastian C., the most scientific of the family ; but an extract from a chart preserved by Hakluyt mentions the father before the son. The expedition returned in August 1497. In 1498, a second was made, with what results we do not know; and in 1499, a third to the Gulf of Mexico. About this time, Giovanni, the father, appears to have died, and we hear no more of *Sebastian* till 1512, when he entered the service of Ferdinand, king of Spain.

During the year 1515, he was engaged in revising maps and charts in connection with his profession, and in planning an exploration of the North-west Passage to Asia, which, however, was laid aside on account of the death of Ferdinand in 1516. C., who seems to have been no favorite with the Spanish courtiers, was now subjected to a series of contemptible insults. This usage induced him to return to England, and in 1517, he was appointed by Henry VIII. to the command of an expedition to Labrador. He reached lat. 67½° N., and entered Hudson's Bay, where he gave names to several places; but the expedition proved on the whole a failure, on account of the cowardice or malice of his vice-commandant, Sir Thomas Perte. C. now entered again into the Spanish service, was made pilot-major of the kingdom by Charles V., and commanded an expedition which examined the coast of Brazil and La Plata, which he attempted to colonize. In 1531, he returned to Spain, and resumed his old situation; but in 1548, he once more betook himself to England, where he was well received by King Edward VI., who made him Inspector of the Navy, and gave him a pension. To this monarch he seems to have explained the variation of the magnetic needle in several places, which he was among the first, if not the very first, to notice particularly. In 1553, C. was the prime mover and director of the expedition of Merchant Adventurers which opened to England an important commerce with Russia. It is not known exactly when C. died.—Memoir of Sebastian Cabot (Lond. 1831).

CABOTZ. See CUSSO.

CA'BRA (ancient *Ægabrum*), a town of Spain, in the province of Cordova, 30 miles south-east of the city of that name. C. is irregularly built between two hills, and surrounded with gardens; vineyards in the neighborhood produce excellent wine. It is chiefly agricultural; but it has manufactures of woollen, linen, hats, soap, earthenware, &c. Pop. 14,000.

CABRAL, or CABRERA, PEDRO ALVAREZ, the discoverer of Brazil, was descended from an old and patrician Portuguese family. Nothing is known of his early life, save the fact, that he must have recommended himself by talent and enterprise to King Emanuel of Portugal, who, after the first voyage of Vasco de Gama, appointed C. to the command of a fleet of 13 vessels, carrying 1200 men, and bound for the East Indies. On the 9th March 1500, he sailed from Lisbon. To avoid the inconvenience of being becalmed on the coast of Africa, he took a course too far westerly, fell into the South American current of the Atlantic, and was carried to the unknown coast of Brazil, of which he claimed possession for the king of Portugal, April 24, 1500, naming the new country 'Terra da Santa Cruz.'

After sending home one vessel to bear news of this great accidental discovery, C. sailed for India; but on the 29th of May, four of his vessels foundered, and all on board perished, including Diaz the great navigator; and soon afterwards three more vessels were lost. C. therefore landed at Mozambique, on the east coast of Africa, of which he first gave clear information, and also discovered (August 23) the Antschedives Islands, of which he described correctly the position. Hence he sailed to *Calicut*, where, having made the terror of his arms felt, he was permitted to found a factory; entered into successful negotiations with native rulers, and thus established the first commercial treaty between Portugal and India. He returned from India, bringing with him a considerable booty, and arrived in the port of Lisbon, July 31, 1501. It appears probable that the king was dissatisfied with the results of the expedition (although it had annexed Brazil to the crown of Portugal), for subsequently we find no mention made of C. among other discoverers. At the request of C., Sancho de Toar wrote a description of the coast of Sofola. C.'s voyages are described in Ramusio's *Navigatione e Viaggi*, 3 vols. (Venice, 1563; new ed., Venice, 1835).

CABRE'RA, a small island in the Mediterranean, lying off the southern point of Majorca. It is about three miles in length and breadth, with an irregular coast, and is little else than a barren calcareous rock. The only interest attached to C. is, that during the war in the Peninsula it formed a Spanish depôt for French prisoners, who were crowded in thousands into the desolate spot, and treated with great barbarity; of which an account is given in a popular work, entitled the *Adventures of a French Sergeant*.

CABRE'RA, Don Ramon, the boldest leader of the Carlist party in Spain, was born at Tortosa, in Catalonia, 31st August 1810. The death of Ferdinand, in 1833, gave the signal for a civil war, and first brought C. into notice. Placing himself at the head of some guerilla troops, he joined the Absolutists, or partisans of Don Carlos, and by his vigilance, energy, and daring soon rose to be second in command in the Maestrazgo district. Throughout Aragon and Valencia his name became a by-word for cruelty. After penetrating as far south as Andalusia, his forces were completely routed by the royal troops, on the borders of Aragon, and he himself, severely wounded, escaped with difficulty into the woods. It was now rumored that C. was dead, when all at once he reappeared at the head of 10,000 foot and 1600 horse. Invading the province of Valencia, he overthrew the royal army at Buñol, 18th February 1837, and again on the 19th March at Burjasot; but was in his turn vanquished at Torre-Blanca, and once more compelled to seek a hiding-place. Shortly after, he reopened the war with fiery energy. Madrid itself was threatened by C., who, about this time, received the title of Count of Morella for his vigorous defence of the fortress of that name, and was also appointed governor-general of Aragon, Valencia, and Murcia. The Carlists now believed that the triumph of absolutism was approaching, when the treachery of the Carlist general, Marotto, changed the whole aspect of affairs, and Don Carlos fled from Spain.

C. held out until Espartero forced him to quit the country in the summer of 1840. He then entered France, where he was taken prisoner, and confined for a short time in the fortress of Ham. In 1845, he strongly opposed Don Carlos's abdication of his rights. On the outbreak of the French revolution in 1848, he renewed the struggle on behalf of absolutism in Spain; but the adventure proved a miserable failure, and on the 17th January 1849, he recrossed the Pyrenees, to live in retirement. He afterwards married a wealthy English lady, Miss Marianne Catherine Richards. When Alphonso was proclaimed king of Spain in 1875, C. advised the Carlists to submit to him, chiefly because he was 'a good son of the church.' He died 24th May 1877.

CABU'L, a river in Afghanistan, rises in lat. 34° 21′ N., and long. 68° 20′ E., on the southern declivities of the Hindu Kush or Indian Caucasus. Its source is 8400 feet above the level of the sea; and an eastward run of 320 miles, with a fall of about 7500 feet, along North Afghanistan, through the Khyber Mountains, and across Peshawur, carries it into the Indus, opposite to Attock, in the Punjab. The point of confluence marks the head of navigation on the main stream, while the tributary itself is practicable about 50 miles upwards for craft of 40 or 50 tons. By means, therefore, of the two taken as one line, there exists an available communication of about 1000 m. between the Khyber Mountains and the Indian Ocean. The C. washes the cities of Cabul, Jelalabad, and Dobundee.

CABU'L is the name given to that part of Afghanistan (q. v.) which lies south of the Hindu Kush, and is drained by the Cabul river. It extends from the south of Ghiznee to the Hindu Kush, and from Bamian (q. v.) to the Khyber Pass. This region has long occupied a prominent position in the world. Through it, as the passage from Persia to India, Alexander the Great marched to complete his eastern conquests; from it issued Mahmoud of Ghiznee, the first Mohammedan invader of Hindustan.

The city of Cabul, from which the surrounding territory takes its name, has 60,000 inhabitants, and stands in lat. 34° 30′ N., and long. 69° 6′ E., near the point where the river, here crossed by three bridges, ceases to be fordable. Elevated about 6400 feet, and overtopped, within a short distance to the north, by pinnacles of the Hindu Kush, about 14,000 feet higher than itself, C. has a severe winter, and a temperate summer, ranging from 75° to 85° F.

The city was formerly surrounded with an earthen wall, which no longer exists. It is separated into different quarters, for defence, by stone walls—The Bala Hissar, or citadel proper, being on the E., and the Kuzzilbashes or Persians having a strongly fortified quarter on the S.W. In the days of Sultan Baber, C. was the capital of the Mogul empire. In more recent times, it has witnessed some of the most momentous events in Anglo-Indian history. In 1839, it was taken by the British: in 1841, it was lost through a treacherous outbreak, which led (6th January 1842) to the massacre of about 4000 soldiers and 12,000 followers; and, finally, after being recovered by General Pollock in the same year, it was abandoned, its bazaars and public buildings having previously been burned to the ground.

After the death of Dost Mohammed, Ameer of Afghanistan, in 1863, Shere Ali, the son whom he had selected as his heir, had to fight for the possession of C. with Afzul Khan, his elder brother, and the son of the latter, Abdulrahman. In 1866, Afzul entered C. in triumph, and was proclaimed Ameer of Afghanistan. He applied to the Indian viceroy for recognition, but the request was declined. At the death of Afzul, his brother Azim took the title of Ameer, not of Afghanistan, but of C. and Candahar. In the end of 1868, Shere Ali, aided by his son Yakoob, obtained possession of C., which became again the capital of Afghanistan. War was declared against Shere Ali by England in 1878. In the treaty concluded in 1879 by Yakoob, now by the death of his father Ameer, it was agreed that an English resident should be admitted to C.; and in July 1879, Sir Louis Cavagnari was established in the capital. But in September he, his suite, and escort were assassinated; war re-commenced; and a month later C. was occupied by English troops, who remained there till August 1880. Meanwhile Yakoob, a fugitive under English protection, had abdicated his sovereignity; and Abdulrahman (or Abdurrahman), son of Afzul, was recognized as Ameer.

CACA'O. See Cocoa.

CACCA'MO, a town in the province of Palermo, Sicily, about 6 miles south-west of Termini, with a population of 7200.

CA'CERES, the capital of the Spanish province of Caceres, lies 18 miles south of the Tagus. It is famous for its bacon; has some manufactures of linen, woollens, leather, and a large trade in the produce of the district. It is the *Castra Cecilia* of the Romans, and many relics of its antiquity have been found. Pop. 14,000.

CA'CERES, Nueva, a town of the Philippines in the province of South Camarines, on the south-east coast of the island of Luzon. Pop. 12,000.

CACHA'O, capital of the province of Tonquin, and the largest city of the kingdom of Anam (q. v.), having an estimated population of 100,000. It stands about 100 miles from the sea, on the Tonquin River, which is thus far navigable for small-craft. It has a considerable trade, sufficient to have at one time attracted English and Dutch factories. The exports are bullion, silks, and lackered ware; and the imports are pepper, arms, long cloths, chintzes, and manufactured goods generally. The port is open to all nations.

CACHA'R, or HAIRU'MBO, a district of British India, since 1874 included in the chief-commissionership of Assam, between 24°—26° N. lat., and 92°—93° 30′ E. long. With an area of 1285 sq. m., it contained, in 1871, 205,027 inhabitants. It is mostly mountainous and uncultivated. Its principal river is the Barak, which, after a singularly tortuous course of 350 miles, enters the Brahmaputra about 40 miles above Dacca. The territory produces rice, cotton, tea, sugar, timber, bamboo, iron-ore, wax, and ivory; and imports salt, cloths, tobacco, and ghee or half-liquid butter.

CACHE (Fr. a lurking-hole), the name given by parties of travelers in the great western prairies of the United States to places for concealing provisions and other articles. Designing to return on their tracks after crossing the Rocky Mountains, they disburden themselves of what articles can be spared, and to conceal them from the Indians, construct places of deposit in the wilderness. The making of a C., is a matter of much labor and ingenuity. A hole is dug to a depth of perhaps six or eight feet and several feet broad, and then the articles being interred, the surface is replaced with the utmost possible care. The excavated earth is also carefully removed, so as to leave no trace whatever of the excavation.

The situation of the C., however, is known to the party by some landmark, and returning months afterwards, they probably find its contents undisturbed.

CACHET, LETTRES DE. See LETTRES DE CACHET.

CACHE'XIA, a name applied by physicians sometimes to a group of diseases, and sometimes to the constitutional state accompanying a particular disease—e. g., Cancerous C., Gouty C., Mercurial Cachexia. The word is derived from the Greek *kakos*, bad, and *hexis*, a habit, and signifies simply *a bad habit of body*, without reference to the cause of illness. From Cullen's having in modern times given extensive circulation to the word, as indicating a large group of chronic diseases, in most of which there are complicated changes in the blood and in the solid textures, C. has come to be chiefly employed with reference to diseases in which the general nutrition of the body is at fault, and in which the local disorders are supposed to be the result of a constitutional cause. Thus, Cancerous C. indicates the peculiar impoverished state of the blood and general debility which are associated with the deposits of cancer in various parts of the body; Gouty C., the state of the general system in gout, as opposed to the mere local attack of gout in the foot, &c. The cachexiæ differ from the fevers in being much slower in development, and, for the most part, in having no natural termination at a fixed period. See CRISIS.

CA'CHOLONG, a beautiful mineral, regarded as a variety of Opal (q. v.). It is sometimes called Pearl Opal, or Mother-of-pearl Opal. It is generally of a milk-white color, rarely with a yellowish or reddish tinge, opaque and dull or pearly and shining, and has a flat conchoidal fracture. Among the localities in which C. is found are the Giants' Causeway and the Faröe Islands.

CA'CHOLOT, CACHALOT, SPERMACETI WHALE, or SPERM WHALE (*Physeter macrocephalus* or *Catodon macrocephalus*), one of the largest of the *Cetacea* (q. v.), very peculiar in form and appearance, much sought after not only on account of the oil, but still more on account of the Spermaceti (q. v.) which it yields. Ambergris (q. v.) is also obtained from it. The C. belongs to the family of *Cetacea* called *Physeteridæ*, or *Catodontidæ*, of which some naturalists still think that there is only one well-ascertained species. There appears, however, to be pretty good reason for thinking that at least two species exist, both of which are occasional visitants of the British shores—the Common C. having no dorsal fin, and the High-finned C. (*Physeter Tursio*), having a very high dorsal fin. The Common C. has a very wide geographical range. It may almost be said to inhabit all seas, although it is most abundant in those of the southern hemisphere. It is not of frequent occurrence on the European shores, although it sometime enters the Mediterranean, and is occasionally stranded on the coasts of Britain. An individual, fifty-four feet long and thirty in circumference, ran ashore on Cramond Island in the Firth of Forth in 1769, and was very particularly described in the Philosophical Transactions by Mr. Robertson of Edinburgh. Twelve were caught at Walderwich, on the Suffolk coast, in 1788. The C. sometimes reaches the length of seventy or eighty feet. The head is enormously large, forming about one-half of the entire bulk of the animal, and occupying more than one-third of the entire length. From the head, the body tapers to the tail, and at last rather rapidly. The general color is very dark gray, nearly black on the upper parts, lighter beneath. Old males, or, in the language of the South Sea whalers, old bull-whales, usually have a large gray spot on the front of the head.

The muzzle is very obtuse, almost as if suddenly cut off in front, the breadth of it almost equalling the thickness of the body. In a protuberance on the upper part of it, is the blow-hole, which is single, situated a little on the left side, and in form not unlike

Cacholot, or Sperm Whale.

the letter S. elongated. The mouth is very large and wide; and the throat, unlike that of the Greenland whale, is very wide, sufficiently so to admit the body of a man. The upper jaw projects some feet beyond the lower, but is destitute both of teeth and whalebone; the lower jaw has from 20 to 25 teeth on each side, according to the age of the animal. The teeth are conical and slightly recurved, projecting about two inches from the gum. The lower jaw is extremely narrow, the two branches being in contact throughout the greater part of its length: it fits into a groove in the upper, in which are cavities for the teeth. The eyes are small, and placed far back in the head, above the angles of the mouth; the left eye is said to be smaller than the right. Just above the eyes, the dorsal line rises considerably; the dorsal fin is also represented by a protuberance about half-way between the neck and the tail; and these parts are seen above water in the ordinary swimming of the animal, which is at the rate of from 3 to 7 miles an hour, and just under the surface of the water, although when alarmed it swims with greater velocity, striking the water upward and downward with its tail with great force. The pectoral fins are small, and seem scarcely if at all to aid in progression, which is accomplished by the large and powerful tail-fin. The tail-fin is very broad, and is divided into two lobes, called by South Sea whalers *the flukes*.

The enormous head of the C. is in great part occupied by a cavity in front of and above the skull, called by whalers *the case*, which is a receptacle for spermaceti (q. v.). This substance being light, it is not wonderful that the animal in swimming raises its head above the surface of the water, which it also often does even when at rest, 'like a black rock in the ocean.' The *case* frequently holds as much as ten large barrels of spermaceti. It is not formed of bone, but of a strong tendinous integument, and is divided into compartments communicating with each other. The substance which it contains is in a semi-fluid state, but hardens on cooling; it consists of spermaceti and oil; the oil is separated by draining and squeezing, and the spermaceti further purified, till, instead of being a yellow unctuous mass, in which state it is brought home by the whalers, it assumes a beautiful pearly white, flaky, almost crystalline appearance. When the spermaceti whale is killed, and towed alongside the whaling-ship, the *case* is emptied of its valuable contents through a hole made in front of the muzzle, and by means of a bucket attached to a pole. The spermaceti was at one time imagined to be the brain of the whale; what purpose it serves in the animal economy, is not well known, except that already alluded to of giving buoyancy to the forepart of the huge body; and perhaps this is its chief use, respiration even more than progression depending on it; but it is distinct enough from the brain, which is comparatively very small, and is indeed, as well as the skull which contains it, small in proportion to the whole bulk of the creature. Cavities filled with spermaceti are distributed over the body, and even ramify through the external fat or blubber, although the principal mass is in the head. The blubber of the C. is not nearly equal in thickness to that of the Greenland whale, being only about fourteen inches thick on the breast of a large whale, and from eight to eleven inches on other parts of the body. It is called by whalers the *blanket*, is removed from the body of the captured whale in great strips, and is heated in large pots, the skin of the whale serving for fuel, when the oil known as SPERM OIL (q. v.) flows from it. The *junk*, a thick elastic mass, which occupies the forepart of the head, immediately under the *case*, yields also a considerable quantity of sperm oil.

The C. feeds upon fishes and cephalopodous mollusks. Squids and cuttle-fishes appear to be its chief food. It is gregarious in its habits and the herds are called *schools* by whalers. Five hundred or more have been seen in a single herd. Large herds generally consist of females, with only a few males; herds of young males also occur; when solitary individuals are met with, they are almost always old males. Terrible conflicts often take place among the males, and it is not unusual to find the lower jaw deformed in consequence of having been dislocated or broken in them. See WHALE-FISHERY.

CACI'QUE, or CAZI'QUE, the designation given to the chiefs of Indian tribes in works relating to the central and southern parts of America. The word was derived by the Spaniards from the language of the former inhabitants of St. Domingo.

CACODÆ'MON. See DEMON.

CA'CODYLE, or KA'KODYLE, is an organic substance containing carbon, hydrogen, and arsenic (C_4H_6As). It has been proposed to employ the oxide of C. (C_4H_6AsO) as a deadly agent in war. This compound, otherwise known as *Cadet's fuming liquor* or *alkarsine*, has the remarkable property of taking fire spontaneously when exposed to the air, and evolving abundant fumes of arsenic. Thus, a shell filled with it would, on bursting, saturate a space of ground, or the rigging or deck of a man-of-war, with a liquid which would quickly take fire of its own accord, and besides causing destruction by burning, would likewise spread death by its fumes.

CACO'NGO, or MALLE'MBA, an independent state of South Guinea, Africa, extending along the South Atlantic Ocean, in lat. 5° S., and stretching south-east as far as the river Bell. Its limits interiorly are not well defined. The country is generally flat,

and the soil fertile. The principal towns are Kinguele, and Cacongo and Mallemba on the coast, the last once a great mart for slaves.

CA'CTEÆ, or CACTA'CEÆ, a natural order of exogenous plants, consisting of succulent shrubs of very singular appearance. Linnæus included all the C. in the single genus *Cactus*, which is now divided into a number of genera; the name *Cactus*, however, still continuing in popular use, common to the whole order. Nearly 500 species are known, but the real number is probably much greater. The C. are, without exception, natives of America, and their extraordinary forms constitute a remarkable feature in the vegetation of its warmer regions. All of them have fleshy stems, either simple or branched, often very soft and juicy; but in many, at least when old, having an easily distinguished woody axis, composed of annual rings, and covered with a layer of inner bark so that the thick fleshy part may be regarded only as a layer of bark.

Most of them are leafless; the *Pereskiæ* alone have true leaves, which are fleshy; and the *Opuntiæ* have rudimentary leaves, which soon fall off; but, instead of leaves, most of the order have clusters of hairs or prickles, where buds are formed in their stems, and these are very numerous, even in the species which in ordinary circumstances most rarely develop branches. The multiplicity of curious forms exceeds imagination; in many species (*Melocactidæ*, or Melon Thistles), the stem swells out into a globe; in others (*Torch Thistles*), it rises up as a column with many angles; in others (*Opuntiæ*, Indian Figs, or Prickly Pears), it divides in leaf-like articulations; in some (*Pereskiæ*) it assumes a tree-like form, in which the thick stem bears a head of branches, and reaches a considerable height, sometimes even 30 or 40 feet. Those which have angular, ribbed, and channelled, or flat and two-edged stems, show a tendency to the cylindrical form as the stem advances in age. Some species have long creeping or trailing stems. The whole organization of the C. adapts them for the endurance of long droughts; they vegetate vigorously during a part of the year, and then rest; the very absence of leaves concurring with the absence of pores or *stomata* in their tough skin to enable them to resist the action of a dry atmosphere and powerful sunshine, and to occupy arid soils and bare rocks, on which they are very generally found, often covering large tracts. Some of them grow rapidly on old lavas, and disintegrate them by their penetrating roots, thus preparing a soil for other plants; and the Prickly Pear is often planted in Sicily by the mere insertion of a branch or joint of it in a fissure of lava. Many species occur as *epiphytes* (q. v.) on the trees of American forests.

Some also grow on high mountains, a few even reaching almost to the border of the snow. The plants of this order are a great boon to the regions in which they chiefly abound, which are, at least during great part of the year, very destitute of water; their stems containing a store of insipid and wholesome juice, of which both men and cattle avail themselves.—Some species, as the Prickly Pear (q. v.), produce a pleasant fruit.—The fruit of *Opuntia Tuna* affords a valuable pigment of the richest carmine color.

Melon Cactus, or Thistle (*Melocactus*).

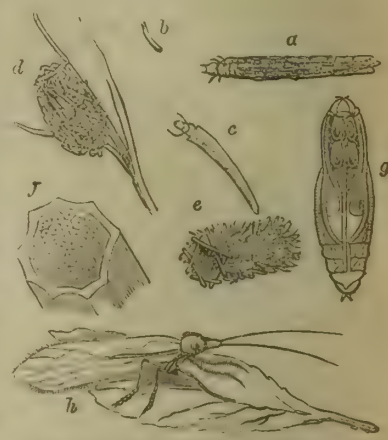
Cochineal or Nopal Cactus (*Opuntia Cochinilifera*), with Cochineal Insects.

The flowers of the C. are in general very short-lived; those of some night-flowering species, as of *Cereus grandiflorus*, well known in our hothouses, endure only for part of a single night. In the greater number, they are large and splendidly colored, in some they are very fragrant. The order is regarded as botanically allied to *Mesembryaceæ* (q. v.) and to *Grossulariaceæ* (q. v., Gooseberry, Currant, &c.).

The cultivation of C. in green-houses and hothouses has been much in fashion for more than 30 years. The gardener must imitate the natural conditions of their growth, by giving water freely during a few months, and withholding it almost entirely during the rest of the year. Most of them are easily propagated by branches, taken off, and allowed to dry a little before being planted. The *Melocactidæ*, which do not readily produce branches, are made to do so by cutting off or burning out the central bud, that the means of propagating them may be obtained.

CADA'MBA, or KUDUMBA, the wood of several species of *Nauclea*, a genus of trees of the natural order *Cinchonaceæ*, natives of the East Indies, having flowers with a funnel-shaped corolla. *N. cadamba* is a noble tree with orange-colored fragrant flowers, collected in heads about the size of a small apple. The leaves are from six to ten inches long. The wood is yellow, soft, and fine-grained. The tree is highly prized for the shade which it affords; the wood is used for various purposes. *N. cordifolia* is a large tree, plentiful in mountainous districts of Hindustan; the wood yellow, close-grained, and used for flooring-planks, packing-boxes, and many other purposes, as is also that of *N. parviflora*. All kinds of C. wood are, however, liable to be injured by moisture, and can only be used where they are to be kept dry.

CA'DDICE, or CA'DDICE-FLY (*Phryganea*), a Linnæan genus of insects of the order *Neuroptera*, a family in subsequent entomological systems, and constituted by Mr. Kirby into a distinct order, *Trichoptera* (Gr. hairy-winged). The caddice-flies certainly differ in important particulars from the other neuropterous insects, and exhibit points of resemblance to the *Lepidoptera*. They have no mandibles, and the maxillæ and lower lip are membranous and united; the head is small with prominent eyes, and two additional small simple eyes, situated on the forehead; the antennæ are long and bristle-like, composed of very numerous indistinct joints. Both wings and body are generally very hairy, and the wings, when at rest, are raised, and meet above the back like those of butterflies, from which, however, they differ very much in form, being much more elongate: the legs are long. Caddice-flies are extremely active, particularly in the evening and at night, when the smaller species often fly in great numbers above streams and ponds.



Various shapes of Caddice Cases, and perfect Insect:
a, case of bark; *b*, case of sand; *c*, case of sand, magnified; *d*, case of grass stems; *e*, case of grass; *f*, orifice of case, showing the silk grating, magnified; *g*, pupa; *h*, stone, or caddice-fly.

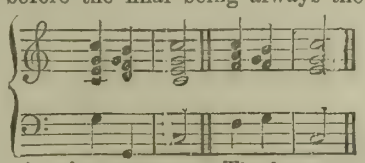
These insects are most interesting, however, on account of their larvæ, of which the larger kinds are the well-known *Caddice-worms*, or *Cad-bait* of anglers. They are of a long, almost cylindrical form, the head and first three segments hard, the remainder—the abdominal segments—soft. To the thoracic segments are attached the feet, six in number, as in the perfect insect. The larva lives always in the water, feeding on aquatic vegetables. It spins by its mouth silken threads, by means of which, together with a viscid substance, it attaches together—and often in a very symmetrical manner, and with interesting peculiarities which differ in the different species—small hard substances, such as small stones, bits of stick, or small shells, even although they happen to contain living inmates, and thus constructs a case for itself, in which its soft body is protected, and from which only the head and hard thoracic segments are voluntarily protruded. When it changes into the pupa state, in which it differs little from the perfect insect, except in the imperfectly developed wings, it fixes its case to some solid substance beneath the water, and closes the two extremities with a kind of grating, which admits the free passage of water, necessary for respiration. Before assuming the perfect form, the pupa of the larger species breaks out of its case by means of a pair of hooks on the forepart of the head, and swims actively by means of the hind legs, or crawls by the other two pair. Many of the smaller species bring their pupa case to the surface of the water, and there take wing from it as from a boat. The species of caddice-fly are very numerous, and they are said to be more so in the north than in the south of Europe. About 200 British species have been described.—The angler looks for cad-bait about the edges of streams and under stones, or on the stalks of water-

cresses, and other aquatic plants. As a bait for angling, the caddice is almost as deadly as the May-fly, and more so, in clear running steams, than the ordinary worm; the usual-sized bait-hook is used, upon which two of the baits are fixed, the angler proceeding exactly as in ordinary worm-fishing.

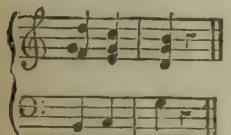
CADE, JACK, a historical character, leader of an insurrection which broke out in Kent, June 1450. Little is known of his personal history, further than that he was an Irishman and an illegitimate relation of the Duke of York, and hence called himself Mortimer. With 15,000 or 20,000 armed men of Kent, C. marched on London, and encamped at Blackheath, whence he kept up a correspondence with the citizens, many of whom were favorable to his enterprise. The court sent to inquire why the good men of Kent had left their homes; C., in a paper entitled 'The Complaint of the Commons of Kent,' replied that the people were robbed of their goods for the king's use; that mean and corrupt persons, who plundered and oppressed the commons, fill the high offices at court; that it was 'noised that the king's lands in France had been aliened;' that misgovernment had banished justice and prosperity from the land; and that the men of Kent were especially ill-treated and over-taxed, and that the free election of knights of their shire had been hindered. In another paper, called 'The Requests by the Captain of the Great Assembly in Kent,' C. demanded that the king should resume the grants of the crown, which he complained the creatures about the royal person fattened on, the king thus being compelled to live on taxation; that the false progeny of the Duke of Suffolk should be dismissed; and that the Duke of York and others should be restored to favor, and a number of persons punished. The court sent its answer in the form of an army, before which C. retreated to Sevenoaks, where he awaited the attack of a detachment, which he defeated. The royal army now objected to fight against their countrymen; the court made some concessions, and C. entered London on the 3d July. For two days, he maintained the strictest order; but he forced the mayor and judges to pass judgment upon Lord Say, one of the king's hated favorites, whose head C.'s men immediately cut off in Cheapside. On the third day, some houses were plundered, the leader himself, it is said, setting the example. C., who at night lodged his army in the Borough, got news that the citizens intended to prevent his entrance into the city on the morrow, and in the night he made an attack on the bridge, but was defeated. A promise of pardon now sowed dissension among his followers, who dispersed, and a price was set upon C.'s head. He attempted to reach the Sussex coast, but was followed by an esquire, named Alexander Iden, who fought and killed him, July 11. His head was stuck upon London Bridge, as a terror to traitors.

CADE'LLE (*Trogosita Mauritanica* or *caraboides*), an insect sometimes found in granaries in Britain, but seemingly imported from more southerly countries, where, as in France, its larvæ often commit great ravages among stored corn. They also live on bread, almonds, and even rotten wood. When full grown, they are about three-quarters of an inch long, flattened, fleshy, rough with scattered hairs, whitish, tapering towards the head; which is black, horny, and furnished with two curved jaws. The perfect insect is a glossy beetle of a deep chestnut color, marked with dotted lines. It belongs to the family of *Xylophagi*, of the order *Coleoptera* (q. v.), section *Tetramera*. The name C. is French.

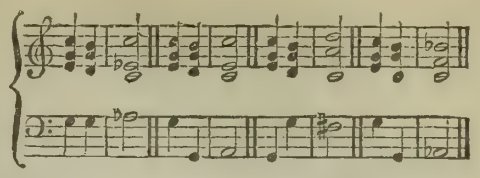
CA'DENCE, in Music, is the finish of a phrase (in German, *Schluszfall*), of which there are three principal species—viz., the whole, the half, and the interrupted cadence. The whole C., which finishes on the harmony of the tonic, is also called the perfect C., and is always used at the end of a composition, and frequently called the final cadence. In its most perfect use, it consists of three chords—the one before the final being always the dominant, as for example:



The half C., also called the imperfect C., is used to mark the termination of an idea or phrase, like the colon and semicolon; showing a considerable division, but at the same time that a continuation is necessary. The harmony of the half C. is the reverse of the whole C., as it falls from the tonic to the dominant, and sometimes to the subdominant, as follows:



In the interrupted C., (Ger. *Trugschulsz*; Ital. *Cadenza d'inganno*), the preparation for the ordinary perfect C. is made; but instead of the harmony of the tonic following the dominant, another harmony quite strange is introduced, so that the ear is deceived. The more particular the preparation for the usual C. is made, the more strange and unexpected is the interruption, which can be made in so many ways that Reicha, in his *Traité de Haute composition Musicale*, gives 129 interrupted cadences. The following are those generally in use:



CA'DENCY (from Lat. *cado*, to fall or decline). The marks by which the shields of the younger members of families are distinguished from those of the elder, and from each other, is an extensive, and, in so far as that term can be applied to heraldry at all, an important branch of the science. No distinction is usually made by writers on heraldry, and probably the practice of heralds in general scarcely admits of any being made, between *marks of C.*, *differences*, *distinctions*, or even *brisures*, though the last term is pretty constantly, and quite appropriately used to include not only differences in general, but also abatements (q. v.), or bearings by which the arms of the family are broken or diminished. See BASTARD BAR. But there is a manifest convenience in the practice which is usually followed in Scotland, of appropriating the label, the crescent, the mullet, and the rest of the series of marks, commonly known as marks of C., to the purpose of distinguishing the sons from the father, and from each other, during the father's lifetime; and of adopting other distinctions—such as the bordeur of various kinds, the chief engrailed, embattled, and the like, as differences between the coats of brothers, after the death of their father, and of the houses descended from them. Another very common mode of differencing the shields of brothers in early times, was by changing the tinctures; but this is now regarded as too extensive a change for such a purpose. The method of differencing by means of the ordinary marks of C. will be understood from the accompanying illustration. Fanciful reasons have been imagined by heralds for assigning these different marks to the different sons.

Distinction of Houses:

In the First House, the first, second, &c., sons are denoted by 1, the label; 2, the crescent; 3, the mullet; 4, the martlet; 5, the annulet; 6, the fleur-de-lis; 7, the rose (not figured in the cut); 8, the cross moline; 9, the double quatrefoil. In the Second House, or family of the second son, the first son is denoted by (1) the crescent, with the label upon it; the second, by (2) the crescent, with the crescent upon it; and so on. In the Third House, or family of the third son, the first son is denoted by the mullet, with the label upon it; the second, by the mullet, with the crescent upon it; and so on.

The differences at present used by the royal family will be found in most of the peerages. The rule with regard to them seems to be that, unlike subjects, they all bear the label of three points argent; but the label of the Prince of Wales is plain, whilst those of the other princes and princesses are charged with crosses, fleurs-de-lis, hearts, or other figures, for the sake of distinction. One of the most frequent reasons for matriculating the arms of the younger branches of families of distinction in the Lord Lyon's Register, is that they may be properly distinguished from those borne by the head of the house.

CADE'NZA, in Music, an ornamental succession of notes introduced at pleasure by the performer at the finishing of a phrase.

CA'DER I'DRIS (Chair of Idris, a reputed giant), a picturesque mountain in Merionethshire, Wales, 5 miles south-south-west of Dolgelly. It consists of an immense ridge of broken precipices, 10 miles long, and 1 to 3 miles broad; the highest peak reaching an elevation of 2914 feet. It is composed of basalt, porphyry, and other trap rocks, with beds of slag and pumice. The view from the summit, which is very extensive, includes the Wrekin in Shropshire, and St. George's Channel almost to the Irish coast.

CADE'T, MILITARY (Fr. *cadet*, younger, junior in service—allied in derivation and meaning to cadency (q. v.) in heraldry), is a term applied in a general sense to a junior member of a noble family as distinguished from the eldest; and in France, any officer junior to another is a C. in respect to him. In a strict military sense, however, a C. is a youth studying for the public service.

In England, military cadetship has presented two aspects, according as it is related to the East India Company's or to the royal service. When the Company possessed political and military authority in India, there were about 5000 English officers in their pay. Those who commanded the Company's own regiments had been professionally educated by the Company. A youth, nominated by the directors, was examined as to his proficiency in an ordinary English education, and admitted between the ages of 14 and 18 to Addiscombe School or College, near Croydon. If a probation of six months resulted satisfactorily, he entered upon a two years' course of study. If he passed through this ordeal well he became a *C.* in the Company's service, receiving pay or salary, and being available for service in India, as opportunity might offer.

The system of Indian cadetship underwent various modifications by the introduction of competition in the appointments, and by the transference of the Company's powers to the Crown; and ceased in 1861, when the accession of fresh officers to the local Indian armies was stopped.

The second aspect of military cadetship in England, adverted to above, is that of the Royal or Queen's cadets. The arrangements in operation until recently will be found noticed under SANDHURST COLLEGE; and the present arrangements are given under STAFF COLLEGE, and MILITARY ACADEMY ROYAL.

CADE'T, NAVAL, is the lowest grade of officer in the royal navy. The cadets enter the royal service at 12 to 13½ years of age. Every captain, on being appointed to a ship in commission, is allowed to nominate one C.; every flag-officer (admiral, &c.), two, on hoisting his flag; each member of the Board of Admiralty, four; the two secretaries, two each; and all the rest are nominated by the First Lord of the Admiralty. The candidates are examined at the Royal Naval College at Greenwich; if they pass, they are sent for two years to the *Britannia* training-ship at Dartmouth, which is virtually a public school, for tuition in which the C.'s parent or guardian pays £70 a year. If they do not progress sufficiently in the training-ship, they are rejected; but if the report is favorable, they are put into sea-going ships. While on board, the C. is expected to watch and learn as much as possible of what is going on—saluting officers, tying knots, splicing ropes, arranging rigging, learning technical terms, going aloft, keeping the log, keeping watch, &c. If he pass from the *Britannia* with a first-class certificate, he becomes a midshipman at once; otherwise, according to the progress he makes. Cadets mess with the midshipmen on shipboard. There were 191 cadets on the navy estimates for 1878—1879, receiving each a shilling a day as pay or pocket-money.

CADETS' COLLEGE A college with this designation was established in 1858 by a remodelling of the Junior Department of the Royal Military College at Sandhurst. Its objects were, to give a sound military education to youths intended for the army, and to facilitate the obtaining of commissions when the education was finished. The age of admission was between 16 and 19. The friends of a youth, able to pay the sums of money presently to be named, applied to the commander-in-chief for permission to place the youth on the list of candidates; this permission was usually granted on production of satisfactory certificates and references. The youth might go up for examination on any half-year. The list of subjects included English composition, continental languages, mathematics, history, geography, natural sciences, experimental sciences, and drawing. After the examination, the candidates were reported to the commander-in-chief in their order of merit. Those who had the most marks were admitted as cadets as soon as vacancies occurred in the college. When entered, they studied for two years on a great variety of subjects connected with military science and practice. The friends supplied clothing, books, and instruments. The annual payment for education, board, and lodging varied from £100 per annum down to £20; the highest sum being demanded for 'the sons of private gentlemen,' while the lowest was deemed sufficient for 'the sons of officers of the army or navy who had died in the service, and whose families were proved to be left in pecuniary distress.' Twenty of the youths were 'Queen's cadets,' sons of officers 'who had fallen in action, or had died from the effects of active service, and had left their families in reduced circumstances.' Those 20 cadets were admitted and educated gratuitously. This system was abolished in 1870. Sub-lieutenants of cavalry and infantry, styled 'student officers,' who have done duty with a regiment for about 12 months, are now required to attend the college at Sandhurst, and go through a course of study for a year. At the end of it, on passing a satisfactory examination, they are promoted to the rank of lieutenant, and rejoin their regiments. See also MILITARY ACADEMY, ROYAL.

CADET'S FUMING LIQUOR. See CACODYLE.

CA'DI, an Arabic word signifying a judge or person learned in the law, the title of an inferior judge amongst the Mohammedan nations, who like the Mollah (q. v.), or superior judge, must be chosen from the higher ranks of the priesthood, as all law is founded upon the Koran.

CA'DIZ (ancient *Gades*), an important commercial city of Spain, capital of the modern province of the same name, which forms a part of the great division of Andalusia; is situated at the extremity of the long narrow isthmus of the Isle of Leon, in lat. 36° 32′ N., and long. 6° 17′ W. The Atlantic Ocean washes its western and part of its southern side, and on the north and north-east it is enclosed by the Bay of Cadiz, a deep inlet of the Atlantic, forming an outer and an inner bay. Connected by only a narrow strip of ground (in some places not above 200 yards across) with the mainland, C. is admirably situated for defence; but though it has several sea and land fortifications, these are by no means considered impregnable. The town, which is surrounded by walls, forms nearly a square, each side being about a mile and a half in length.

The houses being built of white stone, the city presents a remarkably bright and clean appearance from the sea. The streets are well paved and lighted, regular, but narrow, and there are some pleasant public walks, the most frequented of which is the Alameda. It has few public buildings of note; its two cathedrals are, on the whole, but poor specimens of ecclesiastical architecture, and its pictures, with the exception of one or two excellent pieces by Murillo, are of little value. C. declined greatly as a commercial city after the emancipation of the Spanish colonies in South America; but owing partly to the recent extension of the railway system in Spain, and partly to the establishment of some new lines of steamers, the trade has, within the last thirty years, revived considerably. Quite lately again there has been serious depression. In 1873, the total imports of C. were valued at £2,100,729; in 1876, at £1,908,166: in 1873, the exports were worth £3,941,095; and in 1876, only £1,908,166. The number of Spanish ships which entered C. in 1874 was 2677, with a tonnage of 315,333; of foreign ships, 962—tonnage, 300,730. The exports consist of wine, olive-oil, fruits, salt, and metals. The manufactures are glass, woolen cloth, soap, hats, leather, &c. Pop. (1879) 68,000.

C. is one of the most ancient towns in Europe, having been built by the Phœnicians, under the name of Gaddir, 347 years before the foundation of Rome, or about 1100 B.C. It afterwards passed into the hands of the Carthaginians, from whom it was captured by the Romans, who named it Gades, and under them it soon became a city of vast wealth and importance. Occupied afterwards by the Goths and Moors, it was taken by the Spaniards in 1262. In 1587, Drake destroyed the Spanish fleet in the bay; nine years later, it was pillaged and burned by Lord Essex; and in 1625 and 1702, it was unsuccessfully attacked by other English forces. After the revolution of 1808, C. became the headquarters of the insurrectionary junta, by whose orders it was separated from the mainland. The French, in February 1810, commenced a blockade, which they vigorously persevered in, capturing several of the forts, until August 25, 1812, when the victories of the Duke of Wellington forced them to abandon it. The city was besieged and taken by the French in 1823, and held by them until 1828. In the Spanish revolution of 1868, C. played a distinguished part.

CA'DMIA is the term applied to the crust formed in zinc furnaces, and which contains from 10 to 20 per cent. of cadmium.

CA'DMIUM is a metal which occurs in zinc ores, and, being more volatile than zinc, rises in vapor, and distils over with the first portions of the metal. See ZINC. C. is represented by the symbol Cd, has the atomic weight 56—new system, 112—and the specific gravity 8·6. It is a white metal, somewhat resembling tin; is malleable and ductile; fuses at 442° F., and rises in vapor a little above 600°. It is rarely prepared pure, and is not employed in the arts as a metal, though one or more of its salts have been serviceable in medicine. The sulphide of C., CdS, occurs naturally as the mineral *Greenockite*, and when prepared artificially, is of a bright yellow color. It is known as CADMIUM YELLOW, and is of great value to the artist.

A great variety of tints are produced by mixing it with white-lead. Much of what is sold as Naples Yellow (q. v.) is thus prepared; but the genuine Naples Yellow has a greenish tint, which renders it easily distinguishable from the imitation. Cadmium Yellow, however, has many valuable qualities, which are causing it rapidly to supersede Naples Yellow.

CA'DMUS (according to Apollodorus and others) was the son of Agenor and Telephassa, and the brother of Europa. When the latter was carried off by Zeus, he and his brothers, as also their mother, were sent in quest of her, with injunctions from Agenor not to return without her. Their search was vain, and the oracle at Delphi told C. to relinquish it, and to follow a cow of a certain kind which he should meet, and build a city where it should lie down. He found the cow in Phocis, followed her to Bœtia, and built there the city of Thebes, about 1550 B.C. The myth of C., however, like other early Greek myths, abounds in contradictions, and it is wholly impossible to disentangle the historical facts from the meshes of fable in which they are imprisoned. To him is ascribed the introduction into Greece of an al-

phabet of 16 letters, derived from Egypt or Phœnicia, and the discovery of brass, or introduction of its use.

CADOUDAL, GEORGE, a distinguished leader in the Chouan or Royalist war in Brittany, was born near Auray, in Lower Brittany, where his father was a miller, in 1771. He was among the first to take up arms against the Republic, and soon acquired great influence over the peasants. Captured in 1794, he was sent as a prisoner to Brest, from which he soon made his escape, imprisonment having only increased his loyal ardor. Annoyed at the dissensions between the Vendean generals and the emigrant officers, and the disasters consequent thereon, C. organized an army in which no noble was permitted to command, and which Hoche, with all his great military talents, was unable to subdue or disperse. In 1799, C. was the soul of the conspiracy to overthrow the First Consul, and place a Bourbon on the throne; but the events of the 18th Brumaire disarranged the plans of the conspirators. Bonaparte recognized C.'s energy and force of character, and offered to make him a lieutenant-general in his army, which offer C. refused, as well as another of a pension of a hundred thousand francs, if he would only consent to remain quiet. Bonaparte attempted to arrest him, but he fled to England, where, in 1802, he conspired with Pichegru for the overthrow of the First Consul. With this design he went to Paris, but was arrested, condemned, and executed June 25, 1804. C. was a man of stern honesty and indomitable resolution. 'His mind was cast in the true mould; in my hands he would have done great things,' was Napoleon's estimate of him.

CADU'CEUS, the winged staff of Mercury, or Hermes, as he was called by the Greeks, which was supposed to give the god power to fly. The C. in the actual world was the staff or mace carried by heralds and ambassadors, from which circumstance, no doubt, it came to form one of the attributes of the messenger of the gods. Originally, it was simply an olive-branch, the stems of which were afterwards formed into snakes, in accordance with several poetical tales invented by the mythologists. One of these was to the effect that Mercury, having found two snakes fighting, divided them with his rod, and that thus they came to be used as an emblem of peace. Many miraculous virtues were ascribed to the caduceus. On the coinage of antiquity, the C. is often given to Mars, who holds it in the left hand, a spear being in his right, to show how peace and war alternate. It is also seen in the hands of Hercules, Bacchus, Ceres, Venus, &c. Amongst the moderns, the C. is used as an emblem of commerce, over which Mercury was the presiding divinity.

Caduceus.

CÆCI'LIA (Lat. *cæcus*, blind), a genus of reptiles, formerly placed among serpents, on account of their form, although, in their anatomical structure, peculiarities were observed allying them to Batrachians, with which they are now ranked, the important fact having been ascertained of their breathing by gills when young, and undergoing a metamorphosis. The body is almost cylindrical or worm-like, the head small, the eyes very small, and nearly hidden by the skin; in some species, indeed, imperfect or wanting, upon which account the name C. was given to them. and an attempt has been made to transfer to them the English name Blindworm, commonly given to the *Anguis fragilis*. The skin is smooth, viscous, and annularly wrinkled, appearing naked, although upon dissection, minute scales are found disposed between its wrinkles, at least in some species. The vertebræ are articulated as in fishes and in some of the other lower Batrachians, not as in serpents, and the skull is united to the first vertebra by two tubercles. The ribs are imperfectly developed, and much too short to encircle the trunk.—The original genus C. has been subdivided, now forming a family, *Cæciliadæ*. The species are inhabitant of warm climates, and of marshy or moist places.

Two-banded Cæcilia.

CÆ'CUM (Lat. *cæcus*, blind), a blind sac; that is, a sac or bag having only one opening, connected with the intestine of an animal. In man, there is only one C., very small, and apparently not performing any important function, situated at the extremity of the small intestine, where it terminates in the large intestine or colon. In many of the mammalia, however, and particularly in most of those which are herbivorous, it is comparatively large, and is found to secrete an acid fluid resembling the gastric juice. It therefore appears that, where the nature of the assimilatory process is such as to require the detention of the food for a considerable time, this provision is made for it, in order that digestion may be more completely accomplished. The C. is entirely wanting in some quadrupeds, as in bats, and the bear and weasel families. Birds have two cæca, which are generally long and capacious in those that are omnivorous or granivorous, and the position of which is the only circumstance that marks the division of the intestine into two parts, the small and the large intestine, or the *ileum* and the *colon*. In reptiles, a C. is of very rare occurrence. Fishes have none in the position occupied by those of quadrupeds and birds, but many of them have cæca attached to the intestine at its uppermost part, and very generally regarded as appendages of the stomach. The number of these cæca is, however, extremely various; sometimes there are only 2, and sometimes more than 100. The number is different even in very nearly allied species of the same family; thus, there are only 6 in the smelt, but 70 in the salmon; 24 in the herring, and 80 in the shad. In some fishes, as the cod, the cæca consist of large trunks ramified into smaller ones.—The intestinal canal of some of the *Infusoria* is furnished throughout its whole length with numerous cæca, no other organ corresponding to a stomach appearing to exist.

CÆDMON, the first Anglo-Saxon writer of note who composed in his own language, and of whom there are any remains. The date of his birth is unknown, but his death occurred about 680 A.D. He was originally a cow-herd, attached to the monastery of Whitby, and, according to Bede, 'even more ignorant than the majority of his fellows, so that in the evenings, when the domestics assembled in the hall to recreate themselves with music after the labors of the day, Cædmon was frequently obliged to retire, in order to hide his shame when the harp was moved towards him.' One night, however, as he was sleeping in the stable-loft, a stranger appeared to him, and commanded him to sing. C. declared his ignorance, but the stranger would take no refusal, and imposed on the poor cow-herd the sublime task of hymning the glories of creation.

Suddenly a poetic inspiration seized him, and he began to pour forth verses. When he awoke from his dream, the words remained fast-rooted in his memory, and were recited by him to others with new confidence. The Abbess Hilda, and the learned men who were with her in the monastery, immediately declared that he had received the gift of song from Heaven. He was now educated, became a monk, and spent the rest of his life in composing poems on the Bible histories and on miscellaneous religious subjects, many of which have been preserved, and are altogether in bulk nearly equal to the half of *Paradise Lost*, to parts of which some of them bear a striking resemblance. Satan's Speech in Hell is characterized by a simple yet solemn greatness of imagination, which may possibly have influenced at some period of his life the more magnificent genius of Milton.

CÆLATU'RA. See CHASING.

CAEN, the chief town in the department of Calvados, France—formerly the capital of Lower Normandy—is situated on the left bank of the Orne, about 9 miles from its mouth, 122 miles west-north-west of Paris. C. is built in the middle of a fertile plain; its streets are wide and clean, it has several fine squares, and many noble specimens of ancient Norman architecture. Among the best examples are the churches of St. Etienne, founded by William the Conqueror, and which contained his monument, erected by William Rufus, and destroyed by the Huguenots in 1562; La Trinité, called also *Abbaye aux Dames*, founded by Matilda, wife of the Conqueror; St. Nicholas, now a cavalry fodder-store; St. Pierre, and St. Jean. The castle, founded by the Conqueror, and finished by Henry I. of England, was partially destroyed in 1793. There are several beautiful promenades in the city, which has manufactures of lace, blonde, crape, cutlery, cotton-yarn; breweries, dye-works, wax-bleaching, and ship-building yards. Its Angora gloves, made from the unwashed, undyed fur of Angora rabbits, which are reared in the district, are celebrated. Quarries in the neighborhood produce an excellent stone, called Caen Stone (q. v.). Trade is facilitated by a maritime canal connecting the port with the sea, and also by the railway connecting it with the Paris and Rouen line; those to Cherbourg, Tours, and Honfleur, and that to Flers, opened in 1867, which affords C. communication with Granville. Nothing is known of C. before the 9th century. It was a place of importance in 912, when it came into the possession of the Normans, under whom it increased rapidly. William the Conqueror and his queen made it their residence, and greatly improved it. In 1346, it was taken and pillaged by the English, who again captured it in 1417. It was held by them until 1450, when the French compelled them to surrender. During the revolution of 1793, several of the Girondist chiefs, proscribed by the Jacobins, went to C., and organized a revolt against the Mountain, which proved unsuccessful. Pop. (1876) 33,072.

CAEN STONE. The neighborhood of the town of Caen, in Normandy, has been celebrated for its stone-quarries from a very early period. The excellence of the stone, and the facility of transport by sea, led to C. S. being very extensively used in England in the 15th and 16th centuries. In 1460, the Abbot of Westminster obtained a license to import C. S. for the repairs of the monastery. Later, it became a regular article of importation, and in 1582 it is rated at the custom-house at 6*s.* 8*d.* the ton. Winchester and Canterbury cathedrals, Henry VII.'s Chapel at Westminster, and many country churches, are built of C. S., which is still frequently used in England. The stone is an oolite, resembling Stonesfield slate, but without its slaty structure. The quarries are subterraneous, and the stone is brought up through vertical shafts in blocks 8 or 9 feet long, and about 2 thick.

CAERLE'ON (Castle of the Legion), a small but ancient town in Monmouthshire, on the right bank of the Usk, 2 miles north-east of Newport. It is the Isca Silurum of the Romans, and is supposed to have been the capital of the Roman province Britannia Secunda, now Wales, and the residence of the famous King Arthur. It was the seat of an ancient archbishopric, which was removed to St. Davids about 519 A.D. An abbey of Cistercian monks existed here before the Reformation. C. was an important place in the 12th c., but it was afterwards ruined by the frequent wars between the Welsh and Anglo-Saxons. Many Roman relics have been found here, as aqueducts, baths, pavements, altars, tiles, coins, inscriptions, and statues; many of the smaller antiquities are deposited in a museum in the town; besides half-melted ore and cinders, and the remains of a fortress, with walls 12 feet thick and 1800 yards long, and of an amphitheater, called King Arthur's Round Table, 222 by 192 feet in size. Pop. (1871) 1306. The chief occupation is the manufacture of tin-plates.

CAERMA'RTHEN (Welsh, *Caer Fyrddyn*, the *Maridunum* of Ptolemy), a seaport town, capital of Caermarthenshire, South Wales, on the right bank of the Towy, 9 miles from Caermarthen Bay. It lies in a picturesque situation, but the streets are irregular, steep, and often narrow. The Towy is navigable for vessels of 200 tons up to the town, and salmon and sewin are caught in the river. There are tin and iron works near the town. C. exports tin-plates, cast iron, timber, marble, bark, slates, lead ore, bricks, grain, butter, and eggs. The Welsh language is used in most of the churches. C. is a county borough, having a separate jurisdiction from the shire. It unites with Llanelly in returning one member to parliament. Pop. (1881) 10,512. There is a college for Welsh teachers. Near C. are the remains of two Roman camps. In the 5th c., Merlin, the Welsh prophet, is said to have been born here. It was long the residence of the native princes of South Wales. Caermarthen Castle often changed hands in the contests of the Welsh chiefs with each other, and in the subsequent wars with the Saxons and Normans.

CAERMA'RTHENSHIRE, a maritime county in South Wales, on the Bristol Channel; bounded N. by Cardigan, from which it is separated by the Teify; E. by Brecknock; S. by Glamorgan and Caermarthen Bay; and W. by Pembroke. It is the largest of the Welsh counties; length, 53 miles; greatest breadth, 33 miles; area, 974 square miles, nearly a third of which is waste. The county is mountainous in the north and east, and is characterized by productive though narrow valleys and deep wooded glens. Caermarthen Van or Beacon rises to the height of 2596 feet, being the greatest elevation in the county. The coast of C. is marshy, and is all situated on Caermarthen Bay, which washes also some portions of the coasts of Glamorgan and Pembroke, is 17 miles across, 10 miles deep, 35 in circuit, and receives the rivers Taff or Tave, Towy, and Lhoughor. The chief rivers of C. are the Towy, Cothy, Taff, and Teify. The Towy has a course of 60 miles, of which 50 are in Caermathenshire. It yields plenty of salmon, sewin, trout, eels, and lamprey, and is navigable for the last 9 miles of its course. On this river is the celebrated vale of the Towy, 30 miles long, with an average breadth of 2 miles. C., north and west of the Towy, comprising three-fourths of the county, consists of lower Silurian clay-slate and grauwacke. In the south-east corner of the county is a band of carboniferous limestone and grit, to which succeeds a small part of the South Welsh coal-field of Glamorgan and Monmouth, chiefly composed of stone-coal and culm. The mineral productions of the county are iron, coal, copper, lead, slates, lime, dark-blue marble. These, with tinned iron, grain, cattle, horses, sheep, and butter, are exported. The climate of C. is mild but moist; the soil is stiff and poor in the uplands, affording pasturage for small cattle; but the rest of the county is well wooded, and in the south part along the rivers very fertile. Oats and barley are the chief crops. The chief towns are Caermarthen (the county town), Llanelly, Llandeilo-vawr, Llandovery, Newcastle-in-Emlyn. The chief manufactures are woollens and hides. Pop. (1871) 115,710; (1881)124,861. C. sends two members to parliament. The county contains so-called Druidical remains, and Roman roads, besides many baronial and ecclesiastical ruins. In this county originated the 'Rebecca' riots, which in South Wales, in 1843—1844, were directed against the turnpike gates.

CAERNA'RVON (*Caer-yn-ar-Fon*, Fort opposite Mon or Anglesea), a parliamentary and municipal borough and seaport in North Wales, the capital of Caernarvonshire, situated near the south end of the Menai Strait, on the right bank of the Seiont, 245 miles north-west of London. C. has a castle situated at the west end of the town, the building of which was commenced by Edward I. in 1284. It is one of the noblest ruins in the kingdom, the walls being still entire, and enclosing and oblong of three acres. The walls are 7 to 9 feet thick, and are pierced by a covered gallery, with loopholes to discharge arrows. There are thirteen embattled towers, with five, six, or eight sides, and surmounted by turrets. The gateway under the great square tower has four portcullises. The town itself was once surrounded by walls and round towers. These walls, with several of the gates, still exist, but are within the town. The streets are narrow, but regular, and at right angles with each other. In the churches and chapels, the services are in Welsh and English. C. unites with Pwllheli, Nevin, Criccieth, Conway, and Bangor in returning one member to parliament. In 1880, 2256 vessels, with a burden of 149,706 tons, entered, and 2389 vessels, with a burden of 172,021 tons, cleared the port, chiefly small-craft and steamers to and from Liverpool. The harbor admits of ships of 400 tons. The chief exports are copper, ore, coal, and slates. There is also a great iron and brass foundry. C. is a bathing-place, and is much frequented by tourists, on account of its vicinity to the grandest scenery in North Wales. Many families of the upper ranks reside in and around the town. Pop. (1881) 10,237. Half a mile from C. are the remains, covering seven acres, of Segontium, or Caer Seiont, a Roman station or city. Gold, silver, and copper coins and ornaments, and other Roman relics, have been found here. There is a Roman fort on the left bank of the Seiont, still almost complete, with walls 11 feet high, and 6 feet thick, and with parallel rows of holes 3 inches in diameter. C. was the seat of the native princes of North Wales down to 873. In 1284 was born here the first Anglo-Norman Prince of Wales, afterwards the unhappy Edward II. In 1294, the town and castle were burned, and the English inhabitants massacred by the Welsh under Madoc, the illegitimate son of Llewelyn, a native prince of Wales. From a rocky height near Uxbridge Hotel, there is a fine view of Snowden and the island of Anglesea.

CAERNA'RVONSHIRE, a maritime county in North Wales, bounded N. by the Irish Sea; E. by Denbigh, with the Conway between; S. by Merioneth and Cardigan Bay; and W. by Caernarvon Bay and the Menai Strait, the latter separating it from Anglesea. It is 51 miles long; greatest breadth, 22 miles; average, 9; area, 544 square miles, of which ½ is in pasture, and only $\frac{1}{40}$ in tillage. The surface is mountainous, and is traversed by the grandest and highest ranges in South Britain, and it is the highest and most mountainous county in North Wales. The Snowdonian or chief range runs through the middle of the greatest length of the county, from south-west to north-east, and is very bold and rocky. It attains its greatest elevation in Snowdon (q. v.), 3571 feet, in the center of the county, and the highest mountain in South Britain. Caernarvon Bay is 30 miles across, 15 long, with 2 to 30 fathoms water, and communicates with the Irish Sea through the Menai Strait, which is 17 miles long, and ½ to 4 miles broad. The rivers of C. are numerous, but small, from the nearness of all parts of the county to the sea. The Conway, navigable for 10 miles, which runs along the east border, is the chief. Almost all the streams flow through small lakes or tarns—of which there are 50 or 60 in the county—around the central or Snowdonian group of mountains. There are many fine cataracts on these streams. The mineral products of C. are copper, lead, zinc, coal, roofing and writing slates, slabs, chimney-piers, honestone. The slate-quarries employ many thousands of workmen. The climate is mild in the peninsular part of C., but severe among the hills. Large numbers of black-cattle are reared; the sheep are numerous but small. Wheat, oats, barley, and potatoes are raised in the valleys. Pop. (1871) 106,121; (1881) 119,195. The chief towns are Caernarvon (the county town), Bangor, Pwllheli, Conway, Nevin, and Criccieth. In addition to the above boroughs, several flourishing towns have recently sprung into existence in the county—Llandudno, Tremadoc, and Bethesda being the principal. It returns two members to parliament—one for the county, and one for the six chief towns. Connected with C. is the Chester and Holyhead Railway, on the great route from London to Dublin, which crosses into Anglesea by the Britannia Tubular Bridge over the Menai Strait. C. contains the remains of British or Celtic camps and hill-forts, especially around Snowdon, several dolmens and stone circles, and some ancient castles. The Snowdonian mountains were long the stronghold of the Welsh against the Romans, Saxons, and Normans in their efforts to subjugate Wales, and here the Welsh were at last defeated in 1283 by Edward I.

CÆSALPI'NIA, a genus of trees of the natural order *Leguminosæ* (q. v.), the type of the sub order *Cæsalpinieæ*. This sub-order is characterized by irregular flowers, which are not papilionaceous (q. v.) and contains upwards of 700 known species, among which many are notable for their purgative properties, as Senna (q. v.); some produce eatable fruits, as the Tamarind (q. v.), the Carob (q. v.), and the West Indian Locust Tree (q. v.); some yield resinous and balsamic products, as Copaiva (q. v.), Aloes-wood (q. v.), &c.; some produce important dye-woods, as Log-wood (q. v.), Brazil Wood (q. v.), Camwood (q. v.), &c.; and some are trees of great size, and very valuable for their timber, as the Purple-heart (q. v.) and the Wallaba (q. v.), trees of Guiana. No species of the sub-order is British, and it generally belongs to warm climates.—The genus C. contains a number of species, trees with pinnate or bipinnate leaves, natives of the warm parts of Asia and America, which yield the Brazil wood, Pernambuco wood (see BRAZIL WOOD), and Sappan Wood (q. v.) of commerce also the astringent pods called Dividivi (q. v.) used in tanning.

CÆ'SAR, the name of a patrician family of the *Julia Gens*, one of the oldest in the Roman state, claiming to be descended from Iulus, the son of Æneas. When or from what cause the surname of C. was first acquired, is in the highest degree uncertain. Spartianus, in his *Life of Ælius Verus*, mentions four different opinions respecting its origin: 1. That the word signified an elephant in the language of the Moors, and was given as a surname to one of the Julii because he had killed an elephant; 2. That it was given to him because he had been cut (*cæsus*) out of his mother's womb after her death; 3. Because he had been born with a great quantity of hair (*cæsaries*); or, 4. Because he had azure-colored eyes (*cæsii*). The opinion to which we most incline is the third of these, but who was the original 'shock-head' of the gens we cannot say; the first, however, mentioned in history is Sex. Julius Cæsar, prætor in 208 B.C. The greatest individual of the family, and one of the greatest men the world has ever seen, was

CÆSAR, CAIUS (or rather GAIUS) JULIUS, son of a Roman prætor of the same name, was born 12th July, 100 B.C. Two circumstances conspired to determine his sympathies in favor of democracy, and against a republican oligarchy: the first was the marriage of his aunt Julia with Caius Marius; the second, the marriage of C. himself, in 83 B.C., with Cornelia, daughter of L. Cinna, one of the principal enemies of Sulla. The anger of the dictator at this cost C. his rank, property, and almost his life itself.

Feeling that he would be safer abroad for a time, he went to Asia, 81 B.C.; but on learning the death of Sulla (78 B.C.), he hurried back to Rome, where he found the popular party in a state of great ferment, and anxious to regain what it had lost under the vigorous despotism of the aristocratic dictator. C., however, took no part in the attempts of Lepidus to overthrow the oligarchy; but he showed his political leanings by prosecuting (77 B.C.) Cn. Dolabella—a great partisan of Sulla—for extortion in his province of Macedonia. To improve his eloquence, he went to Rhodes to study under the rhetor Apollonius Molo. In 74 B.C., he returned to Rome, where he had been elected pontifex, and now for the first time threw himself earnestly into public life. In the year 70 B.C., he attached himself to Pompey, whose political actions at this time were of a decidedly democratic character. In 68 B.C., C. obtained a quæstorship in Spain. On his return to Rome (67 B.C.), he married Pompeia, a relative of Pompey, with whom he was daily becoming more intimate. In 66 B.C. he was elected to the curule ædileship, and lavished vast sums of money on games and public buildings, by which he increased his already great popularity. For the next few years, C. is found steadily skirmishing on the popular side. In 63 B.C. he was elected pontifex maximus, and shortly after, prætor. During the same year occurred the famous debate on the Catiline conspiracy, in which the aristocratic party vainly endeavored to persuade the consul, Cicero, to include C. in the list of conspirators. In 62 B.C., Pompey returned from the East, and disbanded his army. Next year, C. obtained the province of *Hispania Ulterior*. His career in Spain was brilliant and decisive. On his return, he was elected consul, along with M. Calpurnius Bibulus. Shortly before the passing of the agrarian law (59 B.C.), C. with rare tact and sagacity, had reconciled the two most powerful men in Rome, who were then at variance, Pompey and Crassus, and had formed an alliance with them, known in history as the *First Triumvirate*. Both of these distinguished men aided C. in carrying his agrarian law; and to strengthen still further the union which had been formed, C. gave Pompey his daughter, Julia, in marriage, though she had been promised to M. Brutus; while he himself also married Calpurnia, daughter of L. Piso, his successor in the consulship.

On the expiry of his term of office, he obtained for himself, by the popular vote, the province of *Gallia Cisalpina* and *Illyricum* for five years, to which the senate added—to prevent the popular assembly from doing so—the province of *Gallia Transalpina*. Nothing could have been more favorable for C.'s aims. He had now an opportunity of developing his extraordinary military genius, and of gathering round him an army of veterans, whom perpetual victory should inspire with thorough soldierly fidelity and devotion to his person. This was the very thing he wanted to give him a reputation equal to that of his coadjutors, Pompey and Crassus, whom, in genius, he far surpassed. Leaving, therefore, the political factions at Rome to exhaust themselves in petty strifes, C., in 58 B.C., after the banishment of Cicero, repaired to his provinces, and during the next nine years, conducted those splendid campaigns in Gaul, by which, had he done nothing else, he would have 'built himself an everlasting name.' C.'s first campaign was against the Helvetii, whom he totally defeated near Bibracte (Autun). Out of 368,000 only 110,000 remained. These were commanded by C. to return home, and cultivate their lands. The eyes of the Gauls were now turned upon the new conqueror. His help was solicited, among others, by Divitiacus, an Æduan chief. This involved C. in a second war with a German prince, named Ariovistus, who was utterly overthrown; and now C., having in the course of one campaign successfully concluded two important wars, led his troops into winter-quarters.

Next year (57 B.C.) occurred the Belgic war, in which C. successively routed the Suessiones, Bellovaci, Ambiami, and Nervii, who, alarmed at the progress of the Roman arms, had entered into an alliance with each other against the invaders. When the senate received C.'s official dispatches, it decreed a thanksgiving of 15 days—an honor never previously granted to any other general. During the winter and the spring following, C. stayed at Lucca; and after spending large sums of money in hospitality, and in other less praiseworthy purposes, he departed for Gaul, where the flames of war had burst out in the north-west.

The Veneti, a maritime people of Brittany, were the chief instigators of the insurrection. C.'s plans were laid with consummate skill, and were crowned with the most splendid success. The Veneti were totally defeated, and most of the other Gallic tribes were either checked or subdued. C. wintered in the country of the Aulerci and Lexovii (Normandy), having, in the course of three campaigns, conquered Gaul. Next year (55 B.C.), Crassus went to Syria, and Pompey to Spain, while C.'s provincial government was prolonged for five years. He now undertook a fourth campaign against two German tribes who were about to enter Gaul. He was again successful; and pursuing the fleeing enemy across the Rhine, spent eighteen days in plundering the district inhabited by the Sigambri. He next invaded Britain, about the autumn; but after a brief stay in the island, returned to Gaul. The Roman senate, astonished at his hardihood and his successes in regions where no Roman army had ever been before, accorded him a public thanksgiving of 20 days. In 54 B.C., C. opened his fifth campaign by a second invasion of Britain. On his return to Gaul, C. was compelled—on account of the scarcity of corn, arising from drought—to winter his army in divisions. This naturally aroused the hopes of the Gauls, who thought the time had come for recovering their independence. An insurrection broke out in the north-east of Gaul, which was at first partially successful, but was ultimately crushed. C. resolved to winter at Samarobriva (Amiens), in the vicinity of the malcontents. In 53 B.C., C. commenced his sixth campaign. It was chiefly occupied in crushing a second insurrection of the Gauls. C. now returned to Northern Italy, that he might be able to communicate more easily and securely with his friends at Rome. That city was gradually becoming more anarchic, the evils of weak government more apparent; the hour for decisive action seemed to be approaching, and doubtless C.'s heart beat with expectation of the mighty future, when all at once the plot that Fate was weaving in his favor, appeared to be completely marred by a tremendous rebellion over the whole of Gaul, headed by a young warrior named Vercingetorix. It was in the dead of winter when the news came to C., who instantly saw that, at all hazards, he must preserve his fame and his army. Leaving, therefore, Pompey to succeed at Rome, he hurried to meet the insurgent hordes. His great difficulty was to collect his scattered legions. First crossing, with some Cisalpine and provincial troops, the mountains of Auvergne, though they lay six feet deep in snow, he suddenly appeared among the Arverni, who, terrified at his unexpected approach, sent for their chief, Vercingetorix, to come to their assistance.

This was what C. wished. After some wonderful exhibitions of military skill, and numerous successes, Vercingetorix was shut up in Alesia (Alise in Burgundy) with all his infantry. C. besieged him, and though harassed by nearly 300,000 Gauls without, who attempted, but in vain, to break through the well-defended Roman lines, forced Vercingetorix to capitulate. Many of the

tribes now hastened to submit to C., who prudently determined to winter among the vanquished. The senate, of course, voted him another public thanksgiving. Next year (51 B.C.), C. proceeded to quell the tribes who still held out. This he successfully accomplished, and having in addition reduced the whole of Aquitania, passed the winter of his eighth campaign at Nemetocenna, in Belgium, where he spent the time both in a magnanimous and politic manner. The Gallic princes were courteously and generously treated; the common people were spared the imposition of further taxes, and everything was done to render it possible for him to visit Italy with safety in the spring. This he did, and took up his residence at Ravenna, where he was informed of everything that was going on by the tribune C. Curio. There can be no doubt that at this moment he was the most popular man in the state, while his soldiery were devoted to him with a loyalty as enthusiastic as that which Bonaparte inspired when fresh from his Italian victories.

Meanwhile, Pompey, whose vanity could not endure the greatness of C., had been gradually veering round again to the aristocracy, whose dread of the new conqueror was hourly increasing. After much futile diplomatic finessing on all sides, the senate carried a motion 'that C. should disband his army by a certain day; and that if he did not do so, he should be regarded as an enemy of the state.' The tribunes, Mark Antony and Q. Cassius put their veto on this motion; but they were violently driven out of the senate-chamber, and fearing for their lives, they fled to C.'s camp. The senate, in the madness of their terror, now declared war, and intrusted the conduct of it to Pompey, whose pride in the invincibility of his military prowess hindered him from taking the necessary measures for the defence of the state. He fancied that his name would bring thousands to his standard, and he was even led to believe that C.'s troops were willing to desert their general: the result of which delusion was, that when hostilities formally commenced, he had hardly any soldiers except two legions which had recently been in the service of his rival. C., on the other hand, perceiving that the time for decisive action had at length come, harangued his victorious troops, who were willing to follow him anywhere; crossed the Rubicon (a small stream which separated his province from Italy Proper), and moved swiftly, amid the acclamations of the people, towards Rome.

Pompey fled to Brundusium, pursued by C., but contrived to reach Greece in safety, 17th March, 49 B.C. The Italian cities had everywhere gladly opened their gates to the conqueror as a deliverer. In three months, C. was master of all Italy.

C. next subdued Pompey's legates in Spain, who were at the head of considerable forces. On his return, he took Massilia, where he learned that he had been appointed dictator of the republic—a function which at this time he retained only for 11 days, but these were honorably distinguished by the passing of several humane enactments. Pompey, now thoroughly alive to the magnitude of his danger, had gathered in Egypt, Greece, and the East, a powerful army, while his fleet swept the sea. C., however, crossing the Adriatic at an unexpected season, made a rush for Dyrrhachium, where Pompey's stores were; but was nevertheless outstripped by his opponent. Pompey intrenched his army on some high ground near the city, where he was besieged by C. The first encounter was favorable to Pompey, who drove back C.'s legions with much loss. The latter now retreated to Thessaly, followed by his exulting enemies. A second battle ensued on the plains of Pharsalia, 9th August, 48 B.C. Pompey's army was utterly routed; Pompey himself fled to Egypt, where he was murdered. See POMPEY.

No sooner had the news reached Rome, than C. was again appointed dictator for a year, and consul for five years. He was invested with tribunicial power for life, and with the right of holding all the magistricial comitia except those for the election of the plebeian tribunes. He did not, however, return to Rome after the battle of Pharsalia, but went to Egypt, then in a distracted condition on account of the disputes regarding the succession. Out of love for Cleopatra (who subsequently bore him a son), he entered upon the 'Alexandrine War,' in which he was successful, and which he brought to a close in March 47 B.C. He next overthrew a son of Mithridates, near Zela, in Pontus, August 2 of the same year, and arrived in Rome in September.

He was once more appointed dictator, and the property of Pompey was confiscated and sold. Before the close of the year, he had set out for Africa, where his campaign against the Pompeian generals, Scipio and Cato, was crowned with victory at the battle of Thaspus, 6th April, 46 B.C. Cato committed suicide at Utica, and with such irresistible celerity was the work of subjugation carried on, that by the end of the summer, C. was again in Rome. Now occurred that display of noble and wise generosity which proves C. to have been possessed of a great magnanimous nature. He was not a man that could stoop to the vulgar atrocities of Marius or Sulla, and so he majestically declared that henceforth he had no enemies, and that he would make no difference between Pompeians and Cæsarians. His victories in Gaul, Egypt, Pontus, and Africa, were celebrated by four great triumphs, during which the whole Roman populace was feasted and fêted by the magnificent liberality of the dictator.

He now proceeded to check, by wholesome enactments, as far as in him lay, the social evils which had long flourished in the city. During the year 46 B.C., also, he conferred a benefit on Rome and on the world by the reformation of the calendar, which had been greatly abused by the pontifical college for political purposes. After quelling an insurrection which now broke out in Spain, where Pompey's sons, Cneius and Sextus, had collected an army, he received the title of 'Father of his Country,' and also of *imperator*, was made dictator and *præfectus morum* for life, consul for 10 years; his person was declared sacred, and even divine; he obtained a body-guard of knights and senators; his statue was placed in the temples; his portrait was struck on coins; the month Quintilis was called Julius in his honor; and on all public occasions he was permitted to wear the triumphal robe. He now proposed to make a digest of the whole Roman law for public use, to found libraries for the same purpose, to drain the Pontine Marshes, to enlarge the harbor of Ostia, to dig a canal through the Isthmus of Corinth, and to quell the inroads of the barbarians on the eastern frontiers; but in the midst of these vast designs he was cut off by assassination on the Ides (15th) of March, 44 B.C. The details of this crime—the greatest disaster that could have befallen the Roman world, as subsequent events showed—are too familiar to require narration. It is sufficient to say that, of the sixty aristocrats who were in the conspiracy, many had partaken of C.'s generosity, and all of his clemency. A few, like Brutus, out of a weak and formal conscientiousness, based on theory rather than insight, were probably offended by C.'s desire to change the form of government into a hereditary monarchy; but the most, like Cassius, were inspired by a spleenful hatred of the dictator, and the base ambition of regaining power at all hazards.

C., who was 56 years of age when he was murdered, was of a noble and kingly presence, tall of stature, and possessing a countenance, which, though pale and thin with thought, was always animated by the light of his black eyes. He was bald-headed (at least in the latter part of his life), wore no beard, and though of a rather delicate constitution naturally, he ultimately attained to the most vigorous health. His besetting sin was sensuality; but without meaning to detract from the criminality of his conduct in this respect, it may be said that it was as much the sin of the times in which he lived as his own, and that the superlative grandeur of his position gave a prominence to his licentiousness which a more humble lot would have escaped. His intellect was marvelously versatile. In everything he excelled. He was not only the first general and statesman of his age, but he was—excepting Cicero—its greatest orator. As a historian, he has never been surpassed and rarely equalled in simplicity and vigor of style, and in the truthfulness with which he narrates events of which he was an eye-witness. He was, in addition, a mathematician, philologist, jurist, and architect, and always took great pleasure in literary society. Most of his writings have been lost, though their titles are preserved; but we still possess his invaluable *Commentarii* (generally known as 'Cæsar's Commentaries on the Gallic and Civil Wars'). The *editio princeps* was printed at Rome 1449. C.'s life was formally written in ancient times by Suetonius and Plutarch. There are modern lives by Delorme, Napoleon III. (1865), and J. A. Froude (1879).

CÆSARE'A (*Turris Stratonis*), called by the natives 'Kaisari'yeh.' This once proud and splendid seaport, perhaps one of Herod's most magnificent works—a Grecian town with its temples, amphitheater, baths, &c., imported into Syria—was situated on the coast of Syria, 95 miles south of Beyrout, and 37 miles north of Jaffa.

In 65 A.D., Gessius Florus, the worst of all the petty tyrants that had afflicted Judæa, was appointed governor of Cæsarea. About that time, a terrible revolution, which commenced at C., broke out all over Judæa. It arose from a dispute between the Syrian and Jewish citizens of C. as to which of them the city really belonged to; and some idea may be formed of the extent of the insurrection from the fact, that above 20,000 Jews were massacred in C. in the space of one hour; 13,000 in one night at Scythopolis; 50,000 at Alexandria; 8000 at Joppa; and 10,000 a. Damascus.

C. was occupied by the Crusaders; after them, it seems to have gradually decayed into nothingness. It is now a heap of half-buried ruins, with a few miserable stone houses inhabited by fishermen.

CÆSARE'A PHILI'PPI (*Panium*). This town, mentioned in Matt. xvi. 13, was situated about 20 miles north of the Sea of Galilee. It was distinguished from the Cæsarea on the coast of Syria by the appendage of 'Philippi,' given to it in honor of Philip the Tetrarch, who repaired the city. It is now a heap of ruins, overgrown with bushes and grass.

CÆSA'REAN OPERATION (*cædo—cæsus*) has, from very ancient times, been the popular name for *Hysterotomy* (*hystera*, uterus; *tome*, section). Pliny distinctly alludes to it in his *Natural History* (lib. vii. cap. ix.), saying that Cæsar was so called from being taken by excision out of the womb of his mother, and that such persons were called *Cæsones* (Cæsar a cæso matris utero dictus; quâ de causâ *Cæsones* appellati). In his case, the mother must have survived the operation, as Aurelia was alive when her son invaded Britain.

The pages of a popular work scarcely allow of the details of such a proceeding, but we may state that the first incision is made exactly in the middle line of the body, to a length of 6 or 7 inches. When the uterus is exposed, it must be carefully opened, the child lifted out, and then the after-birth. The uterus now contracts, and sinks down into the pelvis, the wound is closed, and opium is given to the patient to allay pain and nervous irritability.

In Great Britain, the C. O. has been rarely performed, most likely from the skill of the accoucheurs rendering such a proceeding unnecessary; but still several cases are on record where not only the child but the mother are saved. Some women, indeed, seem to have accepted it as their usual method of delivery, having several children, each requiring to be removed through an abdominal incision; one woman submitted to it seven times. It has also been successfully performed in most unfavorable circumstances. In the year 1500, a sow-gelder operated successfully on his own wife; an illiterate Irish midwife, Mary Donally, operated with a razor on a poor farmer's wife in January 1738, and removed a dead child; her patient completely recovered, so as to be able to walk a mile on foot on the 27th day after the operation. Nay, a negro woman in Jamaica cut herself open with a butcher's knife, removed her infant and recovered. Practitioners are not quite decided as to the circumstances which justify the performance of this severe operation on the living female, but all agree on the propriety of at once removing by it the child of a recently dead woman.

Numa Pompilius decreed that every pregnant woman who died should be opened; and the senate of Venice, in 1608, decreed that practitioners should perform under heavy penalties, the C. O. on pregnant women supposed to be dead. In 1749, the king of Sicily decreed the punishment of death to medical men who omitted to perform it on women dying when advanced in pregnancy. Of course, to be of any use, it must be performed immediately.

CÆSIUM. See RUBIDIUM.

CAFFA. See KAFFA.

CA'FFEINE, or THEINE ($C_{16}H_{10}O_4N_4,2HO$), is the alkaloid or active principal of Coffee (q. v.) and Tea (q. v.). When isolated, it forms beautiful white crystals, with silky lustre, which are soluble in water, alcohol, and ether. It is present in coffee to the extent of about 1 per cent., and in ordinary or Chinese tea, from 2½ to 6 per cent., and it is also found in Paraguy and Guiana teas. It may be extracted from coffee or tea by making a decoction in hot water, and adding acetate of lead, which causes a precipitate of caffeotannate of lead. When the latter is acted on by sulphuretted hydrogen, the lead is separated, and the C. left in solution. On evaporation of the liquid, and recrystallization from alcohol, the C. separates in crystals.

CA'FFER BREAD, a name given to several species of *Encephalartos*, trees of the natural order, *Cycadaceæ* (q. v.), which like many others of that order, have much starch in their stems, and afford food to the natives of South Africa. They are also called Bread-trees.

CAFFERS. See KAFIRS.

CAFFRA'RIA. See KAFFRARIA.

CAFFRISTA'N. See KAFIRISTAN.

CAGAYA'N SOOLOO', an island of the Asiatic Archipelago, in lat. 6° 58′ N., and long. 118° 28′ E. It is about 20 miles in circumference well-wooded and elevated. Cagayan is also the name of a province, river, and lake on the island of Luzon, one of the Philippines.

CA'GLIARI, the capital of the island of Sardinia, situated on the side of a hill, on the north-east shore of a spacious bay, and on the south coast of the island, in lat. 39° 13′ N., long. 9° 8′ E. It has a spacious and safe harbor, defended by several forts, and is the emporium of all the trade of the island. The town contains many public buildings and churches, and has a university with 100 students; but its streets, for the most part, are very narrow, steep, and dirty. C. has a pop. of (1872) 32,834. It has also a dockyard, and a good road was some years ago constructed from C. to Sassari, the second city in the island, and to some of the more considerable places. Steamers ply very frequently between C. and Genoa; and it is now united to the continent of Europe by a line of Electric telegraph.

CAGLIARI, PAOLO, best known as *Paolo Veronese*, an Italian painter of great eminence, was born at Verona in 1532. He first studied under his uncle, Antonio Badile, a respectable artist, and afterwards settled in Venice, where he rapidly acquired both wealth and reputation. He had for contemporaries both Titian and Tintoretto, and was held in equal admiration with these famous painters. The church of San Sebastiano, in Venice, contains many of his productions, which are reckoned the most important of his earlier period—i. e., the period before he visited Rome, when he first became acquainted with the master-pieces of Raphael and Michael Angelo. The influence of the Roman school on his style was so happy, that, on his return, he received the honor of knighthood from the Doge. He died 19th April 1588. C. is remarkable for the fertility of his imagination. His design is generally noble, his composition rich, and his execution truthful. In the invention of details, especially, he is inexhaustible, and often overloads his pictures with ornament. One peculiarity of his works is the frequent introduction of splendid architectural backgrounds, which, however, were generally painted by his brother Benedetto. The most celebrated of his productions is the 'Marriage Feast at Cana of Galilee,' now in the Louvre at Paris. It is 20 feet high, and 30 feet in length, and contains 130 figures. Besides these may be mentioned 'The Calling of St. Andrew to the Apostleship,' 'The Feast of Simon,' and the 'Presentation of the Family of Darius to Alexander.'

CAGLIOSTRO, COUNT ALESSANDRO DI, a notorious impostor, who, in the latter part of the 18th c., traveled through Europe, and whose adventures afford considerable sight into the social characteristics of his times. He was born at Palermo, of poor parentage, June 2, 1743, and his true name was GIUSEPPE BALSAMO. Carlyle's picture of him when a boy—'brass-faced, vociferous, voracious'—is probably accurate, and already prophesies the bold and boisterous quack. When 13 years old, he ran away from the seminary of St. Roch, and was afterwards sent to a monastery at Cartagiore.

Here he became assistant to the apothecary of the monastery, and picked up that scanty knowledge of chemistry and medicine, which was afterwards found quite sufficient to impose upon so many respectable individuals. His conduct in the monastery was in keeping with his character, but finding it too contracted a sphere for the development of his ambitious genius, he left it, or was ejected, and for a time led 'the loosest life' in Palermo. When 26 years old, he found it highly advisable to leave his native place. In company with a certain sage named Althotas, C. is vaguely represented as traveling first in some parts of Greece, Egypt, and Asia. At Rome, 'his swart, squat figure first becomes authentically visible in the Corso and Campo Vaccino. He lodges at the sign of the Sun in the Rotunda, and sells etchings there,' very hard up at this time. In Venice, 'the bull-necked forger' contrived to marry a very pretty woman named Lorenza Feliziana, who became a skilful accomplice in his schemes, and captivated many admirers, while C. picked their pockets. C. now made the tour of Italy with great success as a physician, philosopher, alchemist, free-mason, and necromancer! Next, he extended his victorious career through some parts of Germany, and especially carried on a lively business in his 'elixir of immortal youth,' which became very popular among the ladies. By virtue of this fine medicine, the count assured his patients that he had already attained his 150th year, while his young and charming wife often talked affectionately of her son as 'a commander in the Dutch navy.' Through Courland, the count and his accomplice advanced triumphantly to the court of St. Petersburg, where he seems to have first made a failure; for the Empress Catharine, aided by her Scotch physician, Rogerson, a keen-witted native of Annandale, who sceptically examined his famous 'Spagiric food,' and pronounced it 'unfit for a dog,' penetrated his real character, and made him the subject of a comedy. C. soon found it convenient to vanish. We next find him at Warsaw, discoursing on his pet Egyptian masonry, medical philosophy, and the ignorance of doctors, but he has the misfortune to be unmasked by a certain Count M. This, however, had little effect on the stupid credulity of C.'s dupes—belonging, it must be remembered, to the upper classes, who in that age, according to Carlyle, were at once sensual, infidel, and superstitious—so that they persisted for a time in 'distending his pockets with ducats and diamonds,' which, however, his lavish dissipation soon scattered to the winds—for this prophet of a new physical and moral regeneration, and inventor of an 'invaluable pentagon for abolishing original sin,' was a desperate gambler.

In 1780, he went to Strasburg; and soon afterwards we find him in Paris, still founding lodges of 'Egyptian freemasons,' holding nocturnal meetings for calling 'spirits from the vasty deep,' &c., and scandalously simulating the character and deeds of a philanthropist. From Paris he came over to England, where he was cordially received by the followers of Swedenborg. On his return to Paris (1785), he became distinguished at court, was intimate

with the weak and credulous Cardinal Rohan, and played a prominent part in the affair of the Diamond Necklace (q. v.). This lodged him in the Bastile; but he cleared himself by a statement which gained credit, and, after being liberated, carried on his adventures once more in England, but feebly, the sunshine of success now obviously growing dim: in short, the count, in gloom and foreboding, disappeared from the island. But the market in Germany, too, was closed, a general distrust having been excited by the revelations of one of the count's dupes. Elsewhere, also, these began to fail him. 'At Aix, in Savoy, there are baths, but no gudgeons in them;' at Turin, he is ordered off by the king; a similar fate befalls him at Roveredo; at Trent, we catch a glimpse of him, 'painting a new hieroglyphic screen,' which, however, attracts no more the gaping crowd; lower still, 'he pawns diamond buckles;' finally, his wayworn wife—in whom, perhaps, because of her womanhood, the enormous lie and quackery first breaks up—'longs to be in Rome by her mother's hearth, by her mother's grave, where so much as the shadow of refuge awaits her.' In May 1789, he entered the city; on the 29th December, the Holy Inquisition detected him founding 'some feeble ghost of an Egyptian lodge.' He was imprisoned, and condemned to death for freemasonry. His sentence was commuted to imprisonment for life in the fortress San Leon, where, in spite of his 'elixir of immortal youth,' he died, 1795, aged 52 years. His wife ended her days in a convent. His *Mémoires Authentiques*, posthumously circulated in Paris, were *not* authentic.—See Carlyle's *Miscellaneous Essays*, art. Count Cagliostro.

CAGNOLA, Luigi Marchese, a distinguished Italian architect, was born at Milan in 1759—died 1833. Belonging to an ancient and wealthy family, he could afford to follow the bent of his own inclination, and devoted himself earnestly to the study of architecture. His master-works are two triumphal arches. The first is the famous *Arco della Pace*, in Milan, commenced in 1807, but not finished until 1838. It is constructed of white marble, and, with the exception of the *Arc de l'Etoile*, in Paris, is both the largest and noblest structure of the kind in Europe, reaching a height of 78 feet. On the top of the arch is a bronze figure of Peace, in a car drawn by six horses, while the sides are richly adorned with innumerable bas-reliefs. The second forming the *Porta di Marenga, or Porta Ticinense*, is also a work of great beauty, and is much admired. Besides these may be mentioned the *Campanile* (Bell-tower) at Urgnano, in the Bergamese.

CAGOTS is the name given to a tribe of men, of manners and customs akin to those of the gypsies, who are found scattered through various parts of Bearn and Gascony, in France. They are usually thought to be the descendants of the Visigoths, who remained in France after their defeat by Clovis, in the 5th century. Until the French Revolution of 1790, they received even worse treatment than that which generally falls to the lot of the remnants of conquered races. They were forced to wear a peculiar dress, were forbidden to practise all but the most menial trades, and were obliged to live isolated, either in separate villages or in separate quarters of the towns. So complete was their estrangement from the other inhabitants, that they were forced to enter the churches by doors specially set apart for them. Since that Revolution, they have been placed, as regards the law, on an equal footing with other citizens, but socially they are still regarded as a degraded race. Their language has been, so far back as is known, a corrupt dialect of that spoken in the surrounding country; but their blue eyes, fair hair, and fair complexion, mark them out as ethnologically distinct, and speak to a Teutonic origin. From a great liability to the diseases afflicting cretins, probably caused by their exposed manner of life and insufficient nourishment, they were at one time erroneously thought to belong to that unfortunate class. Tribes, whose history and present condition greatly resemble those of the C., are to be found in Britanny, where they receive the name of 'Caqueux;' and in Poitou, Maine, and Anjou, where they receive the name of 'Colliberts.' See Michel's *Histoire des Races Maudites de la France et de l'Espagne* (History of Outcast Races in France and Spain), Par. 1847.

CAGSA'NA, a town near the southern extremity of the island of Luzon, Philippines, with a population of about 13,000.

CAHE'TÉ, or CAETE, a small town of Brazil, in the province of Minas Geraes, about 250 miles north of Rio de Janeiro. The town is tolerably built, has some churches, a hospital, primary school, electoral college. Agriculture and mining are carried on. Pop. about 6000.

CA'HIR, a town in the county of Tipperary, Ireland, on the Suir, beautifully situated at the east end of a valley between the Galtees and Knockmeledown Mountains, 8 miles north-west of Clonmel. In the town is the seat of the Earl of Glengall, with a park which extends along the river for two miles below the town. Cahir Castle, an ancient irregular Norman structure of considerable extent, is situated on a rock on the left bank of the Suir. It was taken by the Earl of Essex in 1599, and by Cromwell in 1650; it has been lately restored. C. has extensive flour-mills, and a pop. of (1871) 2694. There are large barracks near Cahir.

CAHORS (anciently, *Divona*), a town in the department of Lot, France, is situated on a small rocky peninsula, formed by a bend of the river Lot—here crossed by three bridges—about 60 miles north of Toulouse. The streets of C. are steep and narrow, and present many specimens of antique architecture. It has a fine cathedral, and several Roman remains, including those of a magnificent aqueduct. There is an obelisk to Fénélon, who was a student at the university here. The town was taken and pillaged by Henri of Navarre in 1580. It has manufactures of cotton-yarn, woollens, leather, paper, glass, &c.; the district produces wine in considerable quantities. The population in 1872 was 11,416; and in 1876, 12,190.

CAI'COS, or CAY'OS, or KEYS, a term applied to numberless rocky islets of the West Indies, and that generally with a reference to some more considerable island in the neighborhood. Thus, to take the Bahamas as an instance, there are the Keys of Providence, of Eleuthera, of Abaco, &c. But more specifically the name is often appropriated to the more southerly members of the group just mentioned—North, West, East, Grand, and other Keys together covering about 450 square miles, and containing about 5000 inhabitants. They lie between 21° and 22° N. lat., having been transferred, with a local president, from the government of Bahama to that of Jamaica. The revenue is about £8000. The imports are valued at nearly £30,000; and the exports (consisting chiefly of salt) at £25,000.

CAI'FA, or HAI'FA, a seaport on the coast of Syria, situated exactly opposite Acre, upon a spur of Mount Carmel, and on the south side of a wide semicircular bay, four miles across. It is the ancient Hefa, or Sycaminopolis. It covers but a small space of ground, and contains no edifice of any note except a few minarets. The houses are built of rough unhewn sandstone, plastered over with lime—the roofs flat. Pop. about 2000—Moslems, Christians, and Jews. C., having a better anchorage than Acre, is fast eclipsing that city as a port, and in recent years almost all the trade of Acre has been transferred to it. Consular agents from England, France, &c., have, within twenty years, been established at C.; and among other improvements are a coffee-house and billiard-room, things rare in Syria. Several cargoes of barley, wheat, and sesame seed are yearly shipped at C., and exported to Great Britain and France. C. is surrounded by beautiful gardens of palm, olive, orange, citron, fig, mulberry, and pomegranate trees.

CAILLIÉ, René or Auguste, a French traveler, noted for his journey to Timbuktu, was born 19th September 1799, at Mauzé, in the department of Deux-Sèvres. Having gone to Senegal, and engaged in trading with the natives, he learned, about 1826, that the Geographical Society of Paris had offered a premium of 10,000 francs to the first traveler who should reach Timbuktu. Provided with a stock of goods for barter, C. started from Sierra Leone, March 22, 1827, and after some delay caused by illness, he reached the mysterious city in April 1828, where he remained 14 days. On leaving Timbuktu, he accompanied a caravan across the Sahara Desert, reaching the coast of Tangier. After hearing and examining his statements, the Society awarded to him the offered prize, with a pension of 1000 franks, and the order of the Legion of Honor. His notes of travel, arranged by M. Jomard, were published under the title *Journal d'un Voyage à Temboukton et à Jenné dans l'Afrique Centrale*, &c. (3 vols., Par. 1830). In England, doubts were raised as to the veracity of C., but without just grounds. C. died at his estate, in the neighborhood of Paris, May 25, 1838.

CAIN, the first-born of Adam and Eve. His history, as recorded in the book of Genesis, is mysterious and inexplicable, and the traditions which a later superstition has gathered round it, have thrown no light on its dark perplexity. As the first murderer, his memory has always been profoundly execrated by the Christian Church; yet such is the perversity of human nature, that one sect—if not more—of the pseudo-Gnostics found his actions and character so much to their liking, that they called themselves *Cainites* (130 A.D.), and invented an explanation of his alleged crime, which, like most of the Gnostic heresies in the early church, sprang out of the deep-rooted fundamental error of the 'two principles.' The Cainites believed that C. was the offspring of the intercourse of a superior Power with Eve, and Abel of an inferior Power; that their characters corresponded to their paternal parentage, and that the slaying of Abel only symbolized the victory of the superior over the inferior Power. The subsequent punishments of C. were regarded as the persecutions of Abel's father—i. e., the Jewish God. For the same reason, they highly honored all the reprobates of the Old Testament—such as the people of Sodom, Esau, Korah, Dathan, and Abiram—whom they looked upon as the victims of the hatred of Jehovah. It is unfortunate that we possess only distorted and fragmentary accounts of this.

as of all the other heretical sects. The Cainites are also said to have denied the dogma of the resurrection of the body, to have rejected the New Testament, and accepted a gospel of Judas, the betrayer, whom they also reverenced for the singular reason that his crime, by procuring the death of Christ, secured the salvation of men.

CAINOZO'IC (Gr. 'recent life'), a geological term, synonymous with Tertiary, introduced with other words by Mr. Phillips, to avoid the confusion which attended the use of the terms primary, secondary, and tertiary, owing to the various meanings attached to them by geologists.

ÇA IRA (French for 'It will go on!'), the well-known refrain of the song beginning with—

'Ah, ça ira, ça ira, ça ira!
Les aristocrates à la lanterne!'

which must always be remembered as associated with the most terrible scenes of the French Revolution. Like the *Marseillaise*, the *Carmagnole*, and the *Chant du Départ*, it became a French national song, and was styled the *Carillon National*. The melody, taken from another song, is said to have been a favorite air with the unhappy Marie Antoinette.

CAIRD, Rev. John, D.D., a minister of the Established Church of Scotland, and one of the most eloquent living preachers in Great Britain, was born at Greenock in 1820. He studied at the university of Glasgow, and in 1845 was ordained to the pastorate of the church of Newton-upon-Ayr, whence in 1847 he was translated to Lady Yester's Edinburgh. Here his popularity was extraordinary, but the demands made on his physical energies were so great, that he found it necessary to retire to the country, and accepted, in 1849, the country charge of Errol, in Perthshire. A sermon which he preached before the Queen in 1855, in the church of Crathie, and which was published, by royal command, under the title of *The Religion of Common Life*, was universally admired throughout Great Britain; translated on the continent under the auspices of Chevalier Bunsen, who wrote a preface to it, and suddenly carried the fame of the author into all parts of the Protestant world. In 1857 Dr. C. accepted a call to Glasgow. In 1858, he published a volume of sermons, marked by beauty of language, strength of thought, and earnest sympathy with mankind. He received the degree of D.D. in 1860. In 1862, he was appointed Professor of Divinity, and in 1873, Principal of Glasgow University. In 1880 he published an important work on *The Philosophy of Religion*.

CAIRN, or CARN, a Celtic word signifying a protuberance, a heap, a pile. In that sense, it appears in the names of hills and other natural objects in Scotland, Ireland, Wales, Cornwall, and Brittany. It is also applied to artificial heaps of unhewn stones, which, among archæologists, have come to be generally known as 'cairns.'

There are several kinds of cairns. The simplest and most common form seems to be a conical pile of stones of no great size. Next is what may be called the fenced or ringed C.—a heap of stones girdled round by large unhewn stones set upright in the ground. Some cairns have two, and a very few have three such concentric girdles; in some instances, there are concentric rows of upright stones within the cairn. Many cairns are found in the neighborhood of the circles of unhewn stone pillars which antiquaries used to style 'Druidical.' In a few instances, cairns are found at the end of an avenue of standing stones. Some cairns are fenced round by a narrow ditch and a small earthen rampart. A very few cairns have unhewn flat stones on their tops; a still smaller number are surmounted by an unhewn stone pillar. A few are oblong in shape.

Cairns were erected, doubtless, for several purposes. It appears from record that they were often raised to distinguish the marches or boundaries of lands. One C. near Balmoral, on the Highland Dee, is said to have been erected as a mustering-place for the men of Strathdee, who took its name, *Cairn-na-cuimhne*, or 'C. of Remembrance,' for their slogan or war-cry. In later times, places where great crimes had been committed were marked by cairns; thus, 'Mushet's C.,' in the Queen's Park at Edinburgh, shows the spot where a wife was murdered by her husband, under circumstances of peculiar atrocity, in 1720. But that the great purpose of the C. was sepulchral, is shown by the human remains found in so many of them. '*Disjectis et erutis, ossa inveniuntur, et quibusdam honor nominis adhuc manet*,' says Robert Gordon of Straloch, writing of Scotch cairns in 1654. 'For the cairns or heaps of stones in several parts of Ireland,' wrote Thady O'Roddy in 1617, 'some of them were heaped as monuments of battles, some made in memory of some eminent persons buried in such a place.' A Highland suppliant would have said to his benefactor: *Curri mi cloch er do charne*, 'I will add a stone to your cairn.' The bones found in cairns are generally calcined or half-burned, and enclosed either in what are called *cists*—small rude coffins of unhewn stones—or in urns of earthenware, which, again, are in many cases protected by stone cists. Along with the bones are often found flint arrow-heads, flint axe-heads, stone hammers, stone rings, glass beads, implements of bone, bones of horses and oxen, spear-heads, and other weapons of bronze. In some instances, human bones are found unburned, enclosed in stone cists about three feet long, or, more rarely, of the full size of a man. In one case, as many as seventeen stone cists were found in one cairn.

Many cairns are of considerable size. Each of three cairns at Memsie, near Fraserburg, in Aberdeenshire, was about 300 feet in circumference, and about 40 feet high. A C. in the parish of Minnigaff, in Galloway, was 891 feet in circumference. Several of the larger cairns are what is called 'chambered'—that is, have internal galleries or cells. Of three large ringed cairns at Clava, on the banks of the Nairn river, near the battle-field of Culloden, one was found to contain a gallery, about 2 feet wide, leading from the south side of the C. to a circular chamber in the center, about 15 feet in diameter, built of unhewn and uncemented stones, each course overlapping the other so as to meet at the top in that sort of rude dome which has received the name of the 'beehive house' (q. v.). The Boss C., on the moor of Dranandow, in the parish of Minnigaff, had two galleries crossing each other—each 80 feet long, 4 feet wide, and 3 feet high.

But of all the 'chambered' cairns, the most remarkable is that at New Grange, on the banks of the Boyne, near Drogheda, in Ireland. It is 400 paces in circumference, and about 80 feet high, and is supposed to contain 180,000 tons of stones. In 1699, it was described by Edward Llhwyd, the Welsh antiquary, as 'a mount or barrow, of very considerable height, encompassed with vast stones, pitched on end, round the bottom of it, and having another, lesser, standing on the top.' This last pillar has disappeared; of the outer ring of pillars, ten still remain, placed at about ten yards one from another. 'The cairn,' says Mr. Wakeman in his *Archæologia Hibernica* (Dublin, 1848), 'in its present ruinous condition, presents the appearance of a grassy hill partly wooded; but, upon examination, the coating of earth is found to be altogether superficial, and in several places the stones, of which the hill is entirely composed, are laid bare. The opening [which is nearly square, and lined by large flags] was accidentally dissovered about the year 1699. The gallery, of which it is the external entrance, communicates with a [dome-roofed] chamber or cave nearly in the center of the mound. This gallery, which measures in length about 50 feet, is, at its entrance, 4 feet high; in breadth about 3 feet. Towards the interior, its size gradually increases; and its height, where it forms the chamber, is 18 feet. The chamber is cruciform, the head and arms of the cross being formed by three recesses—each containing a basin of granite. The sides of these recesses are composed of immense blocks of stone, several of which bear a great variety of carving, supposed by some to be symbolical. The majority of these carvings must have been executed before the stones had been placed in their present position. The length of the passage and chamber from north to south is 75 feet, and the breadth of the chamber from east to west 20 feet. Of the urns or basins in the recesses, that to the east is the most remarkable. It is formed of a block of granite, and appears to have been set upon, or rather, within, another of somewhat larger dimensions.' The Irish antiquaries believe that the chambered C. of New Grange—'the Cave of Achadh Aldai,' as it was called, from Aldai, the ancestor of the Tuatha De Danaan kings—was opened and rifled by the Norsemen in 862. About a mile from it, on either side, are other two cairns of nearly equal size, named Knowth and Dowth. The latter was opened in 1847, and found to contain a gallery, a cruciform chamber, a basin or sarcophagus, and carved stones, all of the same type as those of New Grange.

Engravings of the sculptures, in both cairns, are given in Mr. W. R. Wilde's *Boyne and Blackwater*, pp. 192—207 (Dublin, 1850), and some of them are obviously of the same character with sculptures found in Scandinavia; at Locmariaker, and at Gavr Innis, in the Morbihan, in Britanny; in one of the cells of a tumulus opened in 1853 at Pickaquoy, near Kirkwall, in Orkney; among the ruins of an ancient fort at the Laws, near Dundee; at the ancient forts of Rowtin Lynn, and Old Bewick, in Northumberland; and on one of the standing stones near Penrith in Cumberland, called 'Long Meg and her Daughters.'

Cairns are most frequent in stony countries. Where, as in many parts of England, stones are scarce, the barrow or earthen mound came in place of the C., from which it differs only in the materials of which it is made. So also in Scandinavia. Cairns, or *dysser*, as they are there called, are rare in Denmark, but of more common occurrence in Sweden and Norway.

CAIRNGO'RM STONE, or simply CAIRNGORM, a name often given by jewelers, and particularly in Scotland, to brown or yellow quartz or rock-crystal, because found at Cairngorm, in Aberdeenshire. The same mineral is found in many other localities, as at Olivet near Orleans, in Brazil, and in Siberia. In Cairngorm

and the neighboring district of Mar, it occurs both in the granite rock and in the alluvial soil. It differs from common colorless quartz or rock-crystal only in the presence of a very little oxide of iron or manganese, to which it owes its color. It is much used as an ornamental stone. The yellow variety is not unfrequently called topaz, although quite different from the true topaz, which it resembles chiefly in color, having neither its hardness nor its brilliancy. The topaz is, however, sometimes found along with it in the granite and gneiss districts of Mar and Cairngorm. The brown variety is sometimes called SMOKY QUARTZ, and when of a good and uniform color is by some preferred to the yellow.

CAI'RO (Arabic, *Musr el Kahirah*, 'the victorious capital'), the capital of modern Egypt, is situated in lat. 30° 2′ N., and long. 31° 16′ E., in a sandy plain betwixt the right bank of the Nile and the ridge of Mokattam, and near the point of the delta of the Nile. From the foundation of the city in 969, the Fatimite califs of Africa, who brought the bones of their ancestors with them from Kairon, reigned for ten generations over the land of Egypt.

The calif Hakem, who built a mosque near Bab-el-Nassr, and who is the supposed founder of the Druse religion, was the third in this succession. In the year 1171, Saladin usurped the throne from the last of the Fatimites. His descendant, Moosa-el-Ashref, was deposed in his turn in 1250; from that time till the year 1517, when the city was stormed and taken by Sultan Selim, C. was governed by a succession of Mameluke kings. C. was occupied by British troops in 1882.

The city of C. occupies about three square miles, and is surrounded by a low wall. Of late years it has been greatly improved. It is lighted with gas, and many fine broad streets have been opened through the crowded districts. The bazaars are well and richly supplied. The houses, which are generally two or three stories high, are all built of variegated brick, with interlinings of wood, and have flat roofs. The city is divided into different quarters, one quarter being appropriated to the Turks, one to the Christians, one to the Jews, &c.; so that every religious sect has its own quarter, which is separated from the adjoining one by strong gates at the end of the streets; these are closed at night, and guarded by a porter, who opens the gate when any one wants to pass.

The most remarkable buildings in the city of C. are its minarets and mosques. The minarets are the most beautiful of any in the Levant, of a prodigious height, and built of alternate layers of red and white stone. The most ancient of all the minarets is that attached to the great mosque of Sultan Tayloon. This mosque was built in the year of the Hegira 265 (879 A.D.), before the foundation of the city, and consists of an immense cloister or arcade built on pointed arches, being the earliest extant in that form. Another magnificent mosque is that of the Sultan Hassan, situated in the place of the Roumayli, near the citadel, and which was finished about the year 1362 A.D. It has two very elegant and high minarets, and the mosque, in consequence of its size, and the thickness of its walls, was frequently seized and made use of as a fortress by the insurgents in the numerous rebellions and insurrections which were always taking place at C. under the rule of the Mameluke kings. Stains of blood are still to be traced on the marble walls of the courtyard.

The population of C. consists of the ruling class, who are all Turks; Arabs, the former conquerors of the land, who form the bulk of the population, all the petty tradesmen and cultivators of the soil being of Arab origin; Copts, who are descended from the original lords of the land, the ancient Egyptians; Jews, Armenians, Syrians, Africans, and Europeans. Pop. (1872) 350,000. The Copts, a mere fraction of the population, completed, in 1867, a fine, lofty, spacious church. Since 1863 the part of C. occupied by Europeans has been handsomely rebuilt. In 1876, C. was connected by rail with Heluan, one of the numerous bathing-places lying to the south.

Of objects worthy of note in the environs of C., there may be mentioned the tombs of the califs, situated about a mile beyond the walls, which are magnificent and imposing buildings, forming beautiful specimens of Arabian architecture. The mausoleum of Sultan Bergook is a triumph of Saracenic architecture. The public gardens, which consist of groves of orange, citron, palms, and vines, are very beautiful. The trade of C. is rapidly increasing. The exports consist mainly of native products, such as ivory, gum, wood, hides, ostrich feathers, cotton, and sugar; while the imports are cotton and woollen goods, prints, hardware, cloth, furniture, shawls, indigo, sheep, tobacco, &c. The manufactures of C. embrace silk and cotton fabrics, gunpowder, glass lamps, sugar, sal ammoniac, weapons, and iron ware. C. is a great seat of learning, and popular education has recently advanced. The government college and the national schools are largely attended, while several thousand pupils attend the theological university attached to the mosque of Ezher. The schools comprise a commercial and juridical school at the Darb Algamâmiz, a school of arts and industry at Boolak (q. v.), and military schools at the Abbasseeyah. The language spoken at C. is Arabic, which, though not the purest, is superior in pronunciation to that spoken in Syria. C. is the official residence of the Khedive of Egypt, and the residence of a consul-general from Great Britain, France, &c. C. has railway connection with Alexandria and Suez, and there is also a line to Upper Egypt.

CAISSO'N, in military matters, is a name sometimes given to a tumbril or ammunition wagon. It is more frequently applied, however, to a large wooden chest or frame, loaded with powder, shells, or both, and buried several feet deep in the ground under some fortification; this destructive combination is to be blown up if there be danger of the enemy approaching and taking possession of that particular part of the defence-work. The French give the name of *caisson pour les vivres* to a large chest, carried with the army, and capable of containing 800 rations.

CAISSON, in relation to shipping, is an apparatus for lifting a vessel out of the water for repairs or inspection. It is usually a hollow structure, sunk by letting water into it. There is an air-chamber inside, which allows it to sink only to a certain depth. In that state it is hauled under the ship's bottom, the traps or openings are closed, the water is pumped out, and the caisson rises with the ship upon it.

In another arrangement, a platform is sunk to a certain depth in the water, and is suspended by iron screws from a strong wooden framework; the ship is floated upon the platform, steadied by shores, and lifted high and dry by means of levers, wheels, pinions, and screws.

CAI'THNESS, a maritime county, the most northerly on the mainland of Scotland. It is triangular in shape; length from north to south, 40 miles; greatest breadth, 30 miles; area, 712 square miles. Except in the west and south, where the mountain-range (composed of granite and gneiss) dividing C. from Sutherland attains, in its highest point, a height of more than 2300 feet, the general aspect of C. is level and bare, being in great part moorland and destitute of trees, while the sea-coast is bold and rocky, with many bays, inlets, promontories, and caves. On the north coast are Dunnet Head and Duncansby Head; and on the west side of the last-named head is a spot of green turf, called John o' Groat's House, where John de Groot or Groat of Warse settled with his brothers in James IV.'s time, and built a house. There are no navigable rivers in C., and no lakes of importance. The climate is damp and chilly, but snow rarely lies on the plains above a day or two at a time. Thunder is rare, but auroræ are seen almost nightly. There are no manufactures, properly so called, although weaving is carried on to some extent. Coal has not been found in C.; the common fuel is peat. The chief crops are oats, bear, turnips, and potatoes. The parts of the surface under tillage are generally a deep fertile loam on a strong till clay. In the north-east the soil is sandy. The crops are 20 days later in ripening than in the Lothians. The occupants of many of the small farms divide their time between farming and fishing. There are herring, ling, cod, salmon, and lobster fisheries.

The herring-fishery in July and August employs about 1500 boats, a part of which come from other parts of the Scotch coasts. Wick is the chief seat of the British herring-fishery. The average number of barrels cured annually in the ports of C. may be stated at 200,000. The other exports are cattle, oats, wool, and flagstones, of which, as well as of freestone and slate, C. contains quarries. Wick is the only parliamentary borough in C.; another town is Thurso, an old burgh of barony. Of the total acreage, which is 455,708 acres, some 35,000 are in corn, 17,000 in green crops, and 32,000 in grass. Pop. (1881) 38,865. The county returns one member to parliament, and Wick unites with Kirkwall, Dornoch, Dingwall, Tain, and Cromarty, in returning another. A railway, completed in 1874, and extending to Wick and Thurso, connects C. with the south. In early times, C. is supposed to have been inhabited by Celts; these afterwards mixed with Danes and Norwegians. C. in the middle ages, was subject to the kings of Norway. David II. adopted the weights and measures of C. for all Scotland. The Scandinavian origin or mixture of the people of C. is shown by their tall forms and soft fair features, and their speaking English instead of Gaelic. C. has remains of Picts' houses, round towers, &c.

CAITHNESS FLAGSTONES are dark-colored bituminous schists, slightly micaceous and calcareous, valuable on account of their great toughness and durability for pavements, cisterns, and various other purposes, and accordingly are largely exported. They belong to the Old Red Sandstone, and contain abundant remains of fossil fishes.

CAIUS, DR. JOHN, the person from whom Caius College, Cambridge, takes its name, was born at Norwich in 1510. His real name was Kaye or Key, which he Latinized into Caius. He was educated at Gonville Hall, university of Cambridge; and at the age of 20, turned into English Chrysostom's *Method of Praying to God*, which was followed by a translation of Erasmus *On True*

Theology. He next went abroad, and resided in Italy for several years, studying medicine. On his return to England, he practised with success at Cambridge, Shrewsbury, and Norwich. Henry VIII. appointed him anatomical lecturer to the Company of Surgeons in London. In 1547, he was elected a fellow of the College of Physicians, of which he was subsequently made president. He also became physician to Edward VI., Queen Mary, and Queen Elizabeth. In 1557, he obtained permission to elevate Gonville Hall into a college, which took the name of Caius College, and of which he became master. This office he held till his death, in July 1573. His principal work is, *A Boke or Counseill against the Disease commonly called the Sweate or Sweatyng Sicknesse. · Anno Do.* 1552. C., however, wrote a great number of works on a variety of subjects, critical, antiquarian, and scientific.

CAIUS COLLEGE. See GONVILLE AND CAIUS COLLEGE.

CAIVA'NO, a town of southern Italy, in the province of Naples, and 8 miles north of the city of that name. It was a place of considerable strength in the middle ages, and still retains many remains of its walls and towers, though they have suffered severely in the various revolutions of Naples. Pop. 10,000.

CA'JEPUT (*Melaleuca Cajeputi* or *M. minor*), a tree of the natural order *Myrtaceæ*, sub-order, *Leptospermeæ*, from the leaves of which the pungent, aromatic, volatile oil, called *Oil of Cajeput*, is obtained by distillation. The C. tree is common on the mountains of the Moluccas. It is rather a small tree, with a crooked trunk, thick spongy bark, white wood (whence the name C., properly *kayuputi*, signifying white wood), elliptical-lanceolate alternate leaves, and terminal spikes of white flowers. The greater number of the species are natives of Australia, some of them are very beautiful shrubs and frequent ornaments of British hot-houses. Much of the oil of C. of commerce is prepared in the island of Banda. It is said that two sackfuls of leaves yield scarcely three drachms of the oil, which is green, transparent, limpid, with a strong penetrating odor, and agreeable only when much diffused.

CA'LABA TREE. See CALOPHYLLUM.

CALABA'R, the name of a coast district of Upper Guinea, Africa, the limits of which are not clearly defined; but it is usually understood to extend between the river Benin and New Calabar, called by the Portuguese, Rio del Rey, and as far north as the Kong Mountains. The surface is low and flat, and the climate unhealthy. Yams, which are the principal food of the inhabitants, are raised in plenty, and also the sugar-cane, and palms, from which palm-oil is obtained in large quantities. The inhabitants are polygamists, and make human sacrifices to good and evil spirits. The United Presbyterians have had a mission here since 1846, which is beginning to produce beneficial changes.

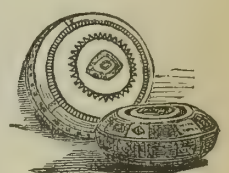
CALABAR (OLD), a river of this district, enters the Bight of Biafra, about 52 miles west-north-west of Fernando Po, by an estuary about 9 miles in breadth. It is navigable by steamers for about 200 miles above its mouth, and abounds in crocodiles. The chief towns on its banks are—Duke Town, situated on its estuary; Creek Town, further up, both seats of British missions; Acoono Coono, and Omun.—CALABAR (NEW), a branch of the Niger falling into the Bight of Biafra, in lat. 4° 30′ N., and long. 7° 7′ E. It has a bar across its mouth, which prevents the entrance of vessels drawing more than 12 feet; but some miles up it has an average depth of 30 feet.

CALABAR BEAN, a very remarkable medicinal agent, which has been introduced into the new edition of the British Pharmacopœia (1867). It is the seed of *Physostigma venenosum*, a twining, half-shrubby plant, a native of Western Africa, of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, nearly allied to the kidney bean, but of a genus distinguished by the hood-shaped stigma, and the deeply-furrowed hilum of the seed. The following are the leading characters of the bean itself: 'About the size of a very large horse-bean, with a very firm, hard, brittle, shining integument, of a brownish-red, pale chocolate, or ash-gray color. Irregularly kidney-shaped, with two flat sides, and a furrow running longitudinally along its convex margin, ending in an aperture near one end of the seed. Within the shell is a kernel, consisting of two cotyledons, weighing on an average about 46 grains, hard, white, and pulverizable, of a taste like that of the ordinary edible leguminous seeds, without bitterness, acrimony, or aromatic flavor. It yields its virtues to alcohol, and imperfectly to water.' It is used in the form of an emulsion by the natives of Africa, as an ordeal when persons are suspected of witchcraft. About twenty years ago, Dr. Christison very nearly fell a victim to his zeal for science in experimenting on some specimens of this bean which had been sent to Edinburgh by some African missionaries, dangerous symptoms having been produced by 12 grains of the kernel which he swallowed. In 1861, Dr. Thomas R. Fraser tried the effects upon himself of doses of 6, 8, and 10 grains. The general symptoms were epigastric uneasiness, great feebleness, dimness of vision, salivation, giddiness, and irregular, feeble, and slow heart's action. About the same time, he made the interesting discovery, that when placed on the eyeball this substance contracts the pupil, and produces near-sightedness; and it is now frequently employed for these purposes by ophthalmic surgeons. In 1864, 50 children were poisoned by eating these beans, which were swept out of a ship at Liverpool. A boy aged six years, who ate six beans, died very rapidly. The chief symptoms in these cases were griping, vomiting, and contracted pupils; the face was pale, the eyes bright and protruding, and in trying to walk, the children staggered as if they were drunk. Dr. Fraser, in a paper which he communicated to the Royal Society of Edinburgh in 1866, maintains that, in mammals, death is generally produced by a combination of syncope (faintness) with asphyxia (suffocation); the symptoms of the one or the other depending on the dose, which, when large, at once destroys the heart's action.

It has been used medicinally in small doses (one to ten grains of the powder, or $\frac{1}{16}$ to $\frac{1}{8}$d of a grain of the extract) in chorea, tetanus, general paralysis of the insane, and other diseases of the nervous system. Being now a recognized medicinal agent, it is satisfactory to know that the dangerous and even fatal effects of excessive doses may be prevented by administering belladonna (night-shade), or its active principle, atropia, as a counter-poison. This fact has been established by Dr. Fraser in a communication to the Royal Society of Edinburgh, embracing the results of 500 experiments on dogs and rabbits. So unmistakable is the power of the antidote, that it can prevent even three times a fatal dose of the kernel from causing death in those animals. Belladonna has also an opposite action on the eye to that of this substance, as it dilates the pupils and produces long-sightedness. When the pupil is contracted by Calabar bean, it may be dilated to its normal, or to a greater, size by belladonna; and when it is dilated by belladonna, it may be reduced to its normal, or to a less, size by Calabar bean.

CALABASH TREE (*Crescentia Cujete*), a tree found in the West Indies and in the tropical parts of America, of the natural order *Bignoniaceæ* (q. v.), suborder *Crescentiaceæ*. In height and size it resembles an apple-tree, and has wedge-shaped leaves, large whitish fleshy flowers scattered over the trunk and older branches, and a gourd-like fruit, sometimes a foot in diameter. The wood of the tree is tough and flexible, and is well adapted for coach-making. But the most useful part is the hard shell of the fruit, which, under the name of *calabash*, is much used in place of bottles for holding liquids, and for goblets, cups, water-cans, &c. These shells may even be used as kettles for boiling liquids, and they will bear this several times without being destroyed. They are sometimes highly polished, carved with figures, tinged with various colors, and converted into ornamental vessels. The rinds of gourds are sometimes similarly used, and called calabashes.

Calabash Tree.



Carved Calabashes.

CALA'BRIA, the south-west peninsula of the kingdom of Italy, bounded north by the province of Basilicata. Its greatest length, from the southern border of Basilicata to Cape Spartivento, is about 160 miles. In its northern part it has a breadth in some places of more than 60 miles, which suddenly contracts, between the Gulfs of Sant' Eufemia and Squillace, to not more than 16. Its entire area is nearly 7000 square miles, and its population, in 1881, amounted to 1,258,225. It is traversed throughout its entire length by the Apennine Mountains (q. v.), whose summits in the region in the north of C., known as La Sila, and the Aspromonte, in the south, are crowned with pines, while forests of oak and beech cover their sides. The valleys between the various hills

afford rich pasture, especially in the north, to which, in spring-time, whole colonies migrate with their flocks and herds. There is no river of any importance in C.; but the valleys and plains, watered by such streams as there are, are very fertile, yielding wheat, rice, cotton, liquorice, saffron, the sugar-cane, &c., and also the vine, orange, lemon, olive, fig, and mulberry, in luxuriance. Iron, alabaster, marble, gypsum, and antimony, are among its minerals. The fisheries of its coasts, particularly the tunny and anchovy fisheries, are important, and afford employment to a large number of the population. Manufactures are in a backward state. Silk is the staple article. The district is very subject to earthquakes. For purposes of administration, C. is divided into the provinces of Cosenza, which has a population of 451,271—capital, Cosenza; Catanzaro, with a population of 434,217—capital, Catanzaro; and Reggio, with a population of 372,737—capital, Reggio.

In ancient times, the name C. was given to the south-east peninsula, nearly corresponding to the modern province of Lecce, no portion of which is included in modern C., which answers to the ancient *Bruttium*. The name C., as applied to the district now known by that name, appears to have originated with the Byzantines sometime prior to the conquest of the country by the Normans. A colony of the Vaudois or Waldenses of Piedmont was founded in C. in 1340, and for some time enjoyed great prosperity, but was extirpated in 1560—1561. The destruction of this colony is one of the blackest passages of the history of religion in Italy.

The Calabrians are a proud, fiery, and revengeful race. They were long celebrated as among the fiercest of banditti; but the crimes which in former times made them infamous are no longer frequent. They strenuously resisted the power of France during the Napoleonic campaigns, and were not finally subdued until 1810.

CALA'DIUM. See Cocco.

CALAHO'RRA, a town of Spain in the province of Logroño, 24 miles south-east of the city of that name, is situated on the small river Cidacos, about 2 miles from its confluence with the Ebro. C. occupies the site of the ancient *Calagurris*, celebrated in classic history for the obstinate but unsuccessful resistance it offered (78 B.C.) to Afranius, Pompey's legate, when the citizens slaughtered their wives and children for food rather than surrender. C. was the birthplace of Quintilian the rhetorician. It has an old cathedral, and a trade in the agricultural produce of the rich district in which it is situated. Pop. about 8000.

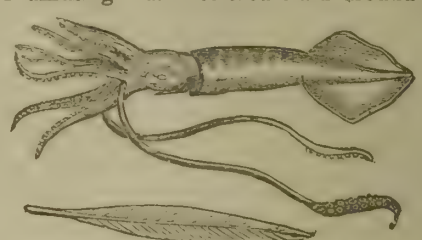
CALAIS, a seaport town of France, in the department of Pas-de-Calais, on the Strait of Dover, near its narrowest part, the distance from the town of Dover not being more than 26 miles. There is here a lighthouse 190 feet high. In 1879 it was determined to encircle C. with vast new fortifications, and make it once more a fortress of the first class. On the south and east, low marshy grounds, which those in the city have the means of submerging, stretch up almost to the walls. The town, adjacent country, and port are commanded by the citadel, which is situated at the west end of the town, while numerous forts, by their cross-fire, defend the weakest points. The harbor, which is nearly dry at low tide, and which has rarely more than from 15 to 18 feet of water in it, is formed by two moles, which project about three-quarters of a mile into the sea. Being one of the chief ports of debarkation for travelers from England to France, it has daily steam communication with Dover—with which it is also connected by submarine telegraph—and with London and Ramsgate several times a week. The city, which is entered from the sea by a drawbridge and gate, erected in 1685 by Cardinal Richelieu, is square in form; its streets are, for the most part, broad and well paved; and its ramparts form pleasant promenades. But it is on the whole a dull place. It has few objects of interest, the most noticeable being the cathedral, with a fine picture of the 'Assumption' by Vandyck.

It has become a manufacturing town of some importance. The chief manufactures are bobbin-net (tulle) and hosiery. Numerous mills have been built; steam-engines are multiplying; and the inner ramparts have been removed to make room for factories. Hats and gloves are extensively made. It has also distilleries, salt-refineries, and ship-building. C. sends many boats to fish for herring and cod on the coasts of Scotland and Iceland. Water, which used to be scarce, is now brought in abundance from the neighborhood of Guines. Its exports consist of eggs, corn, wine, brandy, &c. In 1873, a school of artillery was established in C. Pop. (1876) 12,573.

In the 9th c., C. was but a small fishing-village. In the following c., it was much improved by Baldwin IV., Count of Flanders, and enlarged and strengthened by Philippe of France, Count of Boulogne. After a long siege, it was captured by Edward III. of England, whose hard terms, and the self-devotion shown by six of the citizens, who were saved by Queen Philippa, form one of the most interesting pages of history. The English retained it until 1518, when it was captured by the Duke of Guise, since which time (with the exception of two years, 1596—1598, when it was in the possession of the Spaniards) it has remained in their hands. In 1659, Charles II. of England resided some time here; and about a quarter of a century later, James II. arrived here with French troops for the invasion of England, which the destruction of the French fleet prevented him from accomplishing. Louis XVIII. landed here in 1814, after his exile.

CALAMANDER WOOD, a cabinet-wood of the greatest value, resembling rose-wood, but much surpassing it in beauty and durability. The tree which produces it is *Diospyros hirsuta* (see DIOSPYROS), a species of the same genus which produces ebony; it has oblong obtuse leaves, which are downy beneath, and flowers without stalks and crowded; and is a native of the south-east of India, and of Ceylon, particularly of the forests at the base of Adam's Peak. But this tree 'has been so prodigally felled, first by the Dutch and afterwards by the English, without any precautions for planting or production, that it has at last become exceedingly rare,' so that wood of considerable size is scarcely to be procured at any price. It yields veneers of unusual beauty, 'dark-wavings and blotches, almost black, being gracefully disposed over a delicate fawn-colored ground.' Its density is very great, a cubic foot weighing nearly 60 lbs., and it takes an exquisite polish. The name C. W. is supposed to be a corruption of Coromandel wood.

CA'LAMARY, SQUID, or SLEEVE-FISH (*Loligo*), a genus of cephalopodous mollusks of the order *Dibranchiata*, and family *Teuthidæ*. The body is of an elongated form, firm, fleshy, tapering, and flanked towards its posterior extremity by two triangular fins. The body contains a *gladius*, or internal shell, which is horny and flexible, narrow and pen-shaped, with the shaft produced in front. The mouth is furnished with eight arms. Calamaries have the power of diffusing a dark-colored fluid around them in the



Common Calamary (*Loligo Vulgaris*), *a*, gladius.

water like the cuttle-fish. The different species are distributed over all parts of the world. Several are found in the British seas. In some seas, however, they abound much more, and form a principal part of the food of some of the larger fishes and of whales. The Common C. or Squid (*L. vulgaris*) is of a bluish color, speckled with purple. It grows to nearly a foot and a half in length, without reckoning the head and arms, which add to the length about half a foot more. See CEPHALOPODA.

CALAMIA'NÉS, a group of islands in the Eastern Archipelago, in lat. about 11° 25′—12° 20′ N., and long. 120° E. Calamianes, the name of the largest of the group, is about 35 m. long, and 15 m. broad, elevated and fertile, with abundance of animals, such as deer and hogs. The group, with the northern part of Palawan, forms the Spanish province of C., the poorest in the Philippines.

CA'LAMINE, an ore consisting essentially of carbonate of zinc. The name is said to be derived from the Greek and Latin *calamus*, a reed, because when fused it adheres to the base of the furnace in a reed-like form. Its primary form is a rhomboid, and it occurs in small obtuse-edged crystals, also compact and massive. It is white, yellowish-white, brown, green, or gray; is sometimes opaque, sometimes translucent; is brittle, and has an uneven conchoidal fracture. It occurs in beds and veins in rocks of various kinds, but most commonly in limestone. Mendip, Madlock, Alston Moor, Leadhills, and Wanlockhead are British localities. C. is an important ore of zinc. In the duchy of Limburg, in the Netherlands, about 1,500,000 lbs. of it are annually extracted from the mines.

CA'LAMINT (*Calamintha*), a genus of plants of the natural order *Labiatæ*, nearly allied to BALM (q. v.) (*Melissa*). The Common C. (*C. officinalis* formerly *Mellisa Calamintha*) is not unfrequent in England. It has whorls of flowers (*verticillasters*), on forked many-flowered stalks, and serrated leaves, with an agreeable aromatic odor, not unlike that of some kinds of mint. It is used by the country people to make herb-tea, and as a pectoral medicine.—The LESSER C. (*C. Nepeta*), also an English species, is used in the same way.

CA'LAMITE, a genus of fossil plants whose true position has not been satisfactorily ascertained. They appear first in the De-

vonian rocks, and rise through the intermediate formations to the Oolitic series, where they are represented by a single species. They reach their culminating point in the Coal-measures, where 39 species have been determined. The tall straight stems rose from a swampy clay soil in profusion in the forests of sigillaria, and formed a striking and characteristic feature in the coal flora, though they supplied little material for the structure of coal. They are hollow-jointed cylinders, with longitudinal furrows, giving the fossil the appearance of *Equiseta;* from this resemblance, botanists have generally considered them as huge 'horsetails.' Hooker has been unable to detect any traces of structure, in carefully prepared specimens, or the presence of those siliceous stomata which characterize *Equiseta*, and which would have been preserved in the fossil state, and Fleming has shown that the furrows are markings on the interior cavity. While, therefore, it is certain, that they are not 'horsetails,' the absence of fructification makes every attempt to give them their position but guess-work. Hooker supposes them nearly allied to Ferns, or Club-mosses; Brongniart ranks them among Gymnospermous Dicotyledons. The upper part of the stem, and the foliage, if any, have not been noticed. The root termination was conical, the joints decreasing downwards in size and length. From the scars on the upper portion of each joint, there proceeded filaments, which were supposed to be leaves, but are really roots. These are shown in the species figured—a species common in the English coal-field.

Fragment of Calamite (*C. cannæformis*).

CA'LAMUS, the reed pen which the ancients used in writing, was made of the stem of a reed growing in marshy places, probably *Arundo Donax* (see REED), of which the best were obtained from Egypt. The stem was first softened, then dried, and cut and split with a knife (*scalprum librarium*), as quill pens are made. To this day, the Orientals generally write with a reed, which the Arabs also call *Kalâm*.

CALAMUS, a genus of palms. See RATTAN and DRAGON'S BLOOD.

CALAMUS, a name sometimes given to the Sweet Flag (*Acorus Calamus*). See ACORUS. See also next article.

CA'LAMUS AROMA'TICUS, the name given by the ancients to a plant to which they ascribed important medicinal virtues. It is by no means ascertained what the plant is: the most probable opinion appears to be that of Dr. Royle, who supposes it to be one of the sweet-scented grasses which yield the grass-oil (q. v.) of India, to which he has given the name of *Andropogon calamus aromaticus*. See LEMON-GRASS. The C. A. of the Greeks and Romans came from the East. The *Sweet Calamus* and *Sweet Cane* mentioned in Scripture (Exod. xxx. 23, and Jer. vi. 20) are probably the same with the calamus aromaticus.

CALAMY, EDMUND, an eminent English divine, was born in London, 1600; studied at Pembroke Hall, Cambridge, where he attached himself to the Calvinistic party; and afterwards became domestic chaplain to the Bishop of Ely. In 1626, he was appointed lecturer at Bury St. Edmunds, but resigned his office when the order to read the *Book of Sports* began to be enforced. In 1639, he was chosen minister of St. Mary's, Aldermanbury, London. He now entered warmly into the controversies of the time, and became noted as a leading man on the side of the Presbyterians. He had a principal share in the composition of *Smectymnus*, a work intended as a reply to Bishop Hall's *Divine Right of Episcopacy*, and one of the most able and popular polemics of the day. Like the mass of the Presbyterian clergy, he was monarchical and not republican in his political opinions. He disapproved, therefore, of the execution of Charles, and the protectorate of Cromwell, and did not hesitate to avow his attachment to the royal cause. He was one of the deputies appointed to meet Charles II. in Holland, and congratulate him on his restoration. His services were recognized by the offer of a bishopric, which he refused from conscientious scruples. The increasing tyranny and intolerance of the High Church party compelled him to give up even his royal chaplaincy. He died October 29, 1666.—Two of his sons were educated for a religious profession: the one, Dr. BENJAMIN C., became a High Churchman, and wrote *A Discourse against a Scrupulous Conscience;* the other, EDMUND C., was ejected for nonconformity, and had a son, also named Edmund, who acquired some reputation as the biographer of the ejected clergy.

CALA'NDO, in music, an Italian expression, meaning diminishing by degrees from forte to piano; it differs from decrescendo or diminuendo, as the tempo, at the same time, is slightly retarded, but not so much as in ritardando. The proper performance of the C. is purely a matter of good taste and feeling, depending on the performer.

CALA'NDRA. See CORN WEEVIL.

CALANDRO'NÉ, a wind-instrument, used by the Italian peasants, on which they play simple melodies, and also sometimes accompany their national songs. It has the holes of the common flute, but the intonation is produced as in the common pipe.

CALAS, JEAN, a Frenchman, remembered as the unhappy victim of fanaticism and the shocking mal-administration of justice, was born at Lacaparède, in Languedoc, March 19, 1698. He lived as a tradesman in Toulouse, where he had a very good reputation. One evening after supper (October 13, 1761), the eldest son of the C. family, Marc Antoine, a youth addicted to gambling, and subject to fits of deep melancholy, was found hanged in the warehouse. There was not a shadow of a reason for doubting that the unhappy young man had committed suicide; but popular rumor accused the father, or other members of the C. family, of murdering the eldest son, 'because he had contemplated conversion to Catholicism.' It was also asserted that a young man named Lavaysse, who was in the house on the fatal evening, had been despatched 'by the Protestants of Guyenne to perpetrate the murder.' The clergy exerted all their influence to confirm the populace in their delusion. At Toulouse, the White Penitents celebrated with great solemnity the funeral of the young man, and the Dominican monks erected a scaffold and placed upon it a skeleton, holding in one hand a wreath of palms, and in the other an abjuration of Protestantism. The family of C. was, in consequence of the popular excitement, brought to trial for the murder, and several deluded and (most probably) some bribed witnesses appeared against them. A Catholic servant-maid, and the young man Lavaysse, were also implicated in the accusation. C. in his defence, insisted on his uniform kindness to all his children; reminded the court that he had not only allowed another of his sons to become a Catholic, but had also paid an annual sum for his maintenance since his conversion. He also argued from his own infirmity that he could not have prevailed over a strong young man, and referred to the well-known melancholy moods of the deceased as likely to lead to suicide; and, lastly, he pointed out the improbability that the Catholic serving-maid would assist in such a murder. But all his arguments proved unavailing, and the parliament of Toulouse sentenced the wretched man—by a majority of 8 votes against 5—to torture and death on the wheel. With great firmness and protestations of his innocence to the last, the old man died on the wheel, March 9, 1762.

His property was confiscated. His youngest son was banished for life from France, but was captured by the monks, and compelled to abjure Protestantism. The daughters were sent to a convent. The young man Lavaysse was acquitted, and the widow of C. escaped into Switzerland, where she was so fortunate as to excite the benevolent interest of Voltaire, who brought the whole affair before the public, and, in his book *Sur la Tolérance*, proved that C. had fallen a victim to religious hatred and popular fanaticism. A revision of the trial followed, and, after full investigation, the parliament at Paris declared (March 9, 1765) C. and all his family innocent. Louis XV. gave to the bereaved family the sum of 30,000 livres; but, strange to say, neither the parliament of Toulouse nor the fanatical monks were ever brought to account for this horrible judicial murder!

CALASA'YA BARK. See CINCHONA.

CALASCIBE'ETA, or CALATAS-CIBETTA (Saracenic = Castle of Xibeth, or Scibet), a town of Sicily, near its center, 54 miles south-east of Palermo, in the province of Caltanisetta. The town is mean and dismal looking, and is built on a steep and isolated height, the summit of which is 2570 feet above the sea, and commands a magnificent view. It was founded in 1080. The only object worthy of notice is the tower of the principal church, which is of early architecture. Pop. 5600.

CALASIA'O, a town of the island of Luzon (Philippines, with a population of 18,000, who are engaged in the manufacture of straw-hats, cigar-cases, &c.

CALASPA'RRA, a town of Spain, in the province of Murcia, 40 miles north-west of the city of that name. The inhabitants, numbering 5275, are chiefly engaged in agricultural pursuits.

CALATABELLO'TA, a town of Sicily, in the province of Girgenti, and 27 miles north-west of the city of that name. In the immediate vicinity is the site of the ancient *Triocala*, the chief fortress of the insurgents in the second Servile war, 103—100 B.C. Pop. about 6000.

CALATAFI'MI, a town of Sicily, in the province of Trapani, situated 8 m. S.W. of Alcamo, in a very fertile district. It is ill-built, and has a ruinous old Saracenic castle, Kalat-al-Fimi, from which it derives its name. There is a remarkable Mosaic altar in the church of Santa Croce. Here, in 1860, Garibaldi's troops defeated the Neapolitan soldiers. Pop. 9500.

CALATAGIRO'NE, or CALTAGIRO'NE, a city of Sicily, in the province, and 34 m. S.W. of the city of Catania. It is well built, with wide streets, and has the fame of great wealth. It has manufactures of cotton fabrics and pottery. Pop. (1872) 25,978.

CALATANAZO'R, a town of Aragon, Spain, about 10 miles south-west of Soria. It is celebrated for a great victory over the Christians obtained by Al-Mansur in 1001. Pop. 1500.

CALATAYU'D, a city of Aragon, Spain, situated on the Jalon, near its junction with the Jiloca, about 48 miles south-west of Saragossa. It is built at the base of two rocky ridges, and out of the ruins of ancient *Bilbilis*, which lay about 2 miles to the east. The city is divided into a new and old portion, the former of which is composed of mean old buildings. The latter has some good streets and handsome squares. C. has a noble old castle, and among its other most noteworthy public edifices are the two collegiate churches and the Dominican convent. In the neighborhood are some curious stalactitical caves. It has manufactures of linen and hempen fabrics, woollens, paper, leather, &c., and a trade in agricultural produce. Pop. 11,537.

CALATRA'VA, an order of knighthood in Spain, instituted at Calatrava (q. v.). The statutes of the order, framed by the chapter-general of the Cistercian monks, were sanctioned by the Bishop of Toledo in 1164, and afterwards by the pope. At subsequent periods, many privileges were added. After the death of the king, their patron, some of the knights were no longer willing to obey the abbot, and they consequently separated themselves from the monks, and elected a grand-master, Don Garcias de Redon.

At a later period, they again united themselves to the Cistercians, after they had gained rich possessions from the Moors both in Spain and Portugal. When Castile had fallen into anarchy, and the other kingdoms were exhausting themselves by internal feuds, the war against the unbelievers was almost entirely carried on by the knights of Calatrava. Their almost uniform success, however, gave rise to rashness; the knights were defeated by Emir Jacob ben Yuseff, nearly all of them perished, and Calatrava was occupied by the Moors. After this disaster, the knights transferred their seat to the Castle of Salvatierra, by the name of which they passed for a long time afterwards. A truce of 12 years having been concluded, during which the order revived, the knights were able, at the battle of Las Navas de Tolosa, in 1212, again to turn the tide in favor of the Christians. They then returned to Calatrava. Notwithstanding their splendid achievements, the knights of C. never possessed the vast wealth of their brethren of St. James of Compostella (q. v.), a fact which is probably to be accounted for by their having ceded a part of their conquests to the orders of Alcantara and Aviz. But their grand-masters, who were chosen from the highest families in Spain, were very powerful, and exercised a vast influence on public affairs. They did not, however, escape the jealousy of the crown. Two of them were accused of treason, and died on the scaffold; and on the death of the 13th grand-master, in 1489, the administration of the order was transferred to the king by a bull of Pope Innocent VIII. By way of compensation for the loss of their independence, the knights were permitted to marry once, though they were still bound to make vows of poverty, obedience, and conjugal chastity; and latterly to profess belief in the immaculate conception. Their original costume consisted of a coat of white mail, with a white scapulary, a black cap, and a pilgrim's hood; but this dress the Anti-pope Benedict XIII., in 1397, granted them permission to exchange for a civil apparel. Their present costume is a white mantle, with a red cross cut out in the form of lilies upon the left breast; while the cross of the order has the same symbol on a silver ground. Two convents for nuns were attached to the order, and were at one time richly endowed. The nuns, attached to the Order of C. in 1519, wore the dress of Cistercian nuns, with the cross of the order on the left side of the capoch, fastened to the scapulary.

Red Cross of Knights of Calatrava.

CALATRAVA LA VIEGA, a ruined city of Spain, situated on the Guadiana, about 12 miles north-east of Ciudad Real. In the middle ages it was a strongly fortified place, but nothing now remains but a single tower. Its defence against the Moors, undertaken by Raymond, abbot of Fitero, and Diego Velasquez in 1158, after it had been abandoned by the Templars, is famous on account of its having originated the Order of the Knights of Calatrava, long one of the most honorable in Spain. The town was called C. la Viega, or Old Calatrava, in order to distinguish it from the convent of the knights of the Order of Calatrava, erected in the neighborhood in 1214, and which was called Calatrava la Nueva.

CALBU'RGA, a town of the Nizam's dominions in Hindustan, about 110 miles to the West of Hyderabed. It stands on a tributary of the Beemah, which is itself a tributary of the Kistna or Krishna. It has been successively the capital of Hindu and Mohammedan sovereignties.

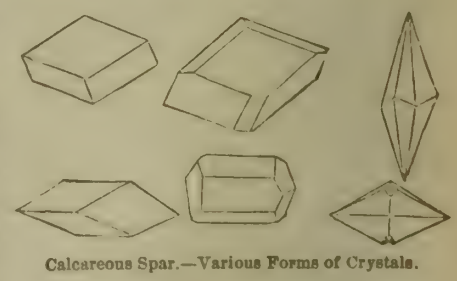
CALCAIRE GROSSIER (Fr. 'coarse limestone'), the French representative of the Bracklesham Eocene beds. It consists of compact limestones with seams of chert, and intercalated marls and freestones. The fossils are fresh water and marine mollusca; so abundant are they that in one spot near Grignon no less than 400 distinct species have been procured. Associated with the fresh-water remains are the bones of reptiles and mammalia.

CALCAIRE SILICEUX (Fr. 'siliceous limestone') is the French representative of the Bembridge Eocene strata. These compact siliceous limestones extend over a wide area in the Paris basin. The few fossils they contain are fresh water and land shells.

CALCA'REOUS, in Chemistry, is a term applied to substances containing much lime (Lat. *calx*). Thus, *C. waters* are those which hold in solution much carbonate and sulphate of lime, and which are generally known as hard waters, and form a deposit in kettles and other vessels when heated therein.—*C. rocks* are those in which lime forms the prevailing element. They may be chemically formed, as in the case of tufas, where a saturated solution of carbonate of lime in water is deposited from evaporation or other causes; but they are generally aqueous rocks, the materials of which are supplied by animal remains. Thus, many rocks, like the mountain-limestone, are composed of shells, corals, and encrinites; while others, like chalk, consist of foraminifera and fragments of other minute testacea. A crystalline structure, varying in degree from the partially crystallized carboniferous limestones to the saccharine statuary marble, is produced in calcareous rocks by metamorphic action.

Oolite is a variety of limestone composed of small egg-like grains resembling the roe of fish. The existence of lime in rocks can always be detected by the application of dilute nitric or muriatic acid, when it effervesces from the liberation of the carbonic acid. Pure lime is obtained from calcareous rocks by calcining them—i. e., by driving off the carbonic acid and other volatile matter by heat.—*C. soils* are produced from the disintegration of calcareous rocks. When the rocks are perfectly pure, they generally yield barren soils, as in many chalk and limestone districts of Britain; but when the lime is mixed with clay, so as to form marl, and has a little vegetable matter added, it forms an excellent though rather light soil. Calcareous soils are difficult of drainage, owing to the property that soft lime has of retaining water, although it easily yields it up by evaporation. Some soils are consequently soon dry at the surface after rain, but yet rarely suffer severely from drought.

CALCAREOUS SPAR, or CALC-SPAR, the name usually given by mineralogists to carbonate of lime, rhombohedral in its crystallization. It differs from arragonite only in crystallization. See ARRAGONITE. C. S. occurs in all geological formations, and is one of the most abundant of all minerals. It often completely fills cavities in rocks and although it has been prevented by want of space from assuming a crystalline form, is readily divided by the knife and hammer into rhomboids, the primary form of its crystals being a rhomboid, of which the greatest angles are 105° 5'. Its secondary forms are more numerous than those of any other mineral. More than seven hundred have been observed. One of the most common, a rather elongated pyramid, is sometimes called *Dog-tooth Spar*. C. S. is colorless and transparent, except in consequence of impurities which may be present in it; and when perfectly transparent, it exhibits in a high degree the property of double refraction of light, which was first discovered in it by Bartholinus. The presence of foreign substances frequently renders C. S. gray, blue, green, yellow, red, brown, or even black.



Calcareous Spar.—Various Forms of Crystals.

The name *Iceland Spar* has often been given to C. S., at least to the finest colorless and transparent variety, because it is found in Iceland, massive in trap-rock. *Slate Spar* is a lamellar variety, often with a shining, pearly lustre, and a greasy feel, of which Wicklow in Ireland, and Glen Tilt in Scotland are localities.

CALCAREOUS TUFA, CALC-TUFF, or TUFACEOUS LIMESTONE, a mineral which in its chemical composition is nearly identical with limestone and marble; but is distinguished by its spongy and cellular structure. It is generally rather soft, brittle, and friable, but sometimes it is sufficiently hard to be used as a building stone. The *travertino*, used for building at Rome, is a hard calcareous tufa. The color of C. T. is generally yellowish-gray, sometimes yellow or yellowish-brown. It occurs massive, or assumes many uncrystalline forms, as tubular, botryoidal (like clusters of grapes), cellular, &c. Sometimes it incrusts animal and vegetable remains. It is frequent in the neighborhood of calcareous springs. It is sometimes used as a filtering-stone.

CALCE'DONY. See CHALCEDONY.

CALCEOLA'RIA (Lat. *calceolus*, a little shoe), a genus of plants of the natural order *Scrophulariaceæ* (q. v.), of which there are numerous species, natives of South America, chiefly of that part of the Andes which is more than 9600 feet above the sea, a few of them reaching almost to the utmost limits of vegetation; although some are found in lower and warmer situations, and some in the southern extremity of the American continent. They abound so much in some parts of Chili and Peru, as to give a peculiar aspect to the landscape. The calyx in this genus is 4-partite; the corolla, 2-lipped; the lower lip remarkably inflated, so as to form a bag; and the shape of the whole in some species considerably resembling that of a slipper. There are only two fertile stamens, and the capsule is semi-bivalvular with bifid valves. Some of the species are shrubby, some herbaceous, almost all the herbaceous species being perennial. Many of them have corymbs of numerous showy flowers. Yellow is the color which chiefly prevails in the flowers of the original species, and next to it purple; but the art of the gardener has succeeded in producing varieties and hybrids which exhibit many other rich and delicate tints. Calceolarias have been florists' flowers since about 1830, the curious appearance of the flowers combining with their beauty to render them attractive, and in no genus is the production of hybrids more easily or frequently effected. They are easily propagated by cuttings. Few plants require more liberal supplies of water.

They are generally treated in Britain as half-hardy or as greenhouse plants.—Some of the species are used in South America for dyeing. The roots of *C. arachnoidea*, a parent of many of the hybrids in our gardens, are largely employed in Chili, under the name of *Relbum*, for dyeing woollen cloths crimson.

CALCINA'TION, or CALCI'NING (see CALX), is the process of heating or roasting in furnaces or in heaps the various metallic ores. It is resorted to as the first stage in the extraction of the majority of the common metals from their ores, and is essentially a process of oxidation.

CA'LCIUM is the metal present in chalk, stucco, and other compounds of lime. It may be obtained by passing a powerful currrent of voltaic electricity through fused chloride of C. (CaCl) when the metal separates in minute globules. It is a yellowish-white metal, can be rolled into sheets, and hammered into leaves, and is intermediate between lead and gold in hardness. It is represented by the symbol Ca, has the atomic weight or equivalent 20 (new system, 40), and has the density 1·578, or nearly half as heavy again as water. At ordinary temperatures, it slowly tarnishes by oxidation, and when placed in contact with water, it rapidly decomposes the water (HO), forming lime (CaO), whilst hydrogen escapes. To be retained bright, C. must be kept under the surface of naphtha. At a red heat, it melts and burns with a dazzling white light, accompanied by scintillations. See LIME.

CALCOTT, SIR AUGUSTUS WALL, R.A., a distinguished English landscape painter, was born at Kensington, London, in 1779. In 1803, he devoted himself to landscape painting; in 1810, was made a member of the Royal Academy; was knighted in 1837; and in 1844, made conservator of royal pictures. His landscapes are remarkable for their beauty, clear definition of objects, good drawing, and truthful natural coloring. He has been called the English Claude, a designation to which he is not altogether unentitled. He died November 1844.

CALCOTT, JOHN WALL, a distinguished musical composer, elder brother of the above, was born at Kensington, 1766. Too nervous to be a surgeon, for which he was intended, he devoted his attention to music, and in 1785 won three of the four gold medals annually given by the Catch Club, the admired *O Sovereign of the willing Soul* being one of the successful pieces. During the next ten years, he obtained twenty of the medals given by the same society. In 1785, he was made Bachelor, and five years afterwards, Doctor of music at Oxford. In 1805, he published his *Musical Grammar;* in the following year his mind gave way under the continuous strain to which it had been subject. He recovered again, but only for three years, when he relapsed, and continued insane until his death in May 1821. He was one of the most eminent composers belonging to the British school of music, and especially celebrated for his glee compositions. His choicest productions were published in two volumes by his son-in-law, Mr. Horsley, in 1824.

CA'LC-SINTER, a mineral, chemically identical with the purest marble and calcareous spar, but peculiarly characterized by its fibrous structure. It is formed from water holding carbonate of lime in solution, and occurs generally incrusting the roofs, walls, and floors of caves, particularly those in limestone rocks; often assuming curious and even fantastic forms. Macalister's Cave, in the Isle of Skye, and the limestone caves of Derbyshire, are the most celebrated British localities. But the stalactitic cave of Antiparos, in the Grecian Archipelago, is a far more famous locality for this mineral, which is often called *Calcareous Alabaster*, and used for the same purposes with the true alabaster (q. v.), to which it is in some respects preferable, particularly as not being liable to injury from exposure to the air. Volterra, in Tuscany, is another very famous locality for Calc-sinter.

CA'LCULATING MACHI'NE. The most remarkable application hitherto made of machinery, is perhaps that through which it has been used to relieve the scientific inquirer to a very great extent of the fatigue of manipulating figures, which consumes so much of his time and energies. Various machines have been constructed for this purpose, differing in the extent of their faculties —to use words more suitable to thinking beings than to engines— and somewhat in the principles of their construction. By the *Arithmometer*, for instance, a machine invented by M. Thomas of Colmar, all ordinary arithmetical operations are executed without fatigue to the operator; and by a machine contrived by M. M. Scheutz, which rests on the principle of *Differences* (q. v.), on the turning of a wheel, the successive terms of any series whose law may be confided to it, are produced—the machine at the same time *printing* a large proportion of its results, and thus providing for the accuracy of its tables. It is a fact of which the nation should be proud, that our countryman, Mr. Babbage, is universally acknowledged as the instigating and guiding genius in the progress of these remarkable inventions.

Among his inventions was a *Difference Engine*, of very comprehensive powers, indeed capable of managing series so complex that the differences of its terms do not reach zero until we ascend to the seventh order (*vide* art. DIFFERENCES, CALCULUS OF). An immense range of nautical and astronomical tables lie within the limits just defined; and the machine further tabulates approximately any series whatever that can be treated by the *Method of Differences*. While engaged in constructing the *Difference Machine*, Mr. Babbage, probably through his increased experience of the capabilities of machinery, was led to form a new conception —that, namely, of the *Analytical Machine*. He actually succeeded so far as to devise the means of making his machine perform all the elementary operations of addition, subtraction, multiplication, and division; and it is clear that all changes that can be produced on quantity are merely combinations of these. If, then, he could but have made his machine perform these operations at command, and according to any special order, it could have clearly developed any function whatever whose law is ascertained and fixed. A solution of this difficulty was suggested by the Jacquard Loom (q.v.), in which the *cards* oblige a machine capable of working *any* pattern to work out one particular pattern; and Mr. Babbage having succeeded so far as to form a machine capable of executing any development, expected, by means of *cards of operations*, to compel his C. M. to work according to one fixed law, and no other. Government, however, did not see its way to make the further grants required for this machine, and at Mr. Babbage's death in 1871, nothing further had been done towards its completion. The *Difference Machine* is now lying, an unfinished curiosity, in the museum of King's College, London. Both machines will be found described in the third volume of Taylor's *Scientific Memoirs*. The *Difference Engine*, constructed by Grant for the university of Pennsylvania, is said to be less expensive than Babbage's, and less complicated than Scheutz's, though provided like it with an apparatus for printing the results.

CA'LCULUS, or STONE (in Medicine), a hard concretion formed within the animal body, in consequence of the deposition in the solid form of matters which usually remain in solution. See CONCRETION. The concretions most commonly termed calculi are those formed in the kidneys or bladder (*Urinary C.*); and those formed in the gall-bladder or biliary ducts (*Biliary C.*). Both of these give rise to very painful symptoms, and may even threaten life.

Biliary C., or *Gall-stone*, may generally be presumed to exist when excessively severe pain suddenly arises in the right side beneath the border of the ribs, and when in a few hours jaundice comes on, showing that some obstruction has existed to the outward flow of the bile. But the absolute proof that these symptoms depend on C. is often wanting. The pain is fortunately transitory, but is more severe while it lasts than almost any other known form of suffering, unless it be that of a C. in the kidney and ureter. It may be relieved by large doses of opium, but the

remedy requires to be cautiously given, as even in medical hands fatal accidents have occurred. Gall-stones, when impacted in the ducts, sometimes have proved fatal; but much more frequently they find their way, sooner or later, into the intestines. They are almost invariably composed of cholesterine (q. v.), with coloring matter and mucus, arranged in layers in a semi-crystalline disposition.

Urinary C. is a disease of all ages, but most common in advanced life and in the male sex. It is also very frequent in gouty persons or among those who pursue sedentary occupations, and live freely. It is rare among those who live much in the open air, or who take much violent exercise, and use little animal food and wine. Among sailors it is peculiarly rare. In certain parts of the country, the disease is said to be frequent, as in Norfolk, and perhaps along the east coast of Scotland. In India, too, where some of the predisposing circumstances mentioned above can hardly be said to prevail, stone is by no means uncommon. It would appear therefore, that the predisposing causes of C. are still very imperfectly understood. In its early stages, the disease usually presents itself in the form of *Gravel*, shown by the passage of numerous very small portions of gritty concretions, which may be observed in the urine as a deposit like sand, or like small grains of Cayenne pepper. When such deposits occur frequently, especially if they are present at the time of passing the urine, and not merely after it has cooled, there is reason to apprehend the formation of calculus. If, in these circumstances, there are pains of a dull character in the loins, with occasional twinges of sharper suffering, no time should be lost in seeking medical advice. If a fit of very severe pain should occur in a person for some time affected with gravel, if the urine be bloody, if agonizing twinges, commencing in the loins, sting downwards into the thigh or the groin it is probable that a stone has already formed in the kidney, and is being displaced towards the bladder.

C. in the bladder is at first attended with little suffering, as compared with that caused by the stone in its passage downwards from the kidney; but unless removed or evacuated, the C. is sure to enlarge, and it then becomes the cause of one of the most painful diseases that afflict humanity. The existence of a stone in the bladder, however, should never be taken for granted without a surgical examination, as all the symptoms are deceptive in certain cases. The most striking, and perhaps the most trustworthy evidence of stone in the bladder, apart from the use of the sound (see LITHOTOMY), is smarting and burning pain experienced after the bladder has been emptied, together with occasional temporary stoppage in the flow of the urine. The correct appreciation of all the symptoms, however, demands considerable familiarity with such cases.

The discovery of the tendency to urinary C. at an early period of its growth, has been greatly aided by the use of the microscope and of chemical tests. Generally speaking, it may be said that whenever the urine, after standing for a few hours, can be observed to contain more sediment than a very slight cloudiness towards the bottom of the vessel, there is room for careful inquiry into the existence of some derangement of the health. But all sediments are not equally apt to determine C., nor is the treatment of the different kinds of sediment at all similar; care should therefore be taken to determine, from time to time, whether the character of the sediment may have undergone a change, so that the treatment may be adapted accordingly.

Alternating Calculus—from Dr. Marcet's Essay on Calculus.

a, uric acid nucleus; *b*, oxalate of lime; *c*, phosphates of lime, and of magnesia and ammonia.

The chief varieties of urinary C. are—1. Uric acid (red sand); 2. Urates of ammonia, soda, lime, &c. (brick-dust sediment); 3. Phosphates of ammonia and magnesia, lime, &c.; 4. Oxalate of lime; 5. Carbonate of lime (chiefly in domestic animals); 6. Cystine; 7. Xanthic oxide (a very rare form, discovered by Dr. Marcet). Calculi are frequently found to be composed of numerous successive layers, having a perfectly distinct chemical composition. Urates and phosphates in particular frequently succeed each other, and form what is called an alternating calculus.

When C. has once fairly formed in the urinary passages, it seems probable that no absolute cure exists except the removal of it, if possible, from the body (see LITHOTOMY and LITHOTRITY); but in the stage of gravel, and still more in the earlier stages detected by careful examination of the urine, much may be done to check the tendency to this distressing and dangerous malady. The chief remedies consists in careful regulation of the diet and mode of living, together with the use of solvents adapted to the particular form of deposit found to be habitually present. See URINE.

CA'LCULUS, THE INFINITESIMAL, otherwise sometimes called the Transcendental Analysis, is a branch of mathematical science which commands, by one general method, the most difficult problems in geometry and physics. The merit of the invention of this powerful mathematical instrument has been claimed for Leibnitz, but is undoubtedly due with equal justice to Newton, who laid the foundations for it in that celebrated section of his *Principia* in which he demonstrates the chief theorems regarding the ultimate values or limits of the ratios of variable quantities. The view of one class of writers is, that these distinguished men invented the C. simultaneously and independently; and it is the fact that Leibnitz's system is unfolded from premises differing somewhat from those of Newton. See FLUXIONS. Another class of writers hold that Newton is the real inventor, and that to Leibnitz no more can be conceded than that he was the first who, using the suggestions of Newton's genius, gave a systematic statement to the principle of the transcendental analysis, and invented its appropriate symbolic language. He had the doctrine of limits before him when he wrote, and did little more than unfold more fully the logic of the processes therein suggested, and exhibit them in algebraical forms.

The Infinitesimal C., both in its pure and applied forms, whether of geometry or mechanics, is a branch of the science of number; its symbols are of the same kind, are operated on according to the same laws, and lead to analogous results.

It differs from the other branches of the science of number, such as arithmetic and algebra, in regarding number as continuous—i. e., as being capable of gradual growth and of infinitesimal increase, whereas they deal with finite and discontinuous numbers. It differs from ordinary algebra in another respect. In the latter, the values of unknown quantities, and their relations with each other, are detected by aid of equations established between these quantities *directly;* in the C., on the other hand, the equations between the quantities are not directly established, but are obtained by means of other equations primarily established, not between them, but certain derivatives from them, or elements of them. This artifice is most fertile, for it can be shown that in the great majority of cases the relations of quantities concerned in any problem may more easily be inferred from equations between these their derivatives or elements than between themselves.

It will be seen that the C. created a new notion of number—as continuous or growing. It is now necessary, in order to a proper conception of it, that a precise idea should be formed of a *differential*. The simplest idea of a differential is unquestionably that got by considering number as made up of infinitesimal elements, and a differential or 'infinitesimal' as being the value of the difference between a number at one stage of its growth and at another *very* near it. Every finite number being—in the view of the C. as first conceived by Leibnitz—composed of an infinite number of these infinitesimal elements, certain axioms at once present themselves regarding infinitesimals; as, for instance, 'that a finite number of them has no value at all when added to a finite quantity.' Many other such axioms readily follow, from which, on this view, the whole theory of the infinitesimal C. may be constructed. But there are logical objections to this mode of forming the theory of the transcendental analysis, and of three views that have been propounded, that now universally accepted as the most logical, and as being capable of the easiest application, is that founded on the method of limits, already referred to as the invention of Newton. The meaning of a differential on this view will now be explained.

It is clear that the C. can be applied only where numbers may have the continuous character—i. e., where they are or may be conceived as being variable. If two unknown quantities are connected by a single equation only, we clearly have the condition satisfied, as where y and x are connected by the equation.

$$(1) \quad y = F(x),$$

where F is a sign denoting some *function* of x, as tan. x, cos. x, x^2, &c. This equality may be satisfied by innumerable values of y and x. One question which the C. solves is, how does y vary when x varies? To solve it, and, at the same time, show how the doctrine of limits affects the definition of a differential, suppose x, y, and $x + Dx$, $y + Dy$, to be two pairs of values of the variables which satisfy the above equation; then

$$(2) \quad y = F(x), \quad \text{and} \quad (3) \quad y + Dy = F(x + Dx).$$

From (2) and (3) we have, by subtraction,

$$(4) \quad Dy = F(x + Dx) - F(x);$$

whence we have the ratio

$$\frac{Dy}{Dx} = \frac{F(x + Dx) - (Fx)}{Dx}$$

This ratio will generally change in value as Dx and Dy diminish,

till, as they both vanish, which they must do simultaneously, it assumes the form $\frac{0}{0}$. Taking this form, it ceases to have a determinate actual value, and it is necessary to resort to the method of limits, to ascertain the value to which it was approaching, as Dx and Dy approached zero. Let, then, dx and dy be any quantities whose ratio is equal to the limiting ratio of the increments Dx, Dy, so that

$$\frac{dy}{dx} = \text{limit} \frac{Dx}{Dy}$$

as Dx and Dy approach zero. Then dx and dy are the differentials of x and y. It may be observed that where x and y are connected as above, they cannot vary independently of one another. In the case assumed, x has been taken as what is called the *independent* variable, the question being, how does y vary when x varies. If y were made the independent variable, it would be necessary to solve the equation $y = F(x)$, if possible, so as to express x in terms of y. The result would be an equation $x = \phi(y)$. This being obtained, we should find $\frac{dx}{dy} = \text{limit} \frac{Dx}{Dy}$ as before. It will be seen that on this view differentials are defined merely by their ratio to one another. Their actual magnitude is perfectly arbitrary. This, however, does not render an equation involving differentials indeterminate, since their relative magnitude is definite, and since, from the nature of the definition, a differential cannot appear on one side of an equation without another connected with it appearing on the other.

The idea of a differential being once comprehended, the reader will be able to understand in a general way, the main divisions of the C., which we shall now briefly delineate. So much is clear from what has been stated, that there must be two main divisions —one by which, the primary quantities being known, we may determine their differentials; and another by which, knowing the differentials, we may detect the primary quantities. These divisions constitute the Differential C. and Integral C. respectively.

1. The Differential Calculus.—Recurring to the formula already given we know

$$\frac{dy}{dx} = \text{limit} \frac{Dy}{Dx} = \text{limit} \frac{F(x + Dx) - F(x)}{Dx}.$$

It is clear that, in the general case, $\frac{F(x + Dx) - F(x)}{Dx}$ at the limit will still be some function of x. Calling it $F'(x)$, we have generally $\frac{dy}{dx} = F'(x)$. $F'(x)$ is called the first differential coefficient of y or $F(x)$. Being a function of x, it may be again differentiated. The result is written

$$\frac{d^2y}{dx^2} = F''(x),$$

$F''(x)$ being the second differential coefficient of y or $F(x)$; and again $F''(x)$ may be a function of x, and so capable of differentiation. Now, it is the object of the differential C. to show how to obtain the various differentials of those few simple functions of quantity which are recognized in analysis, whether they are presented singly or in any form of combination. Such functions are the sum, difference, product, and quotient of variables, and their powers and roots; exponentials, logarithms; and direct and inverse circular functions. The C. so far is complete as we can differentiate any of those functions or any combination of them—whether the functions be explicit or implicit; and with equal ease we may differentiate them a second or any number of times. This C. is capable of many interesting applications as to problems of maxima and minima, the tracing of curves, &c., which cannot here be particularly noticed.

2. The Integral Calculus deals with the inverse of the former problem.—The former was: Given $F'(x)$, to find $F''(x)$, $F'''(x)$ and so on. The present is in the simplest case—viz., that of an explicit function: Given $\frac{dy}{dx} = F'(x)$, to find $F(x)$. The methods of the Integral C., instead of being general, are little better than artifices suited to particular cases; no popular view can be given of these. In many cases, integration is quite impossible. The explanation of *integration by parts*, by *approximation*, *definite integrals*, and *singular solutions*, is far beyond the scope of the present work The reader is referred to any of the numerous text-books on the subject. The Integral C. has applications in almost every branch of mathematical and physical science. It is specially of use in determining the lengths of curved lines, the areas of curved surfaces, and the solid contents of regular solids of whatever form. The whole of the lunar and planetary theories may be described as an application of the integral C., especially of that branch of it which deals with the integration of differential equations. It is applied, too, in hydrostatics and hydrodynamics, and in the sciences of light, sound, and heat. In short, it is an instrument without which most of the leading triumphs in physical science could never have been achieved.

Calculus of Variations.—The foundation of this C. is a method of differentiation, but of quite a peculiar kind. As above explained, the object of the differential C. is to determine the form which a function, such as $F(x)$, will assume if x receive an indefinitely small increment, such as Dx. In the C. of variations, the object is to ascertain and lay down the laws of the changes supervening on a slight alteration of the *form of the function*, or should $F(x)$ become Fx. This C. commands with ease a class of problems called problems of isoperimeters, which were formerly insoluble. It has also power over mechanical problems, and many departments of high physics cannot be touched without its aid. Mr. Airy and Professor Jellet have both written works on the subject, which may be consulted.

Calculus of Finite Differences, Calculus of Functions.—For brief notices of these growths from the original Transcendental Analysis, see the articles under the headings Difference and Functions.

CALCU'TTA (*Kali Ghatta*, the ghaut or landing-place of the goddess Kali), the capital of the province of Bengal, and metropolis of British India, is situated on the left bank of the river Hooghly, an arm of the Ganges, in 22° 35′ N. lat., and 88° 27′ E. long., about 100 miles from the sea by the river. C. was founded by Governor Charnock in the year 1686, by the removal hither of the factories of the East India Company. In 1700, three villages surrounding the factories having been conferred upon the company by the emperor of Delhi, in recognition of a present made to Azim, a son of Aurungzebe, they were forthwith fortified, and received the name of Fort William, in honor of the reigning king; but the place was subsequently termed Calcutta, the name of one of the villages. In 1707, C. had acquired some importance as a town, and was made the seat of a presidency. In 1756, however, a great misfortune befell the rising town; it was unexpectedly attacked by Surajah Dowlah, the Nawaub of Bengal, and being abandoned by a number of those whose duty it was to defend the place, it was compelled to yield after undergoing a two days' siege. Only 146 men, however, fell into the enemy's hands, but these were treated with heartless cruelty. Cast at night into a confined cell, about 20 feet square—the notorious 'Black Hole' (q. v.)—they endured the most unheard-of sufferings, and in the morning it was found that only 23 out of 146 had survived the horrors of that night. The city remained in the hands of the enemy until eight months afterwards, when Clive arrived in the country from England. In conjunction with Admiral Watson, Clive succeeded in recapturing the town, and afterwards concluded a peace with the Nawaub. Soon after this, and subsequent to the important victory of Plassey, the possessions of the East India Company were greatly extended by means of grants made by the emperor of Delhi, and C. once more resumed its career of progress, and advanced rapidly in prosperity. In 1852, C. was erected into a municipality, the proprietors paying assessments, and electing commissioners to apply the proceeds of these assessments in cleansing, improving, and embellishing the town. In 1837, the population of the town proper amounted to 229,700; in 1872 it had increased to 447,601, or with Howrah and suburbs, 892,429, (1881, without Howrah, 683,458).

Besides these, thousands of the three and a half millions who sleep at night in the surrounding districts of Hooghly and the twenty-four Pergunnahs, flock during the day to C., on foot, by boat, or by railway, to their daily toil. The inhabitants are mostly Hindus; but there is also a good proportion of Mohammedans About 20,000 are Europeans; 20,000 Eurasians, or the progeny of white fathers with native mothers; and there is a considerable number of Armenians, Greeks, Jews, Parsees, and negroes. The city extends for about five miles along the river, and is somewhat less than two miles in breadth at its broadest part, the area being about eight square miles, and comprised for the most part between the river and the Circular Road, a spacious roadway which marks the landward boundary of the city proper. Beyond this road there lie extensive suburbs, the chief of which are Chitpore on the north, Nunden Baugh, Bahar-Simleah, Sealdah, Entally, and Ballygunge on the east, and Bhowaneepore, Allipore, and Kidderpore on the south. The villages of Sulkeah, Howra, and Seebpoor are situated on the opposite side of the river, and contain the saltgolahs or warehouses of the government, extensive manufactories, dockyards and ship-building establishments. The appearance of the city as it is approached by the river is very striking; on the left are the Botanical Gardens, destroyed by the cyclones of 1867 and 1870, but since replanted, and the Bishop's College, a handsome Gothic edifice, erected by the Society for the Propagation of the Gospel in Foreign Parts; on the right is the suburb of Garden Reach, with its handsome country seats and beautiful gardens; further on are the government dockyards and the arsenal; beyond these is the Maidan Esplanade, which has been termed the Hyde

Park of India, being the favorite place of resort of the *élite* of C. for their evening drive. Here, near the river, lies Fort William, the largest fortress in India, having been constructed at a cost of £2,000,000, and occupying, with the outworks, an area of about half a mile in diameter. It is garrisoned by European and native soldiers, mounts 619 guns, and its armory contains 80,000 stands of small-arms. Facing the Esplanade, among other fine buildings, is the Government House, a magnificent palace erected by the Marquis of Wellesley. Beyond this, extending northwards along the river bank, is the Strand, two miles in length, and 40 feet above low water, with various ghauts or landing-places.

It is adorned by many fine buildings, including the Custom-house, the new Mint, and other government offices, and the appearance given by these and other edifices has gained for C. the appellation of 'City of Palaces.' Among its other places of interest mention may be made of the Sudder Dewanee Adawlut, the principal court of justice; the town-hall, a fine building; the Bengal Club, Writers' Buildings, Bank of Bengal, Jesuits' College, Medical College, university, theater, besides various churches, mosques, Hindu temples, and pagodas and numerous bazars. There are a number of monuments throughout the city, the most noticeable being those erected to the Marquis of Wellesley and Sir David Ochterlony. Although the European quarter of the town is distinguished for its fine public buildings and commodious dwelling-houses, the quarters occupied by the natives present a very different appearance, their houses being in most instances built of mud or bamboo and mats, and the streets narrow and unpaved. Considerable improvements have, however, been effected of late; new and wider streets have been opened through crowded quarters; brick houses are fast replacing the huts, and an extensive system of drainage has been carried out, to the no small advantage of the inhabitants. The cyclone of November 1867 destroyed 30,000 native houses, and that of June 1870 was likewise very destructive.

The water supply of C. has recently been very much improved. Formerly, the water was kept in large tanks, interspersed throughout the city, whence it was borne by water-carriers or *bahisties* in large leather bags. But within the past five years, a supply of excellent water has been obtained from the Hooghly, about 15 miles above C., where it is filtered and sent down by pipes in the usual way. The result of this has been a marked improvement in the health of the city. Gas has now taken the place of the oil-lamps which were formerly in general use for lighting the streets at night. Tramways have been recently tried in some of the principal streets, but as yet with little success. A canal girds a part of the city beyond the Circular Road.

The communications of C. afford great facilities for its extensive commerce. There are several lines of railway to various parts of India; the East Indian to Benares, Delhi, and Multan, its present terminus, whence it is to be continued to Kurachee; the Eastern Bengal, the extension of which to Gulundu was opened in 1871; and the Calcutta and South-eastern to the mouth of the Ganges.

The great Indian Peninsula Railway branches off from the East Indian, and connects C. with Bombay and Madras. C. is also connected by electric telegraph with the principal towns of India, and can communicate with England by three different lines. Uninterrupted communication is kept up with Great Britain by numerous and well-appointed steamers and sailing-vessels. This intercourse has been greatly facilitated by the opening of the Suez Canal. Navigation on the Hooghly is dangerous, owing to the shifting sands; and though much has been attempted, little has been effected in the way of remedying the evil. The river, adjacent to the city, varies in breadth from a quarter of a mile to nearly a mile. Ships of 2000 tons can ascend to C.

The growth of scientific and literary societies, here and elsewhere in India among the native communities, indicates a degree of progress and intellectual activity very hopeful for the future of India. The principal of these in C. are the Bengal Asiatic Society, founded in 1784 by Sir W. Jones, possessing a fine library, and a valuable and extensive museum; the Bethune Society, for the promotion of intercourse between European and native gentlemen; the Dalhousie Institute, for the literary and social improvement of all classes of the community; the Bengal Social Science Association, and others. The university of C. was founded in 1857, on the same basis as the London University, and exercises functions over Bengal, the north-west Provinces, Oudh, and the Central Provinces. Colleges have been instituted to prepare intending students. In 1879-80, of 3512 candidates for admission to the university of C., 1291 passed the required examinations. Other educational institutions are numerous in C. The principal places for religious instruction are Bishop's College, intended chiefly for the education of missionaries and teachers, and the institutions of the Established and Free Churches of Scotland for the same purpose, all which are ably conducted.

C. may be regarded as the great commercial center of Asia. One-third of the whole trade of India is done here. In 1877, the exports amounted to £26,596,018, exclusive of treasure, and the imports to £16,693,813. The chief exports are jute, cotton, rice, sugar, indigo, coffee, tea, saltpetre, linseed, shellac, buffalo horns, hides, castor-oil, cutch, gunny, bags, &c. The jute exported in 1872 was valued at £4,000,000, the indigo at £2,500,000, and the tea at £1,400,000. In the same year 658 sailing-vessels and 301 steamers, with a total tonnage of 999,614, arrived in the Hooghly; and 637 sailing-vessels and 301 steamers, with a total tonnage of 957,523, sailed. The principal industries are sugar refining, cotton manufacturing, flour, saw, and oil mills, and ship-building docks. Several newspapers are published. There are a few banks and numerous insurance and other companies, with a Chamber of Commerce.

Living is comparatively cheap, and most of the luxuries of life, as well as its necessaries, are to be had in the unpretentious shops of C. as readily as in most European towns. The annual fall of rain averages 64 inches; the temperature in the shade ranges in July from 78° to 87°, and in December from 60° to 79°.

C. is the headquarters of the governor-general of India, and the seat of the government, the supreme courts of justice, and of the court of appeal for the province of Bengal.

CA'LDAS, or CALDE'TAS (Lat. *callidus*, hot), the Spanish for warm springs (*aquas*, waters, being understood), which are very abundant in the Peninsula, where a great number of places have received their names from the presence of these mineral waters; such as C. de Malavella, C. de Estrac, and C. de Mombuy, in Catalonia; C. de Reyes, C. de Cuntis, and C. de Tuy, in Galicia; C. de Taïpas, C. de Faveios, C. de Rainhas, and C. de Renduse, in Portugal. The name has also passed into the topography of the New World. There is a C. in Brazil, which is noted for its hot sulphur springs.

CA'LDER, a river in the West Riding of Yorkshire. It rises in a marsh on the borders of Lancashire, near Burnley, runs tortuously east in the deep valley of Todmorden, past Halifax, Dewsbury, and Wakefield. It then runs north-east, and after a total course of 40 miles, it joins the Aire near Pontefract, that river falling into the Ouse. The C. is important as forming a considerable portion of the canal route through Yorkshire and Lancashire, between the east and west coasts of England.

CA'LDERON (Don Pedro) DE LA BARCA HENAO Y RIANO, was born in Madrid, in the year 1601, and received his early education in the Jesuits' College at Madrid. Afterwards, at Salamanca, he studied chiefly history, philosophy, and law. His poetical genius was precocious. Before he was 14 years old, he had written a drama, *El Carro del Cielo* (The Celestial Chariot). In early life he gained, by his poetry, and also by his fertile invention of decorations, &c., for festive occasions, the patronage of several distinguished persons, and, on leaving Salamanca, 1619, was well received by the courtiers at Madrid. Love of military adventure induced him to enter the army, 1625; and, after serving with distinction in Milan and the Netherlands, he was recalled to the court of Philip IV., a prince fond of theatrical amusements, by whom he was employed to superintend various court-amusements, and especially to invent dramas for the Royal Theater.

In the following year C. was made knight of the order of San Jago, and took part in the campaign in Catalonia. Peace brought him back to poetry. The king gave him a pension, contrived to let him cultivate uninterruptedly his fertile dramatic genius, and spared no cost in securing for his plays a splendid initiation on the stage. In 1651, C. received from the head of the order of San Jago permission to enter the church, and, in 1653, was appointed to the chaplaincy of the arch-episcopal church of Toledo; but as this post removed him too far from the court, he was appointed chaplain in the Royal Chapel at Madrid, 1663, and received, with other favors, a pension charged on the revenue of Sicily. In the same year he was appointed a priest in the brotherhood of San Pedro, and, shortly before his death, was elected by his brethren as their *capilan mayor*. He died May 25, 1681, leaving his considerable property to the fraternity of San Pedro, by whom a splendid monument to his memory was raised in the church of San Salvador at Madrid. Fame and pecuniary prosperity had accompanied his career. The chief cities of Spain—such as Toledo, Seville, and Granada—had paid him, from time to time, large sums of money for writing their *Autos Sacramentales*, or *Corpus Christi* pieces. In these compositions, C. excelled all his predecessors, and esteemed them more highly than all his other works, though in many respects the latter display the author's genius quite as remarkably.

Spain numbers C. among its greatest poets, and criticism must allow that many of the defects in his works are to be ascribed to circumstances, and the times in which he lived, rather than to the native tendencies of his genius. He is characterized by brilliancy of fancy, elegance of versification, and a richness of detail, which from its very abundance often becomes tedious. His collected dramatic works—including many pieces of intrigue, heroic comedies, and historical plays, of which some deserve the title of tragedy—amount to 128. Among his romantic tragedies, the

Constant Prince (*El Principe Constante*) holds the first rank. Besides these, he wrote 95 *Autos Sacramentales;* 200 *Loas* (preludes); and 100 *Saynetes* (divertissements). His last play, *Hado y Divisa*, was written in his 80th year. His shorter poems have perished; but his dramas have held their place on the stage better than those of Lope de Vega himself. The most complete edition of his dramas appeared at Madrid (9 vols., 1683—1689); another was published by Apuntes (10 vols., Madrid, 1760—1763). Goethe and Schlegel have made him popular in Germany, but in Britain he is not well known, and in France not cared for.

CALDERON, Don Serafin Estebanez, a Spanish poet, was born at Malaga about the commencement of the century, studied law at the university of Granada, and in 1822 became professor of poetry and rhetoric there. A volume of poems which he published shortly after procured for him some distinction. Subsequently, he became an advocate in his native city, but still continued faithful to the muses. In 1830, he went to Madrid, where he published anonymously his *Poesias del Solitario* (1833). He also wrote several articles on Andalusian manners for the *Cartas Españolas*, the only literary journal at that period in Spain. In 1836 he was appointed civil governor of Logroño, but an accident obliged him to return to Madrid, where he devoted himself to collecting MSS. of the old national literature, to be the basis of a great critical edition of the *Cancioneros* and *Romanceros*. C. wrote likewise a fine novel, *Cristianos y Moriscos*. To the literature of the Spanish Moors he paid great attention. His *Escenas Andaluces* (1847) are a series of lively sketches of Andalusian life. At his death in Feb. 1867, he left behind him a work on the *Expediciones y Aventuras de los Españoles en Africa*. The Spanish government purchased his very valuable library.

CALDERWOOD, David, an eminent Scottish divine and ecclesiastical historian, descended of a good family, was born in 1575, and about 1604 was settled as Presbyterian minister of Crailing, Roxburghshire. Opposed to the designs of James VI. for the establishment of Episcopacy in Scotland, on that monarch's visit to his native country in 1617, he and other ministers signed a protest against a bill, then before the Scots parliament, for granting the power of framing new laws for the church to an ecclesiastical council appointed by the king, and in consequence he was summoned before the High Commission of St. Andrews. Refusing to submit, he was committed to prison for contumacy, and then banished the kingdom. He retired to Holland, and in 1623 published there his celebrated controversial work, entitled *Altare Damascenum*, &c., in which he rigorously examined the origin and authority of Episcopacy. In 1622, a pretended recantation of his protest was published at London by a venal writer, Patrick Scott. While on the continent, C. was known by the quaint appellation of Edwardus Didoclavius, being an anagram on his name Latinized. After King James's death in 1625, he returned to Scotland, and for some years was engaged collecting all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the Reformation there to the death of James VI.

In 1638, he became minister of Pencaitland, near Edinburgh; and in 1643 was appointed one of the committee for drawing up the *Directory for Public Worship in Scotland*. He died at Jedburgh in 1651. From the original MS. of his *History of the Kirk of Scotland*, preserved in the British Museum, an edition was printed for the Wodrow Society, in 8 vols., 8vo. (Edin. 1842—1845), edited by the Rev. Thomas Thomson.

CALDIE'RO (ancient *Caldarium*), a decayed town of North Italy, about nine miles east of Verona. Its thermal springs were in repute as early as the 1st c. of the Christian era, and continued to enjoy popularity until the commencement of the 16th c., after which they gradually became neglected, and are now little visited. The Austrians repulsed the French here in 1796.

CALEDO'NIA, a kind of poetical name applied to Scotland; being a resumption of that given by the Romans to the country north of the Wall of Antoninus, which ran between the Firths of Forth and Clyde. Among the chief tribes of this region were the Caledonii, whence the whole country has been called Caledonia. Tacitus speaks of the Caledonians as having red hair, large limbs; being naked and barefooted; living in tents without cities; supporting themselves by pasturing cattle, by the chase, and by certain ferries; addicted to predatory warfare; and fighting in chariots with shields, short spears and daggers. They are supposed to have been of Gaelic or Celtic origin, and to have painted their bodies, whence the name Picti or Picts, by which, according to many writers, they were afterwards known. Agricola was the first Roman general to come in contact with the Caledonians. In 84 A.D. he defeated them, now united to repel a common enemy, under their chief Galgacus, at the Mons Grampius (or Graupius), the site of which has not been determined. The Romans overran the north-east of Scotland as far as the Moray Firth, and formed many encampments (of which remains still exist), but they never reduced the country to a Roman province. Roman coins and military relics have been found in connection with these camps. The name of Caledonii disappears about the beginning of the 4th c., when the inhabitants of Scotland begin to be spoken of as Scots (q. v.) and Picts (q. v.).

CALEDONIA, New. See New Caledonia.

CALEDONIAN CANAL, a chain of natural lakes united by artificial canals, running across the north of Scotland in a straight line from north-east to south-west, from the North Sea to the Atlantic, through Glenmore, or the Great Glen of Albin, in Inverness-shire, and touching Argyleshire at the south end. The sea and fresh water lochs in this line are Beauly, Ness, Oich, Lochy, Eil, and Linnhe. The canal was formed to avoid the dangerous and tedious navigation of ships, especially coasting vessels, round by the Pentland Firth, Cape Wrath, and the Hebrides; the distance between Kinnaird's Head and the Sound of Mull by this route being 500 miles, but by the canal only 250, with an average saving of 9½ days for sailing vessels. The C. C. begins in the Beauly Firth, near Inverness, whence a cut of 7 miles joins Loch Ness, which is 24 by 1½ mile. A cut of 6 miles joins Loch Ness and Loch Oich, which is 3½ by ½ mile. Another cut of 2 miles joins Loch Oich and Loch Lochy, which is 10 by 1 mile; and a fourth cut of 8 miles joins Loch Eil at the village of Corpach, 2 miles north of Fort William. This ship-communication is 60½ miles long, 37½ miles being through natural lochs or lakes, and 23 miles by artificial cuts. Each cut is 120 feet broad at surface, and 50 at bottom, and 17 deep. The highest part is Loch Oich, which is 94 feet above the sea. There are in all 28 lochs, each 170 to 180 feet long, and 40 wide, with a rise or lift of water of 8 feet. Eight of the lochs, called Neptune's Staircase, occur in succession near the west end of the canal. Some large mountain streams between Lochs Eil and Lochy are conducted in huge culverts under the canal and by a new cut, the Lochy water is turned into the Spean. The practicability of this great work was first shown by a survey under government in 1773 by the celebrated James Watt; but it was not till 1803 that it was begun under Mr. Telford. The whole line was opened for ships in 1823. After three years of repair, it was re-opened 1847. Ships of 500 to 600 tons, fully laden, can pass through the canal.

The canal and tonnage rates for sailing vessels are each a farthing per mile per ton, and a half of this for vessels under 125 tons. Steamers pay 2s. a ton. Of £1,368,203 expended on this canal, from 1803 to 1856, £1,242,387 were voted by parliament, and, £90,748 were from canal dues. Heavy gales and rains in December, 1848 and January, 1849, did much damage to the canal, which was repaired by a government grant of £10,000. For the year ending April, 1881, the total income of the canal was £7498, whereas the expenditure amounted to £7726—a state of accounts unusually favorable. There is a regular steam communication by the canal between Glasgow and Inverness. The scenery is wild and romantic on both sides of the canal, and has many other objects of interest to the tourist, such as Fort William, Ben Nevis, Inverlochy Castle, Tor Castle, the ancient seat of Cameron of Locheil, Glen Spean, Glen Roy, with its Parallel Roads, Fort Augustus, the Fall of Foyers, and Inverness.

CA'LEMBOURG, or CA'LEMBOUR, the French name for a pun (q. v).

CA'LENDAR (from Calends, q. v.), the mode of adjusting the months and other divisions of the civil year to the natural or solar year. The necessity of some division and measurement of time must have been early felt. The phases or changes of the moon supplied a natural and very obvious mode of dividing and reckoning time, and hence the division into months (q. v.—see also Week) of 29 or 30 days was, perhaps, the earliest and most universal. But it would soon be observed that, for many purposes, the changes of the seasons were more serviceable as marks of division; and thus arose the division into years (q. v.), determined by the motions of the sun. It was soon, however, discovered that the year, or larger division did not contain an exact number of the smaller divisions or months, and that an accommodation was necessary; and various not very dissimilar expedients were employed for correcting the error that arose. The ancient Egyptians had a year determined by the changes of the seasons, without reference to the changes of the moon, and containing 365 days, divided into twelve months of 30 days each, with five supplementary days at the end of the year. The Jewish year consisted, in the earliest periods, as it still does, of twelve lunar months, a thirteenth being from time to time introduced, to accommodate it to the sun and seasons; this was also the case with the ancient Syrians, Macedonians, &c. The Jewish months have alternately 29 and 30 days; and in a cycle of 19 years there are seven years having the intercalary month, some of these years having also one, and some two days more than others have, so that the length of the year varies from 353 to 385 days.

The Greeks, in the most ancient periods, reckoned according to real lunar months, twelve making a year; and about 594 B.C., Solon introduced in Athens the mode of reckoning alternately 30 and 29 days to the month, accommodating this civil year of 354

days to the solar year, by occasional introduction of an intercalary month. A change was afterwards made, by which three times in eight years a month of 30 days was intercalated, making the average length of the year 365¼ days. See METONIC CYCLE.

The Romans are said to have had originally a year of 10 months; but in the times of their kings, they adopted a lunar year of 355 days, divided into 12 months, with an occasional intercalary month. Through the ignorance of the priests, who had the charge of this matter, the utmost confusion gradually arose, which Julius Cæsar remedied, 46 B.C., by the introduction of the JULIAN CALENDAR, according to which the year has ordinarily 365 days, and every fourth year is a leap-year of 366 days—the length of the year being thus assumed as 365¼ days, while it is in reality 365 days, 5 hours, 48 minutes, and 50 seconds; or 11 minutes 10 seconds less. Cæsar gave to the months the number of days which they still have.

So comparatively perfect was the Julian style of reckoning time, that it prevailed generally among Christian nations, and remained undisturbed till the renewed accumulation of the remaining error of eleven minutes or so had amounted, in 1582 years after the birth of Christ, to ten complete days; the vernal equinox falling on the 11th instead of the 21st of March, as it did at the time of the Council of Nice, 325 years after the birth of Christ. This shifting of days had caused great disturbances, by unfixing the times of the celebration of Easter, and hence of all the other movable feasts. And accordingly, Pope Gregory XIII., after deep study and calculation, ordained that ten days should be deducted from the year 1582, by calling what, according to the old calendar, would have been reckoned the 5th of October, the 15th of October 1582; and in order that the displacement might not recur, it was further ordained that every hundredth year (1800, 1900, 2100, &c.) should not be counted a leap-year, excepting every fourth hundredth, beginning 2000. In this way the difference between the civil and the natural year will not amount to a day in 5000 years.

In Spain, Portugal, and part of Italy, the pope was exactly obeyed. In France, the change took place in the same year, by calling the 10th the 20th of December. In the Low Countries, the change was from the 15th December to the 25th; but it was resisted by the Protestant part of the community till the year 1700. The Catholic nations, in general, adopted the *style* ordained by their sovereign pontiff; but the Protestants were then too much inflamed against Catholicism in all its relations, to receive even a purely scientific improvement from such hands. The Lutherans of Germany, Switzerland, and, as already mentioned, of the Low Countries, at length gave way in 1700, when it had become necessary to omit *eleven* instead of ten days. Scotland adopted the new reckoning in 1600. In England, a bill to this effect was brought before the parliament in 1585, but did not get beyond a second reading in the House of Lords; and it was not till 1751, after great inconvenience had been experienced from the difference of the reckoning for nearly two centuries, that an act was passed (24 Geo. II., 1751) for equalizing the style in Great Britain and Ireland with that used in other countries of Europe. It was then enacted that eleven days should be omitted after the 2d of September 1752, so that the ensuing day should be the 14th. Russia, Greece, Roumania, and the minor countries belonging to the Greek confession, still adhere to the *old style*; an adherence which renders it necessary when a letter is thence addressed to a person in another country, that the date should be given thus:—April $\frac{1}{13}$ or $\frac{\text{Jun. } 27}{\text{July } 9}$; for it will be observed, the year 1800, not being considered by us as a leap-year, has, interjected another (or twelfth) day between old and new style.

The C. of the French Republic remains to be noticed, which was adopted in consequence of a decree of the National Convention in 1793. The midnight preceding the autumnal equinox of 1792 was fixed upon as the new epoch, from which the years were to be reckoned as the Year One, the Year Two, &c. The year was divided into 12 months, each of 30 days, to which new names were given, as *Vendémiaire* (vintage month), *Brumaire* (foggy month), &c.; and instead of weeks, each month was divided into periods of 10 days, called *Primidi, Duodi, Tridi*, &c. Five *complimentary* days were added at the end of each year, which were the *Fête du Génie, Fête du Travail*, &c. By Napoleon's command, this new system was abolished, and the use of the Gregorian C. resumed on January 1, 1806.

CALENDAR OF PRISONERS, in the practice of the criminal law in England, is the technical term given to the list of all prisoners' names in the custody of the sheriff of each county, prepared for the assizes. When the business is over, and the trials concluded, the clerk of assize makes out in writing four lists of all the prisoners, with separate columns, containing their crimes, verdicts, and sentences, leaving a blank column, in which, if the judge has reason to vary the course of the law, he writes opposite the names of the capital convicts—*to be reprieved, respited, transported*, &c. These four calendars, being first carefully compared together by the judge and the clerk of assize, are signed by them, and one is given to the sheriff, one to the jailer, and the judge and the clerk of the assize respectively keep another. If the sheriff receives afterwards no special order from the judge, he executes the judgment of the law in the usual manner, agreeably to the directions of his calendar. In every county, this important subject is settled with great deliberation by the judge and the clerk of assize, before the judge leaves the assize-town; but probably in different counties, with some slight variation, as in Lancashire, no calendar is left with the jailer, but one is sent to the home secretary.

CA'LENDERING is the term applied to the process of finishing by pressure the surface of linen, cotton, and other textile fabrics. It is usually done by passing the fabric between cylinders pressed together with great force; hence the origin of the term, which is a corruption of *cylindering*.

The familiar domestic processes of starching and ironing afford the simplest illustrations of the object and result of calendering. The domestic mangle effects the same object as the flat iron, and is a near approach in construction to the C. engines of the manufacturer, no traversing-box of stones being used in the new patent mangles.

The cylindrical C. machine is said to have been introduced into this country by the Huguenots, driven here by persecution. The cylinders were originally of wood, but the liability to warping is a strong objection to these.

The modern calender usually consists of four, five, or six cylinders or 'bowls' set vertically in a strong iron frame, with suitable driving gear, and furnished with weights suspended over a pulley to produce the required pressure. This sometimes amounts to, or even exceeds, 20 tons, including the weight of the rollers. In a five-roller machine, the arrangement is this: The center roller is of iron or copper, made hollow for the admission of steam or a red-hot heater, the one immediately above and that directly below it are of paper; and the remaining two, one at the top and the other at the bottom, are of cast-iron. At least one of the rollers is always of paper, as it has more elasticity than metal, and is not liable to warp, like wood. It consists of sheets of brown paper or pasteboard, densely packed and compressed on an iron axis. The edges of these form the surface of the roller, which is turned and polished, an operation of some difficulty.

Before the final rolling in the C. machine, the fabric is first lightly smoothed by passing over warm cylinders. Cotton goods are starched with a starch prepared from flour, and the starch is sometimes thickened with plaster of Paris, porcelain clay, or a mixture of these, to give a fictitious appearance of stoutness, which of course vanishes when the article is washed. For ordinary C. the fabric is then simply passed between plain cylinders, which produces the desired effect by flattening the otherwise round threads. When, by means of a hot cylinder, with a pattern raised upon it, the amount of this flattening is unequal on different parts of the cloth, the beautiful effect known as 'watering' is the result. *Glazing* is produced by combined rubbing and pressure; the rollers, one of which is heated, being made to move with different velocities, so that one side of the fabric is rubbed as well as pressed by the roller whose surface moves with the greater rapidity. Before the invention of these rubbing cylinders, glazing was effected by rubbing the surface of the fabric with a polished flint. Calendering is done on a very large scale in some manufacturing towns, such as Manchester and Glasgow. In Dundee, where half a century ago it was not the custom to calender the linen at all, there are now more than 1000 hands employed in this branch of industry. Machines similar in construction to the one above described, but with all the rollers of iron, and also called calenders, are used for rolling india-rubber into sheets for coats, shoes, &c.

CA'LENDS. The Romans made a threefold division of the month into *Calends, Nones*, and *Ides*. The C. always fell upon the 1st of the month; the Nones in March, May, July, and October, on the 7th; and the Ides on the 15th; and in the remaining months, the Nones on the 5th, and the Ides on the 13th. The C. were so named because it was an old custom of the College of Priests on the first of the month to *call* (or assemble) the people together to inform them of the festivals and sacred days to be observed during the month; the Nones received their name from being the *ninth* day before the Ides, reckoning inclusively; and the Ides from an obsolete verb, signifying to divide, because they nearly halved the month. This threefold division also determined the reckoning of the days, which were not distinguished by the ordinal numbers first, second, third, &c., but as follows: Those between the C. and the Nones were termed *the days before the Nones;* those between the Nones and the Ides, *the days before the Ides;* and the remainder, *the days before the C.* of the next month. Thus, the Ides of January, happening on the 13th of that month, the next day would not be termed by a Latin writer the 14th, but *the 19th before the C. of February*, reckoning inclusively, i. e.

reckoning both the 14th of January and the 1st of February, and so on to the last, which was termed *pridie Calendas*.

Ad Calendas Græcas, a Roman proverbial saying, practically equivalent to 'never.' The Roman C. were often appointed as days for payment of rent, interest, &c.; but as the Greeks had no C., a postponement of payment *ad Calendas Græcas*, simply meant a refusal to pay altogether. It is said that the Emperor Augustus frequently used the phrase, which afterwards became a proverb.

CA'LENTURE, a Spanish term (*calentura*) applied to a species of temporary delirium or fever occurring on board ship in hot climates, and probably due to the effect of exposure to the direct rays of the sun. The descriptions of the disease seem rather fanciful and contradictory, and the term is nearly obsolete. See *Dictionnaire des Sciences Médicales*.

CALHOUN, JOHN CALDWELL, an eminent American statesman, descended from an Irish family who founded the Calhouns' Settlement in South Carolina, was born at Abbeville, South Carolina, March 18, 1782. Having gained distinction at the bar, he was sent to congress in 1811, where he soon made himself the leader of the war-party against England. Author of the tariff of 1816, so favorable to his native state, he in 1817 was named minister of war by President Monroe, and reduced the confused state of affairs in his department to order, and made a great reduction in the expenditure of the army without sacrificing its efficiency.

This early part of C.'s career was marked by broad and patriotic views, to which his subsequent preference of southern interests presented an unfavorable contrast. The tariff of 1828 not being very favorable to the Southern States, C. still adhered to the government, hoping that the president, Jackson, would veto the measure; but as this hope was disappointed, C. went to South Carolina, and there (1829) carried in the legislature the notorious resolution, 'that any state in the Union might annul an act of the Federal government.' To this decision, Virginia, Georgia, and Alabama gave in their adhesion, and threatened a dissolution of the Union. President Jackson promptly used energetic measures to make this resolution of no effect. C. lost popularity, and despairing of reaching the presidency, resigned his vice-presidency; but soon afterwards was elected into the senate. In 1838, he delivered his famous speech on slavery, and continued to agitate on behalf of the slave-holding interest and for a dissolution of the Union, both with voice and pen, until his death, which took place at Washington, March 31, 1850. In his private character, C. was blameless; but in his career, as a statesman he is understood to have implanted in the minds of his partisans those principles which culminated in the late war for the dissolution of the Union. During many years, he had been employed in his work on *The Philosophy of Government*, in which he vindicates the doctrine of state sovereignty, and which, along with other works, was posthumously published.

CALIA'NO, a small town of the Austrian Tyrol, situated on the left bank of the Adige, about 9 miles south of Trent. It figures in history as the place where the Austrian archduke, Sigismund, won a signal victory over the Venetians in 1487. Being a place of considerable military importance, it was also contested in the campaigns of 1797 and 1809.

CA'LIBRE, or CA'LIBER, is a technical name for the diameter of the bore of a firearm, whether a piece of ordnance or a small-arm. The ordnance from which solid shot are projected are usually denoted by the weight of each shot, as 24-pounder, 68-pounder, &c.; but mortars, and such guns as project shell or hollow shot, are more usually denoted by the C., such as 13-inch mortar, 10-inch shell-gun, &c. The C. of the chief kinds of firearm will be noticed under the proper headings; but it may here be observed, generally, that the C. of English ordnance has been greatly increased within the last fifty years, partly by boring up old guns, and partly by casting new.

CA'LICO-PRINTING is that department of the art of dyeing which takes cognizance of the production of a colored pattern on cloth. It appears to have been first practised at *Calicut* in India —hence the term *calico;* and the *pallampoors*, or large cotton chintz counterpanes, which have been manufactured in the East Indies for centuries, are evidence of the successful practice of the art in that country. From the East Indies, the art spread to Asia Minor and the Levant, thence to Augsburg in Bavaria; from whence, at the beginning of the 18th c., it spread to Alsace in France, to Switzerland, and ultimately to England and Scotland. The term is strictly applicable to the production of colored patterns on cotton cloth or calico; but as now employed, it includes all the processes followed in the formation of a colored pattern on cotton, linen, worsted, and silk goods, as also mixtures of two or more of these, such as the fabric called *de laine*, which is composed of cotton and worsted.

The first operation connected with the printing of cloth is the removal of the surface-hairs or minute threads which communicate a fibrous down or nap to the surface of the cloth, and if allowed to remain, would interfere with the uniform application of the colors. The surface down is got rid of by the process of singeing, during which the cloth is drawn over a red-hot iron or copper bar or plate, or through a series of gas jets. The apparatus generally used for *hot-plate singeing* consists of a furnace surmounted by a metal plate, which is sometimes ridged on the surface. The cloth having previously been joined at the ends, to make a long length, and been placed on a winch-roller, is first brought in contact with roller brushes, which raise the nap on the cloth, then passes over the white-hot metal cylindrical bar, and is wound on to a second winch-roller.

The process is repeated twice on the face of the cloth, being the surface to be printed on, and once on the back. *Gas-singeing* is accomplished by drawing the cloth through brushes, and then over a horizontal pipe, perforated with rows of small holes, or slit from end to end, so that the gas issuing therefrom burns as a narrow sheet of flame. The cloth is not only allowed to come in contact with the burning gas, but the flame is transmitted through the cloth, and a suction-apparatus is often placed immediately above, so as to draw the flame through more effectually. When well singed, the cloth undergoes the process of bleaching (q. v), and is thereafter calendered. See CALENDERING.

There are several modes of applying the colors to cloth, and these are respectively named—1. The Madder style; 2. The Padding style; 3. Topical style; 4. Resist or Reserve style; 5. Discharge style; and 6. China blue or pottery style. These various processes are at one in being intended to fix upon the cloth the different colors; but they differ from each other more or less in the several steps through which the cloth is passed, though occasionally there is little or no line of separation; and at times the cloth is treated by one method, and subsequently by another style.

The *madder style* is that in which a certain fixing agent or mordant is printed on the cloth, which is then introduced into the coloring matter in a dye-vat, when the mordant, having an attraction alike for the fibre of the cloth and for the coloring matter, acts the part of glue or paste, and cements the color to the cloth. Originally, madder was the only coloring substance employed in this style; but nowadays, by far the greater number of dye-stuffs, vegetable and animal, including cochineal, logwood, &c., are attached to cloth in this manner. The fixing agents or mordants generally employed are different strengths of *red liquor* (acetate of alumina), *iron liquor* (acetate of iron), and mixtures of these. These are thickened with wheat-starch, potato-flour, roasted starch or dextrine, and gum-arabic, so that the mordant may not run when it is placed on the cloth by the pattern-block or by the printing-machine. After the mordant has been imprinted on the cloth, the latter is hung in a warm airy room, where it can easily dry, but where it is at the same time surrounded by a moist atmosphere.

The result is, that the mordant is decomposed, the acetic acid is evolved, and the alumina or iron is left attached to the fibre of the cloth in the state of an insoluble sub-salt, which cannot be dissolved by water. As some of the mordant is still left in its original soluble condition, it is necessary to wash the cloth free from this, else, during the dyeing operation, the soluble part of the mordant would run on to those parts of the cloth not intended to be colored, and thus produce a blotted appearance. To obviate this, the cloth, having undergone the process of *drying and ageing*, is then introduced into a vat containing water, through which is diffused some cow-dung, dung substitute—a preparation of bone ash, sulphuric acid, carbonate of soda, and glue—or bran. The result of this process of *dunging* is the removal of the soluble part of the mordant, as also the starch or thickening agent, leaving the decomposed or insoluble mordant adhering to the fibre. The terms *dung*-fixing, *substitute*-fixing, and *bran*-fixing, have reference to the employment of one or other of these agents at this stage of the operation. When the cloth has been well washed from the dunging, it is introduced into the vat or dye beck containing the coloring matter. The whole is heated by steam-pipes, and the cloth being placed on a sparred reel kept in motion, is repeatedly wound out of the vat, and returned thereto. The result is, that wherever the mordant adhered to the cloth, the coloring matter is attached thereto, and little or no trace of color adheres to the unmordanted parts. The last operation is the *clearing*, or *brightening*, during which the colored cloth is introduced into warm baths of water containing soda, soap, or, for the more delicate tints, bran, and is thereafter acted on by weak acid solutions. The object is to clear the colors, and at the same time to confer upon them the property of resisting the fading action of the air and sun for a much longer time. The different shades of color which can be obtained from the same madder beck or vat, with different mordants, are very numerous, and include reds, lilacs, purples, chocolates, and blacks. Thus, when a weak solution of red liquor (acetate of alumina) is employed as the mordant, a light red tint is procured; with a stronger aluminous mordant, a deep red is formed on the cloth; with a more or less dilute solution of iron liquor (acetate of iron), the cloth is colored lilac, violet, or purple; with a strong solution of iron liquor, black is obtained. Indeed, the same piece of cloth stamped in different places with the various

strengths of aluminous and iron mordants, and mixtures of these, and immersed in the madder-bath, will be obtained dyed with all the shades mentioned; and in this manner, many of the beautiful variegated colored dresses and handkerchiefs are prepared for market.

The *padding style* in C. is intended mainly for the impregnation of cloth, in whole or in part, with mineral coloring substances. When the cloth is to be entirely colored, it is immersed wholly in a vat containing the mordant. When the color is to appear as a pattern on the fabric, the mordant is applied by a pattern block, or by the printing-machine. In either case, the cloth is thereafter thoroughly dried, and washed in various solutions, and then introduced into a vat containing the substance to form the color. Thus, if a piece of cloth is to be entirely impregnated with *chrome yellow*, it is first treated or *padded* in a solution of 8 parts of bichromate of potash ($KO2CrO_3$) to a gallon of water dried, and then placed in a vat containing a solution of 6 or 8 ounces of acetate or nitrate of lead (PbOA, or $PbONO_5$) to the gallon of water. The result is that the chromate of lead ($PbOCrO_3$) is formed in the tissue of the cloth; and when the latter is washed and dried, the yellow color still adheres to the cloth firm and fast. To print a yellow pattern on cloth, 7 to 9 ounces of acetate of lead, and the same quantity of nitrate of lead, are dissolved in a gallon of water, thickened with starch, and placed upon the cloth according to pattern. After drying, the cloth is first immersed in water containing a little carbonate of soda, and ultimately in a solution of bichromate of potash, when the pattern becomes fixed in bright yellow, insoluble in water. To produce *Prussian blue* on cloth, it is treated with acetate and sulphate of iron, dried, washed with warm chalk-water, and immersed in a very weak solution of yellow prussiate of potash. A pattern in Prussian blue is produced by printing a pattern in the cloth with the iron solutions thickened with gum, and thereafter proceeding as above. Chrome green is produced in a similar way, by using sulphate and acetate of copper, thickened with glue, and thereafter arsenious acid with potash; and also other colors, such as iron buff or chamois, manganese bronze, &c.

The *topical style* in C. is the process whereby certain coloring matters which are insoluble in water, and cannot therefore be applied to cloth by the modes suggested under the madder and padding styles, are treated at once with the mordant, and the mixture by one operation transferred by block, or otherwise, directly on the surface or *top* of the cloth, and hence the term *topical*. Indigo, safflower, and arnotto are instances of such insoluble coloring substances; and when these and other dye-stuffs, such as logwood and Brazil wood, are treated with water, thickened with starch and nitro-muriate of tin (known as *spirits*) added, with occasionally a little of other salts, such as nitrate of copper, the result is the formation of *spirit-colors*, which can be printed on the surface of cloth, and possess a certain degree of fixity.

The permanency of these *spirit-colors*, however, is very much increased, and the general appearance improved, by afterwards subjecting the goods to the action of steam in a wooden chest or box, when the term *steam-colors* is applied.

The *resist style* in C. is that in which certain materials are placed on the surface of cloth, to protect it from the adherence of the mordants, and consequently, to keep that part of the cloth from being attacked by the coloring matter. These materials are termed resists, reserves, or resist-pastes, and they are divisible into mechanical and chemical. The *mechanical resists* are such substances as fats, resins, oils, wax, and pipe-clay. A common resist for silk and woollen goods is a mixture of 2¼ of resin and 1 of suet; and it is principally in the color-printing of silk and woollen dresses and handkerchiefs that mechanical resists are employed, though they are occasionally used for the printing of cottons. The chemical resists may act on the mordant or on the color. Thus, if it be desirable to remove the mordant, and thus leave certain parts of the cloth unable to attach color, the printing of a pattern with some acid substance on the cloth will form with the mordant a soluble salt, which can be readily removed by washing, whilst the parts which have not been so acted on by acid are not dissolved away by the washing, and still retain the full power in the color-vats to cause the adhesion of the color. For this purpose, where an iron or aluminous mordant has been employed, it is customary to print thereon in the requisite pattern, lemon-juice or lime-juice (containing citric acid), tartaric or oxalic acid, and bisulphate of potassa, or a mixture of two or more of these, thickened with pipe-clay, China-clay, gumarabic, dextrine (British gum), gum-Senegal, or a mixture of these; occasionally, chloride of tin is employed. Sulphate of zinc, sulphate and acetate of copper, and the chloride of mercury, are used to resist the adherence of indigo blue.

The *discharge style* in C. comprehends the employment of similar materials to those used in the resist style, but *after* the cloth has been colored or dyed, and for the purpose of discharging the color, or bleaching the cloth at certain parts, according to pattern. The dischargers for organic coloring matters are chlorine and chromic acid. The chlorine is employed in the form of bleaching-powder (q. v.), and the cloth already dyed is printed with a solution of tartaric acid (or other acid), thickened with pipe-clay and gum, then dried, and passed through a solution of bleaching-powder, when the decoloration occurs, as already explained under BLEACHING.

The chlorine is also applied by placing a number of folds of colored cloth between perforated pattern-plates, and subjecting the whole to great pressure; a solution of chlorline (obtained by adding an acid to a weak solution of bleaching-powder) is allowed to percolate down through the perforations of the plates, and the cloth immediately underneath, so that only those spots are bleached while the rest of the cloth is so highly compressed as to keep the liquid from coming in contact therewith. The well-known Turkey-red handkerchiefs are *patterned* in this way. The chromic acid is generally employed in discharging indigo color. The cloth, already entirely blue, is soaked or padded in bichromate of potash, and then an acid discharger printed thereon; and whenever the acid discharger (tartaric, oxalic, citric, or hydro-chloric acid) comes in contact with the blue cloth containing the bichromate of potash chromic acid is liberated, and destroys the color. Instead of acting upon the colored cloth, the discharger may be employed to carry off the mordant. Thus, cloth treated wholly with a mordant, and thereafter printed with a pattern in acid, has the mordant removed at those parts where the pattern block has placed the acid. Mineral colors can also be discharged in a similar way.

The *China blue or pottery style* in C. is a modification of the topical style, where indigo is deposited on cloth in the insoluble state, and is thereafter manipulated with, so as to impregnate the cloth with the indigo more or less strongly, and thus produce different shades of blue.

The above descriptions of the various operations in C. have special reference to cotton cloth; and though many steps of the manipulative processes apply equally well to linen, silk, worsted, de laines (worsted and cotton), yet considerable modifications in mode of treatment and material employed are required in the successful color-printing of all texture containing animal fibre, such as silk and wool. Where the printing of such fabrics differs essentially from the processes already indicated, special reference will be made under SILK and WOOL. The different coloring matters employed in C. being identical with those used in dyeing, will be considered under general popular title DYE-STUFFS; and the mode of compounding these into the various colors and shades, will be more appropriately introduced under DYEING.

CA'LICUT, a seaport in the district of Malabar, which, though on the west side of the peninsula of Hindustan, yet forms part of the presidency of Madras. In lat. 11° 15′ N., and long. 75° 50′ E., it is distant from Goa and Bombay respectively 300 and 566 miles. It was the first spot in India visited by Vasco da Gama, being then the chief emporium on the coast, with stately dwellings and magnificent pagodas. So populous and powerful was it, that it twice repulsed the Portuguese, slaying their commander in 1509, and expelling Albuquerque himself, after a momentary success on his part, in 1510. It stands near the mouth of a small river of the same name, appearing to have possessed at one time a tolerably good haven. Gradually, however, this harbor has been filled up with sand; and now its anchorage is merely an open roadstead, at a distance, at least for large vessels, of two or three miles from land. Independently of this physical disadvantage, the ravages of war and the competition of superior localities contributed to the decay of Calicut. Accordingly, in 1792, when it fell into the hands of the English, the city was little better than a ruin. Since then, it has made considerable progress, and in 1871 was found to have 47,962 inhabitants. From C., *calico* is understood to have derived its name, just as *cambric* from Cambria, in the north-east of France.

CA'LIF (Turk, a successor), the title of Mohammed's successors in temporal and spiritual power, from which the historians of the middle ages designated the Arab empire founded by these princes, the CALIFATE. This empire, for two or three centuries, exceeded even the Roman empire in extent. As Mohammed died without leaving any sons, a contest arose concerning the inheritance of his power, which terminated (632 A.D.) in the triumph of Abubekr (q. v.), one of his father-in-laws, over Ali, his nephew and son-in-law. Abubekr now assumed the title of Califet-Resul-Allah—i. e, Representative or Deputy of the Prophet of God. He sent forth his armies for the extension of Mohammedanism, and after several victories over the forces of the Byzantine empire, conquered Syria. He was succeeded in 634 by Omar, another father-in-law of Mohammed, by whom Egypt and Jerusalem were annexed to the califate. He assumed the title of Emir-al-Mumenin—i. e., Prince of the Faithful—a title which all subsequent califs retained. Othman, a son-in-law of the Prophet, was the third C., and was elected by six persons appointed by Omar before his death. During his reign (644—656 A.D), the Arabian empire grew with extraordinary rapidity, being extended into

Persia, and westward along the north coast of Africa as far as Ceuta. The Byzantine emperors recovered Egypt; but it was wrested from them again at a prodigious expense of blood. The people of Medina elected Ali-ben-Abi-Taleb as C. upon the death of Othman. The Shiites regard him as the first true Imam or high-priest, and honor him and his son Hassan almost equally with Mohammed himself. Contests against rivals prevented him from doing much for the extension of the califate.

Moawijah, the governor of Damascus, having made himself really independent during Ali's life, and having extended his power over Syria, Egypt, and part of Arabia, became C. in 661, and founded the dynasty of the Ommiades, making the califate hereditary. He removed the seat of the califate to Damascus. His armies ravaged Asia Minor, and laid siege to Constantinople, but could not take it. He made important conquests, however, in Central Asia. The califate did not remain long in the family of Moawijah, and it frequently happened that in one or other of the subject countries a governor raised himself to a temporary independence; and rival califs frequently contended for power. Abdalmelek (685—705 A.D.) united all the Moslems under his dominion. Under his son, Walid I., the califate reached its zenith of prosperity, the Arabs conquering Turkestan in 707, Galatia in 710, and Spain in 711. Under Hesham, the progress of the Arabs in the west was arrested by Charles Martel at Tours (732 A.D.) and at Narbonne (736 A.D.). The dynasty of the Ommiades in Asia terminated with Merwan II. in 752, giving place to that of the Abbasides. But a branch of the Ommiades founded an independen tcalifate at Cordova, and another founded one in Arabia, which subsisted till the 16th century. Abul-Abbas (750—754 A.D.), the first Abbaside C., signalized himself by his cruelty and the torrents of human blood which he shed. His successor, Abu-Jafar, called Al-Mansur, a patron of the arts, but a persecutor of Christians, founded Bagdad (q. v.), and removed the seat of the califate thither. From the beginning of the 9th c., the Arab empire, which had suffered much from corruption and internal disorganization under the last califs of the Ommiade dynasty, and had never completely recovered, showed increasing signs of decay. Even under the C. Harun-al-Raschid, whose praises the eastern poets were accustomed so much to celebrate, independent kingdoms were established (800 A.D.) by the Aghlabides in Tunis, and the Edrisides in Fez. In 821, Taher, the governor of Khorassan, made himself independent, and established a dynasty there, and other governors of provinces followed his example. But under the C. Al-Mamun, the Arabians conquered Sicily and Sardinia, the former of which they held till it was taken from them in 1035 by the Normans; and the latter till it was conquered by the Pisans in 1051. The C. Motassem (833—842 A.D.) was the first to employ Turkish soldiers; but the practice was followed by his successors; and the Turkish body-guard soon became a formidable power in the califate, and about the middle of the 9th c. assumed the right of deciding the succession to the throne.

Many of the califs, meanwhile, were base voluptuaries, and of the others, some were of little capacity, and their power rapidly declined. Ere the middle of the 10th c., the califs themselves exercised a mere nominal sovereignty, whilst the emirs, like the mayors of the palace towards the close of the Merovingian dynasty among the Franks, possessed all real power. The princes of the Fatimide dynasty, which succeeded that of the Aghlabides in Tunis, having made themselves masters of Egypt in 970, assumed the title of C., so that there were now three califates—at Bagdad, at Cairo, and at Cordova. In the 11th c., the califs of Bagdad were still acknowledged as the spiritual chiefs of all the Moslems; but their temporal power scarcely extended beyond the walls of Bagdad. Bagdad itself became the prey of a Mongol horde in 1258, and the representative of the califs fled to Egypt, where, under the protection of the Mamelukes, who had made themselves masters of that country in 1250, he retained his title and spiritual power, which he transmitted to his successors, who continued to reside there till the Turks conquered Egypt in 1517, when the last of them was carried to Constantinople; and since that time the Turkish sultans have assumed the title of C., and claimed to be regarded as the spiritual chiefs of all the Moslems, a claim to which little respect has ever been paid except within the limits of their own empire.

CALIFO'RNIA. This name was at first applied to a peninsula on the west side of Mexico, but was gradually extended to an indefinite portion of the adjoining continent, as far north as the parallel of 42°. The original C., however, and its augmentation were distinguished from each other as Old and New, Lower and Upper. In 1848, partly by conquest and partly by purchase, continental C., down to the parallel of 32° 28′, was ceded to the United States. After existing as a *territory* for two years, it was, in 1850, constituted one of the United States, bounded N. by Oregon, E. by Nevada and Arizona, S. by Lower C., and W. by the Pacific. Between the two Californias of the present day, the American one and the Mexican one, there is nothing in common but the name.—1. *Mexican C.* is the peninsula above mentioned, which, though considerably longer than Great Britain, is yet so narrow as to be very little larger than Scotland. From end to end, it is one ridge of mountains, which here and there rise to about 5000 feet above the sea. A few favored spots yield fruits and grains in abundance; but generally speaking, the productions are unimportant, for even trees, and those of no great size, are found only towards the southern extremity of the country. The population does not exceed 25,000—the oldest and most considerable town, Loretto, on the east side, containing barely 1000 inhabitants.

On the west side is the magnificent harbor, peculiarly on a coast so destitute of shelter, formed by the Bay of Magdalena and the island of Santa Margarita.—2. *American C.*, vaguely claimed, under the name of New Albion, by Drake for England in 1579, lay unoccupied till 1767, when it was invaded by Franciscan friars, the successors in Mexico of the newly expelled Jesuits. These zealous apostles, backed, when necessary, by armed coadjutors, planted various missions, bringing under their influence, such as it was, the great mass of the aborigines. Under such circumstances, the new province became pre-eminent, even in Spanish America, for everything that could paralyze the progress of a community. Anglo-Saxon speculators engrossed most of the trade; American trappers walked through the land as if it had been their own; the Muscovites established, in the north, a town under the ominous title of *Ross* or *Russia;* and a Swiss adventurer of the name of Sutter, who had carved out for himself a *New Helvetia*, virtually set the government at defiance. But the discovery of gold in Sutter's mill-race during 1847, and the political transfer of 1848, taken together, changed, as if by a miracle, the aspect of affairs. The matchless harbor of San Francisco became the grand mart on the Pacific, presenting a center of attraction to the restless and energetic of every race and every clime. Between 1850 and 1855, the population increased from 92,597 to 327,000; in 1870 it was 560,247; and in 1880 it was 864,686, of whom 75,000 were Chinese. The total yield of gold in this state up to 1875 was about 1,000,000,000 dollars. In 1874 the value of the gold and silver produced was 20,300,531 dollars, and in 1881, 19,870,000 dollars. C. possesses the richest quicksilver mine in the world—that of New Almaden—which at one time produced from 2,500,000 lbs. to 3,500,000 lbs. per annum. It now yields about 1,000,000 lbs. In 1864, 15,000 tons of copper were exported, to be smelted at Swansea and Boston, but not nearly so much is now produced. Platinum has been found in many of the placers. There is coal in nearly all the coast counties; and asphaltum is produced. Other mineral products are iron, tin, and borax. In the year 1881–82, C. shipped 870,472 barrels of flour, and 22,170,000 centals of wheat. In 1881, there were 100,000 acres of vineyards, and the produce of the vintage was 9,000,000 gallons of wine.

Silk culture is making rapid progress; and the woollen factories of C. consume nearly 6,000,000 lbs. of wool annually, while about 30,000,000 lbs. are exported. Manufacturing industry has lately greatly increased, the chief manufactures being woollen goods, flour, iron, glass, wine, sugar, and silk. The amount of taxable property, real and personal, as assessed in 1878, was 584,583,651 dollars. The state debt amounted in the same year to 3,403,000 dollars.

The country is mountainous, and is cut into coast and interior by a subordinate range from Oregon. The interior is subdivided into the valleys of the Sacramento and the San Joachim—two rivers from the north-east and the south-east, which enter the noble haven of San Francisco. The former is the chief seat of the 'diggings.' Since the completion of the Pacific Railway, terminating in San Francisco, C. has been visited by many pleasure-seekers attracted by its magnificent scenery. The most celebrated district is the Yosemite Valley (q. v.). C., with a lovely and salubrious climate, produces fruits and grains freely, under advantageous circumstances of soil and situation. In the growth of timber, however, it appears to be almost unrivalled. Fremont measured one tree that was 21 feet in diameter, or 66 in circumference; and another has been seen, which, with a length of 150 yards, is nearly 120 feet in girth. A *Sequoia gigantea* in Mariposa county is 274 feet in height. Besides San Francisco, the state contains the cities of Sacramento (the capital), Oakland, Stockton, San José, Los Angelos, Marysville, and San Diego, with a fine port. The university of C., near Oakland, was established in 1869 : there are besides several colleges.

CALIFORNIA, GULF OF, an arm of the Pacific Ocean, which divides the peninsula above described from the rest of Mexico. It was originally known as the Sea of Cortez, having been discovered under his auspices, and explored by himself; and it has, from its shape, been occasionally designated the Adriatic of the New World. It is 700 miles in length, and varies in width from 40 to 100 miles. At its northern extremity, it almost touches the territory of the United States, receiving therefrom the united streams of the Gila and the Colorado. The gulf contains many islands,

particularly towards its head, and has long had a pearl-fishery. At the east side of the entrance stands Mazatlan, on a river of the same name, now the most frequented port of the neighboring regions.

CALI'GULA, Caius Cæsar Augustus Germanicus, Roman emperor (37—41 A.D.), the youngest son of Germanicus (nephew of Tiberius) by Agrippina, was born 31st August, 12 A.D., at Antium, and was educated in the camp, where the soldiers gave him the by-name C., from the half-boots (*caligæ*) which he wore. On the death of his brother Drusus, he was made augur in his stead; and on the death of Tiberius (37 A.D.), who, it was suspected, had received foul-play at his hands, it was found that he had been appointed co-heir along with the grandson of Tiberius, but the senate and the people allowed C. supreme and sole authority. In the beginning of his reign, he appeared hardly likely to fulfil the threat of Tiberius, who had talked of educating C. 'for the destruction of the Roman people.' He was, to appearance, lavishly generous and merciful, pardoning even those who had been the instruments of cruelty against his own family. But this ostentatious magnanimity was itself a disease, an unwholesome affectation, founded on no principle, or even humanity of heart, and co-existed with the most savage voluptuousness and lust. Consequently, when illness, the result of his vicious life, had weakened his faculties, the lower qualities of his nature obtained the complete mastery. In addition to the senseless prodigality with which he commenced his career—expending in one year the enormous wealth left by Tiberius (720 millions of sesterces)—he began to manifest the most barbarous propensities. He banished or murdered his relatives, excepting his uncle Claudius and sister Drusilla (with whom he carried on incestuous intercourse); filled Rome with executions, confiscating the estates of his victims; amused himself, while dining, by having victims tortured and slain in his presence; and uttered the wish 'that all the Roman people had but one neck, so that he might decapitate Rome at one blow!' To vie with Xerxes, he made a bridge of ships over the bay between Baiæ and Puteoli (a distance of three Roman miles and six hundred paces), and celebrated the exploit by a costly banquet on the middle of the bridge, and by collecting on it great numbers of people, and causing them to be drowned. His favorite horse was stabled in a palace, fed at a marble manger with gilded oats, was made a member of the college of priests, and afterwards raised to the consulship. As a climax to all his absurdities, he declared himself a god, and had temples erected, and sacrifices offered to himself. To gratify his monstrous desires, he shrunk from no infamy; he robbed, plundered, and taxed his subjects to a degree which seems almost incredible, and when even these means proved insufficient, he established a brothel in his own palace, and sent out his slaves to solicit the public patronage for it. At length a conspiracy was formed against him, and he was assassinated 41 A.D.

CALI'PPIC CY'CLE. See Period.

CALI'TRI, a town of Italy, in the province of Avellino, near the Ofanto, and about 7 miles east-north-east of Conza. It has a population of 6200, who are chiefly engaged in agricultural pursuits. Sheep are reared to a considerable extent in the vicinity.

CA'LIVER was a matchlock or firearm about midway in size and character between an arquebus and a musket; it was small enough to be fired without a rest or support.

CALI'XTINES, a Bohemian religious sect, so named from the Latin *calix*, a cup, because they contended for giving the cup, as well as the consecrated wafer, to the laity. Their confession of faith (1421) contained the following articles: 1. That the word of God ought to be freely and regularly preached by the priests of the Lord throughout Bohemia; 2. That the eucharist in both kinds ought to be administered to all burdened with 'no mortal sins,' according to the language and command of the Saviour; 3. That the clergy should separate themselves from secular affairs; 4. That all 'mortal sins,' and especially public ones, such as debauchery and simony, and any other disorders contrary to the law of God, should be prevented or punished by those who were the lawful authorities in such matters. In other main points they were moderate followers of John Huss, and were opposed to the more extreme sect of Taborites (q. v.). Their peculiar articles of faith were conceded by order of the council at Basel (1433); and having prevailed over the Taborites in the conflict which took place at Boehmischbrod 30th May 1434, they became the dominant party in Bohemia, and exercised considerable influence over political affairs. Gradually, however, the C. lapsed from the severity of their four articles, while the schism of the energetic Taborites, and later of the Bohemian Brethren (q. v.), rendered them completely powerless. At the beginning of the 16th c., they had ceased to possess any importance, and only served to prepare the way for Protestantism.

CALIXTUS, Georg (properly, *Callisen*), an eminent theologian of the Lutheran Church, was born 14th Dec. 1586, at Medelbye in Schleswig; studied at Flensborg and Helmstedt; and, in 1605, became professor of philosophy in the latter of these cities. Two years after, he betook himself to theology, and attracted great attention by the breadth and originality of his views. After traveling for some time in Germany, Holland, England, and France, where he made the acquaintance of the most learned men of his time, he returned to Helmstedt in 1613, and was appointed professor of theology. His genius, the depth of his knowledge, and his large experience of the world and of men, which he had acquired in his travels, developed in him a spirit of great tolerance towards all who held their religious opinions honestly, whatever these might be. Although his dissertations on the Holy Scripture, transubstantiation, communion in one kind, &c., are acknowledged by learned Catholics to be about the most solid and admirable which have been composed by Protestants against the distinctive doctrines of Catholicism, he was, on account of some statements in his work, entitled *De Præcipuis Religionis Christianæ Capitibus* (Helmstedt, 1613), which seemed favorable to Catholic dogmas, and of others in his *Epitome Theologiæ Moralis* (Helmstedt, 1634), *De Tolerantia Reformatorum*, &c. (Helmstedt, 1658), which approached too near to the Reformed or Calvinistic standpoint, declared guilty of abominable heresy by the adherents of the letter of the Concordienformel—i. e., the orthodox and dogmatically rigid Lutherans. C. felt keenly that the polemical harshness of Lutheranism was a serious obstacle in the way of a great Catholic Christianity, and that Protestantism must assume another form before it could hope to become the religion of Europe. Under this conviction, C. endeavored to show that the oldest and most fundamental articles of the Christian faith—viz., the facts embodied in the 'Apostles' Creed'—were common to all Christian sects. In subsequent dissertations, having stated that the doctrine of the Trinity was less distinctly taught in the Old than in the New Testament, and that good works were necessary to salvation; and finally, at the religious conference of Thorn, in 1649, whither he was sent as a mediator by the Elector of Brandenburg, having been on more intimate terms with the Calvinistic than the Lutheran theologians, C. was accused of apostasy. Fortunately, however, he had powerful friends, who stood firmly by him, and through the help he was enabled to retain his professorial chair till his death, on the 19th March 1656.
